appear as a small elliptical motion of the earth's axis performed in the same time as the moon's nodes take to complete a revolution, the axes of the ellipse being respectively $18''\cdot5$ and $13''\cdot7$, the

longer axis being directed towards the pole of the ecliptic. But this motion, when combined with the more rapid one of precession, causes the pole of the earth's axis to describe a wavy line round P, the pole of the ecliptic.

The effect of nutation, when referred to the equator and ecliptic, is to produce a periodical change in the obliquity of the ecliptic and in the velocity of retrogradation of the equinoctial points. It thus gives rise to the distinction of 'apparent' from 'mean' right ascension and declination, the former involving and the latter being freed from the fluctuations arising from nutation.

Nut-cracker (*Nucifraga*), a genus of birds of the family Corvidæ, with a straight, stout, conical bill, both mandibles terminating in an obtuse point, and tail nearly square at the end. Four species are known, ranging from northern Europe and Arctic Siberia to the Himalayas and China. One species (*N. caryocatactes*) is occasionally seen in Britain and is not uncommon in many parts of Europe and of Asia, particularly in mountainous regions covered with pines. It is about 12 inches long. The plumage is light brown, speckled with white, except on the wings, rump, and tail, which are nearly black. The female shows a somewhat redder brown colour on the wing-feathers. The nut-cracker frequents the tops of the high pine-trees, its favourite food being the pine-cone seeds, which it extracts, holding the cone in its foot. Its diet, however, is often very varied. Its nest of sticks, roots, and grass, lined with moss or lichens, is built on the bough of a tree near the stem and at

Nut-cracker (*Nucifraga caryocatactes*).

some distance from the ground.—A closely allied species (*N. multipunctata*) is found in Kashmir, and a larger species (*N. hemispila*), with browner plumage, in the Himalayas.

Nut-galls. See GALLS, GALL-FLY.

Nut-hatch (*Sitta*), a genus of birds of the family Sittidae, having a straight conical or prismatic bill, short stout legs, the hind-toe very strong, and large hooked claws. They run up and down trees with great agility, moving with equal ease in either direction, and without hopping, so that the motion is rather like that of a mouse than of a bird. They feed on insects, in pursuit of which they examine the crevices and remove large pieces of the bark; at other times on seeds, as those of pines, and the kernels of nuts, to obtain which they fix the nut in some crevice and then hammer it with their bill until the shell is broken, each blow being delivered with the whole strength of the body working from the hip-joint; hence the name of Nut-hatch or Nut-hack. Seventeen species are known, ranging south in the Old World to Southern India and Burma, and in the New World to Mexico, being well represented in North America.

One species (*S. caesia*) is fairly common in many districts of England containing old timber. It occurs in the south of Scotland, and has been reported as seen in Skye and in the Shetlands; but as yet it is unknown in Ireland. It extends through central and southern Europe to Persia and even south-eastern Siberia. Its whole length is about 5½ inches. The upper parts are generally of a blue slate colour; the wing-quills grayish brown; the middle tail-feathers more slate-gray, the remainder black at their bases and barred and

Nut-hatch (*Sitta caesia*).

tipped with white and gray; a black band runs from the base of the bill through the eye to the nape of the neck; the throat and under parts are of a pale cinnamon or rich buff colour; the bill, legs, and feet are brown. The plumage of the female is somewhat duller. Its nest is made of dry leaves or scales of cones, generally in the hole of a tree. From five to seven eggs are laid, of a white colour spotted with reddish brown.—A closely allied species (*S. europæa*), with nearly white under parts, is found in the Danish Islands and throughout northern Europe and northern Asia as far as Japan. The nut-hatch is absent from Malta and Sardinia, but in Corsica a distinct species (*S. whiteheadi*) is found, the under parts being white and the head jet-black in the male. The nut-hatches of Australia and New Guinea belong to a distinct though closely allied genus, *Sitella*. The Blue Nut-hatches (genus *Dendrophila*) are found from Ceylon and India to Burma and Malaya. The Coral-billed Nut-hatch, the only species of another genus (*Hypherpes*), is found only in Madagascar.

Nutmeg. This well-known and favourite spice is the kernel—mostly consisting of the albumen—of the fruit of several species of *Myristica*. This genus belongs to a family of dicotyledons called *Myristicaceæ*, which contains about 150 species, all tropical trees or shrubs, natives of Asia, Papua, Madagascar, and America. They generally have red juice, or a juice which becomes red on exposure to air. The leaves are alternate and without stipules. The flowers are unisexual, the perianth generally trifid, the filaments united into a column. The fruit is succulent, yet opens like a capsule by two valves. The seed is nut-like, covered with a lacinated fleshy aril, the albumen penetrated by its membranous covering. All the species are more or less aromatic in all their parts; their juice is styptic and somewhat acrid; the albumen and aril contain both a fixed and an essential oil, and those of some species are used as spices. The species which furnishes the greater part of the nutmegs of commerce is *M. fragrans*; but the long nutmeg (*M. fatua*), from the Banda Isles, is now not uncommon in our markets. The common nutmeg-tree is about 25 feet in height, with oblong leaves and axillary few-flowered racemes; the fruit

is of the size and appearance of a roundish pear, golden yellow in colour when ripe. The fleshy part of the fruit is rather hard, and is of a peculiar consistence, resembling candied fruit; it is often preserved and eaten as a sweetmeat. Within is the nut enveloped in the curious yellowish-red aril, the *Mace* (q.v.), under which is a thin shining brown shell, slightly grooved by the pressure of the mace, and within is the kernel or nutmeg. Up to 1796 the Dutch, being the possessors of the Banda Isles, jealously prevented the nutmeg from being transplanted; but during the British occupation plants were sent to Penang, India, the West Indies, Brazil, Réunion, where they are now successfully

Nutmeg (*Myristica fragrans*):

a, fruit bursting open; b, the same with one valve removed, showing the seed; c, section of seed; d, seed with the testa removed (Bentley & Trimen).

cultivated. Nutmegs are very liable to the attack of a beetle, which is very destructive, and it is a common practice to give them a coating of lime before shipping them to Europe to kill the vitality of the germ. The nutmeg yields by-expression a peculiar yellow fat, called oil of mace, because from its colour and flavour it was generally supposed to be derived from mace; and by distillation is obtained an almost colourless essential oil which has very fully the flavour of the nutmeg. Nutmegs are chiefly used as a spice, but medicinally they are stimulant and carminative. They possess narcotic properties, and in large doses produce stupefaction and delirium. The trees which are transplanted in the nutmeg parks are generally such as have been propagated from the fruit by a certain blue pigeon. This bird, extracting the nutmeg from its pulpy covering, devours the whole entire. The mace only is digested, and the nutmeg in its shell being voided is readily propagated by the assistance of the bird's dung when it falls in a shady place. If carefully lifted it may be transplanted at any age. The plants do not produce flowers till they are eight or nine years old. The sexes being on different trees, when the plants are two years old the greater number are headed down and grafted with scions from the female tree, a few only of the male to ensure fecundation. Other species of *Myristica* besides those already named yield nutmegs sometimes used, but of very inferior quality. The fruits of several species of *Lauraceæ* also resemble nutmegs in their aromatic and other properties, as the cotyledons of *Nectandra Puchury*, the *Pichurim* Beans of commerce, and the fruit of *Acrodictidium Camara*, a tree of Guiana, the *Camara* or *Ackawai* nutmeg. The clove nutmegs of Madagascar are the fruit of *Ravensara aromatica*, and the Brazilian nutmegs of *Cryptocarya moschata*. All these belong to the *Lauraceæ*. The Calabash Nutmeg is the fruit of *Monodora Myristica*, of the *Anonaceæ*.

Nutria. See COYPÚ, FURS.

Nutrition. See the articles on BLOOD, CIRCULATION, DIET, DIGESTION, FOOD, &c.

Nux Vomica, the seed of *Strychnos Nux-vomica*. The seeds are imported from the East Indies, and are flattish and circular, about an inch in diameter, umbilicated and slightly convex on one side, externally of an ash-gray colour, thickly covered with short satiny hairs, internally translucent, tough and horny, in taste intensely bitter, inodorous. The tree is a native of Coromandel, Ceylon, and other parts of the East Indies. It is a tree of moderate size, with roundish-oblong, stalked, smooth leaves, and terminal corymbs. The fruit is a globular berry, about as large as a small orange, one-celled, with a brittle shell, and several seeds lodged in a white gelatinous pulp.—The bark is sometimes known as *False Angostura Bark*, having been confounded with *Angostura Bark*, which is non-poisonous, and simply has the action of a bitter. The seeds contain (in addition to inert matters, such as gum,

Nux Vomica (Strychnos Nux-vomica) Branch with Flowers:

a, fruit; b, section of fruit (Bently & Trimen).

starch, woody fibre, &c.) two alkaloids closely related to each other, which act as powerful poisons on the animal frame, and speedily occasion violent tetanic convulsions and death. These alkaloids are named *Strychnine* (q.v.) and *Brucine* (q.v.), and exist in the seeds in combination with lactic and strychnic (or igasuric) acids.

Nyam-Nyams. See NIAM-NIAM.

Nyasa, the southernmost of the great lakes of Africa, is about 260 miles SE. of Tanganyika and 400 from the east coast. It lies at an altitude of 1570 feet, is very deep in the middle, shelving rapidly from the shores, which are rocky and high. Long and narrow, it measures 350 miles from north to south and an average of 40 from east to west. The river Shiré used to emerge at its southern extremity, and carry its waters south to the Zambezi. Of late the uppermost part of the Shiré has been dry, leaving Nyasa without an outlet. The waters of the lake are sweet, and abound in edible fish. Although the Portuguese had knowledge of the existence of the lake under the name of Maravi early in the 17th century, Livingstone in 1859 was the first to fix its exact situation and to navigate it.

NYASALAND PROTECTORATE, in 1891-1907 known as the British Central Africa Protectorate, lies along the southern and western shores of Lake Nyasa, extending nearly to the banks of the Zambezi; and includes the Shiré Highlands, the greater part of

the Shiré basin, and Lake Shirwa. It is administered under the Colonial Office by the governor, assisted by executive and legislative councils. The total area is 40,000 sq. m., and the population 1,000,000, of whom 1500 are Europeans and 660 Asiatics. The chief towns are Blantyre (6000), Zomba (seat of the administration), Fort Johnston (chief port of Lake Nyasa), Karonga, at the north end of the lake, and Kotakota, on the western shore. Cotton, tobacco, and tea cultivation has been rapidly developed; coffee and sugar are also grown; rice is largely cultivated; and oats and barley thrive in the uplands. Rubber and ivory are also exported. Almost all the trade is with Britain. The Shiré and the Zambezi having deteriorated as waterways, Nyasaland has come to look more to the railway for outer communications. Railway connection with the Portuguese port of Beira is broken only by the Zambezi, which is to be bridged. Northward extensions are planned. Education is progressing. See Johnston's *Central Africa* (1897), Duff's *Nyasaland* (1903), and Murray's *Handbook of Nyasaland* (1922).

Nyāya. See SANSKRIT LITERATURE.

Nyborg. See FÜNEN.

Nyctaginaceæ, a family including herbaceous plants, both annual and perennial, shrubs and trees. There are about 160 known species, natives of warm countries. Some have beautiful flowers, as those of the genus *Mirabilis*, known in gardens as *Marvel of Peru*. The fruits of the Australian and East Indian tree *Pisonia umbellifera* are so sticky that birds are often found adhering to them.

Nyctalopia, the defective vision of persons who can see in a faint light but not in bright daylight; sometimes applied to the opposite defect, inability to see save in a strong daylight.

Nycteribia, very remarkable, wingless, spider-like, Dipterous insects, parasitic on bats.

Nyiregyháza, a town of eastern Hungary, 130 miles E. by N. of Budapest, is the centre of an extensive wine district; pop. 43,000.

Nyköping, a seaport of Sweden, situated on a bay of the Baltic, 62 miles SW. of Stockholm, manufactures machinery and cotton. The castle ranked in strength next to those of Stockholm and Calmar. King Waldemar was imprisoned there after his dethronement in 1288, till his death in 1302. Eric and Waldemar, brothers of King Birger, were left in 1317 to perish of hunger in a dungeon, the keys of which the king threw into the sea. In horror of this deed the people seized the castle and demolished it. In 1719 the town was taken and dismantled by the Russians. Pop. 12,000.

Nyl-ghau, or NILGAI (*Boselaphus tragocamelus*), a species of antelope, with somewhat ox-like head and body, but with long slender limbs, and of great activity and fleetness. It is one of the largest of antelopes, and is more than four feet high at the shoulder. The horns of the male are about as long as the ears, smooth, black, pointed, slightly curved forwards. The female has no horns. The neck is deep and compressed, not rounded as in most of the antelopes. A slight mane runs along the neck and part of the back, and the breast is adorned with a long hanging tuft of hair. The back is almost elevated into a hump between the shoulders. The nyl-ghau inhabits the dense forests of India and Persia, where it has long been regarded as one of the noblest kinds of game. The name is Persian, and signifies 'blue ox.' It is often taken, like other large animals, by the enclosing of a large space with nets, and by great numbers of people. It is a spirited animal, and dangerous

to a rash assailant. It is capable of domestica-

Nyl-ghau (*Boselaphus tragocamelus*).

tion, but it is said to manifest an irritable and capricious temper.

Nymphæaceæ, a natural order of dicotyledons, growing in lakes, ponds, ditches, and slow rivers, where their fleshy root-stocks are prostrate in the mud at the bottom; and their large, long-stalked, heart-shaped, or peltate leaves float on the surface of the water. Their flowers also either float or are raised on their stalks a little above the water. The flowers are large, and often very beautiful and fragrant. There are usually four

sepals and numerous petals and stamens, often passing gradually into one another. The ovary is many-celled, with radiating stigmas, and very numerous ovules, and is more or less surrounded by a large fleshy disc. The seeds have a farinaceous albumen. More than fifty species are known, mostly natives of warm and temperate regions. The root-stocks of some of them are used as food, and the seeds of many. See WATER-LILY, LOTUS, NELUMBO, VICTORIA, and EURYALE.

Nymphs, in Greek Mythology, female divinities of inferior rank, inhabiting the sea, streams, groves, meadows and pastures, grottoes, fountains, hills, glens, and trees. Among them different classes were distinguished, particularly the *Oceanides*, daughters of Oceanus (nymphs of the great ocean which flows around the earth), the *Nereids*, daughters of Nereus (nymphs of the inner depths of the sea, or of the Inner Sea—the Mediterranean), *Potameides* (River nymphs), *Naiads* (nymphs of fountains, lakes, brooks, wells), *Oreads* (Mountain nymphs), *Napææ* (nymphs of glens), and *Dryads* or *Hamadryads* (Forest nymphs, who were believed to die with the trees in which they dwelt). They were the goddesses of the fertilising power of moisture, possessed prophetic power, and took interest in the nourishment and growth of infants, the chase, and dancing. They are among the most beautiful conceptions of the plastic fancy of the ancient Greeks. See W. H. Roscher's *Lexikon der Griechischen und Römischen Mythologie* (1890-1900). —For Nymph in natural history, see CHRYSALIS.

the fifteenth letter of the modern English alphabet, represents historically the sixteenth letter of the ancient Semitic alphabet. Alone among the Semitic letters it passed into the Greek and thence into the Roman alphabet in exactly the shape in which it appears in inscriptions of the

9th century B.C. In the later Semitic alphabets, on the other hand, the primitive O was variously altered, so that no resemblance to the original form remains. In the ordinary Hebrew alphabet it has become **ו**.

The original sound of the letter was a guttural consonant peculiar to the Semitic languages, somewhat resembling the original sound of the first letter of the alphabet (see the article A). The letter had also a harsher guttural sound, which was rendered by G in the Greek and Roman spelling of some proper names, as Gaza, Gomorrha; but in the dialect of the inventors of the alphabet the two sounds had probably become identical. To Western ears the softer of the two Semitic consonants does not seem to be an articulate sound at all. Hence in popular transcriptions the letter is omitted; it is, for instance, in Hebrew the initial of the proper names which in the English Bible appear as Amram, Eber, Iddo, Omri, and Uz, and in Arabic of the name commonly written Abdallah. In more scientific transcriptions the sound is rendered by a mark like the Greek rough breathing ('). In Hebrew the name of the letter is 'ayin, in Arabic 'ain, identical with the word for 'eye' in those languages; and the character O may have been intended to represent an eye.

To a Greek ear the name of the letter would seem to begin with a vowel; it was, therefore, natural that the Greeks should use the letter as a vowel. As four out of their five recognised vowels had obviously appropriate symbols in the alphabet, O was made to stand for the remaining one—viz. the rounded back vowel, uttered with the back of the tongue lowered from the position of *u* (as in *truth*, *püt*). This sound, in one or other of its possible varieties of articulation, is the normal value of O in all alphabets descended from the Greek. The Greek language had two *o*-sounds: the 'close *o*' (somewhat approaching *u*), which was short, and the 'open *o*,' which was long. Originally the letter O expressed both sounds, but afterwards the modified form Ω was invented for the long open vowel. As the Semitic name of the letter did not begin with its Greek sound, it was abandoned. In classical times the sounds of O and Ω were used as their names (the name of O, however, was written *ou*, pronounced as a lengthened 'close *o*'). By the Greek grammarians of the Middle Ages O and Ω were called respectively *o mikron* (small *o*) and *ō mega* (large *o*).

The Greek alphabet known to the early Romans did not include the letter Ω, so that in Latin O was used both for the short and for the long vowel. In the later periods of the language the long *o* was close and the short *o* open. The combination *oe*, originally representing a diphthong composed of

the sounds of the two letters, came in late Latin to be pronounced like long *e*.

In English the ordinary 'long *o*' (the sound which serves as the name of the letter) has in modern pronunciation become a diphthong (*o + u*); the ordinary short *o* (as in *not*) is an open *o*, more open than the French 'open *o*' in *cloche*. From various historical causes the letter is often used for other than true *o*-vowels, as in *do*, *love*; but these values are felt to be abnormal, so that they would not naturally be used in reading an unknown word. On the other hand, *oo* is the normal symbol for the long *u* vowel, and *ou* or *ow* for the diphthong *a + u*, though these diagraphs have also other pronunciations. In the continental languages O nearly always stands for a true *o* sound; exceptions occur in the French *oi* and *ou*, and in the Dutch *oe* (= English *oo*).

In German *ö* (formerly *ö*; in some proper names still written *oe*) stands for a rounded front vowel descended from an original *o*; the same sound is expressed by *ö* in Swedish and *ø* in Danish. The Portuguese *ô* is used in the combination *õe*, representing a nasal diphthong. The ligature *Œ*, *œ*, as used in Latin and English, has the same history as *Æ*, *æ* (for which see A); in modern French it occurs in the combination *œu* (pronounced like French *eu*) and in the word *aïl* (pronounced as *euil*); the abnormal spelling is confined to words in which the sound etymologically represents a Latin *o*.

Oahu. See HAWAII.

Oajaca, a mountainous state in the south of Mexico (q.v.), bordering on the Pacific. The capital, Oajaca, lies 5060 feet above the sea, in the fertile valley of the Atoyac. It contains a large cathedral (1729), a quaint bishop's palace, the Seminario Tridentino, and the State Institute. It was the birthplace of Porfirio Diaz. The manufactures are chiefly chocolate, cotton goods, cigars, candles, and soap. Pop. 28,000.

Oak (*Quercus*), a genus of trees and shrubs of the natural order Fagaceæ, having monœcious flowers, the male in slender catkins or spikes, the female solitary or clustered; the fruit a nut or acorn, oblong, ovoid, or globular, protruding from a woody cup formed by the enlarged scales of the involucre; the leaves are deciduous or evergreen, alternate, entire, lobed, or sinuate. The species, of which there are about 300, are spread over nearly the whole of the northern hemisphere, except the extreme north. They are more numerous in America than in Europe; a few are found in Asia, none in tropical Africa, in Australia, or in South America except about the Andes. The Common or English Oak (*Q. Robur*) is the most widely distributed of the species. It extends all over Europe, except the extreme north, and penetrates into central Asia by way of the Caucasus. In Britain there are two well-marked 'races,' which in their more extreme forms are reckoned by some as species, by others merely as varieties of *Q. Robur*. The form that is most common—*Q. Robur*, by some called *Q. pedunculata*—is characterised by having auriculate leaf-bases, leaves smooth on the under

side, regularly spaced longitudinal striation on the acorn. The other form—*Q. sessiliflora*—has petioles of $1\frac{1}{2}$ cm. or more, stellate hairs on the under side of most leaves, and smooth upper side. The former is found most plentifully in the south and midland counties of England, the latter in the west and north, and in Scotland. But not only are the two

Fig. 1.—Common Oak (*Quercus Robur pedunculata*): a, branch in fruit; b, male flower; c, female flower.

forms found growing together in all districts, but the extremes of structural difference are linked together by every intermediate gradation. The Durmast Oak (*Q. lanuginosa*), which is most abundant in the New Forest, differs only from the stalkless-fruited variety in having the leaves more or less downy on the under side, and in retaining them longer in winter than either of the others. But this variety is also found in company with the others in different parts of the country.

No other European tree combines in itself the essential elements of strength and durability, hardness and elasticity, in the same degree as the oak. Longevity is a characteristic of all species of

Fig. 2.—Sessile-fruited Oak (*Quercus Robur sessiliflora*) Branch in Fruit.

oak, but the British oak is celebrated above all others for the great age to which it attains. In many districts of England, and in a few also of Scotland, there exist huge venerable living remains of giant oaks, whose age cannot be computed with accuracy, but which, when compared with younger trees authentically known to be 300 or 400 years old, may, without improbability, be reckoned to have stood for more than 1000 years. Many of these ancient trees are historical landmarks, being associated with the events and the names of persons of the remote past. Legendary though some of these associations may appear to be when applied to such as the 'King Oak,' in Windsor Forest, which is said to have afforded

shade and shelter to William the Conqueror, it is far from improbable that the tree may have been of considerable age at the time of the Conquest. The circumference of the trunk of this tree in 1864, at 3 feet from the ground, was 26 feet. But there are many larger living oaks in other parts of the country. The Cowthorpe Oak, for instance, in the village of that name, 6 miles S.E. of Knaresborough, measured, at 3 feet from the ground, 48 feet in circumference. This tree is simply a wreck of former grandeur, yet lives and puts forth leaves annually. Taking the less favourable character of the climate of the West Riding of Yorkshire, when compared with that of Windsor Forest, into account along with the immensely greater bulk of the Cowthorpe Oak than the King Oak, it is not extravagant to assume that the former may be twice the age of the latter. Most often struck by lightning of all European trees, the oak was associated with the Indo-European thunder-god.

The history of the use of the timber of the oak as material for shipbuilding may be said to date from the time of King Alfred (see NAVY). The timber is also employed in architecture, cabinet-making, carving, mill-work, and coopering; and the sawdust was formerly employed in the dyeing of fustian. The bark furnishes tan, and yields a bitter extract named *Quercine*, employed in medicine as a tonic and astringent. Colouring matter is also obtained from it, which can be used in dyeing wool. The acorns are excellent food for swine; and their importance for this purpose is clearly shown by the pannage laws enacted by Ine, king of Wessex, in the 7th century, for the regulation of the rearing and fattening of hogs, then, and for centuries afterwards, perhaps the most important agricultural pursuit of the people. Although the fruit of the British oak is neither so palatable nor so easily digested as to recommend itself for human food, that of many other oaks is sweet, wholesome, and nutritious. In Turkey the acorns of several kinds, after being buried in the ground for some time to deprive them of their bitter principle, are dried, washed, and ground to powder along with sugar and aromatics. The compound thus prepared is called *palamonte*, and a food is made from it named *racahout*, which is much esteemed by the ladies of the seraglios for maintaining their plumpness and good condition. The fruit of the Barbary Oak (*Q. Ballota*) and the Evergreen Oak (*Q. ilex*), especially the former, is sweet and nut-like in flavour and wholesome to eat. The Dwarf Chestnut Oak (*Q. Prinoides*), a North American species, and several others of that country also produce edible acorns. Among other oaks remarkable for the utility of their products are the Cork Oak (*Q. Suber*; see CORK); the Valonia Oak (*Q. Egilops*), native of the Levant, whose cups are said to contain more tannin in a given bulk of substance than any other vegetable; the Black or Quercitron Oak (*Q. tinctoria*), an abundant native of the United States, whose bark yields the *Quercitron* dye of commerce; the Gall Oak (*Q. infectoria*), a native of Asia Minor, furnishing the *gall-nuts* of commerce (see GALLS); the Kermes Oak (*Q. coccifera*), a native of the south of Europe, the Levant, and the north of Africa, which supplies the *kermes* or *scarlet grain* of commerce. The timber of most of the American oaks is valuable. The following are the most esteemed as timber-trees: the White Oak or Quebec Oak (*Q. alba*), spread from the Gulf of Mexico to Canada, regarded as only inferior in quality to British oak; the Over-cup Oak (*Q. lyrata*), native of the southern states, occupying situations liable to inundation; the Chestnut-leaved White Oak (*Q. prinus*), also a native of the southern states; the Live Oak (*Q. virginiana*), extending from the Gulf of Mexico as

far north as Virginia, regarded as the most valuable of American oaks for shipbuilding; the Red Oak (*Q. rubra*), pretty generally distributed in the United States and in Canada, furnishing the *Red Oak Staves* so much in demand in the West Indies. Of the Turkey Oak (*Q. Cerris*) there are several interesting varieties, as the Fulham Oak (*Q. fulhamensis*), which is semi-evergreen although the parent is strictly deciduous. The hybrid Austrian Oak (*Q. austriaca*), the Evergreen or Holm Oak already named, and a number of the American species already noticed are much appreciated ornamental trees in Britain. Green oak is a condition of oak-wood caused by its being impregnated with the spawn of *Peziza æruginosa*, which communicates a beautiful tint of green, taken advantage of for inlaying, bead-making, &c.—The Common Oak and most others cultivated in Britain delight in deep moist loamy soil, in which, however, there should be no stagnant water. Great depth is of more consequence than superior quality of soil. Plantations of oak are slow in coming to marketable value, except in the shape of copsewood, for which the oak is one of the best adapted trees, owing to the facility with which it stools or sends saplings up from its roots on being cut down. Copsewood oak is valuable for firewood, the making of charcoal, crates, &c., while the bark is suitable for the purpose of the tanner. The acorns of all species of oak supply oil in considerable quantity, which has been used in cookery and for other domestic purposes.

In south-east Asia and its islands and in New Guinea are a number of closely related genera, which may be reckoned oaks in a wider sense—*Pasania*, *Lithocarpus*, *Cyclobalanopsis*, *Castanopsis*. Many other trees bear the name oak popularly applied. Thus, the Poison Oak (*Rhus Toxicodendron*), a shrub or small tree of North America, Indian Oak (*Tectona grandis*), African Oak (*Oldfieldia africana*), and the Australian She-oak (*Casuarina*), are examples of this erroneous use of the name oak.—For Oak-apples, see GALLS; and for Oak-apple Day, RESTORATION.

See Evelyn's *Sylva* (1664); Strutt's *Sylva*; Camden's *Account of the New Forest*; Gilpin's *Forest Scenery*; Loudon's *Arboretum Britannicum*; *Trans. Highland and Agric. Soc.* (1881); Marshall Ward's *The Oak* (1892); C. Mosley's *The Oak, its Natural History, Antiquities, and Folk-lore* (1912).

Oakham, the county town of Rutland, in the vale of Catmose, 25 miles WNW. of Peterborough. The castle, every peer passing which must forfeit either a horseshoe or a fine, is in ruins except the hall, used for county business. The town has a fine parish church, with a lofty spire, and Archdeacon Johnson's grammar-school (1584; reconstituted 1875). Beer, boots, and hosiery are made. Pop. 3300.

Oakland, an important seaport, capital of Alameda county, California, is on the east side of San Francisco Bay, $4\frac{1}{2}$ miles from San Francisco. It is a beautiful town, with wide streets adorned with evergreen oaks, and surrounded with gardens and vineyards. It is the terminus of the Southern Pacific Railroad, and steam ferry-boats ply constantly to San Francisco. Besides numerous churches, a medical college, and other schools, the city contains iron and steel works, shipyards, canning-factories, cotton-mills, &c. Pop. (1870) 10,500; (1910) 150,174; (1920) 216,261.

Oaks, THE. See HORSERACING.

Oamaru, a port of New Zealand on the east coast of South Island, 78 miles NE. of Dunedin by rail; a bathing resort and place of active trade; its principal export is grain; pop. 5700.

Oa'ses (through Latin and Greek from Coptic), fertile spots in a desert, due to the presence of wells or of underground water-supplies. The best known and most historically famous are those of the Libyan Desert and the Sahara; they occur also in the deserts of Arabia and Persia, and in the Gobi. The French have created many oases in the Algerian deserts by sinking Artesian Wells (q.v.). The chief vegetation of the African oases is palms—especially date and dum palms; with barley, rice, and millet, when the fertile area is large enough to admit of settled occupation. In the Libyan Desert are the oases of Siwa, Farafa, Bahriya, Dakhel, and Khargeh. In the western Sahara, Tuat, 1000 miles SW. of Tripoli, is the best known; in the eastern Sahara are Fezzan (q.v.), Gadames (q.v.), Bilma (q.v.), and Air (q.v.) or Asben. See DESERT.

Oastler, RICHARD (1789–1861), known for his work in factory reform as 'the factory king,' was born at Leeds in 1789. His name is principally associated with the movement for a ten hours' day. This agitation he led from 1830 till the successful carrying into law of the proposal in 1847. His opposition to the new Poor Law of 1835 led indirectly to his imprisonment for debt in 1840. During his three years' incarceration he published the *Fleet Paper*, in which periodical he continuously urged the need for factory reform.

Oates, TITUS, was born at Oakham about 1649, the son of a Norwich ribbon-weaver. He was brought up at Oakham school, Merchant Taylors' (1665), and Sedlescombe in Sussex; entered Caius College, Cambridge (1667); and two years later was admitted a sizar at St John's. Next taking orders, he held several curacies and a naval chaplaincy, but was as often expelled for infamous practices, of which perjury was not the worst. So, in concert with a Protestant alarunist, the Rev. Dr Tonge, he resolved to concoct the 'narrative of a horrid plot,' and, feigning conversion to Catholicism, was admitted as 'Brother Ambrose' to the Jesuit seminaries of Valladolid and St Omer. From both in a few months he was expelled for misconduct, but, returning to London in June 1678, he forthwith communicated to the authorities his pretended plot, the main features of which were a rising of the Catholics, a general massacre of Protestants, the burning of London, the assassination of the king, and the invasion of Ireland by a French army. Charles treated the story with contempt; but Oates swore to the truth of it before a magistrate, Sir Edmund Berry Godfrey, who on 17th October was found dead in a ditch—murdered possibly by Titus and his confederates. All London straightway went wild with fear and rage; Shaftesbury skilfully fanned the excitement; and Oates became the hero of the day. A pension of £480 was granted him, and a suite of apartments at Whitehall set apart for his use. Bedloe, Dangerfield, and other wretches came forward to back or emulate his charges; the queen herself was assailed; and many Catholics were cast into prison. Some thirty-five of them were executed, including five Jesuits and old Viscount Stafford; but after two years a reaction set in, and Oates was driven from his rooms in the palace. In May 1683 he was fined £100,000 for calling the Duke of York a traitor, and being unable to pay was imprisoned; in May 1685 he was found guilty of perjury, and sentenced to be pilloried, flogged, and imprisoned for life. The Revolution of 1688 gave him liberty and a pension, but in 1696 he had sunk into utter destitution, and he died 12th July 1705.

See *The Popish Plot*, by John Pollock (1903), and Father Gerard's reply (1903); A. Lang's *Valet's Tragedy* (1903); and *Who Killed Sir Edmund Berry Godfrey?* (1905).

Oath, in LAW, is the declaration, attested by the name of God, which is required on entering certain public offices and before giving evidence in a court of justice. Of oaths taken on entering office, the most important is the coronation oath, administered to the sovereign by an archbishop or bishop of the Church of England in presence of all the people (see CORONATION). The oaths required to be taken to government by the holders of certain offices have now been reduced to three in number—the oath of allegiance, the official oath, and the judicial oath. The oath of Allegiance (q.v.), ‘to be faithful and bear true allegiance to his Majesty,’ and the official oath, ‘to well and truly serve his Majesty,’ must be taken by all the principal officers of state in England, Scotland, and Ireland. Short forms of these oaths are provided in the Promissory Oaths Act, 1868, and in a schedule appended to this statute will be found a complete list of the officials to whom these different oaths are to be tendered. All the judges of the land on entering office take, in addition to the oath of allegiance, what is known as the ‘judicial’ oath, ‘to do right to all manner of people after the laws and usages of this realm, without fear or favour, affection, or ill-will. Members of parliament now take only the oath of allegiance, which has come in the place of the several oaths of allegiance, supremacy, and abjuration formally required from every member of both Houses of Parliament and from all persons holding office under the crown. The form of the oath of allegiance is different for members of the Imperial Parliament and the members of the parliament of Southern Ireland respectively. Till comparatively recent times, oaths were required on many trivial occasions and from numerous classes of persons. By 5 and 6 Will. IV. chap. 62, and several succeeding statutes, however, nearly all these unnecessary oaths have been abolished and declarations have been substituted. Special oaths are, nevertheless, still taken by privy-councillors, by archbishops and bishops, by peers, baronets, and knights on their creation, by aliens on being naturalised, by recruits, and others.

The most important oaths affecting the general public are those which are administered in courts of justice to jurors and witnesses. Jurymen, who are called on to exercise their functions, whether in civil or criminal cases, are sworn ‘to well and truly try the issue between the parties, and a true verdict give, according to the evidence.’ Further, no person can give testimony upon any trial until he have in one form or another given a pledge that he will narrate the truth; he thus renders himself liable to the temporal penalties of perjury in the event of his wilfully and corruptly giving false testimony. In England, the oath which is administered to witnesses is in this form: ‘The evidence I shall give shall be the truth, the whole truth, and nothing but the truth, so help me God.’ The universal usage in England and Ireland for many centuries was for the witness, after hearing the oath repeated by the officer of court, to kiss the New Testament. This form and the still older form of laying the hand on the book are in accordance with an ordinance of the Emperor Julian prescribing that the oath be taken *sacrosanctis evangelis tactis*. In recent years the practice of swearing with uplifted hand came into use mainly for sanitary reasons; and now the standard manner of taking the oath is that directed by the Oaths Act, 1909 (9 Edw. 7, chap. 39) as follows: ‘The person taking the oath shall hold the New Testament, or, in the case of a Jew, the Old Testament, in his uplifted hand, and shall say or repeat after the officer administering the oath the words, “I swear by Almighty God that . . .” followed by the words of the oath prescribed by law.’ Under the act the

oath must be administered in this form, unless the person about to take the oath voluntarily objects, or is physically incapable of taking the oath, or is neither a Christian nor a Jew. In Scotland the witness, standing and holding up his right hand, repeats the oath after the judge, as follows: ‘I swear by Almighty God, and as I shall answer to God at the great day of judgment, that I will tell the truth, the whole truth, and nothing but the truth.’ Children are sworn only if and when the judge is satisfied that they understand the nature and moral obligation of an oath. By the Act 1 and 2 Vict. chap. 105, legislative sanction has been given to the rule of the common law that all persons shall be bound by the oaths which are lawfully administered to them, ‘provided they are administered in such form and with such ceremonies as the parties sworn declare to be binding on their consciences.’ Thus a Jew is sworn on the Pentateuch, with his head covered; a Mohammedan, on the Koran, laying his right hand flat on the sacred book and then touching it with his forehead. A Chinaman is sworn by the ceremony of breaking a saucer before taking the oath. As regards the persons entitled to administer oaths, Lord Brougham’s Act of 1851 provides that ‘every court, judge, justice, officer, commissioner, arbitrator, or other person, now or hereafter, having by law or by consent of parties authority to hear, receive, and examine evidence, is hereby empowered to administer an oath to all such witnesses as are called before them.’ Further, by statute (18 and 19 Vict. chap. 42) all diplomatic and consular agents abroad are empowered to administer oaths and do notarial acts. The statute 5 and 6 Will. IV. chap. 62 renders it unlawful for any justice of peace, or other person, to administer or cause to be administered any oath, affidavit, or solemn affirmation touching any matter of which he has no jurisdiction or cognisance. To some extent it is left to the discretion of the justice whether the particular matter is one as to which it is proper to administer an oath.

Of late years there have been made many alterations of the law as to oaths in relief of persons having conscientious scruples. Relief in this direction was first granted to Quakers, Moravians, and Separatists; they were allowed to make affirmation, whether as witnesses or on other occasions where an oath was formerly required (see AFFIRMATION). A further concession was made in 1854 to those who, not being Quakers, yet refused to take the oath from sincere conscientious motives, such being allowed also to affirm. Previous to 1869 atheists and persons who admitted that they had no religious belief were excluded from giving evidence in courts of justice. This exclusion of the testimony of atheists was put an end to, and at the same time the principle of substituting affirmations for oaths was largely extended by the Evidence Further Amendment Act of 1869 (32 and 33 Vict. chap. 68). When in 1880 Mr Bradlaugh, member for Northampton, claimed to make an affirmation under these Evidence Amendment Acts in lieu of taking the usual parliamentary oath, a select committee of the House of Commons reported that the acts did not apply to the oath taken by members of parliament. This view was confirmed in 1883 by the courts of law in the case of *Clarke v. Bradlaugh*, 7 Q.B.D. 38. In 1883 the government brought in a bill permitting members of parliament to affirm, but it was lost. However, in 1888, a short statute, 51 and 52 Vict. chap. 46, provides that every person upon objecting to be sworn, and stating as the ground of such objection either that he has no religious belief, or that the taking of an oath is contrary to his religious belief, shall be permitted to make his solemn affirmation,

instead of taking an oath, in all places and for all purposes where an oath is and shall be required by law, which affirmation shall be of the same force and effect as if he had taken the oath; and if any person making such affirmation shall wilfully, falsely, and corruptly affirm anything which, if affirmed on oath, would have amounted to perjury, he shall be liable to prosecution as if he had committed perjury. Further, the Act 52 and 53 Vict. chap. 63, sect. 3, provides that in every statute passed since 1850, unless a contrary intention appears, the expressions 'oath' and 'affidavit,' in the case of persons allowed for the time being to affirm or declare instead of swearing, include affirmation and declaration, and the expression 'swear,' in the like case, includes affirm and declare. Prior enactments relating to the administration of oaths are consolidated by the statute 52 Vict. chap. 10, known as the Commissioners for Oaths Act. See PERJURY.

Oats (*Avena*), a genus of edible grasses, containing many species, among which are some valuable for the grain which they produce, and some useful for hay. The Linnean genus *Avena*, as now restricted, has the spikelets in loose panicles, the glumes as long as the florets, and containing two or more florets; the paleæ firm, and almost cartilaginous, the outer palea of each floret, or of one or more of the florets, bearing on the back a knee-jointed awn, which is twisted at the base. The awn, however, tends to disappear, and often wholly disappears in cultivation. Those species which are cultivated as corn-plants have comparatively large spikelets and seeds, the spikelets—at least after flowering—pendulous. The native country of the cultivated oats is unknown, although most probably it is central Asia. There is no reference, however, to the oat in the Old Testament; and although it was known to the Greeks, who called it *Bromos*, and to the Romans, it is probable that they derived their knowledge of it from the Celts, Germans, and other northern nations. It is a grain better suited to moist than to dry, and to cold than to warm climates, although it does not extend so far north as the coarse kinds of barley, owing to its requiring a longer growing period. The grain is either used in the form of groats or made into meal. Oatmeal cakes and porridge form great part of the food of the peasantry of Scotland and of some other countries. Oatmeal is now more largely used as food amongst the wealthier classes than formerly, but with the working-classes, alike in town and country, it is losing favour. No other grain is so much esteemed for feeding horses. Besides a large quantity of starch—about 65 per cent.—some sugar, gum, and 7 or 8 per cent. of oil, the oat kernel contains about 15 per cent. of nitrogenous or proteid compounds. The husk of oats is also nutritious, being similar in composition to good straw, and is mixed with other food for horses, oxen, and sheep. From the starchy particles adhering to the husk or *seeds* after the separation of the grain, a light dish, long popular in Scotland under the name of *souans*, is made by means of boiling water. The grain is sometimes mixed with barley for distillation. The Russian beverage called *kvass* is made from oats. The straw of oats is very useful as fodder, bringing, for that purpose, a higher price than any other kind of straw.

The varieties of oats in cultivation are very numerous, well over a hundred being distinguishable by definite morphological characters. A large majority of these are embraced in the species *Avena sativa*, but there are several others of some importance. The modern classification is as follows: (1) *Avena strigosa*, the Bristle-pointed Oat, has the outer palea terminating in two long bristles. Up

till the 18th century it was widely cultivated in Scotland, where it was generally known as the 'small' oat. It is still cultivated to some extent on poor soils in Orkney and Shetland, as well as in Wales; the grain is long, but thin, and of inferior quality; (2) *Avena brevis* is readily distinguishable from the last by its much shorter grain. The bristle-points occur only on the lower grain of the spikelet, and are much shorter than in *A. strigosa*. The Short Oat does not occur in Britain, but is cultivated as a grain-crop on poor soils at high elevations in France and Spain, ripening where others do not; it is also grown in some parts of Europe as a forage-crop; (3) *Avena fatua*, the common Wild Oat of Britain and northern Europe, is a frequent weed in corn-fields. The upper as well as the lower grain is awned, and the base of the grain is articulated, so that it very readily sheds when ripe; (4) *Avena sativa* is an artificial species, comprising the cultivated forms derived from *A. fatua*. It is distinguished from the latter by the absence of an awn on the upper grains, and also by the attachment of the grain. The articulation, which is characteristic of *A. fatua*, is completely solidified, so that the grain does not readily shed. Some authors make a sub-species, *orientalis*, to include the so-called Tartarian varieties, in which the head or panicle is contracted, and all turned to one side. Of much more importance is the distinction between winter and spring types. In the former the young plant is prostrate, and tillers or proliferates very freely, while in the latter type the young plant is erect or sub-erect and tillers less freely, being consequently less resistant to frost, &c. Winter Oats are largely grown in Britain south of the Humber, and occasionally farther north. In the extreme south and south-east of England they are much more reliable than the spring sorts; (5) *Avena nuda*, the Naked Oat, is like *A. sativa* in many vegetative characters, but the outer palea is glume-like and does not closely invest the seed, which therefore readily falls out in threshing. This species was formerly grown in England under the name of 'Pilcorn,' and its cultivation survived in West Cornwall until the latter half of the 18th century. The Chinese Naked Oat is a variety of this species, with very numerous grains in the spikelet, usually 4-7; (6) *Avena sterilis*, the Wild Oat of the Mediterranean region, is sometimes known as the Animal Oat, because the ripe seeds, which somewhat resemble insects, move about in an extraordinary manner through the twisting and untwisting of the awns. The lower grain is articulated as in *A. fatua*, but the upper grains are persistent to the rachilla of the grain below. There is a thick tuft of hairs at the base of the grain; (7) *Avena sterilis culta* embraces a group of cultivated varieties, sometimes referred to as Algerian Oats, derived from *A. sterilis*, and differing from the latter in the same way as does *A. sativa* from *A. fatua*. Algerian Oats, and hybrids between them and common varieties, are grown somewhat extensively in Australia. Amongst the species of oat useful not for their grain but for fodder are the Downy Oat-grass (*A. pubescens*) and Yellow Oat-grass (*A. flavescens*, referred by some botanists to the genus *Trisetum*—the short awn being like a middle-tooth in the bifid palea), both natives of Britain, the former growing on light ground and dry hills, especially where the soil is calcareous, the latter on light meadow-lands.

Far more ground is occupied with oats in Scotland than with any other grain. In all the higher districts it is almost the only kind of grain which is cultivated. Throughout Scotland it is the crop that is chiefly sown after land has been in pasture for one or more years. The seed is sometimes sown

broadcast by hand over the ploughed land, which is afterwards well harrowed and rolled. Sowing by broadcast or drill machines is now largely practised, and in the latter case the harrowing is done before the seed is sown. On soils that are infested with annual weeds, such as charlock, it is common to drill the seed, which permits the land to be hand-hoeed and thoroughly cleaned. Oats thrive best upon deep and good soils, especially if enriched by decayed vegetable matter. They yield but poorly on thin sandy soils, where they suffer sooner from drought than barley, rye, or wheat. The produce per acre varies from 20 to over 80 bushels, weighing from 36 lb. to 48 lb. per bushel. Common yields run from 32 to 56 bushels; average weight from 40 lb. to 44 lb. per bushel. A crop of 45 bushels per acre will absorb and carry away about 55 lb. of nitrogen, 46 lb. of potash, and 19½ lb. of phosphoric acid per acre. Few soils, in ordinary tillage, require the direct application of potash for oats. Very light soils are most likely to need it. Superphosphate of lime and nitrate of soda are suitable manures for oats; common quantities being from 1 to 2 cwt. of the former and from ½ to 1 cwt. per acre of the latter, applied as a top-dressing. The Potato Oat is a variety widely cultivated on average soils in Scotland. It is an early and productive variety. The Hopetoun Oat is also much sown in the earliest districts. The Sandy Oat is still largely sown, more particularly when the climate is inferior and wet. It is not liable to shed its grain, and the straw is of fine quality for fodder. Many new varieties have been produced in recent years by crossing or by selection. Among the most popular are the Abundance, Record, Crown, Victory, &c. &c. All these are varieties of the Common Oat. The White and Black Tartarian are much cultivated in some districts. They are very productive, and well suited for feeding horses, cattle, and sheep. On the continent of Europe this grain is seldom seen of quality equal to what is produced in Scotland; even in most parts of England the climate is less suitable to it, and it is less plump and rich.

Oaxaca. See OAJACA.

Ob, or **OBI,** the great river of Western Siberia, rises in two branches, the Biya and the Katun, both of which have their origin in the Altai Mountains, within the frontier of the Chinese dominions, and flows north-west and north for 2120 miles to the great Gulf of Ob in the Arctic Ocean. Its chief tributaries are the Irtysh, Tcharysh, Tom, and Telulym, all navigable. On the banks of the Ob are Barnaul, Tomsk, and Narym. For accessibility by sea, see KARA SEA.

Obadiah, the shortest book in the Old Testament canon, the work of one of the twelve 'minor prophets,' of whose personality absolutely nothing is known. The name is not uncommon, meaning 'servant of Jehovah,' and was borne by the devout chamberlain of Ahab (1 Kings, xviii. 3-16), who protected the prophets of the Lord from the fury of Jezebel. Delitzsch thinks the author of the prophecy may have been identical with the Obadiah mentioned in 2 Chron. xvii. 7, as one of the Levites sent by Jehoshaphat to teach the law in the cities of Judah. From internal evidence the date of composition of the book may, with much probability, be put shortly after the capture of Jerusalem by Nebuchadnezzar, about 587 B.C. The book was placed next to Amos merely because the prophecy of doom upon Edom is an amplification of that pronounced earlier by Amos (Amos, ix. 12). This passage in Obadiah (verses 1-9) is closely parallel to Jeremiah, xlix. 7-22, from which indeed Knobel, Bleek, and Reuss think it directly borrowed. Ewald maintained that the first seven verses of

Obadiah were written by a prophet of that name during the inroads of Rezin and Pekah, that the eleventh refers to the capture of Jerusalem by the Arabs and Philistines in the reign of Jehoram, and that the remaining verses were compiled by a later writer, partly from the older prophet (who was also used by Jeremiah), and partly from other sources. Caspari offers strong reasons for his statement that the words of Obadiah were modified and expanded by Jeremiah. Some scholars again, as Keil, have supposed unnecessarily that Joel, ii. 32, is a distinct reference to Obadiah 17. The book of Obadiah possesses high individuality of style, and contains some peculiar words. It has ever been favourite reading among the Jews, and it was from it that they derived the name of 'Edom' as applied to Rome, to Christians, and all their enemies. The book falls naturally into two well-marked divisions, of which the first (1-16) denounces destruction to Edom, and the second (17-21) prophesies the restoration of Israel.

See the commentaries on the prophet by Ewald, Orelli, Hitzig, Keil and Delitzsch, and Pusey; the books on Hebrew prophecy by Kuenen (Eng. trans. 1877), Robertson Smith (1882), Duhm (1875); commentaries by Hendewerk (1836), Caspari (1842), and Perowne (1883); Farrar's *Minor Prophets* (1890); and the *International Critical Commentary* (on six minor prophets, 1912).

O'ban, a fashionable watering-place of Argyllshire, 84 miles WNW. of Stirling, and 136 of Edinburgh, by a railway opened in 1880. It curves round a beautiful and almost land-locked bay, which, sheltered from every wind by the island of Kerrera on the west and by the high shores of the mainland, forms a spacious haven, crowded in summer by yachts and steamers. A mere 'clachan' when Dr Johnson visited it in 1772, Oban began to be feued in 1803-20. In 1832-1918 it was one of the Ayr parliamentary burghs. It is now the great tourist headquarters of the West Highlands, possessing many hotels, splendid steamboat facilities, Roman Catholic and Anglican cathedrals. Objects of interest are the picturesque ruins of Dunolly and Dunstaffnage Castles (see ETIVE). Prehistoric cave-dwellings were discovered in 1890-94, with Azilian relics. Pop. (1821) 1359; (1871) 2413; (1881) 3991; (1901) 5427; (1921) 6344.

O-Becse. See BECSE.

Obedientiaries were the officers of a conventual institution as subject to the superior, whether charged or not with special duties.

Obeid, EL, capital of the province of Kordofan, in the Egyptian Sudan, 220 miles SW. of Khartum, consists of a number of villages originally separate. Gum-arabic, ivory, cattle, and ostrich-feathers are the chief articles of trade. Pop. about 15,000. Near it, in 1883, a force of Egyptians under Hicks Pasha, with an English staff, was exterminated by a large army of the Mahdi. The railway from Khartum reached it in 1912. See also UR.

Obelisk (Gr. *obelos*, *obeliskos*, 'a spit'), a word applied to four-sided monuments of stone and other materials, terminating with a pyramidal or pointed top. These monuments were placed upon bases before gateways of the principal temples in Egypt, one on each side of the door. They served in Egyptian art for the same purposes as the stelæ of the Greeks and columns of the Romans, and appear to have been erected to record the honours or triumphs of the monarch. They were placed upon a cubical base of the same material, which slightly surpassed the breadth of the base. Their measurements were always in fixed proportion. Their sides are slightly concave, to increase their apparent height. Their height varies from upwards of 100 feet to a few inches. The sides are generally sculptured with hieroglyphs and representations, recording the names and titles of kings, generally

in one line of deeply-cut hieroglyphs down each side. Hewn in the rough out of a solid piece in the quarries, they were transported on rafts down the Nile during the inundation, to the spot where they were intended to be placed, and raised by inclined planes, aided by machinery. Some obelisks, before their erection, had their pyramid capped with bronze gilded, or gold, the marks of such covering still being evident on their surfaces. At the time of the 18th dynasty it appears that religious ceremonies and oblations were offered to the obelisks, which were treated as divinities. Their sepulchral use is evinced by their discovery in the tombs of the 4th dynasty, and the vignettes of early papyri. The most of them date from the 18th and 19th dynasties. Two which formerly stood at Heliopolis (q.v.) were re-erected in the 1st century A.D. at Alexandria, and have been

Cleopatra's Needle, Thames Embankment, London.

popularly known as Cleopatra's Needles. One, which long lay prostrate, was, after an adventurous voyage, brought to London in 1878, and erected on the Thames Embankment; it weighs 186 tons, and is 68½ feet high. The other, presented by the Khedive to the United States, was set up in Central Park, New York, in 1881. There are several large ones in Rome (that now at St Peter's having been taken to Rome by Caligula), one in Florence, one in Paris (given by Mehemet Ali in 1837), and Lepsius's in Berlin (the oldest and smallest of all, 2 feet 1½ inch high), besides many others that have found their way into European museums. By far the largest obelisk in the world is the Washington monument (1885), at Washington, D.C. It is of marble, 55 feet square at the base, and 555 feet high.

Ober-Ammergau, a village in the valley of the Ammer in Upper Bavaria, 45 miles SW. of Munich. Here the famous Passion Play (established 1633; discontinued between 1910 and 1922) is performed decennially. See article MYSTERIES AND MIRACLE PLAYS.

Oberhausen, a manufacturing town in the Rhine province of Prussia, 40 miles N. of Cologne.

Of recent origin, it is an important industrial railway centre, and has large iron and other works, and coal-mines. Pop. 100,000.

Oberland. See BERN.

Oberlin, a village of Lorain county, Ohio, 34 miles by rail WSW. of Cleveland. It is primarily an educational centre, having grown up round Oberlin College, which, founded in 1833, now embraces a college of arts and sciences, an academy, a theological seminary (Congregational), a conservatory of music, and considerable libraries. Oberlin was the first American college to adopt co-education of the sexes, and was a pioneer also in the co-education of the black and white races. Pop. 4200.

Oberlin, JOHANN FRIEDRICH, born at Strasbourg, 31st August 1740, in 1767 became Protestant pastor of Waldbach, in the Steinthal, a wild mountainous district of Alsace. Here he spent the remainder of his life. The district had suffered terribly in the Thirty Years' War, and the scanty population which remained was sunk in poverty and ignorance. Oberlin introduced better methods of cultivating the soil, and various branches of manufacture, and made roads and bridges. He founded an itinerating library, began the first infant schools, and introduced ordinary schools in the district. Population and general prosperity rapidly increased. Oberlin was ably assisted in his reformatory labours by his pious housekeeper, Louise Scheppler (1763-1837). He died 1st June 1826. A collected edition of his writings appeared at Stuttgart (4 vols. 1843).

See Sims's *Brief Memorials of Oberlin* (1830); the *Memoirs of Oberlin* (1852); and the biographies by Bode-mann (1868), Spach (Paris, 1866), and Butler (1882).

Obermann. See SÉNANCOUR.

Oberon, the king of the elves or fairies, and the husband of Titania. The name is derived from the French *Auberon* or *Alberon*, and that from the German *Alberich* (*alb*, 'elf,' and *rich*). Oberon is first mentioned as 'Roi du royaume de la féerie' in the 13th-century French poem of *Huon de Bordeaux*. The quarrel between Oberon and Titania and their subsequent reconciliation through Huon, a French noble, and Amanda, daughter of the sultan of Babylon, whom the former leads home by the help of Oberon, after many difficulties, form the basis of this tale, which was afterwards shaped into a popular prose romance. Lord Berners's early 16th-century translation of *Huon de Bordeaux* contains the first reference to Oberon in English. The name appeared thereafter in many ballads, and was adopted by Spenser and by Greene in his play, *The Scottish History of James Fourth, slain at Flodden*. It was really Shakespeare, however, with his *Midsummer Night's Dream*, where the fairies form a community ruled over by the princely Oberon and the fair Titania, who made the name familiar. Wieland used the subject of Oberon and Titania for his well-known romantic poem, and Planché's adaptation of this forms the subject of Weber's opera. The old *chanson de geste* was edited by Guessard and Grandmaison (Paris, 1860).

See FAIRIES; HUON OF BORDEAUX; Voretzsch's *Epische Studien* (vol. i. 1900).

Obesity, or CORPULENCE, may be defined to be 'an accumulation of fat under the integuments or in the abdomen, or in both situations, to such an amount as to embarrass the several voluntary functions. A certain degree of fatness is not only quite compatible with health, but, as has been shown in the article FATS, the fatty tissue is of considerable use in the animal body, partly in consequence of its physical and partly in consequence of its chemical properties; and it is only when the fatness begins to interfere with the

discharge of any of the vital powers that it can be regarded as a morbid condition. Obesity may occur at any period of life, but it is most commonly after the fortieth year that the tendency to an inordinate accumulation of fat begins to show itself. After that time, in the case of men the pleasures of the table are usually more attractive than in earlier life, and much less muscular exercise is taken; while in women the cessation of the power of child-bearing induces changes which tend remarkably to the deposition of fat. The extent to which fat may accumulate in the human body is enormous. Daniel Lambert (1770-1809) weighed 739 lb.; his exact height is not recorded, but, according to the tables generally accepted by life insurance companies, the normal weight of a man 6 feet high should not exceed 178 lb. Dr Elliotson has recorded the case of a female child, a year old, who weighed 60 lb.

The predisposing causes of obesity are a peculiar habit of body, hereditarily transmitted; inactivity; sedentary occupations, &c.; while the more immediate or exciting causes are a rich diet, including fatty matters, and matters convertible in the body into fats, such as saccharine and starchy foods, and the partaking of such a diet to a greater extent than is necessary for balancing the daily waste of the tissues. 'Fat meats, butter, oily vegetable substances, milk, saccharine and farinaceous substances are the most fattening articles of food; whilst malt liquors, particularly rich and sweet ale, are, of all beverages, the most conducive in promoting obesity. The fattening effect of figs and grapes, and of the sugar-cane, upon the natives of the countries where these are abundant, is well known. In various countries in Africa and the East, where obesity is much admired in females, warm baths, indolence, and living upon saccharine and farinaceous articles, upon dates, the nuts from which palm-oil is obtained, and upon various oily seeds are the means usually employed to produce this effect' (Copland's *Dictionary*). The knowledge of the means of inducing obesity affords us the best clue to the rational treatment of this affection. It is a popular belief that the administration of acids—vinegar, for example, or one of the mineral acids—will check the deposition of fat; but if the desired effect is produced it is only at the cost of serious injury to the digestive, and often to the urinary organs. The employment of soap and alkalies, as advocated over a century ago by Flemming, is less objectionable than that of acids, but the prolonged use even of these is usually prejudicial. An extract of the common sea-wrack (*Fucus vesiculosus*) has been strongly recommended, and its value probably depends on the iodine it contains. Thyroid extract is also useful, particularly in reducing the obesity of elderly persons.

A very interesting *Letter on Corpulence*, published in 1863 by Mr William Banting (1797-1878), in which he records the effect of diet in his own case, after all medicinal treatment had failed, is well worthy of the attention of those who are suffering from the affection of which this article treats. The following are the leading points in his case. He was sixty-six years of age, about 5 feet 5 inches in stature (and therefore, according to the life insurance tables, ought to have weighed about 142 lb.), and in August 1862 weighed 202 lb. 'Few men,' he observes, 'have led a more active life . . . so that my corpulence and subsequent obesity were not through neglect of necessary bodily activity, nor from excessive eating, drinking, or self-indulgence of any kind, except that I partook of the simple aliments of bread, milk, butter, beer, sugar, and potatoes, more freely than my aged nature required. . . . I could not stoop to tie my shoe, nor attend to the little

offices humanity requires without considerable pain and difficulty; I have been compelled to go downstairs slowly backwards, to save the jar of increased weight upon the ankle and knee joints, and been obliged to puff and blow with every slight exertion.'

By the advice of a medical friend he adopted the following plan of diet: 'For breakfast I take four or five ounces of beef, mutton, kidneys, broiled fish, bacon, or cold meat of any kind except pork; a large cup of tea (without milk or sugar), a little biscuit, or one ounce of dry toast. For dinner, five or six ounces of any fish except salmon, any meat except pork, any vegetable except potato, one ounce of dry toast, fruit out of a pudding, any kind of poultry or game, and two or three glasses of good claret, sherry, or Madeira: champagne, port, or beer forbidden. For tea, two or three ounces of fruit, a rusk or two, and a cup of tea without milk or sugar. For supper, three or four ounces of meat or fish, similar to dinner, with a glass or two of claret' (p. 18). 'I breakfast between eight and nine o'clock, dine between one and two, take my slight tea meal between five and six, and sup at nine' (p. 40). Under this treatment he lost in little more than a year (between the 26th of August 1862 and the 12th of September 1863) 46 lb. of his bodily weight, while his girth round the waist was reduced 12½ inches. He reported himself as restored to health, as able to walk up and down stairs like other men; to stoop with ease and freedom; and safely to leave off knee-bandages, which he had necessarily worn for twenty years past. Other more or less similar systems have since been recommended; such as the Salisbury treatment of subsisting only on meat, with a large draught of hot water before every meal. Such a radical change of diet, however, should not be adopted without medical advice, as in some cases it might cause disturbance of digestion or excretion, and lead to new dangers to health. See FASTING.

Obi. See OB.

Obi, OBEAH, or OBE, the sorcery or witchcraft once practised by *Obi-men* and *Obi-women* among the negroes of the West Indies and the United States, of which at least traces survive. Essentially a propitiation of the snake-god *Obi*, it was doubtless an importation from West Africa in the days of the slave trade. The *Obi-man*, a sorcerer trafficking in philtres, potions, and spells, possessed enormous influence over the credulous blacks. See WITCHCRAFT; and H. J. Bell, *Obeah* (1889).

Obit, in the Roman Catholic Church especially, an office performed in commemoration of or on behalf of the soul of a deceased person on the anniversary of his death. It usually consisted of matins and lauds, followed by a mass. Records kept in churches of obits there performed often contain valuable antiquarian and genealogical materials.

Object, and its correlative, **SUBJECT**, are terms used philosophically, even by the same writers, in a perplexing multiplicity of senses. Thus, it may be said that while ordinarily the *subject* is the knowing mind, the *object* is that which is known, thought, felt, seen, imagined—the psychological corresponding fairly with the grammatical usage. At another time the subject is the ego, while the object is the non-ego, the external world, with an implication that the objective has a firmer, surer ground, if not wholly independent of the subjective at least less liable to vary or fluctuate. On the other hand, if the *noumenon*, the subject, is the truly real, the phenomenal object is comparatively an accident. Yet again, that which is the law of the consciousness, which is prior to experience, is by

some regarded as more indefeasible and objective than the fleeting elements of conscious experience. For some, objective is that which is common to *all* minds (and to the absolute mind) at all times, and the subjective that which is peculiar to my mind or any given mind at any given time. Thus the essence of the subjective becomes the most objective thing in existence; really objective truth is that which from the nature of the case is prior to and independent of experience. It is needless to point out that, when the subject thinks of itself, the subject may be said to become its own object. In general, however, that is objective which deals much with the external world, and that subjective which is mainly based on introspection of mental states.

In addition to the possibility of confusion arising out of current usage, it should be remembered that in the middle ages, and even in Descartes and Spinoza, *subject* meant almost the same as *substance* (something highly real); and in William of Ockham *objective* is that which the mind feigns, the image or representative idea as opposed to the real object which exists independently.

Oblates (Lat. *oblatus*, *oblata*, 'offered up'), the name of a class of religious bodies in the Roman Catholic Church, which differ from the religious orders strictly so called in not being bound by the solemn vows of the religious profession. The institute of oblates was one of the many reforms introduced in the diocese of Milan by St Charles Borromeo towards the close of the 16th century. The members consisted of secular priests who lived in community, and were merely bound by a promise to the bishop to devote themselves to any service which he should consider desirable for the interest of religion. St Charles made use of their services chiefly in the wild and inaccessible Alpine districts of his diocese. The oblates of Mary Immaculate, founded at Marseilles in 1816, have twelve houses in Great Britain and Ireland, and are numerous in Canada, British India, and the United States. Two Irish reformatories are under their charge.

Obligation, DAYS OF, holidays on which faithful Catholics are bound to abstain from servile work and to hear mass. These are, for England and Wales, Circumcision, Epiphany, Ascension Day, Corpus Christi, SS. Peter and Paul, Assumption, All Saints, Christmas Day. Scotland adds to these St Andrew, and Ireland St Patrick and the Annunciation.

Oboe (Fr. *hautbois*; Ger. *Oboe*), a treble reed musical instrument, to which the bassoon may be said to be the bass. Its reed is double, like that of the bassoon and the chanter of the bagpipe, and consists of two thin blades of cane attached by silk thread to a short metal tube. A similar instrument may be traced from the earliest times from Egyptian and Greek sculpture and paintings; and the Kensington Museum contains many specimens from Arabia, China, India, Walachia, &c. The modern instrument, however (shown in the figure), from successive improvements and additions bears little resemblance to its ancient prototype, and is one of the most complicated and intricate of wind-instruments. It is made variously of boxwood, ebony, cocco-wood, and silver, having holes for the fingers and usually fifteen keys, besides two automatic octave keys to assist the higher notes. It is an octave instrument like the Flute (q.v.), and its usual compass is from

B below the stave to F in alt, although several semitones higher can be produced. For orchestral purposes it is pitched in the key of C, but in military bands a B♭ instrument is sometimes used, and its music is written in the G clef. The tone of the oboe is rich, and, from its great power in swelling and diminishing the sound, it is capable of every variety of expression. The oboe has the privilege of giving the pitch to the violin in the orchestra. Beethoven, Mozart, Bach, and nearly all the great composers make extensive use of it in their compositions. Strauss in his *Salome* (1905) introduced a baritone oboe, between oboe and bassoon, since used by Weingartner and other composers. See also COR ANGLAIS. The Oboe d'Amore and the Oboe di Caccia, oboes in the key of A and F or E♭ respectively, are nearly obsolete.—*Oboe* is also the name of a treble stop on the organ, its bass being the *bassoon*.

Obok, a French possession, now part of French Somaliland, with a decayed part of the same name, opposite Perim; population, 500.

Obolus (Gr. *obolos* or *obelos*, 'a spit'; see NUMISMATICS), the smallest of the four common Greek coins and weights, the sixth part of a Drachma (q.v.).

O'Brien, WILLIAM, born at Mallow, Co. Cork, 2d October 1852, was educated at Cloyne and at Queen's College, Cork. In 1880 he founded *United Ireland* as mouthpiece of the Land League, and in 1883 entered parliament as a Nationalist. Prosecuted nine times on political charges, he spent over two years in prison. He was a member of the Land Conference of 1903. He became leader of the Independent Nationalists, founded the All-for-Ireland League, and continued to sit for Cork till 1918. He wrote several books on Irish politics—*An Olive Branch* (1910), *Evening Memories* (1920), *The Irish Revolution* (1923), &c.

O'Brien, WILLIAM SMITH, Irish patriot, was born 17th October 1803. Descended from the royal line of Thomond, he was the second son of Sir Edward O'Brien, Bart., of Dromoland, in County Clare. He was educated at Harrow and Trinity College, Cambridge, and entered parliament for the pocket borough of Ennis in 1826. Though a Protestant, he supported the Catholic claims; and for some years he gave an independent support to the Tory party. He lost his seat in 1831, but was returned for the county of Limerick in 1835, and till 1843 generally supported the Whigs. But in October 1843 he announced his adhesion to O'Connell's Repeal Association. O'Connell's rooted aversion to an appeal to physical force soon made a wide gulf in sympathy between his party and those fiery spirits who became known as 'Young Ireland,' and whose fervid and warlike poetry and prose filled the columns of the *Nation* newspaper. To this party O'Brien soon joined himself; and after the death of Thomas Davis (q.v.) in 1845 he withdrew from the association. Next the Young Irelanders set up a Repeal League of their own, under the leadership of O'Brien; and his ardent temperament soon brought him into collision with the law. The sentence of John Mitchel (q.v.) in 1848 hastened the projected rising, which proved a miserable fiasco, ending in an almost bloodless fight in a Tipperary cabbage-garden. O'Brien was arrested and sentenced to death; but the sentence was commuted to transportation for life. In 1854 he was released on condition of not returning to Ireland, and in 1856 he received a free pardon. He died at Bangor, in North Wales, 16th June 1864. See A. M. Sullivan's *New Ireland* (1877), and Sir C. G. Duffy's *Young Ireland* (new ed. 1896).

Oboe.

Obscenity in books, prints, or pictures exhibited in public renders the exhibitor liable to be indicted for a misdemeanour. Persons exposing them in streets, roads, or public places are also liable to be punished as rogues and vagabonds with hard labour. Lord Campbell's Act was passed in 1857 to suppress the traffic in obscene books, pictures, prints, and other articles. By the Customs Laws Consolidation Act, 1876, such articles were prohibited to be imported into the United Kingdom. The Post Office (Protection) Act, 1884, made it a misdemeanour to send or to attempt to send such articles by post, punishable on summary conviction by fine not exceeding £10, and on conviction on indictment by imprisonment not exceeding twelve months. By the Burgh Police Act, 1892, such articles are forbidden to be published, printed, sold, exhibited or distributed under penalty of £10 or imprisonment for sixty days. See also the Indecent Advertisements Act, 1889.

Obscurantists ('lovers of darkness'), the name given to those who are supposed to look with dislike and apprehension on the progress of knowledge, especially to such as defend theological prejudices against what is believed to be scientific truth.

Observantists. See FRANCISCANS.

Observatory, an institution supplied with instruments for the regular observation of natural phenomena, whether astronomical, meteorological, magnetical, or seismological. These different classes of observation may be carried on in the same or separate institutions. Astronomical observatories were first established for the determination of the apparent movements of the sun, moon, and planets. This is most satisfactorily accomplished by determining the positions of these bodies at different times relatively to the fixed stars, whose positions relatively to one another are almost invariable. The Greek astronomers employed Armillary Spheres (q.v.) and Astrolabes (q.v.), and Ptolemy in the 2nd century A.D. used a Quadrant (q.v.). At the time of the revival of astronomy in Europe in the 16th century, Tycho Brahé built a great observatory at Uraniborg, on the island of Hveen, between Copenhagen and Elsinore, which was equipped with finer instruments than any previously used by astronomers. In particular he employed a quadrant in the meridian for the determination of declinations, and a vertical quadrant in another azimuth for the determination of time and right ascension. The use of the quadrant in the meridian was continued by astronomers for several centuries. Bradley, at Greenwich, in 1750 had two, one facing north and the other south, for the determination of declinations. The difficulty of preserving the quadrant from distortion led to its being superseded by the Mural Circle (q.v.), which was greatly improved by the substitution of micrometer microscopes for verniers. The determination of time and right ascension by the Transit Instrument (q.v.), invented by Römer, was rendered possible by the improvement of the clock by Graham. A transit instrument with a telescope of 8 feet focal length and an axis of $4\frac{1}{2}$ feet was constructed by Bird for Bradley about 1750. Early in the 19th century the mural circle and transit instrument were combined in the Transit Circle (q.v.); and about the middle of it the method of observing transits chronographically instead of by eye and ear, introduced in America, simplified the work of observing, and increased the number of stars observable in a given time. Methods for eliminating and correcting various errors to which this instrument is liable have made it the principal means of determining the positions and thence the movements of sun, moon, planets, and the brighter stars. The most complete series of lunar and

planetary observations is that made at Greenwich, from 1750 to the present time.

Now that a close agreement has in the main been reached between observation and gravitational theory for the movements of the sun, moon, and planets, more attention is being given to observations of the stars for the study of their movements. A comparatively small number of stars are observed at a large number of observatories possessing excellent instruments, and the positions and movements of these fundamental stars obtained with all possible accuracy. Observations with the transit circle of a much larger number of stars—amounting to several hundred thousand—have been made at many different observatories, the known positions of the fundamental stars being used to a greater or less extent in simplifying the work and securing great accuracy. The positions of these secondary stars are again used as points of reference in determining the positions of several millions of stars by photography, an international project inaugurated in Paris in 1884, in which eighteen observatories co-operate.

The largest telescopes in observatories are usually mounted equatorially (see EQUATORIAL), so that the telescope mechanically follows the daily motion of the stars across the sky, and the observer's attention can be given for any length of time to one object or small area in the sky. Most differential observations—i.e. the determination of the position of a body with reference to neighbouring bodies—are made with a telescope so mounted. Also, most observations of the brightness of stars and other objects, descriptive observations of planetary features, of sun-spots, of the forms of nebulae, or of comets' tails, are made with instruments mounted to follow the diurnal motion of the sky. Three different kinds of telescopes may be employed: (1) Visual refractors, used mainly for double-star observations and study of planetary detail, and for visual photometry. (2) Photographic refractors—i.e. telescopes whose object-glasses are constructed so that blue light, to which photographic plates are generally more sensitive, is brought to sharp focus. These are used for all differential observations of position up to distances of one or two degrees, and are specially valuable for determinations of the 'parallaxes' of stars. The study of sun-spots, for example, is pursued by daily photographs of the sun taken at various observatories. With double or triple object-glasses refracting telescopes are made which cover a large field, and are used to photograph large areas on a small scale. (3) Reflecting telescopes: these may be used either visually or photographically, but are generally employed to obtain photographs of faint objects, such as nebulae; and especially for spectroscopic observation of faint objects.

Spectroscopic researches form an important part in the work of many observatories. These are directed to the determination of the physical and chemical constitution of the heavenly bodies, and also of their movement to or from the observer. The latter class of observations, initiated by Huggins and greatly improved by Vogel, depending on 'Doppler's principle,' is usually carried on photographically. Large telescopes and long exposures are required for the spectra to impress themselves on the photographic plate. The large telescopes at the Lick Observatory and the Mount Wilson Observatory in California, and of the Victoria Observatory in British Columbia, have been employed in this manner. A new type of mounting called a 'Tower' telescope has been employed by Hale at Mount Wilson. By means of mirrors sun-light is reflected down a vertical tower into a powerful spectroscope or other physical apparatus.

In addition to observations made for the study

of the stars, the movement of the earth's axis indicated by the variation of latitude is determined in some astronomical observatories. The national observatories are generally charged with the determination of time and the distribution of time-signals.

The national astronomical observatories in Great Britain and Ireland are Greenwich, founded in 1675 for the service of navigation as well as astronomy; Edinburgh and Dunsink, which are in close relationship with the universities of Edinburgh and Trinity College, Dublin; and the Solar Physics Observatory at Cambridge. At Oxford there are the University and the Radcliffe Observatories, and at Cambridge the University Observatory and the Newall Astrophysical Observatory. At the Cape of Good Hope there is a large observatory, which, like that at Greenwich, is under the control of the Admiralty. At Kodaikanal and Dehra-Dun are solar observatories under the control of the India Office. The Australian states possess observatories at Adelaide, Melbourne, Perth, and Sydney; Canada, at Ottawa, Montreal, and Victoria.

The following are some of the many European observatories: the National Observatory at Paris (founded 1671), the Astrophysical Observatory at Meudon, the National Observatory at Potsdam (Astrophysics), the National Observatory at Pulkova, near St Petersburg. There are observatories in nearly all the European capitals and in many university towns. In the United States the National Observatory at Washington, the University Observatories of Harvard and Yale, the Yerkes Observatory near Chicago, the Lick Observatory near San Francisco, and Mount Wilson Observatory near Los Angeles are best known.

For the work carried out at different observatories, see *Les Observatoires Astronomiques*, by M. Stroobant, astronomer at the Royal Observatory of Belgium.

Obsidian, a natural glass—the vitreous condition of an acid lava. It is hard and brittle, with remarkably vitreous lustre, and perfectly conchoidal fracture, the edges of the fractures very sharp and cutting like glass. It varies from semi-transparency to translucency only on the edges. It is often black or very dark gray; sometimes green, red, brown, striped, or spotted; and sometimes *chatoyant* or *aventurine*. Some obsidians are rendered porphyritic with microscopic crystals of sanidine; others are often highly vesicular and plentifully charged with spherulites usually arranged in the line of lava-flow. The rock is usually rich in crystallites and microlites (the ‘beginnings of crystallisation’), which are frequently arranged in parallel or undulating lines = ‘fluxion-structure.’ Steam- or vapour-pores of minute size occur abundantly in some obsidians. Obsidian is thus a kind of lava. It is capable of being polished, but is apt to break in the process. It is made into boxes, buttons, ear-drops, and other ornamental articles; and before the uses of the metals were well known it was employed, in different parts of the world, for making arrow and spear heads, knives, &c. It is found in Iceland, the Lipari Isles, Vesuvius, Sardinia, Hungary, Spain, Tenerife, Mexico, South America, Madagascar, Siberia, &c. Black obsidian was used by the ancients for making mirrors, and for this purpose was brought to Rome from Ethiopia. It was used for the same purpose in Peru and Mexico. Mirrors of black obsidian are indeed still employed by artists. Chatoyant or aventurine obsidian is very beautiful when cut and polished, and ornaments made of it are sold at a comparatively high price.

Obstetrics (Lat. *obstetrīx*, ‘a midwife,’ from *obsto*, ‘I stand before,’ thus literally ‘a woman who

stands before or beside another’), called also MIDWIFERY (O.E. *mid*, ‘together with,’ and *wif*, ‘a woman’). As a branch of medical science and practice obstetrics is concerned with the study and care of women during the processes of pregnancy, parturition, and the puerperium, or lying-in. As a department of medical study it embraces the anatomy and physiology of the female organs of generation, the phenomena of conception and pregnancy, of labour, normal and abnormal, and of the puerperium or the return of the organs to their non-pregnant position. Strictly speaking, these processes are normal and physiological, and in perfectly natural conditions require little or no skilled help or assistance. But, while theoretically this may be so, it is still the case that these processes each produce an effect on the female organism which results in great modifications of the ordinary vital functions, so that the condition is one of continued physiological tension, which at any moment may pass into a pathological or abnormal condition in which skilled assistance is of the utmost importance. There can further be no doubt that many influences at work in states of civilisation tend greatly to increase the dangers of the reproductive process, so that the members of highly civilised communities are peculiarly liable to disaster; but at the same time the rudest savages are by no means free from these risks, and the care which most of them take of their women during pregnancy and parturition amply proves how conscious they are of this fact (but see COUVADE). The dangers with which the reproductive process is associated may be in some measure realised when it is understood that during pregnancy women are liable to be affected by many of the ordinary diseases in an aggravated form, which may give rise to premature expulsion of the ovum—abortion—a process in itself attended by grave dangers; that during parturition the child may present by some part of the body other than the head, causing increased difficulty, often impossibility of spontaneous delivery; that there may be some disproportion between the size of the child's head and the pelvis, due to disease or deformity; that from disease or exhaustion the uterus may be incapable of expelling its contents; that after the birth of the child the natural processes for checking hemorrhage from the site of the placenta may be at fault, or again the retention of a blood-clot or fragments of placenta may expose the patient to the risks of septicæmia or blood-poisoning. These are but a tithe of the dangers which surround the reproductive process, but they give an ample explanation of the existence of a science and art of obstetrics by which these and similar dangers may be obviated. With regard to parturition itself it may be noted that the great majority of labours (95 per cent.) are natural—i.e. the head presents, and they are spontaneously accomplished within twenty-four hours. But in civilised countries, and under the best practice, it is estimated that one in 120 women dies within a fortnight after labour. It would be out of place in a work of this kind to enter into the details of this science, but a sketch of the history of its origin and development may be of interest.

Until about the beginning of the 16th century the practice of obstetrics was mainly empirical. It was founded on experience and superstition, and was in great measure destitute of an anatomical or physiological foundation. Such practice is seen in the present day among uncivilised races, and we find procedures described as employed by the Egyptians, Jews, Greeks, and Romans in vogue among the North American Indians and negroes at the present time. During the empirical period we find, as we might expect, that the ordinary practice was wholly in the hands of women. At first female

friends and neighbours would perform what kindly offices they could, but soon a distinct class of midwives arose, whose experiences or special aptitude fitted them for the duty. All ordinary labours were attended by them, and they did not yield up a difficult case to the surgeon or physician until they had exhausted a code of practice partly reasonable as founded on experience, partly superstitious, but often very elaborate. When these resources failed, the aid of the male practitioner, who combined the offices of priest and physician, was usually invoked. At first the aid yielded by these was largely based on superstition, consisting in charms, incantations, and invocation of special deities. Ellithyia among the Greeks and Lucina among the Romans were the chief deities presiding over childbirth, though among the Romans particularly a number of minor deities were regarded as specially available for special complications. With the growth of medical knowledge the purely religious office of the priest became detached from that of the physician, and among the Egyptians in quite early times the physician became a separate functionary and rendered much more practical aid. The ignorance of the anatomy of the organs involved greatly limited their practice, and cases of difficult or delayed labour were usually treated by Cæsarean (q.v.) section, or later by some form of embryotomy.

The writings of Hippocrates (400 B.C.) contain the earliest attempt to formulate a practice of obstetrics. While his writings on this subject show keen observation and shrewd judgment, yet his imperfect anatomical knowledge led him into grave errors. The presentation of the head was the only way by which he considered it possible that delivery could be effected, and then cephalic turning was enjoined by him in all cases where the head did not come first. When this was found to be impossible, as in many cases it must have been, embryotomy or Cæsarean section were the only alternatives. For over 300 years the teaching of Hippocrates was practically unquestioned, until the study of anatomy in Alexandria, under the Ptolemies, served to clear up many of his errors, and so advance the art. To the knowledge of anatomy gained here is due the great advance in obstetrics shown by the Greek physicians who practised in Rome about the beginning of the Christian era. Chief among these is Soranus (98-137 A.D.), who published a work 'on the diseases of women,' which shows a wonderful advance in the knowledge of the anatomy of the female organs of generation. He further showed a knowledge of obstetrics which is a long way ahead of Hippocrates. He insisted upon the safety of foot and breech presentations, and recommended and described the operation of podalic turning. He showed the importance of posture in favouring difficult labours, and gave careful instruction for the performance of various destructive operations. After Soranus came Galen (born 130 A.D.), who gave an account of obstetric art as it existed at that time, but whose anatomy was very defective as compared with that of Soranus. His teaching and opinions seem to have largely influenced the Persians, and through them the Arabs, for their practice all through the middle ages seems to have been founded on Galen. Probably about the 4th century a remarkable book was published by Moschion, *Peri tōn Gunaikeiōn Pathōn*, which is sometimes, though not quite correctly, called the first obstetric work published. It is based on Soranus, and shows a much sounder anatomical knowledge than Galen possessed. Three hundred years later Paulus Æginetus published a work on this subject which is really a compilation from previous authors, and shows no advance on

Moschion. From this time until the beginning of the 16th century it may be said that obstetrics made no progress. Indeed, with the fall of the Roman empire this, like other arts and sciences, fell on evil days, and the knowledge was in great measure lost and its practice degenerated, gradually passing into the hands of the lowest and most degraded women. All trace of the earlier teaching was lost with the knowledge of the anatomical principles on which it rested; practice was regulated by the grossest superstition and ignorance, and the male practitioner was never allowed to enter a lying-in room save as a last resort. Indeed, the practice of midwifery by men was for many centuries in Europe regarded as a crime and an offence against morals, and so late as 1522 Werdt of Hamburg, who donned female attire in order to permit his attending and studying a case of labour, was detected and publicly burned at the stake. And a hundred years later a Dr Willoughby, an Englishman, whose daughter was a midwife, crawled into a darkened room on his hands and knees in order to assist her at a difficult labour! Nothing could have been more deplorable than the state of obstetric practice during this period, and the suffering and mortality resulting from this condition of affairs could not be easily estimated.

The first indication of a new order of affairs is found in the training of midwives in the medical school of Salerno about the beginning of the 16th century. Some time previously this school had inaugurated the study of anatomy, and the light shed thereby had its influence on the dark and degraded practice of obstetrics. Progress was, however, slow, and its practice still largely remained in the hands of women, to whom clung the superstition of the dark ages. Yet in the hands of anatomists like Vesalius, Fallopius, Berengarius, and surgeons such as Paré, a scientific basis was again being laid, and the knowledge of Soranus and Moschion being rediscovered. And, while all ordinary labours were managed by women, the surgeons were called in to assist when a difficulty arose. By them turning was rediscovered, and embryotomy, Cæsarean section, &c. were restored and developed on more scientific principles. By-and-by, especially in France, the practice of obstetrics by surgeons gradually gained ground, though there, and still more elsewhere, its practice by men lay under a reproach. The invention of the obstetric forceps by the Chamberlens, about the beginning of the 17th century, gave a great impulse to the art. In 1668 Mauriceau published his *Treatise*, which ran through seven editions, and was for long the standard work on the subject. It was translated into English by Hugh Chamberlen in 1672, and it seems to be about this time that men began generally to engage in the practice of midwifery: Harvey, the Chamberlens, and others took it up in England; whilst La Vallière, the mistress of Louis XIV., by employing Julian Clement, a surgeon of high eminence, in her first confinement in 1663, did much to establish the practice in France.

Since the revival of the study of anatomy and physiology the progress of scientific obstetrics has been steady and sure. The reproach under which its practice so long lay has been entirely removed, and the colleges of physicians and surgeons, which at one time refused their fellowships to any one engaged in obstetric practice, now receive them on the same terms as other practitioners, and all medical licensing bodies demand an adequate knowledge of its theory and practice from every candidate for their diplomas. The science and practice have been built up by a host of workers, the mere mention of whose names here space precludes. But it may be of use to indicate some of

the great advances and discoveries on which the art rests.

(1) *The Rediscovery of Podalic Version or Turning*.—In 1550 Paré described this operation, whose value had been recognised and its method described in the 1st century by Soranus. It had, however, been lost to practice since the 7th century. Paré showed how it could be performed, and pointed out its advantages in saving foetal life; and it is certain many children were delivered safely by this means whose lives could not have been otherwise saved. The operation has been extended and modified in various ways since.

(2) *The Invention of the Forceps*.—About the end of the 16th or beginning of the 17th century the forceps (for application to the head of the living child) was invented by Dr Peter Chamberlen, a son of a William Chamberlen, a Huguenot refugee living in England (see **FORCEPS**). The secret, long kept, ultimately leaked out, and by 1747 the instrument was generally known and employed. The original instrument was modified by Levet of Paris, Smellie and Simpson in Great Britain; and, later, its construction was elaborated by Tarnier of Paris on what is called the 'axis-traction' principle. It is probable that no single invention has been more successful in saving life and relieving suffering.

(3) *The Employment of Anaesthetics*.—In 1847 Sir James Young Simpson first employed chloroform anaesthesia to relieve the pain of labour, and this certainly marks one of the most beneficent advances in the history of obstetrics, as of surgery in general. Besides relieving and abolishing untold suffering in ordinary labour, it permits the performance of many operations and the correction of untoward conditions which previously were impossible or irremediable. In recent years further steps have been taken in the same direction with the hope of relieving the sufferings of child-birth in the earlier stages, when the use of chloroform is generally inadvisable. Hypodermic injections of morphia and hyoscine induce a condition of narcosis—the so-called 'twilight sleep' (*Dämmerschlaft*)—which diminishes the pain without arresting the progress of the labour, and at the same time abolishes the memory of any suffering.

(4) *The Prevention of Puerperal Fever*.—Up to 1870 the great scourge in maternity hospitals and a frequent cause of disease in private practice was the prevalence of Puerperal Fever (q.v.). In that year the teaching of Lister began to influence obstetric teaching and practice, and since then the rigorous use of antiseptics, and in more recent years the observance, in so far as possible, of strict asepsis, have become the rule in all maternity hospitals. The result has been to reduce the mortality in many instances from about 6 per cent. to practically zero. A maternity hospital, or a nursing home in which proper surgical conditions can be obtained, is now the safest place for a woman in labour.

(5) Since the beginning of the present century the improvements in surgical technique have rendered the operation of Cæsarean Section vastly more successful than it used to be. In favourable circumstances the maternal mortality from the operation has now been reduced to about 2 per cent. This has greatly extended the scope of the operation, with corresponding benefit to both mothers and children in some of the more serious complications of labour.

(6) Unquestionably the most important development in obstetrics since the beginning of this century has been the increasing realisation of the paramount importance of adequate ante-natal care. Most of the important complications of pregnancy can be detected in their earliest stages, and their more serious developments averted, if the pregnant

woman is under the constant observation of the physician; and many of the greatest difficulties likely to be met with in the actual confinement can similarly be foreseen, and either obviated or properly prepared for by suitable measures. The recognition of these points has led to the establishment in most large towns of ante-natal clinics, where women attend during pregnancy, and are seen from time to time by competent obstetricians. The result has been a considerable diminution in the frequency of the necessity of sacrificial operations (embryotomy, &c.), and a very welcome drop in the number of still-births in different hospitals where proper records are kept. The development of obstetrics along such preventive lines is bound to continue, and promises to be increasingly fruitful in good results.

The teaching of midwifery is provided for in the curricula of all the medical schools of the United Kingdom. A course of lectures, varying from three to six months in different schools, is necessary, and in addition the student has to receive clinical instruction in maternity hospitals and attend a certain number of cases of labour. In view of the enormous importance of obstetrics in the daily work of the medical practitioner, the General Medical Council has recently recommended an increase in the clinical teaching of this subject, and steps are being taken by the medical schools to meet the requirements of the council in this respect. The proper training of nurses in midwifery is also being undertaken on an increasing scale. Every large maternity hospital is now a training-school, where lectures and demonstrations are regularly given to nurses, so that the ignorant midwife of the past is being rapidly replaced by trained women, who are competent to undertake the management of all ordinary cases of labour.

A great advance in this direction was made by the passage in 1902 of the Midwives Act. This provides a central examining and controlling authority in the Central Midwives Board, and prohibits any person acting as a midwife, either habitually or for gain, who does not hold the certificate of that body. Certificates of practice are granted only after full examination, and all breaches of the rules laid down by the board are punishable at law. A similar act for Scotland was passed in 1915, and for Ireland a few years subsequently, a separate central board being established in each case.

BIBLIOGRAPHY.—Among recent standard books on the subject are those of Whitridge Williams, Eden, Jellett, Johnstone, Munro Kerr and Haig Ferguson, Edgar, De Lee; in French, Fabre; in German, Bumm, v. Winkel. See also articles in this work on **ABORTION**, **CÆSAREAN SECTION**, **FÆTUS**, **FORCEPS**, **PREGNANCY**, **PUERPERAL FEVER**.

Ocarina, an instrument of flute-like sound, made of pottery, and shaped like the body of a bird (without head or neck), used by many savage peoples and revived as a toy in Italy.

O'Carolan (or *Carolan*), **TURLOUGH** (1670–1738), a blind bard of Ireland, the writer and composer of many pieces in Irish, the most famous perhaps his *Receipt for Drinking*. His work is still familiar in Ireland.

Occam, **WILLIAM**. See **OCKHAM**.

Occasionalism. See **DESCARTES**.

Occleve, **THOMAS**. See **HOCCKLEVE**.

Occlusion, a term applied to the solution of a gas by a melted solid—as of oxygen by melted silver—which gas is given up by the melted material when it solidifies, so that in the case of silver the metal sometimes 'spits' or gives off the gas in bubbles, thereby roughening its otherwise smooth surface. Sometimes the gas is absorbed or

'occluded' (in a wider sense) even though the metal be not fused—e.g. hydrogen gas by cold palladium, carbonic oxide by red-hot cast-iron.

Occultations (Lat. *occultatio*, 'a concealment') are neither more nor less than 'eclipses'; but the latter term is confined by usage to the obscuration of the sun by the moon, and of the moon by the earth's shadow, while the former is restricted to the eclipses of stars or planets by the moon. Occultations are phenomena of frequent occurrence; they are confined to a belt of the heavens about $10^{\circ} 17\frac{1}{2}'$ wide, situated parallel to and on both sides of the equinoctial, and extending to equal distances north and south of it, being the belt within which the moon's orbit lies. These phenomena serve as data for the measurement of the moon's parallax; and they are also occasionally employed in the calculation of longitudes.

Occultism. See MAGIC, ALCHEMY, ASTROLOGY, DIVINATION, SECOND-SIGHT, THEOSOPHY, WITCHCRAFT.

Ocean. See SEA.

Ocean Island, one of the chief of the Gilbert Islands, is the administrative centre of the Gilbert and Ellice Islands Colony. Its guano deposits are worth many millions sterling.

Oceanography, the study of the ocean in all its aspects—extent, depth, tides, currents, compositions, deposits, temperature, vegetation, animal life, &c. See SEA.

Oceanus, the god of the river Oceanus, which, according to Greek mythology, having neither source nor mouth, flows ceaselessly round the whole earth, never mingling with the sea, which it encloses. Oceanus was the husband of Tethys, and father of all the river-gods and water-nymphs of the earth. As the geographical knowledge of the Greeks advanced the name was applied to the outer sea, especially the Atlantic.

Ocelot (*Felis pardalis*) is a species, with several varieties, which is confined to the New World, and ranges from Arkansas in the north to Paraguay. These animals are inhabitants of forests, and very expert in climbing trees. Their prey consists in great part of birds. They are beautifully marked and coloured. The coloration varies

Ocelot (*Felis pardalis*).

considerably, but the ground tint is always a rich red or tawny colour, blending finely with the dark brown on the margins of the open spots, of which there are chains along the sides; the head, neck, and legs being also variously spotted or barred with dark brown or black.

Ochil Hills, a pastoral range occupying parts of the Scottish counties of Stirling, Perth, Clackmannan, Kinross, and Fife, and extending from the vicinity of Stirling north-east to the Firth of Tay. It is 24 miles in length, and about 12 in breadth. Chief summits are Benclough (2363 feet), Dumyat (1375), and King's Seat (2111). The hills, which are formed chiefly of lavas, contain silver, copper, and iron ores.

Ochino, BERNARDINO, Italian reformer, was born at Siena in 1487, and joined the Franciscan Observants, but in 1534 changed to the Capuchin order, as being more strict. In four years' time he was vicar-general of the order, having already before joining it gained the reputation of a man of great piety and eloquence. In 1542 he was summoned to Rome to answer to the Inquisition for certain evangelical tendencies which had been manifested in sermons delivered by him at Venice three years before, and had been much talked about. Warned by Cardinal Contarini, Ochino turned back at Bologna and fled to Geneva, where Calvin gave him a welcoming hand. In December 1545 he was appointed preacher to the Italian congregation in Augsburg, but fourteen months later was driven from the city by the advent of the imperial troops. From this time Ochino was dogged by misfortune, and was never able to stay long in any one place. He first found refuge in England, invited there by Cranmer; he was made pastor to the Italian exiles and given a prebend in Canterbury Cathedral. In England he wrote the *Tragedy*, a series of dramatic dialogues translated from the original Latin into English by Bishop Ponet, which is believed to have had some influence upon Milton's *Paradise Lost*. At Mary's accession (1553) Ochino fled to Switzerland, and ministered to the Italian exiles in Zurich for ten years. Then the publication of *Thirty Dialogues*, one of which the Calvinists stated to contain a defence of polygamy, occasioned his being banished precipitately from the canton. In the dialogue in question Ochino states expressly and repeatedly that 'polygamy is immoral;' but, being a man of inquiring, questioning intellect, he at the same time threw out the suggestion that there might be individual cases in which it might perhaps be permissible, provided the individual were quite certain he had God's approval. Ochino fled to Poland, but was soon driven thence by an edict directed against all foreigners, and died in flight at Schlackau in Moravia in the end of 1564. See Life by Benrath (trans. Helen Zimmern, 1876).

Ochotona, or LAGOMYS, a genus of Duplicitate Rodents, known as tailless hares or Pikas, represented in mountainous regions in both the Old World and the New; the only European species is *Ochotona pusilla*, in southern Russia. They are small alpine animals, with fore and hind legs almost equal, with short ears, and without external tail.

Ochres are native pigments consisting of clays or earths composed chiefly of silica and alumina, along with oxide of iron or more rarely with other oxides. Some are found in a natural state fine enough to be used after being simply washed. The two important classes of ochres are the yellow and the red, the colouring material of the former being the hydrated oxide of iron, and that of the latter the red or sesquioxide. Umber (q.v.), which is classed with the ochres, contains manganese as well as oxide of iron. Yellow ochres are reddened by being burned. Most of the ochres can be prepared artificially, but these are not so safe for artists' purposes as the native earths. The latter are remarkable for their stability, as can be seen in many pictures by the old masters. Yellow ochre and Roman ochre are much used both by artists and house-painters, and so also (but the first more by artists) are the red ochres, known as light red, Indian red, and Venetian red. This last, however, is an artificial product, and, although it is an oxide of iron colour, it contains no earthy base, so that correctly speaking it is not an ochre. Ochre is worked in Anglesey and Devonshire. Canada has large deposits. The earthy or powdery varieties of

some of the less common metallic compounds found native are called ochres—e.g. bismuth ochre, antimony ochre, nickel ochre, chrome ochre. See *MAGIC*.

Ochrida, OKHRIDA, or OHRID, a town (pop. 10,000) and beautiful lake (area about 100 sq. m., but variable) in south-west Yugoslavia. Ochrida was for centuries a Bulgarian patriarchate. The lake is near the point where Yugoslavia, Albania, and Greece meet.

Ochroma, a genus of Bombacaceæ, consisting of *O. Lagopus* (Balsa or Corkwood), a West Indian tree, whose wood being very light is used for floats, life-saving apparatus, and the like.

Ochterlony, SIR DAVID, British general, was born of Scottish (Forfarshire) descent, at Boston, Massachusetts, on 12th February 1758, went out to India as a cadet at eighteen, and was made lieutenant-colonel in 1803. In the following year he defended Delhi against Holkar; but his greatest services were rendered against the Goorkhas. In 1814 he stormed their hill-forts one after the other, and compelled them to sue for peace; on the renewal of the war in 1815 he shut up their principal chief in the hill-fort of Malaun, forced it to surrender, and penetrated to within a few miles of the Nepalese capital. Peace was again made; and the treaty has remained in force down to the present time. Ochterlony was made (1816) a baronet for his success. He rendered excellent service in the Pindari and Mahratta wars of 1817 and 1818. He died at Meerut, 15th July 1825.

Ockham (more usually in the Latinised form OCCAM), WILLIAM OF, surnamed *Doctor Singularis et Invincibilis*, a famous 14th-century schoolman, was born in England, at Ockham in Surrey, but when is not known; the date usually given is 1270 or 1280. He entered the Franciscan order, and studied at Oxford and Paris, being a pupil, afterwards the rival, of Duns Scotus. It seems not to be correct that he took part in the contest between Philip the Fair of France and Boniface VIII., the famous *Disputatio super Potestate Prælati Ecclesiæ . . . commissæ*, usually attributed to him, having been probably written by another. But in the revolt of the Franciscans against Pope John XXII. at Perugia in 1322 he did take part, being one of the most active in the movement. After four months' imprisonment at Avignon he repaired to Munich, and found there a defender in the Emperor Louis of Bavaria, whom he in his turn defended stoutly against the temporal pretensions of the pope. In 1342 he seems to have become general of the Franciscans. Besides insisting on the independent divine right of temporal rulers, and so in some measure clearing the way for modern constitutional ideas, Ockham won greater fame as the reviver of Nominalism (q.v.), for which he won a final victory over the rival Realism, chiefly by setting forth its real meaning in plain and simple language. He seems to have died at Munich in 1349. His views on civil government are expounded in *Super Potestate Summi Pontificis octo Questionum Decisiones* (1339-42) and *Tractatus de Jurisdictione Imperatoris in Causis Matrimonialibus*, his philosophical views in *Summa Logices* (1488) and the commentary on the *Sentences* of Peter the Lombard, and his theological in this last and the *Tractatus de Sacramento Altaris* (1516). See T. M. Lindsay in *Brit. Quart. Review* (1872).

Ockley, SIMON (1678-1720), Orientalist, was educated at Oxford, and in 1711 became Arabic professor. His *History of the Saracens* (2 vols. 1708-18; long a standard, though not based on the best authorities) was partly written in a debtor's prison.

O'Clery, MICHAEL, Irish chronicler, was born in 1575 at Kilbarron on Donegal Bay. Educated in

East Munster, he was for some time in the Franciscan convent of Louvain. Returning to Ireland he, with the assistance of other Irish scholars, did much valuable work in Irish historical research. His principal works are the *Royal List* (1624-30), an account of the Irish kings and their pedigrees; the *Book of Invasions* (1627-31), an account of the several settlements of Ireland; the *Annals of the Four Masters* (1632-36), a digest of the old *Annals of the Kingdom of Ireland*; and *Martyrologium Sanctorum Hiberniæ* (1636), a complete calendar of the saints of Ireland. He died at Louvain in 1643.

O'Connell, DANIEL, 'the Liberator,' great Irish patriot and orator, was born near Cahirciveen in County Kerry, 6th August 1775. He was the eldest son of Morgan O'Connell, but was early adopted by his uncle, Maurice O'Connell. He was sent in 1791 to the college of St Omer, where his unusual promise was recognised. In 1792 he went to the English college at Douai. On more than one occasion he witnessed the follies and excesses of the French Revolution, and the experience served in later life to give to his mind a deep conservative tinge. He entered Lincoln's Inn in 1794, and was called to the Irish bar in 1798. He was on the Munster circuit for twenty-two years. He soon became famous as a counsel as well as an unrivalled cross-examiner of Irish witnesses, and before long was plunged in an enormous practice. The wide popularity of 'the Counsellor'—to the last a favourite title among his Irish admirers—was due to his fearlessness and professional dexterity, his boisterous wit and good-humour, his constant tact and readiness in reply, and not least to the violent language he often employed in court. In 1802 he married his cousin, Mary O'Connell, who bore him five sons and three daughters, and with whom he lived till her death in 1836 in uninterrupted happiness. With an inherited dislike to British rule in Ireland, O'Connell was early drawn into political agitation. It appears that he had some connection with the rebellion of 1798, the unhappy issue of which cured him for life of all love for secret societies.

At the beginning of the 19th century the worst severities of the penal code had been relaxed in Ireland, but Catholics still laboured under many and grievous disabilities. It was then that O'Connell rose as a champion of the cause of Catholic emancipation, and became by 1811 the real director of the movement. Grattan's motion in favour of emancipation was carried in March 1813, but his bill was lost in committee. The 'securities' it proposed were most distasteful to the Catholic bishops, and O'Connell supported them in their policy of opposition to Grattan. The timid counsels of the pope, then a pensioned prisoner of Napoleon, were displeasing to the Catholic party, but it was O'Connell's own conscientious convictions that nothing short of repeal would be permanently satisfactory that made him fight resolutely against all compromise. His attacks on the 'beggarly corporation' of Dublin, then an Orange stronghold, brought him a challenge from J. N. D'Esterre, and in the duel that ensued his pistol unfortunately inflicted a fatal wound on his antagonist, 1st February 1815. O'Connell was filled with lifelong remorse; he settled a pension on the widow, and never till his latest day passed the dead man's house without uncovering his head and breathing a prayer. His fiery invectives brought him in the course of his lifetime many challenges, but only once did he allow himself to accept—in the case of Peel in September 1815. The duel was only prevented by his being arrested on his wife's information and bound over to keep the peace. Meantime the

Catholic cause languished; Grattan died in 1820, and Plunket took up his mantle, but again the Lords threw out the bill. The visit of George IV. to Ireland in August 1821 raised hopes only to be nipped in the bud, while famine and commercial insecurity paralysed the public confidence. In 1823, at the moment of deepest gloom, O'Connell formed on a broad and popular basis the Catholic Association, and before the end of the year had brought the priests into it. The movement for emancipation then became for the first time really national and irresistible. The Association was a gigantic organisation, perfectly new to Ireland, and aroused the greatest enthusiasm from sea to sea. By the 'Catholic Rent' a large sum of money was raised for its purposes, a penny a month not being too little as a test of membership. By the end of 1824 it had grown to a formidable power, the average weekly rent for its last three months being as much as £500. The government in alarm brought in a bill to suppress the Association, but it dissolved itself, 18th March 1825. The Irish forty-shilling freeholders now began to find courage to oppose their landlords at the elections. Waterford was carried in 1826, and O'Connell himself stood for Clare in 1828, and was elected amid enormous enthusiasm, yet perfect order. The Clare election set the whole country aflame, but O'Connell seeing that an outbreak would ruin the Catholic cause on the very eve of its triumph ended the agitation with magical effect. In 1829 the Catholic Emancipation Bill was passed, admitting Catholics to parliament, repealing the oath of abjuration, and modifying that of supremacy, the 'securities' being the abolition of the forty-shilling franchise and raising the qualification to £10. On the 15th May 1829 O'Connell came to take his seat, but his claim was refused on the ground that re-election was necessary. Going down to Clare like a conqueror he was returned unopposed, and, now fifty-five years old, took his seat at the beginning of 1830. At the new election following on the death of George IV. later in the year he was returned for Waterford.

Much of the good effect of the act of 1829 was lost by the unnecessary insult to a sensitive people of not allowing its champion to take his seat without re-election, still more by the fact that no Catholics were appointed to the bench, and by the placing in the hands of the lord-lieutenant the power to suppress arbitrarily by proclamation any assembly that seemed to him dangerous. O'Connell now formed a new society for Repeal, 'The Friends of Ireland of all Religious Persuasions,' which was quickly suppressed, only to be revived as often as suppressed by a succession of others under new names and forms so as to elude the letter of the law. For these legal evasions he was threatened with prosecution in 1831, but saved himself by temporising. In the same year he became King's Counsel, the honour having been kept back as long as possible. Liberal in every part of his imperial policy, during the Reform struggle O'Connell supported the Whigs, as later he advocated free trade in corn, negro emancipation, the removal of the disabilities of the Jews, the cause of Poland, not to speak of universal suffrage, and the drastic reformation of the House of Lords. In the autumn of 1830 the potato crop had been very poor, and much misery was the result in Ireland. Under O'Connell's advice the people declined to pay tithes, and that winter disorder was rampant everywhere.

He had sat last for Kerry, when at the general election of 1832 he was returned for Dublin. At this time he nominated about half of the candidates returned, while three of his sons and two of his sons-in-law composed his 'household brigade.' Of the 105 Irish members but 23 were Tories; while of the 82 Liberals as many as 45—his famous 'tail'

—were declared Repealers. The severest of all coercion acts hitherto in force was that of 1833, against which O'Connell fought in the House of Commons with masterly courage and ability. The disgraceful interruptions and outrageous insults of his opponents somewhat excuse the violence of his tone and the frequent vulgarity of his language. He was constrained by Feargus O'Connor, the *Freeman's Journal*, and his more ardent followers to bring the Repeal movement into parliament; but prematurely, and in the spring of 1834, his motion for a committee to inquire into the Act of Union was overwhelmingly defeated. The Whigs under Lord Melbourne came into power in 1835, and, Repeal being for the time set aside as hopeless, O'Connell would have accepted office had not the king intervened to forbid it. For the next five years he gave the Whigs a steady support. His phrase, 'a bloated buffoon,' applied to Lord Alvanley, brought a challenge which was refused, but his son Morgan went out in his stead, and two shots were fired. A later challenge to the same son by D'Israeli, whom O'Connell had designated as 'heir-at-law of the blasphemous thief who died upon the cross,' was, however, declined. O'Connell visited the north of England and Scotland in 1835, and was everywhere received by enormous crowds. An incident in the Carlow election of the same year brought upon him from unscrupulous and watchful enemies the charge of having pocketed money to procure a man a seat, but the inquiry only brought out that he was grossly careless in managing affairs, and left no real stigma on his character. One of the most common Tory slanders upon him was that Repeal was not so much the object of 'the big Beggarman' as the Repeal rent; but it must be remembered that to serve his country O'Connell surrendered a very lucrative practice at the bar, and all hope of professional promotion; true, £10,000 of tribute flowed yearly into his hands, but despite the large fortune bequeathed by his uncle in 1825 and a subscription of £50,000 in 1829 raised on his behalf, he died worth scarcely a thousand pounds. The vast hospitality he certainly exercised was undoubtedly a necessity of his position.

Mulgrave and Drummond governed Ireland so mildly and impartially that O'Connell was prepared to abandon the Repeal agitation in the prospect of at last obtaining justice for his country. In 1836 he was unseated on petition for Dublin, but was subsequently returned for Kilkenny. He had loyally supported the Whigs at the risk of vanishing popularity in Ireland, but he began to feel misgivings as he saw his dreams of justice to Ireland vanishing in a more and more distant future. In 1838 he was offered the Mastership of the Rolls, but declined. In August he founded his 'Precursor Society,' and on 15th April 1840 his famous Repeal Association, the members of which were grouped in three classes—volunteers who subscribed or collected £10 a year, members who subscribed £1, and associates who subscribed one shilling. That summer and autumn he addressed meetings incessantly, but the agitation languished till the appearance of the *Nation* in October 1842 brought him the aid of Dillon, Duffy, Davis, Mangan, and Daunt. In 1841 O'Connell lost his seat at Dublin, but found another at Cork, and in November he was elected Lord Mayor of Dublin. On 25th February 1843 he successfully raised the question of Repeal in the Dublin corporation. The agitation now leaped into prominence, and the priests came pouring in to swell its strength. That year's rent was £48,400; Conciliation Hall was built in Dublin, and a magnificent and perfect organisation arranged with great enthusiasm and perfect harmony. Even a Repeal police was instituted under a Head Paci-

ficator. Arbitration courts were formed, and a great mass of national literature disseminated. O'Connell travelled that same year 5000 miles. Monster meetings, attended by hundreds of thousands (one at the Hill of Tara estimated at three-quarters of a million), were held in every corner of Ireland. These meetings, however, were never mobs—nowhere was there crime. O'Connell had, indeed, an innate horror of rebellion and bloodshed—'he who commits a crime adds strength to the enemy' was a favourite motto; another, 'no political change whatsoever is worth the shedding of a single drop of human blood.' Throughout a whole generation with wonderful skill he had kept the public mind at a pitch of the highest political excitement, yet restrained it from unconstitutional action. But now the Young Ireland party, with all the infallibility of youth and enthusiasm, began to grow impatient of the old chief's tactics, and, impelled by their enthusiasm and certain of the speedy surrender of the government, O'Connell allowed himself in his speeches to outrun his better judgment. But this time Wellington was resolute in his measures, and poured 35,000 men into Ireland. A great meeting was fixed at Clontarf for Sunday, 8th October 1843, but it was proclaimed the day before. O'Connell, apprehensive of a bloody scene, issued a counter-proclamation abandoning the meeting. Early in 1844 he was tried with his son and five of his chief supporters for a conspiracy to raise sedition. Being found guilty, he was sentenced to twelve months' imprisonment, a fine of £2000, and £5000 security for good behaviour for seven years. The House of Lords, however, set aside the verdict, and at once bonfires blazed across Ireland from sea to sea. But during the fourteen weeks the Tribune lay in prison the disease seized him of which three years later he was to die. And he found that in his absence the Young Ireland party had taken a forward step, and that his moral force policy was now discredited. His proposed scheme of federation and local parliaments found no favour, and he withdrew it. He opposed Peel's provincial 'godless colleges,' and soon came an open split between him and Young Ireland, the members of which seceded from the Association after angry disputes in 1846. Next followed the potato famine. Distraction at the sufferings of his country, dismay at the stalking shadow of famine, vexation at the breach in his party, consciousness of failure in the dearest project of his life, religious austerities in expiation of the errors of his youth, the progress of insidious disease, and last of all a crazy passion for a young English girl, now combined to break down his herculean frame. He left Ireland for the last time on 26th January 1847, made a touching but scarce audible speech in the House of Commons on 8th February, next went to Hastings and to Folkestone, and as he felt the hand of death upon him was filled with a great longing to reach Rome. Boulogne, Paris, Moulins, Lyons, Marseilles, and Genoa were the slow stages of the journey. At the last, after some days of delirium, he died, 15th May 1847. His heart by his own desire was carried to Rome, and buried in the church of St Agatha; his body rests in the Glasnevin Cemetery, Dublin, in a crypt at the base of an Irish round tower 165 feet high.

Daniel O'Connell was framed by nature for the part he had to play in life. Almost six feet high, of burly figure, giant strength, inexhaustible energy, and enormous powers of work, he had a splendid command of nervous language, and a mighty voice that rose high above the uproar of the crowd. A magnificent orator, trenchant, versatile, self-possessed, sincere with all his exaggeration, ready in unstudied and effective retort, richly endowed with a coarse but genuine humour, and ever thoroughly

Irish, he controlled at will the wildest emotions of an Irish mob, and passed with the ease of a master from bursts of passion and outrageous buffoonery to the tenderest pathos. He was master of all the artillery of vituperation, but it should be remembered in extenuation that he was assailed all his life by a malignity and hatred now difficult to realise. O'Connell was no demagogue; he opposed the poor-laws of 1838 on the most unpopular grounds, and rejected the proffered alliance of the Chartists, constantly denounced rebellion, and was unswerving in personal loyalty to the sovereign. He was no mere tool of Rome, and never abused Protestants as such, but advocated a large tolerance in religion far beyond the ideas of either his antagonists or his supporters, making for his aim a really Liberal Catholicism. His church policy was carried out far beyond his dreams in 1869, his fixity of tenure granted by the Land Bill of 1870; and indeed the magnitude of the measures since his time adopted to heal the distresses of Ireland but shows how sound was his statesmanship and how real were the evils that he denounced. Yet together with all this good there was mixed much evil also. He was coarse, scurrilous, cunning, violent, bombastic, unscrupulous, more than Celtic in his looseness of phrase and exaggeration, he often played upon unworthy passions, and left behind him an inheritance of bitterness. But it should never be forgotten that he taught his country to manage within constitutional limits the whole machinery of political agitation, and again aroused within her the spirit of nationality and the instinct of freedom. He said himself with justifiable pride, 'Grattan sat by the cradle of his country, and followed her hearse: it was left for me to sound the resurrection trumpet, and to show that she was not dead, but sleeping.' With all his faults he was a great and sincere patriot, whose devotion to the best interests of Ireland will never fade from her remembrance.

Of O'Connell's published writings the most characteristic is the *Letter to the Earl of Shrewsbury* (1842). His *Memoir of Ireland, Native and Saxon* (1843), never saw its second volume, and is poor and inaccurate. There are Lives by his son John O'Connell (1846), William Fagan (1847-48), M. F. Cusack (1872), O'Rourke (1875), R. Dunlop (1900), and M. MacDonagh (1903). See also W. J. O'Neill Daunt's *Personal Recollections* (2 vols. 1848); his son's *Recollections and Experiences during a Parliamentary Career from 1833 to 1848* (2 vols. 1849); W. E. H. Lecky's *Leaders of Public Opinion in Ireland*, unquestionably the ablest estimate of his character (revised ed. 1903); M. F. Cusack's *Speeches and Public Letters of the Liberator* (2 vols. 1875); Shaw Lefevre's *Peel and O'Connell* (1887); the excellent study by J. A. Hamilton in the 'Statesmen' series (1888); and W. J. Fitzpatrick's authoritative and invaluable *Correspondence of Daniel O'Connell, the Liberator* (2 vols. 1888). The delightful letters to his wife and Archbishop M'Hale, contained in the last, gave a new revelation of his character.

O'Connor, FEARGUS EDWARD (1794-1855), Chartist, was educated at Portarlington and Trinity College, Dublin. He was called to the Irish bar, and in 1832 entered parliament for Co. Cork. At first a supporter of O'Connell, he became estranged from his leader, and devoted himself to the cause of the working-classes in England. His great stature and strength, his eloquence and enthusiasm, gave him vast popularity as a leader, and by his paper, the *Leeds Northern Star* (1837), he did much to advance the cause of Chartism. Elected for Nottingham in 1847, he presented the monster Chartist petition in the April of the following year. In 1852 he became hopelessly insane.

Oconto, capital of Oconto county, Wisconsin, on Green Bay, at the mouth of the Oconto River,

149 miles by rail N. of Milwaukee. It has large steam sawmills, and exports pine lumber. Pop. 5000.

Ocotea, a genus of trees of the order Lauraceæ, sometimes called Mountain Laurel. *O. opifera* is a native of the countries on the lower part of the Amazon. A volatile oil obtained from the bark is used as a liniment, and when kept for a short time deposits a great quantity of camphor. *O. cupularis* is a very large tree with strong-scented wood, the bark of which yields the cinnamon of Mauritius. It grows also in Bourbon and Madagascar. *O. foetens*, a native of the Canaries, has wood (*Til-wood*) of a most disagreeable odour. *O. bullata*, the *Stink-wood* of the Cape of Good Hope, is also remarkable for the disagreeable odour of its wood; but it is hard, durable, beautiful, and takes an excellent polish.

Octave (Lat. *octavus*, 'eighth'), in the church calendar, is the eighth day after a festival, counting in the festival day itself; also, the week after a church festival.—In Music octave is the interval between any musical note and its most perfect concord, which is double its pitch, and occupies the position of the eighth note from it on the diatonic scale. The name octave is often given to the eighth note itself as well as to the interval.

Octavia, the sister of the Roman emperor Augustus, and wife of Mark Antony, distinguished for her beauty, her noble disposition, and womanly virtues. On the death of her first husband, Marcellus, she consented in 40 B.C. to marry Antony, to make secure the reconciliation between him and her brother; but in a few years Antony forsook her for Cleopatra. In 32 B.C. war, long inevitable, broke out between Antony and Octavian; and the former crowned his insults by sending Octavia a bill of divorce. But no injury was too great to be forgiven by this patient Griselda of the ancient world; and after her husband's death she brought up with maternal care not only her own children by Antony, but also those of Cleopatra. She died 11 B.C.

Octavian. See AUGUSTUS.

October (Lat. *octo*, 'eight') was the eighth month of the so-called year of Romulus, but became the tenth when Numa changed the commencement of the year to the first of January, though it retained its original name, in spite of attempts to change it made by the Roman senate, and by the emperors Commodus and Domitian. Many Roman and Greek festivals fell to be celebrated in this month, the most remarkable of which was the sacrifice at Rome of the October horse to the god Mars.

Octopus, a widely distributed genus of eight-armed cuttle-fishes, the members of which (e.g. *O. vulgaris* in Europe, and *O. bairdii* in America) usually live near shore, lurking among the rocks, preying upon crustaceans and molluscs. The term is often extended to related genera, such as *Eledone*, and to other members of the sub-order Octopoda. These differ in many ways from the Decapoda, such as *Sepia* and *Loligo*: thus, the suckers on the eight arms are sessile and without a horny ring; the body is more rounded, and there is no internal residue of a shell. Of the half-hundred species some are large: thus, *O. vulgaris* may have tentacles about 8 feet long, and *O. punctatus* of the Pacific coasts even twice as much. These are dwarfed, however, by the gigantic ten-armed *Architeuthis*, of which one specimen exhibited in America had a head and body $9\frac{1}{2}$ feet long and arms of 30 feet, while another had a body twice as big. Many fanciful descriptions have been given of the Octopus, notably that by Victor Hugo in his

Toilers of the Sea, in which the characters of cephalopod and polyp are dramatically combined. Large specimens may of course act powerfully on the defensive, but by nature they are timid, lurking animals, the conger eel and other voracious fishes being their most formidable foes. They are sometimes caught in sunken pots, into which they creep, and the flesh is used both as food and bait. The

Common Octopus (*Octopus vulgaris*).

predominant colour is reddish, but it changes rapidly with that of the surroundings and with the temper of the animal, which has also the power of discolouring the water by a discharge of inky fluid. The eggs are enclosed in small translucent sacs, and hundreds are attached to a common stalk which is glued to the rock, and protected and kept free of small seaweeds, &c., by the female. For their general structure, see CEPHALOPODA, CALAMARY, and CUTTLE-FISH.

Octroi (Lat. *auctoritas*, 'authority'), a term which originally meant any ordinance authorised by the sovereign, and thence came to be restrictively applied to a toll or tax in kind levied from a very early period in France and other countries of northern Europe on articles of food which passed the barrier or entrance of a town. The octroi was abolished in France at the Revolution, but in 1798 it was re-established. The octroi officers are entitled to search all carriages and individuals entering the gates of a town. Similar taxes are raised in Italy, Spain, Portugal, and elsewhere.

O'Curry, EUGENE (1796–1862), Irish antiquary. See IRELAND, *Language and Literature*.

Od, the name given by Baron Reichenbach (q.v.) to a peculiar physical force which he thought he had discovered, intermediate between electricity, magnetism, heat, and light. This force, according to him, pervades all nature, and manifests itself as a flickering flame or luminous appearance at the poles of magnets, at the poles of crystals, and wherever chemical action is going on. All the phenomena of mesmerism were ascribed to it. See Buchner, *Das Od* (1854); Fechner, *Erinnerungen an die letzten Tage der Odlehre* (1876); and the *Transactions of the Psychical Research Soc.* (1883).

Odænathus, or ODENATUS. See ZENOBIÆ.

Ode (Gr. *ōdē*, from *aeidō*, 'I sing'), a form of lyrical poetry associated in its supreme form with

the name of Pindar, but practised with splendid success by many English poets. The Greek ode was simply a chant or poem arranged to be sung to an instrumental accompaniment, and all the variations of form that occurred were merely subjective, incapable of imitation, and conditioned only by the exigencies of the music. Archilochus was the first to expand the simple distich into an *epode*; Aleman, to adopt the more complex form of the *carmen* or ode. Sappho, Alcæus, and Anacreon carried it further, and shaped the lighter form of ode, known to us, through the masterpieces of their greatest imitator, as the Horatian. Stesichorus modified the ode of Aleman by elaborating a triple movement, in which the metrical wave moving in the *strophe* was answered by the counter-wave moving in the *antistrophe*, the whole concluded by the *epode*, a blended echo of the two. Simonides adapted this elaborate form to Dorian music, and next followed Pindar, the greatest master of the ode. His *Parthenia* or odes for virgins, his *Skolia* or dithyrambic odes in praise of Dionysus, and his encomiastic odes have all perished; only his *Epinikia*, or triumphal odes, remain. These display an infinite variety of metrical ingenuity; no two odes have the same metrical structure, yet each obeys a definite structural law. The Humanist poets imitated the simplest Ætolian measures as they found them in Catullus and Horace; but many of our poets, taking Pindaric as synonymous with irregular, produced so-called odes whose only likeness to their great original was their 'unshackled numbers.' But irregularity in verse is not allowable except in cases where it is a natural aid grasped by the poetic mood in its moment of exaltation; for the most constant charm of poetry is the inevitableness of cadence, which must never be lightly flung away unless to subserve another and still higher law—that of emotional necessity. It is only in the hands of a master that the ode may safely be imitated in English; by all others the apparent artifice of the form and the necessary spontaneity of the impulse may not be reconciled.

Ben Jonson's odes are unequal; Herrick's, poor; Spenser's *Epithalamium*, or marriage ode, is one of the most splendid triumphs of English poetry; and Milton, in his magnificent poem, *On the Morning of Christ's Nativity*, found in this a form adequate for that poetic exaltation which was his habitual mood. Cowley was already an expert in the Horatian ode, when he fell in with Pindar, and imitated him, in externals at least, in a number of elaborate compositions, usually redeemed from dullness by bursts of undoubted poetic power. Dryden has left at least three immortal odes, *To Mistress Anne Killigrew*, *For St Cecilia's Day*, and *Alexander's Feast*; and Congreve wrote not only a few admirable, if formal, examples, but an excellent critical *Discourse on the Pindarique Ode* (1705). The matchless Orinda, Lord Orrery, Ambrose Philips, Young, Akenside, and Shadwell followed after their kind; and Gray, first drawn to this form by Gilbert West, translator of Pindar, produced in 1754 and 1756 his two inimitable Pindaric odes, the *Progress of Poesy* and *The Bard*. The exquisitely poetic, though not Pindaric, odes of Collins were given to the world somewhat earlier. Wordsworth, Coleridge, Shelley, Keats, and Tennyson poured some of their noblest verse into this form, while modifying it further, whether as *regular*—i.e. following a definite arrangement in stanzas, or as *irregular*, following no such arrangement. There are no finer odes or nobler poems in our language than Coleridge's odes *To the Departing Year* and *To France*; Wordsworth's *To Duty* and *Intimations of Immortality from Recollections of Early Childhood*; Shelley's *To the West Wind*, *To*

a *Skylark*, *To Liberty*, and *To Naples*; Keats's odes *To a Nightingale*, *On a Grecian Urn*, and *To Autumn*; Tennyson's funeral ode *On the Death of the Duke of Wellington*; and Swinburne's *To Victor Hugo in Exile*.

See *English Odes* (1881), admirably selected by Edmund Gosse, with an excellent introduction; and the subtle and suggestive article 'Poetry,' by Theodore Watts-Dunton, in the *Encyclopædia Britannica*; also R. Shafer, *The English Ode to 1660* (1918).

Ödenburg. See OEDENBURG.

Odense, the chief town of the Danish island of Fünen (q.v.). Its cathedral was founded in 1086; and diets were held here in 1527 and 1539. Hans Andersen was a native. Pop. 50,000.

Odenwald, a mountainous system partly in Baden and Bavaria, but mainly in Hesse (q.v.).

Oder (Lat. *Viadrus*), one of the principal rivers of Germany, rises in the Oderberg on the tableland of Moravia, 1950 feet above the level of the sea, traverses Prussian Silesia, Brandenburg, and Pomerania, then empties itself into the Stettiner Haff, whence it passes into the Baltic by the triple arms of the Dievenow, Peene, and Swine, which enclose the islands of Wollin and Usedom. It has a course north-west and north of 550 miles, and a basin of 50,000 sq. m. The rapid flow, induced by its very considerable fall, together with the silting at the embouchures of the numerous tributaries, renders navigation difficult; great expense and labour being, moreover, necessary to keep the embankments in order, and prevent the overflowing of the river. Canals connect the Oder with the Spree, the Havel, and the Elbe; the Warthe is the only tributary of importance for navigation. On the banks of the Oder are Ratibor (where it is navigable for barges), Brieg, Breslau, Frankfurt-on-the-Oder, Stettin, and Swinemünde.

Odescalchi, BENEDETTO. See INNOCENT XI.

Odessa, great seaport and city of Ukraine, stands on the shore of the Black Sea, about midway between the estuaries of the Dniester and the Dnieper, by rail 967 miles SSW. of Moscow and 381 S. of Kieff. The city is built facing the sea on low cliffs, seamed with deep ravines and hollowed out by galleries in the soft rock, in which numbers of the poorest inhabitants, casual dock labourers for the most part, herd together. Above ground the streets are long and broad, the town presenting a west-European aspect. Odessa was only founded in 1794, near a Turkish fort that fell into Russian hands in 1789; but it quickly became the principal export town for the extensive corn-growing districts of South Russia. Its progress was greatly aided by its being declared a free port from 1817 to 1857, and again by the construction of the railway to Kieff in 1866. The population increased rapidly, from 3150 in 1796 to 25,000 in 1814, 100,000 in 1850, 184,800 in 1873, 270,600 in 1887, 404,651 in 1897, and 631,040 in 1912. In 1923, however, it was reckoned at 317,000. A very large percentage of the inhabitants are Jews, who share with the Greeks most of the trade. Merchants of many other nationalities dwell here also. The harbour is made up of a roadstead and three basins, protected by moles against the dangerous winds that sweep the Black Sea. It is impeded by ice—scarcely ever closed by it—during an average of only a fortnight in the year. The bulk of the exports is grain, especially wheat. Sugar in very large quantities, wool, and flour are the other chief items. The main branches of industrial activity are flour-milling, sugar and oil refining, and, in a secondary degree, the manufacture of tobacco, machinery, leather, soap, chemicals, biscuits, &c. Odessa has a university (1865) with about 3000 students; a great number of schools,

including a cadet, a commercial, and two music schools; several learned societies, and a public library (1829) with many rare books. The museum of the Historical and Antiquarian Society contains treasures from the coasts of the Black Sea, belonging to the Hellenic, the Veneto-Genoese, and the Tataro-Mongol civilisations. Amongst the public buildings of Odessa are the cathedral (1802-49), which is the church of the Archbishop of Kherson, three dozen other churches, a very fine opera-house (1887), palatial grain-warehouses, corn-elevators, and the 'palais royal,' which, with its gardens and park, is a favourite place of resort. Monuments to Count Worontsoff (1863), the Duke de Richelieu (1827)—both great benefactors of Odessa—and Pushkin (1889) adorn the city. The statue of Catherine II. (1900) was pulled down by the Odessa Soviet and a monument to Karl Marx raised in its place in 1920. The town is defended by numerous coast-batteries. Water is brought by aqueduct (27 miles long) from the Dniester. Odessa has an unenviable reputation as a home of cholera. Lagoons outside the city supply mud-baths, reckoned among the best in Europe. Odessa was bombarded by an Anglo-French fleet in 1854 and by the Turkish in 1876, on both occasions unsuccessfully. It has been the scene from time to time of Jewish persecutions. In 1905 it witnessed violent revolutionary disorders, accompanied by a naval mutiny. During the Great War it was frequently bombarded by the Turks, and ultimately fell into the hands of the Central Powers (March 1918). With their defeat the town experienced many alternations in its fortunes, being now in the hands of Ukrainian troops, and now in the possession of the anti-Bolshevist or Bolshevist forces of Russia. The latter finally held it.

Odeypoor. See UDAIPUR.

Odilon-Barrot. See BARROT.

Odin (*Odhinn*; O. H. Ger. *Wuotan*; O. E. *Woden*, or *Woden*—whence *Wednesday*), the chief god of northern mythology, common to all Germanic peoples. He is not the creator of the world, but its ruler, king of heaven and earth. Odin, as the highest of the gods, the *Alfadur*, rules heaven and earth, and is omniscient. As ruler of heaven, his seat is the palace Hlidskialf in Asgard, from whence his two black ravens, Hugin (Thought) and Munin (Memory), fly forth daily to gather tidings of all that is being done throughout the world. As god of war, he holds his court in Valhalla, whither come all brave warriors after death to revel in the tumultuous joys in which they took most pleasure while on earth. His greatest treasures are his eight-footed steed Sleipner, his spear Gungner, and his ring Draupner. As the concentration and source of all greatness, excellence, and activity Odin bears numerous different names. By drinking from Mimir's fountain he became the wisest of gods and men, but he purchased the distinction at the cost of one eye. He is the greatest of sorcerers, and imparts a knowledge of his wondrous arts to his favourites. Frigga (q.v.) is his queen, and the mother of Balder (q.v.), the Scandinavian Apollo; but he has other wives and favourites, and a numerous progeny of sons and daughters. He is claimed as ancestor of various royal dynasties. Rhys contends that the myths relating to Woden, the great Teutonic sky-god, may be traced to a Celtic origin, and compares the name Woden with the Celtic Gwydion. See SCANDINAVIAN MYTHOLOGY.

Odoacer, ODOVACAR (434-493), the ruler of Italy from the year 476 to 493, was the son of Ædico, a captain of the Germanic Scyri. He entered the military service of the western Roman empire, and rapidly rose to eminence. He took part in the revolution by which Orestes (475) drove the Emperor

Julius Nepos from the throne, and conferred on his son Romulus the title of Augustus, which the people scoffingly changed into *Aūgustūlus*. He soon perceived the weakness of the new ruler, and at the head of the Germanic mercenaries—Herulians, Rugians, Turcilingians, and Scyri—marched against Pavia, which Orestes had garrisoned, stormed the city, and put his opponent to death (476). Romulus abdicated, and withdrew into obscurity. Thus perished the Roman empire. Odoacer showed himself to be a wise, moderate, and politic ruler, sought to conciliate the Byzantine emperor Zeno, and, with the title of *Patricius*, ruled Italy from Ravenna. The barbarian ruler did everything in his power to lift Italy out of the deplorable condition into which she had sunk. Though an Arian himself, he acted with a kingly impartiality that more orthodox monarchs have rarely exhibited. He conducted a successful campaign in Dalmatia, and against the Rugii on the Danube. The increasing power of Odoacer excited the jealousy and alarm of Zeno, who encouraged Theoderic, king of the Ostrogoths, to undertake an expedition against Italy (489). Odoacer, defeated in three great battles (at Isonzo, at Verona, and on the Adda), shut himself up in Ravenna, which he bravely defended for three years. Compelled by famine, he capitulated (493) on condition that the kingdom of Italy should be shared between him and Theoderic; but a fortnight after Odoacer was assassinated at a feast by Theoderic himself. See Hodgkin, *Italy and her Invaders*.

Odometer. See PEDOMETER.

O'Donnell, LEOPOLD, Marshal of Spain, born at Teneriffe, 12th January 1809, was descended from an ancient Irish family. He entered the Spanish army when young, and espoused the cause of the infant Queen Isabella against Don Carlos (see CARLISTS). When the Carlists were overthrown he was created Chief of the Staff to Espartero. He took the side of the queen-mother in 1840, emigrated with her to France, and took up his residence at Orleans, where he planned many of the political risings which took place under the rule of Espartero. In 1843 his intrigues against Espartero (q.v.) were successful; and he was rewarded by the governor-generalship of Cuba, where he amassed a large fortune by favouring the iniquitous trade in slaves. When he returned to Spain (1848) he intrigued against Bravo Murillo and Narvaez; was made war minister by Espartero in 1854; but plotted against his benefactor, and in 1856 supplanted him by a *coup d'état*. He was in three months' time succeeded by Narvaez, but in 1858 he returned to power; in 1859 he commanded the army in Morocco, and after a tedious campaign took the Moorish camp, and the city of Tetuan surrendered, whereupon he was made Duke of Tetuan. In 1866 his cabinet was upset by Narvaez, and he died at Bayonne, 5th November 1867.

Odontopteryx (Gr. *odous*, 'a tooth'; *pteryx*, a 'wing'), an extinct bird, probably related to the Solan Goose or Gannet. It is known only by an imperfect skull from the London Clay (Lower Eocene) of Kent (see EOCENE SYSTEM). The most remarkable feature is the presence on both jaws of pointed bony processes, which are parts of the bone itself and not teeth. They seem to have been continued into similar processes of the horny beak.

Odontornithes, a general name applied by Marsh to a number of types of extinct toothed birds. It is necessary to distinguish several distinct groups. Thus the *Odontolcae*, with teeth in grooves, are well represented by *Hesperornis* from the Upper Cretaceous of Kansas. This was a large flightless bird, standing over three feet high,

specialised for aquatic life. The wing was greatly reduced, and the breast-bone was without a keel. The vertebrae were like those of modern birds. Very different were the Odontornæ, with teeth in distinct sockets, represented by Ichthyornis, also from the Upper Cretaceous of Kansas. This was a relatively small bird, about a foot high, with a well-formed wing and a keeled breast-bone. In its teeth and biconcave vertebrae it was distinctly reptilian; it is regarded by many as ancestral to the group of birds including gannets, cormorants, and pelicans. With types so different as Hesperornis and Ichthyornis, the Odontornithes cannot be regarded as a natural division. See O. C. Marsh, *Odontornithes: a Monograph of the Extinct Toothed Birds of North America* (Washington, 1880).

Odoric (1286?–1331), born near Pordenone in Friuli, became a Franciscan, and travelled by Constantinople through Persia to India, and thence by sea to China, where he spent three years (1324–27?) in mission work. He returned by Tibet and Persia to Italy (1330), and died at Udine on his way to the Pope, then at Avignon. His narrative, taken down from his lips by a friend, was first published in 1513, and was included in the second edition (1574) of the great collection of *Navigazioni e Viaggi* compiled by the Venetian state secretary Gian Battista Ramusio (1485–1557); and it was translated with notes by Sir H. Yule in *Cathay and the Way Thither* (1866). It was from Odoric's story that Mandeville (q.v.) plagiarised so shamelessly.

Odyssens, Odyssey. See ULYSSES, HOMER.

Ecclampadius, JOANNES (1482–1531; his real name was Hausschein or Hussgen), born at Weinsberg in Swabia, studied at Bologna and Heidelberg, and as a monk at Basel was employed by Erasmus on his New Testament. Stirred by Luther's teaching, he was for a while chaplain to Franz von Sickingen (q.v.), and at Basel in 1522 became a reformed preacher and professor of Theology. Inclining more and more to Zwingli's views on the Lord's Supper, he in 1529 disputed with Luther in the conference at Marburg, and he wrote several treatises. He was remarkable for his gentleness of character. There are Lives in German by Herzog (1843) and Hagenbach (1859). The theological faculty of Basel has undertaken a complete edition of writings by or relating to him.

Ecology. See ECOLOGY.

ECUMENICAL. ECUMENICAL.

Edema (Gr., 'swelling,' or 'dropsy') is the term applied in medicine to the swelling occasioned by the effusion or infiltration of serum into cellular or areolar structures. The subcutaneous cellular tissue is the most common seat of this affection. Edema is not a disease, but a symptom, and sometimes a symptom indicating great danger to life. The means of removing it must be directed to the diseased condition or cause of which it is the symptom, e.g. kidney disease, heart disease, &c.

Oedenburg (Magyar *Sopron*, the *Scarabantia* of the Romans), a town of Hungary, 3 miles W. of the Nunsiedler See and 48 S. by E. of Vienna. It is one of the most beautiful towns in Hungary, and has manufactures of candied fruits, sugar, soap, &c., with a large trade in wine, corn, and cattle, the neighbourhood being rich and well cultivated. A plebiscite (1921), not recognised by Austria, resulted in Hungary's retaining Oedenburg contrary to the Treaty of Trianon (1920), by which, along with the rest of western Hungary, the town and district should have passed to Austria. Numerous Roman remains have been found. Pop. 35,000.

Ædipus (Gr. *Oidipous*), the hero of a legend which supplied subjects for some of the noblest tragedies of Sophocles and Euripides. Ædipus was the son of Laius, king of Thebes, by Jocasta, the sister of Creon, and was exposed after his birth, with his feet pierced through, on Mount Cithæron, because his father had learned from an oracle that he was doomed to perish by the hands of his own son. The child was discovered by a herdsman of Polybus, king of Corinth, and was named Ædipus from his swollen feet. Polybus brought him up as his own son. Being told by the oracle at Delphi that he was destined to slay his father and commit incest with his mother, he would not return to Corinth, but proceeded to Thebes to escape his fate. As he drew near he met the chariot of the king, and the charioteer ordering him out of the way, a quarrel ensued, in which Ædipus unwittingly slew Laius. In the meantime the famous Sphinx had appeared near Thebes, and propounded a riddle to every one who passed by, putting to death all who failed to solve it. In the terror of despair the Thebans offered the kingdom, together with the hand of the queen, to whoever should deliver them from the monster. Ædipus offered himself, whereupon the Sphinx asked him, 'What being has four feet, two feet, and three feet; only one voice; but whose feet vary, and when it has most, is weakest?' Ædipus replied that it was man, whereat the Sphinx threw herself headlong from the rock on which she sat. Ædipus became king, and husband of his mother, Jocasta. From their incestuous union sprung Eteocles, Polyneices, Antigone, and Ismene. A mysterious plague now devastated the country, and, when the oracle declared that before it could be stayed the murderer of Laius should be banished from the country, Ædipus was told by the seer Tiresias that he himself had both murdered his father and committed incest with his mother. In his horror he put out his own eyes, that he might no more look upon his fellow-creatures, while Jocasta hanged herself. He wandered towards Attica, accompanied by his daughter Antigone, and at Colonus near Athens the Eumenides charitably removed him from earth.

Ehlenschläger, ADAM GOTTLÖB, Danish poet, was born 14th November 1779 in a suburb of Copenhagen, where his father, a Sleswicker, was an organist. After an irregular and desultory course of education, he tried unsuccessfully the career of an actor, and then took to law studies, but soon devoted all his energies to the cultivation of the history and poetry of his own country. In 1803 appeared his first collection of poems; and the *Vaulunders Saga* (1805) and *Aladdins forunderlige Lampe* raised him to the rank of the first of living Danish poets. These early efforts were rewarded by a travelling pension, which enabled him to spend some years in travelling the Continent, and becoming acquainted with Goethe and other literary celebrities. During this period (Ehlenschläger wrote his *Hakon Jarl*, the first of his long series of northern tragedies (1807; Eng. trans. by F. C. Lascelles, 1875), and at Rome his *Correggio* (1809; Eng. trans. by Theodore Martin, 1854). In 1810 Ehlenschläger returned to Denmark, where he was hailed with acclamation, and made professor of Æsthetics in the university. In 1814 took place his literary feud with Baggesen (q.v.). In 1819 appeared one of his most masterly productions, *Nordens Guder*, which showed that the severe criticism to which his writings had been exposed during the celebrated Baggesen quarrel had corrected some of the faults, and lessened the self-conceit which had characterised his earlier works. His reputation spread with his increasing years both abroad and at home. In

1829 he went to Sweden, where he was welcomed by a public ovation; and he was honoured in his own country in 1849 by a grand public festival in the palace at Copenhagen. He died 20th January 1850. His fame rests principally on his twenty-four tragedies, most of them on northern subjects. Besides those already referred to, the best are *Knud den Store*, *Palnatoke*, *Axel og Walborg*, *Væringerne i Miklagord*. His lyrical and epic poems are of less value. His *Poetiske Skrifter* were edited in 1857-62 in 32 vols.; the German translations were done by himself. An Autobiography appeared in 1830-31, his *Reminiscences* in 1850; and there are *Lives* by Arentzen (1879) and Nielsen (1879). His Danish and German works amount in all to 62 volumes.

Oehler, GUSTAV FRIEDRICH (1812-72), one of the greatest Old Testament scholars of the 19th century, was born at Ebingen, studied at Tübingen, taught at Basel and Tübingen, became in 1840 professor in the theological seminary in Schönthal, and in 1845 ordinary professor of Theology at Breslau. In 1852 he was called to Tübingen to be head of the theological seminary.

Öland, or **ÖLAND**, a long and narrow island in the Baltic, 4 to 17 miles from the east coast of Sweden. It is 55 miles long and 5 to 12 broad. Scarcely more than a limestone cliff, it is scantily covered with soil, but in some parts well wooded. It has good pasture-ground, large alum-works, excellent fishing.

Oels, a manufacturing town of Prussian Silesia, 16 miles ENE. of Breslau by rail; pop. 11,000.

Enanthic Ether. See **ETHER**.

Enothera, a genus of ornamental plants of the family Onagraceæ, related to the Fuchsia (q.v.), though strikingly dissimilar in general appearance. The Evening Primrose (*E. biennis*),

a native of Virginia, has been known in Europe since 1614, and is now naturalised in many parts of Europe and in some parts of Britain, on the banks of rivers, in thickets, on sandy grounds, &c. The flowers are fragrant in the evening. The roots somewhat resemble a carrot in shape, but is short; it is usually red, fleshy, and tender, and is eaten in salads, or in soups, and as a boiled vegetable. Eaten after dinner it incites

Evening Primrose
(*Enothera biennis*).

to wine-drinking, as olives do: hence possibly the name (literally 'wine-catcher'). Many other species, chiefly North American, are cultivated in England. The genus is interesting from a Mendelian point of view.

Oera Linda Book. See **FRISIANS**.

Örebro, a town of Sweden, at the entrance of the Svarta into the Hjelmars Lake, 170 miles W. of Stockholm by rail. It has an ancient castle, in which many diets have been held; and there is a trade in minerals and matches. Pop. 36,000.

Oersted, HANS CHRISTIAN, physicist, was born 14th August 1777 at Rudkjöbing, on the Danish island of Langeland, and studied medicine at Copenhagen, where in 1806 he was appointed extraordinary professor of Physics. He held numerous scientific appointments and honorary offices and distinctions, and died 9th March 1851. He may be regarded as the father of the science of electromagnetism (see **ELECTRICITY**). Of his many works the best known are *Naturlarens Mechaniske Deel* (1845; 3d ed. 1859) and *Aanden i Naturen* (1850).

Oesel, or **SAARE-MAA**, an island in the Baltic belonging to Esthonia, and lying across the mouth of the Gulf of Riga. It is about 45 miles in length from north-east to south-west, has an area of 1000 sq. m., and a pop. of 60,000. The surface is undulating, broken by low hills, marshy, watered by numerous small streams, and well wooded. The coast is generally formed by high cliffs. The climate is milder than that of the neighbouring continental districts. Agriculture and fishing are the principal industries. The only town is Arensburg, or Kuresaare, on the south-east coast (pop. 6000). Long governed by the Teutonic Knights, Oesel became a Danish province in 1559, was given up to Sweden in 1645, and in 1721 fell into the hands of Russia, where it remained till the emergence of the Esthonian Republic in 1918.

Esophagus, or **GULLET**, a membranous canal about 9 inches in length, which extends from the pharynx to the stomach, and thus forms part of the alimentary canal. See **DIGESTION**, and **CHOKING**.

Estridæ. See **BOT**.

Oetinger, CHRISTOPH FRIEDRICH (1702-82), theosophic theologian, was born at Göppingen, and, after holding various cures, died at Murrhardt. His system, developed in various works, has been described as lying between Jacob Boehme and Schelling.

Ofen. See **BUDAPEST**.

Offa (d. 796), king of Mercia from 757, contended successfully against Wessex and the Welsh, and made Mercia the principal state in England.

Offa's Dyke, an entrenchment extending along the border of England and Wales, from the estuary of the Dee to near the mouth of the Wye. In some places it is nearly obliterated by cultivation; in others it is of considerable height. Nearly parallel with it, some two miles to the east, is *Watt's Dyke*, which, however, seems never to have been so great a work. Offa (q.v.) is said to have erected Watt's Dyke in 765 to keep back the Welsh, and Offa's Dyke a few years later. See J. H. Hewlett, *Offa's Dyke* (1924).

Offenbach, a manufacturing town of Germany, in Hesse, on the south bank of the Main, 5 miles by electric railway SE. of Frankfurt. Among its manifold industrial products are chemicals, fancy leather goods, machines, and carriages. The *schloss* was a residence of the princely House of Isenburg-Birstein. Pop. (1831) 7802; (1875) 26,012; (1890) 35,079; (1900) 50,468; (1919) 75,380.

Offenbach, JACQUES, a composer of opera-bouffe, born of Jewish parents at Cologne, 20th June 1819. He went to Paris in 1833, and settled there, becoming *chef d'orchestre* in the *Théâtre Français* in Paris, and manager of the *Bouffes Parisiens* in 1855. He died 4th-5th October 1880. Offenbach composed a vast number of light, lively operettas, *Le Mariage aux Lanternes*, &c., perfect as musical trifles; but the productions by which he is best known are a series of burlesque operas, in virtue of which he must be regarded as the inventor of the modern form of opera-bouffe. Amongst the most notable are *Orphée aux Enfers* (1858), *La Belle Hélène*, *Barbe Bleue*, *La Grande-*

are cut. Taking an Ogam stone *in situ*, one most commonly reads upwards, and the scores are placed on either side of the edge. In some instances the vowels are not mere notches in the edge of the stone, but scores of nearly the same length as those of the third group, but differing from them in being cut perpendicular to the edge. This would seem to supply a reason for the slanting of the digits of the third group, but that is not supported by the most ancient class of inscriptions. Turning to the individual characters, the value of *h* given to the first of them is derived only from Irish tradition, but there is no reason to doubt its accuracy, though good inscriptional evidence on the point is lacking. The same was for long the case of *ng*, but the

character  was eventually found in an ancient inscription for the nasal in the borrowed word,  *Sancti*. The case of 

is one of some difficulty, as the letter has never been found in an inscription, while Irish tradition ascribes it the value of *z* or *st*. This, however, does not mean two different accounts of the Ogam, as the Irish sometimes treated *z* and *st* as equivalents, as, for example, when they wrote *steta*, *Stephyrus*, and *Elistabeth* for *zeta*, *Zephyrus*, and *Elizabeth*. It should be explained that *st* has long been commonly reduced in Irish words to *s* or *ss*. Thus all that Irish tradition respecting this Ogam seems to mean is, that it was *z* or a certain other sibilant. Now, as to *z* representing the soft sound corresponding to the sharp sound of *ss*, it is not to be found in Irish from the 9th century down, and it is doubtful whether it existed in the language late enough to claim a place in the Ogam alphabet. We venture to accept the indication afforded by

Irish tradition that ~~///~~ was a sibilant, or let us

say an *s*, for that is the only sibilant known to the language, except *sh*, which is written *s* preceding *e* or *i*; we must therefore look for a class of words where the actual or attested *s* of Irish stands for a consonant which was at one time not an *s*. We have such probably in borrowed words, like *srian*, 'a bridle,' from the Latin *frenum*, or *seinstir*, 'a window,' from the Latin *fenestra*. But the change from *f* to *s* is not confined to borrowed words, as there is a group of words with *s* in modern Irish corresponding to Welsh *ff*, as in Irish *sonn*, Welsh *ffon*, 'a staff,' in which the initial combination of consonants seems to have been at first *sp* or *sp-h*. This would seem to have been simplified into *f* or *φ*, and that ultimately changed in Irish into *s*. We should accordingly be inclined to believe that *f* or *φ* was the value of the

Ogam ~~///~~; and the phonetic change afterwards

into *s* would account for the sibilant value ascribed to this Ogam by Irish tradition. Moreover, a genitive *Fanoni* in a Devonshire inscription, reading in Roman letters FANONI MAQVIRINI, shows that early Irish had the sound of *f* or *φ*; and as the Ogam alphabet provided no symbol for it, un-

less it was ~~///~~, this consideration confirms the conclusion already suggested. It is right here to remark that modern Irish has the consonant *f* in abundance, but in earlier Irish this was *w* or *v*, which between vowels has since been everywhere elided, while initially it has been strengthened into *f*; thus, in Adamnan's *Life of St Columba* the name *Fergna* is *Virgnous*, while the ancient *Terra Convaleorum* in Louth appears in the Annals of the Four Masters as *Tir-Conaille*, or rather *Tir-Conaille-Cerd*, to distinguish it from the district of Tirconnell in Donegal. As to the Ogam ~~||||~~, which we have transliterated *qu*, that combination,

when written in Latin capitals, is found represented by QV, as in the MAQVIRINI, already cited; the exact pronunciation of the *u* cannot be ascertained, but it was probably not very far from that of the English *w*, as in one instance the QV is represented in Ogam by *go* or , and in one other by *qw* or . In any case, it is worthy of note that

no instance of confounding |||| (*gu*) with |||| (*e*) is known to occur in the more respectable class of Ogam inscriptions. Lastly, a character $\times$ occurs which was, as it were, outside the Ogam alphabet of twenty symbols. In Ireland this $\times$ had two values: sometimes it represented one of the sounds of *e* and sometimes the consonant *p*; the latter was also its value in South Wales, where it occurs in the Ogmic spelling of the genitive of the Roman name *Turpillus*. In Goidelic words themselves it cannot have been often wanted, as the *p* of the Aryan parent speech is nowhere retained in the Celtic languages. It is noticed, however, that in some words the place of Aryan *p* was occupied in Old Irish by *h*; e.g. *huile*, 'all,' from the same stem as the Greek πολλοί, 'many,' and *huathad*, 'the singular number,' from the same root as Latin *paucus*, English *few*.

A word must now be said of the distribution of Ogam monuments. All the Ogam inscriptions, whether still existing or known to have once existed, number just over 300, most of which consist of epitaphs. Of that number about 250 belong to Ireland, mostly the southern counties, especially Kerry, Cork, and Waterford, though one has been heard of as far north as Londonderry. The Ogam

in Britain and the islands make rather more than fifty in all. Of these some thirty are in England and Wales. Pembrokeshire (including Caldy Island) has most specimens to show. Next in order come the other South Welsh counties and Devon, while Cornwall boasts only a single instance, and that of a somewhat doubtful nature. No Ogams have been found in Mid-Wales, and only one is known in North Wales—to wit, near Ruthin, in the county of Denbigh. The Ogams of Wales, however, and Devon have an importance out of all proportion to their number, owing to the fact that most of them are accompanied by a version in Latin. An isolated Ogam has been found as far east as Hampshire. Proceeding

northward, one comes across a highly interesting group of Ogams in the Isle of Man; but the first Scottish Ogam is a very doubtful one, found, as it is supposed, in the island of Gigha. There are, however, about twenty-two Ogams mentioned as

The Newton Stone, Aberdeenshire, from a photograph appended to the reprint of the Earl of Southesk's paper mentioned below.

The Ogam inscription, as distinguished from that in alphabetic characters, is thus read by the Earl of Southesk: (A)IDDAI QNEAN FORRERI IBH UA IOSIE, and interpreted as 'Ada, daughter of Forar, of the race of the sons of Huas.'

belonging to Scotland, most of which have no doubt attaching to them as to their being Ogams, though more doubt than enough exists as to the import of some of them, or even to the language employed. They occur in the counties of Fife, Aberdeen, Elgin, and Sutherland; also in Orkney, and more frequently in Shetland.

A common origin was at one time claimed for Ogmie and Runic writing (see RUNES), but that theory has now been entirely abandoned. The Ogam alphabet was most probably invented during the Roman occupation of Britain, by a Goidelic grammarian who had seen the Brythons of the Roman province making use of Latin letters. The Celts were in the habit probably of setting up stones to mark the tombs of their great men, but it was presumably from the Romans they learned to inscribe them. It has been supposed that the inventor of the Ogam alphabet took a hint from a habit of scoring for the purpose of counting, and that his group

 were the initials of the first five numerals, which in modern Irish are *aon*, *dá*, *tri*, *ceathair*, *cúig*. Such a theory proves on examination to be substantially tenable, as the early Goidelic forms of the numerals in question were approximately the following: *oinos*, *duō'u*, *tris*, *ceitūō's*, *quē'gque*. The case of the first Ogam is difficult, as we should have to suppose *h-aon* and *h-oinos*, where the cognate languages prove that the *h* cannot have been organic, even though it sometimes crept into the pronunciation of this word. It is possible, however, that the word doing service for the first numeral was one of a different origin—for instance, a word related to *huathad*, 'the singular number,' and *huaitiu*, 'lonelier,' 'loneliest;' and it is worthy of notice that one of the names of the Ogam for *h* was *huath*. In such words as these the *h* may be supposed, as already suggested, to have been of ancient standing.

The distribution of the Ogams indicates that the connection was close between the districts now represented by the counties of Pembroke and Waterford. The latter is divided by a low ridge of hills into Decies within Drum and Decies without Drum, where the name Decies refers to an ancient people called the *Déisi*, whom Irish tradition traces across to Pembrokeshire.

The ancient Ogams are all epitaphs on stone, but a few of the later ones occur on lead and on rings and brooches. So far as this goes, it might be gathered that stone was the most common material on which Ogams were cut; this may, however, be doubted, and more use may have been made of pieces of wood. In any case, when a workman had to cut an Ogam inscription on a tombstone, it was probably handed to him on a slip of wood with prepared angles. We can call to mind more than one instance where it can be shown that the cutter, so far from knowing what he was cutting, began the Ogam at the end instead of at the beginning. Had he had the Ogam before him on a piece of skin or any plane surface he might be expected to have cut the scores on the middle of the face of the stone. In fact, some of the specimens of Ogams from Shetland are found to have been so written; and as the edge of the stone would be represented in manuscript by a continuous straight line, we find a groove scratched on the flat part of the stones, and the Ogam scores arranged in connection with it instead of following one of the edges. So it is not improbable that prepared pieces of wood formed the most usual material for cutting Ogams, as they seem to have done for the Runic alphabets of Teutonic nations. It is needless to mention that Ogam is not a species of shorthand: few hands could well be longer; and

it ought likewise to be needless to say that there is nothing cryptic about this method of writing. Lastly, for the study of Goidelic philology the importance of the Ogam inscriptions extant, few comparatively speaking and meagre as they are, is much the same as that of Roman inscriptions would be for Romance philology, supposing all other remains of Latin speech had utterly perished.

The most comprehensive work on Ogams is Brash's *Ogam-inscribed Monuments of the Gaedhil in the British Islands, with a Dissertation on the Ogam Character* (Lond. 1879); and next to it in point of comprehensiveness must be ranked Sir Samuel Ferguson's *Ogam Inscriptions in Ireland, Wales, and Scotland* (Edin. 1887); R. A. S. Macalister's *Studies in Irish Epigraphy* (1897, 1902, 1907) is a work of much importance. Papers on Ogams will be found in the *Trans. Roy. Irish Acad.*, especially by the Bishop of Limerick, who also propounded a theory of the origin of Ogmie writing in the *Hermathena*. The journal which has above all others kept its pages open for Ogam finds in Ireland is that of the Royal Hist. Archæo. Assoc. Ireland (originally founded as the Kilkenny Society in the year 1849). Among other things its Journal for 1874 contains tracings made by G. M. Atkinson of old treatises on Ogams, together with explanations, including the theory of the numerical origin of the Ogams for *h*, *d*, *c*, *qu*, contributed by the Rev. Edmond Barry. The Ogams of Wales and Devon will be found in their places in Hübnér's *Inscriptiones Britannicæ Christianæ* (Berlin, 1876). Further, those of the Principality have from time to time been noticed and illustrated in the *Archæologia Cambrensis*, and they will also be found in Westwood's *Lapidarium Walliæ* (Oxford, 1876-79). The Ogams of the Isle of Man have been described in the *Academy* and the *Manx Note-book*; and papers on the Scottish Ogams were read before the Society of Antiquaries of Scotland in the years 1882-84 by the Earl of Southesk after careful examination of the stones. The names in the Ogams of Wales and Devon have been discussed in detail in Rhys's *Lectures on Welsh Philology* (Lond. 1879), and some Ogmie forms have been used for the purposes of Celtic philology by Dr Whitley Stokes in his *Celtic Declension* (Gött. 1886). Lastly, the most important Irish tract on Ogams is to be found in the 15th-century manuscript known as the Book of Ballymote: it occupies folios 308-314 of the autotype edition (Dublin, 1887) of that extensive codex.

Ogasawara. See BONIN.

Ogden, capital of Weber county, Utah, is situated, at an elevation of 4340 feet, at the confluence of the Weber and Ogden rivers, where the former passes through the Wahsatch Mountains, 37 miles N. of Salt Lake City. It is of importance as a railway junction. The city contains flour-mills, canning-works, iron-works, and other factories, &c. Pop. (1880) 6069; (1900) 16,313; (1920) 32,804.

Ogdensburg, a port of New York, on the St Lawrence, at the mouth of the Oswegatchie, opposite Prescott, Canada. Its principal buildings are the Roman Catholic cathedral and the United States government building. The city has a large lake and river trade, and contains huge grain-elevators and manufactories of flour, lumber, and leather. A steam ferry plies to Prescott. Pop. 15,000.

Ogee, an architectural term and form of the word 'Ogive' (q.v.), applied usually to a compound curve in moulding, made up of a convex curve continued by a concave one. Ogee moulding is that also called *Cyma reversa*, illustrated at MOULDINGS.

Ogham. See OGAM.

Ogier le Danois. See CHANSONS DE GESTE.

Ogive (Fr. *ogive*, from the Spanish *auge*, and that from the Arabic *awj*, 'summit,' 'vertex') is the name given by the French to the pointed arch in architecture. As an English architectural term, ogive ribs are the main ribs which cross at the in-

tersection of the vaulting. Ogival work is common in the Decorated style (q.v., fig. 3), and may be seen in the tracery of the Flamboyant (q.v.).

Oglethorpe, JAMES EDWARD, founder of Georgia, was born in London, 21st December 1698, the son of Sir Theophilus Oglethorpe, of Godalming in Surrey. After studying awhile at Oxford he joined the Guards before he was twenty, and served on the Continent with Prince Eugene. From 1722 to 1754 he represented Haslemere in parliament. Meanwhile he projected a colony in America, where the debtors then languishing in English gaols might start life afresh, and which should be also a refuge for the persecuted German Protestants (see SALZBURG). Parliament contributed £10,000, George II. gave a grant of the necessary land, after him called Georgia; and in 1733 Oglethorpe went out with a company of 130 persons and founded Savannah. In 1735 he took out 300 more, including the two Wesleys; and in 1738 he was back again with a regiment of 600 men, raised in anticipation of a war with Spain, from whose neighbouring colony of Florida he had already received annoyance. War was declared by the mother-countries in 1739, and in 1741 Oglethorpe invaded Florida and unsuccessfully attacked St Augustine (see his own account, published 1742); the next year he repulsed a Spanish invasion of Georgia. In 1743 he left the colony for the last time, to meet and repel before a court-martial the malicious charges of one of his own officers. He was again tried and acquitted after the Forty-five for having failed, as major-general, to overtake Prince Charles's army. The charter of his colony he surrendered to the British government in 1752. His later years were spent at Cranham Hall, his seat in Essex, where he died 30th January 1785. His intimate friends included many of the most eminent men of the day. Pope's couplet is well known:

Or driven by strong benevolence of soul,
Will fly, like Oglethorpe, from pole to pole.

Dr Johnson urged him to write his life, and even offered to do it himself; and Boswell made a few, but insufficient, notes with the same object.

See *Lives* by Harris (Boston, 1841), Wright (London, 1867), Bruce (New York, 1890), and Cooper (1903).

Ogotai, son of Genghis Khan. See MONGOLS.

Ogowé, or OGOWAY, a river of West Africa, from 2° 40' S. lat., 14° 30' E. long. flows north-west, west, and finally curves round by the south so as to pour its waters into Nazareth Bay, on the north side of Cape Lopez. It forms a wide delta of some 70 sq. m. in extent. In the dry season (July to September) it shrinks to a narrow current winding between the rocky obstructions of its bed; at other times it is a deep, broad stream, navigable by boats; numerous islands and sandbanks and shallows prevent vessels of any size from ascending.

Ogy'ges, the earliest legendary king of Attica and Boeotia, in whose time a great flood took place called the Ogygian Flood.

Ogygia, a genus of Trilobita (q.v.).

O'Higgins. See CHILE.

Ohio, a river of the United States, called by the French explorers, after its Indian name, *la Belle Rivière*, next to the Missouri the largest affluent of the Mississippi, is formed by the union of the Alleghany and Monongahela at Pittsburgh, Pennsylvania, and flows west-south-west 975 miles, with a breadth of 400 to 1400 yards, draining, with its tributaries, an area of 214,000 sq. m. In its course it separates the northern states of Ohio, Indiana, and Illinois from the southern states of West Virginia and Kentucky. The principal towns upon its banks are Pittsburgh, Wheeling, Cincinnati, Louisville (where there are rapids of 22 feet

in a mile, with a steamboat canal), Evansville, New Albany, Madison, Portsmouth, Covington, and Cairo. The river's principal affluents are the Tennessee, Cumberland, Wabash, Kentucky, Great Kanawha, Green, Muskingum, and Scioto. It is usually navigable from Pittsburgh.

Ohio, fourth in population of the states of the American Union, is one of the north-central group, and from the number of its horse-chestnuts or buckeyes, is called the 'Buckeye State.' It stretches from north to south 210 miles, and from east to west 220 miles; the northern and southern and much of the eastern boundaries are irregular. Area, 41,040 sq. m., or equal to that of Ireland and Wales together. Ohio is a part of the original North-west Territory, chiefly claimed by Virginia but in part also claimed by Massachusetts, Connecticut, and New York. These states gradually yielded their claims to the general government, which thus gained its first landed possession. This was accomplished in 1785, but the territory still needed to be conquered from the powerful Indian tribes who held it. Ohio was the first state created within the territory. It is watered on the north by Lake Erie, and on much of the east and all of its southern boundary by the Ohio River, from which it derives its name.

The face of Ohio, taken as a whole, presents the appearance of an extensive, monotonous plain. It is moderately undulating, but not mountainous; in many places streams have forced a way through bold cliffs of sandstone. A low ridge enters the state near the north-east corner and crosses it in a south-westerly direction. This divide separates the waters of Lake Erie and the Ohio River, and maintains an average elevation of a little over 1300 feet above sea-level. North of this ridge the surface of the country is generally level, gently declining toward the lake. The central part of Ohio is almost a level plain, about 1000 feet above the sea, slightly inclining southward. The southern part is somewhat hilly, the valleys growing deeper as they approach the Ohio River, whose tributaries here water many extensive and fertile valleys. There are a few prairies or plains in the north-western parts of the state, but over its greater portion originally existed immense quantities of timber. The principal rivers draining southward to the Ohio are the Muskingum, Scioto, Great Miami, and Little Miami. Northward to the lake are the Tuscarawas, Cuyahoga, Sandusky, Huron, and Maumee, all but the last named being entirely in the state.

The rocks underlying Ohio belong to the Silurian, Devonian, and Carboniferous systems. The general arrangement of the geological formation shows a layer of sheets resting in the form of an arch from Lake Erie to the Ohio River. The limestone (No. 4) midway in the state is unbroken, and stretches from side to side; the Oriskany, the Corniferous, the Hamilton, and Huron formations, though generally removed from the crown of the arch, still remain over a limited area near the central portion. On the side of the great anticlinal axis the rocks dip downward into a basin, which for several hundred miles, north and south, occupies the interval between the Nashville and Cincinnati ridge and the first fold of the Alleghany Mountains. As they dip toward the centre of this trough, on the eastern and southern border of the state, the older rocks are deeply buried, and the surface is here underlain by the Alleghany coal-measures; while in the north-western part of the state the strata dip northward and pass in the same way under the Michigan coal-basin. The coalfields of Ohio cover over 12,000 sq. m., the beds estimated to average 15 feet in thickness. Immense deposits of limestone, freestone, and mill-stones abound.

Ohio ranks high among the states in mineral production. Coal, clay-products, petroleum, and natural gas, iron ore, cement, and salt are abundant. It is one of the leading manufacturing states, and stands next to Pennsylvania in production of pig-iron. Other industries are rubber, automobiles, packing and canning, pottery, lumber. In agriculture it occupies a prominent position, especially in the production of corn, wheat, and oats, and in the value of its live-stock. The wool-clip is large, and it is a leading pork-producing state.

Archæologically Ohio is the richest field in the United States. In no other state have been found so many evidences of man's antiquity, exemplified in implements of stone, bone, copper, and clay; while the most extensive and elaborate systems of earthworks in America are at Newark, near Chillicothe, and on the Miami bluffs near Waynesville. See MOUND BUILDERS.

History.—In 1787 the Ohio Company of Associates was organised in New England by those who had served in the war of the revolution, and under their auspices a large tract of land was purchased from the government in the territory north-west of the Ohio River, payment being made in 'Continental Certificates' issued to the soldiers for their services. This was the first public sale of land by the United States government. In connection with its sale the famous 'Compact' or 'Ordinance of 1787' was passed, guaranteeing for ever in the territory civil and religious freedom, the system of common schools, trial by jury, and the right of inheritance. In 1788 Marietta and Cincinnati were founded, and till 1791 settlements in the southern part of the territory increased rapidly. In that year the Indians became troublesome, owing to the continual encroachments of the whites, and an army under the governor suffered a disastrous defeat. In November 1794 a signal victory was gained by General Anthony Wayne over the Indians at 'Fallen Timbers' on the Maumee River. The year after a treaty of peace was concluded at Fort Greenville, the Indians ceding a great portion of territory, which settlers began at once to fill, and the towns of Xenia, Dayton, Hamilton, Chillicothe, Zanesville, Franklinton, and others were established. Chillicothe was made the seat of government for the territory, and a capitol erected. In 1802 a constitution was adopted for the 'Eastern Division of the Territory North-west of the Ohio,' to be known as 'Ohio,' and on 19th February 1803 Ohio was formally admitted into the Union. By 1810 its population was 230,760, and the increase from that period was rapid. As early as 1812 steam-boat navigation up and down the Ohio River was accomplished. The Mad River Railroad, begun in 1837, was opened for traffic in 1842, and completed to the lakes by 1848; some 14,000 miles of railway traverse the state.

Ohio is divided into 88 counties, and returns 2 members and 22 representatives to congress. The justices of the supreme court are elected for terms of five years by the people. There are now about 1000 high schools and large numbers of elementary ones, with academies of various kinds, professional and art schools and colleges and universities. The institutions for higher education number about 40. The ratio of illiteracy is less than the average of other states. The largest cities are Cleveland, Cincinnati, Toledo, Columbus (the capital), Akron, Dayton, Youngstown, Canton, Springfield, Lakewood, Lima, Hamilton, Lorain, Portsmouth. Pop. (1850) 1,980,329; (1870) 2,665,260; (1880) 3,198,062; (1890) 3,672,316; (1900) 4,157,545; (1910) 4,767,121; (1920) 5,759,394.

Öhlenschläger. See EHLENSCHLÄGER.

Ohligs, a town of the Rhine province of Prussia, 3 miles W. of Solingen. It has important steel manufactures, especially cutlery. Pop. 28,000.

Ohm, GEORG SIMON (1787-1854), born at Erlangen, was physicist professor at Munich. For Ohm's Law and the *ohm* as a measure of electric resistance, see ELECTRICITY.

Ohnet, GEORGES (1848-1918), a French novelist of great popularity. Born at Paris he studied law, and after practising some time as an advocate took to journalism, and later to literature proper. Under the general title (later abandoned) of *Les Batailles de la Vie* he published a series of novels dealing comprehensively with social questions. The first was *Serge Panine* (1881, crowned by the Academy), followed amongst many others by *Le maître de forges* (1882), *La grande marnière* (1885), *Dette de haine* (1891), *Le brasseur d'affaires* (1901), *La conquérante* (1905), *La route rouge* (1908), *L'aventure de Raymond Dhaute* (1910), *La serre de l'aigle* (1912). Many of his novels were successfully dramatised, and he produced several plays. In his last years he wrote a diary of the Great War.

Ohrid. See OCHRIDA.

Ohthere, a Norse maritime explorer, who between 880 and 900 undertook two voyages of trade and discovery for King Alfred, whose service he had entered about 878. In the first, having rounded the North Cape, he explored the White Sea; in the second, he voyaged by way of the fiord of Christiania to Haddeby, near Sleswick.

Oidium, or ERYSIPHE, a genus of minute fungi infesting various plants, and especially important as the cause of a ravaging disease of the vine, popularly known as vine-mildew. The disease was first observed in Kent in the spring of 1845; it spread rapidly over the English vineries, and was observed about the same time in the vineries of Paris, and soon afterwards in those of nearly all parts of France, Italy, Greece, Tyrol, and Hungary, and in a less degree in the Rhine valley. Its ravages extended to Algeria, Syria, Asia Minor, and especially to the island of Madeira, where it nearly put an end to the production of the celebrated wine. Over-cultivation and long use of the same ground are predisposing causes. Powdered sulphur has been found useful as a cure.

Oil-beetle, a name given to beetles of Meloe and allied genera, which when disturbed emit a yellowish oily liquor from the joints of their legs. Some species are used as vesicants instead of cantharides.

Oil-bird. See GUACHARO.

Oil-cake is used mainly for feeding sheep and cattle. It is made from the solid residue of oleaginous seeds (linseed, rape-seed, cotton-seed), after a large proportion of their oil has been extracted by crushing and grinding or by solution of the oil in bisulphide of carbon. By the latter means the oil may be almost completely extracted. Mustard, rape, castor-oil, undecorticated cotton-seed cake, and some others are also used as fertilisers.

Oil City, Pennsylvania, on both sides of the Alleghany River (here crossed by long railroad and passenger bridges), 133 miles by rail N. by E. of Pittsburgh, is one of the principal oil markets in the state, and the centre of a busy trade. It contains, besides oil-refineries, engine- and boiler-factories, and a huge cooperage. There were fearful inundations here in 1892. Pop. (1870) 2276; (1880) 7315; (1890) 10,932; (1900) 13,264; (1920) 21,274.

Oil-engine, Oil-fuel, Oil-gas. See INTERNAL-COMBUSTION ENGINE, MOTOR-CARS, FUEL, GAS (HEATING AND LIGHTING BY), PETROLEUM.

Oil Palm, a tropical African palm (*Elæis guineensis*) whose fruits on boiling yield palm-oil, used for railway axles. Other species of *Elæis* are found in tropical America. See PALMS.

Oil Rivers. See NIGERIA.

Oils (including Fats). The fats and fixed oils constitute an important and well-marked group of organic compounds, which exist abundantly both in the animal and in the vegetable kingdom. They are not simple organic compounds, but each of them is a mixture of several such compounds, to which the term *glycerides* is applied; they are esters of the triatomic alcohol glycerol, and the glycerides, which by their mixture in various proportions form the numerous fats and oils, are mainly those of palmitic, stearic, and oleic acids, and to a less extent those of other fatty acids, such as butyric, caproic, caprylic, and capric acids, which are obtained from butter, myristic acid, which is obtained from coconut oil, &c. The members of this group may be solid and hard, like suet; semi-solid and soft, like butter, horse-grease, and lard; or fluid, like the oils. The solid and semi-solid are, however, usually placed together and termed fats, in contradistinction to the fluid oils. The most solid fats are readily fusible, and become reduced to a fluid or oily state at a temperature lower than that of the boiling-point of water. It is not until a temperature between 500° and 600° F. is reached that they begin nearly simultaneously to boil and to undergo decomposition, giving off Acrolein (q.v.; an acrid product of the distillation of glycerine) and other compounds. In consequence of this property these oils are termed *fixed oils*, in contradistinction to a perfectly separate group of oily matters, on which the odoriferous properties of plants depend, and which, from their being able to bear distillation without change, are known as *volatile oils*. These, which are also known as *essential oils*, differ *in toto* in their chemical composition from the compounds we are now considering. All the fats and oils are lighter than water, and are perfectly insoluble in that fluid. Their specific gravity ranges from about 0.91 to 0.94. They dissolve in ether, oil of turpentine (one of the volatile oils), benzol, and to a certain extent in alcohol; while, on the other hand, they act as solvents for sulphur, phosphorus, &c. These bodies possess the property of penetrating paper and other fabrics, rendering them transparent, and producing what is well known as a greasy stain. They are not readily inflammable unless with the agency of a wick, when they burn with a bright flame. See LAMPS. In a pure and fresh state they have but little taste or odour, but on exposure to the air they become oxidised and acid, assume a deeper colour, evolve a disagreeable odour, and are acrid to the taste; or, in popular language, they become *rancid*. This is mainly brought about by an enzyme lipase. The rapidity with which this change occurs is considerably increased by the presence of mucilaginous or albuminous bodies. The rancidity may be removed by shaking the oil in hot water in which a little hydrated magnesia is suspended.

The general diffusion of fats and oils in the animal kingdom has been already described (see FATS). In the vegetable kingdom they are equally widely distributed, there being scarcely any tissue of any plant in which traces of them may not be detected; but they are specially abundant in the seeds. The seeds of the Cruciferae are remarkably rich in oil; linseed yielding fully 20 per cent., and rape-seed about 40 per cent. of oil; and some fruits, as those of the olive and oil-palm, yield an abundance of oil.

The uses of oils and fats are numerous and highly important, many being extensively em-

ployed as articles of food, as medicines, as lubricating agents, in the preparation of soaps, ointments, varnishes, pigments, for candles, lamps, and other means of illumination, and for the purpose of dressing leather, &c. In Africa, Asia, and the Pacific animal and vegetable oils and fats are much used for anointing the person and smearing the hair, thus affording a protection against heat and the attacks of insects, and checking excessive perspiration. This practice conduces to health and preserves the skin smooth and soft. Oil thrown on the sea has a remarkable effect in subduing the force of the waves. A few gallons cast upon stormy seas moderates and prevents the waves breaking with force. This practice might be adopted by lifeboats when approaching wrecks, and rescuing the crews of stranded vessels. The composition of the fine oils required for watches and sewing-machines is often carefully kept secret. Those principally used are ben, almond, olive, and neat's-foot. The oils suitable for machine-shops and general cotton and woollen machinery require a good body, rather viscid. For woollen spindles a lighter oil, and for cotton spindles, which have a speed of 4000 revolutions per minute, an oil of still lighter body. For lubricating purposes mineral oils may with advantage be mixed with animal and vegetable oils to diminish their tendency to thicken; the more fluid an oil is the less friction takes place. See LUBRICANTS.

(1) *Vegetable Fats*.—The chief solid fats of vegetable origin are coconut oil, nutmeg-butter, cocoa-butter, and palm-oil. The fluid vegetable fats or oils are divisible into the *non-drying* and the *drying oils*; the latter being distinguished from the former by their becoming dry and solid when exposed in thin layers to the air, in consequence of oxygenation. Some of the drying oils, when mixed with cotton, wool, or tow, absorb oxygen so rapidly, and consequently become so heated, as to take fire, and many cases of the spontaneous combustion of heaps of oily materials that have been employed in cleaning machinery have been recorded. The chief non-drying oils are olive-oil, almond-oil, and colza-oil; while the most important drying oils are those of linseed, hemp, poppy, and walnut; castor-oil seems to form a link between these two classes of oils, since it gradually becomes hard by long exposure to the air.

(2) *Animal Fats*.—The chief solid fats are beef and mutton suet or tallow, lard, butter, goose-grease, &c.; while among the fluids sperm-oil, ordinary whale-oil, cod-liver oil, and neat's-foot oil may be especially mentioned. In many of their characters spermaceti and beeswax resemble the solid fats. As a general rule, stearin and palmitin, both of which have comparatively high fusing-points (between 157° and 114° F.), preponderate in the solid fats; while olein, which is fluid at 32°, is the chief constituent of the oils.

When any of these bodies are heated with the hydrated alkalies they undergo a change which has long been known as Saponification, or conversion into Soap (q.v.), in which the fatty acid combines with the alkali to form a *soap*, while the sweet viscid liquid Glycerine (q.v.) is simultaneously formed. When the fatty acids are required on a large scale, as for the manufacture of the so-called stearin candles, which in reality consist mainly of stearic and palmitic acids, sulphuric acid and the oil or fat are made to act upon each other at a high temperature (see CANDLE). The fatty acids may also be procured in a very pure form by the injection of superheated steam at a temperature between 500° and 600° into heated fat. *Hardened Oils*.—Many of the liquid oils if treated with nascent hydrogen in presence of finely divided nickel take up hydrogen and form solid fats. A

complete list of even the chief fats and fixed oils would take up far more space than we can command. The more important are noticed in separate articles, such as Fixed Oil of Almonds, Castor-oil, Croton-oil, &c., and some account given of their properties and uses; or under the names of the substances from which they are procured—Linseed, Rape, Candle-nut, Coconut, Cotton (for Cotton-seed Oil), &c. Reference may also be made to the articles on Butter, Ghee, Lard, Cod-liver Oil, &c.

The *Volatile* or *Essential Oils* exist, in most instances, ready formed in plants, and are believed to constitute their odorous principles. They form an extremely numerous class, of which most of the members are fluid. Many used for flavouring are artificially compounded (see BUTYRIC ACID). Essential oils are much employed in perfumes, for flavouring liqueurs and confectionery, and for various purposes in the arts. See PERFUMERY. The *mineral oils* will be found discussed under the heads of Naphtha, Paraffin, Petroleum; and see also SHALE. For the ritual use of oils see CHRISM, CORONATION, EXTREME UNCTION.

Oil-wells. See BAKU, PENNSYLVANIA, PETROLEUM.

Oinomania. See DIPSOMANIA.

Ointments are fatty substances intended to be applied to the skin by rubbing in, and having the consistence of butter. The material employed as a basis for the ointment varies considerably, and as a rule the activity and action are entirely due to the substance incorporated with the basis. The most generally used basis is lard, either alone or mixed with wax, &c., to give it more consistence. To avoid rancidity the lard is usually melted previously with gum-benzoin, and is then known as *benzoeated lard*. Although lard is readily absorbed by the skin, yet in this respect it is surpassed by sheep's wool fat and Oleic Acid (q.v.). The former of these, when incorporated with water, forms an excellent ointment base, smooth, and in every way suitable. So also some of the unctuous oleates are used with great advantage. Soft paraffin, known in commerce under a number of names, has also been used for ointments and does not turn rancid, but on the whole its use is not extending. As nearly all substances may be made into ointments, there is no limit to their number, but perhaps the best known are Zinc Ointment (q.v.), Boracic Ointment, and the Red and White Precipitate Ointments (see PRECIPITATE OINTMENT). In all cases the greatest care is required to ensure that the active principle is rubbed perfectly smooth with a small quantity of oil or lard before adding the bulk of the ingredients, otherwise the production of a homogeneous ointment free from grit is impossible. See COLD CREAM.

Oise, a department in the north of France, separated from the English Channel by Seine-Inférieure; area, 2261 sq. m.; pop. (1881) 404,555; (1891) 401,835; (1921) 387,760. The rivers are the Oise, tributary to the Seine, 150 miles long, with the Aisne and Therain, affluents of the Oise. The soil is in general fertile, and agriculture advanced. The products are the usual grain-crops, with an immense quantity of vegetables, which are sent to the markets of the metropolis. There are extensive iron manufactures; porcelain, paper, chemicals, beet-root sugar, woollens, cottons, and lace (at Chantilly) are also made. The department is divided into the four arrondissements of Beauvais, Clermont, Compiègne, Senlis; capital, Beauvais.

Oisin. See OSSIAN.

Ojibways, a tribe of American Indians of the Algonquian stock. Formerly occupying the

lands round Lakes Huron and Superior, they are now settled in reservations in that neighbourhood.

Oka, an important navigable river of central Russia, the principal affluent of the Volga from the south, flows in a generally north-east direction, and joins the Volga at the city of Nijni-Novgorod after a course of 706 miles. Its basin comprises the richest and most fertile region of Russia. The principal towns on its banks are Orel, Bielev, Kaluga, Riazan, and Murom; the chief affluents are the Moskwa, Kliasma, and Tzna.

Okapi (*Ocapia*), a giraffe-like animal discovered by Sir H. H. Johnston (1899) in the Semliki forest in Central Africa, between Lakes Albert and Edward. Neck and legs are shorter than in the giraffe, ears larger and broader. The horns are on the frontal bone. The upper parts are a slightly purplish chocolate-brown; buttocks and upper parts of fore and hind legs have wavy black stripes on a buff ground. The living okapi, with several extinct types, is included in the family Giraffidæ (Camelopardidæ). The first okapi brought to Europe was placed in the Zoological Gardens of Antwerp in 1919. See Johnston's *Uganda Protectorate* (1902), and monographs by Jules Fraipont (Brussels, 1908) and Sir E. Ray Lankester (1910).

Okhampton, a municipal borough and market-town of Devonshire, 26 miles W. by N. of Exeter. There is a manufacture of glass. The traces of a supposed British camp are to be seen, also the remains of the Roman road from Exeter to Cornwall, and the ruins of a Norman keep. Pop. 3500.

Oken, LORENZ (1779–1851), naturalist, was born at Bohlsbach in Baden, studied at Würzburg and Göttingen, and in 1807 became a professor of Medicine at Jena. In 1816 government interference led to his resignation, but in 1828 he obtained a professorship at Munich, and in 1832 at Zurich. Oken aimed at constructing all knowledge *a priori*. His system of natural science is a nature-philosophy, which, though decried as transcendental and a deduction from foregone conclusions, was fertile in suggestive ideas. It was he who wrought out the theory, claimed by Goethe, and now exploded, that the skull is but a modified vertebra.

His principal works are his *Lehrbuch der Naturphilosophie* (1808–11; Eng. trans. 1847), his *Lehrbuch der Naturgeschichte* (3 vols. 1813–27), and *Allgemeine Naturgeschichte* (17 vols. 1833–45). See works on Oken by Ecker (1880) and Guttler (1884), and see Sir Richard Owen's article in the *Encyclopædia Britannica*.

Okhotsk, SEA OF, an extensive inlet of the North Pacific Ocean, on the east coast of Siberia, nearly enclosed by Kamchatka and the Kuriles and Sakhalin.

Okhrida. See OCHRIDA.

Oklahoma, from 1890 a territory of the United States, was in 1907 raised to the rank of a state and extended so as to include Indian Territory. The state is bounded by Colorado, Kansas, Missouri, Arkansas, Texas, and New Mexico. Area, 70,057 sq. m.; pop. (1890) Oklahoma, 78,475, Indian Territory, 180,182; (1900) 398,331 and 392,060 respectively, (1910) Oklahoma State, 1,657,155; (1920) 2,028,283, including 149,408 negroes and 57,337 Indians. To this must be added 119,481 Indians in reservations (1766 sq. m.). Oklahoma City in 1910 superseded Guthrie as capital.

The surface, which rises gradually toward the north and west, is for the most part an upland prairie. The most important elevations are the Wichita Mountains in the south. The charms of Oklahoma ('Beautiful Country') have been much overrated. It is fairly well watered by the Red and Arkansas rivers and their affluents, but many of the streams are brackish, and so saturated with

alkaline salts as to be at times unfit for drinking purposes or for irrigation. In the river-valleys and in some of the upland regions there are fertile and productive spots, but much of the region is likely to be subject to the same disappointment which prevails in western Kansas during unfavourable seasons. The climate is generally mild, but subject to sudden changes produced by the 'northerners' common in this region. There is a good yield of maize, wheat, cotton, and oats; and the raising of livestock is profitable. After 1904 Oklahoma rapidly rose to the second place as a petroleum-producing state. Natural gas and coal are also plentiful; and lead, zinc, limestone, gypsum, and other minerals are worked. Manufactures are less important but growing, refined petroleum, flour, and cotton-seed oil the chief products.

The history of Oklahoma dates from the year 1866, when the tribes to whom the lands of Indian Territory had previously been granted ceded the western portion of their domain to the United States. The land thus acquired was known as the Oklahoma district, but it was agreed that it should be used only for settlement by other Indian tribes or freedmen. Notwithstanding this stipulation western speculators claimed that the lands were the property of the government, and open, like other public lands, for settlement under the Homestead laws. In 1879 an organised effort was made to take forcible possession of the lands, and adventurers from Texas, Kansas, and Missouri, equipped and ready for permanent settlement, invaded the territory. Their action was forbidden by proclamations from President Hayes, and the intruders were finally ejected by United States troops. From this time until his death in 1884, David L. Payne, the leader of the 'boomers,' was repeatedly arrested, but he always evaded punishment and returned to the forbidden land, with the number of his followers augmented. He is said to have received more than \$100,000 in fees from persons who secured from him permission to settle in Oklahoma. After his death the invasions were continued with even greater pertinacity by his lieutenants. Although the government repeatedly proclaimed the integrity of the treaties with the Indians and enforced them by the authority of the military, negotiations were opened, as a result of which, upon the receipt of an additional sum, the Indians waived all claims to a district in the heart of Indian Territory. This unoccupied area was opened for public settlement on 22d April 1889. No one was allowed to enter the borders until noon, but between that hour and twilight the population was increased by at least 50,000. Claims were selected, town sites staked out, and portable houses erected before nightfall. At Guthrie a bank with \$50,000 capital did a prosperous business during the afternoon. The territory was regularly organised with extended boundaries on 2d May 1890. It consisted of two detached sections, separated by the Cherokee Outlet, lying between the southern border of Kansas and the parallel 36° 10' N., and extending from the vicinity of the Arkansas River to the 100th meridian. But the Cherokee Outlet was sold by the Indians in 1893, and incorporated with the territory in the same year; when, as again in 1901, new lands were thrown open to settlement. The Public Land Strip situated N. of the Texas 'pan-handle' and S. of the parallel 37° N., ceded to the United States by Texas at the time of its annexation, was by an oversight not included in any of the adjacent states or territories, and until its incorporation in Oklahoma was known as No Man's Land. The next great administrative change was the incorporation with it, raised to the rank of state, of the Indian Territory.

Oklahoma City, capital of Oklahoma, on the North Fork of the Canadian River, has cotton, corn, and machinery industries; pop. 91,000.

Okra, a name for the *Hibiscus* (q.v.) *esculentus*.

Olaf, St., born in 995, having made his name a terror in several descents on Normandy and England, succeeded, in 1015, in wresting the throne of Norway from Erik and Svend Jarl. The cruel severity with which he endeavoured to exterminate paganism by fire and sword alienated the affections of his subjects, who hastened to tender their allegiance to Cnut of Denmark on his landing in Norway in 1028. Olaf fled to the court of his brother-in-law, Jaroslav of Russia, who gave him a band of 4000 men, at the head of whom he returned, in 1030, and gave Cnut battle at Stiklestad, where Olaf was defeated by the aid of his own subjects, and slain. His body was removed to the cathedral of Trondhjem, where the fame of its miraculous power spread far and wide; and Olaf was solemnly proclaimed patron saint of Norway in the succeeding century. See *Passio et Miracula Beati Olavi*, edited by F. Metcalfe (Oxford, 1881).

Oland. See **ÖLAND**.

Olaus. For Olaus Magnus, see **MAGNUS**; for Olaus Petri, see **SWEDEN** (*Literature*).

Olbers, HEINRICH WILHELM MATTHÄUS, physician and astronomer, was born at Arbergen, a village of Bremen, October 11, 1758, studied medicine at Göttingen from 1777 till 1780, and subsequently practised at Bremen. In 1811 he was a successful competitor for the prize proposed by Napoleon for the best 'Memoir on the Croup.' He became known as an astronomer by his calculation of the orbit of the comet of 1779. He discovered the minor planets Pallas (1802) and Vesta (1807); and in 1781 he had the honour of first rediscovering the planet Uranus. He also discovered five comets in 1798, 1802, 1804, 1815, and 1821, all of which, with the exception of that of 1815 (hence called *Olbers' comet*), had been some days previously observed at Paris. His observations, calculations, and notices of various comets, which are of inestimable value to astronomers, were published in various forms. Olbers also made some important researches on the probable lunar origin of meteoric stones, and invented a method for calculating the velocity of falling stars. He died at Bremen, 2d March 1840. See *Life* by Schilling (1894, &c.).

Old Age. See **LONGEVITY**, **PENSIONS**.

Old Bailey, the court or sessions house in which the sittings of the Central Criminal Court are held monthly for the trial of offences within its jurisdiction. The judges of this court are the Lord Mayor, the Lord Chancellor, the judges, aldermen, recorder, and common serjeant of London. But of these the recorder, the serjeant, and the judge of the sheriff's court are in most cases the actually presiding judges. The judicial sittings here are of such antiquity that all record of their commencement has been lost. Crimes of all kinds, from treason to petty larceny, are tried, and the numbers in past times were enormous, but are now greatly reduced by the extended jurisdiction given to the quarter sessions, and the summary powers granted to magistrates. Here were tried in 1660, after the Restoration, the surviving judges of Charles I.; and Milton's *Eikonoklastes* and *Defensio Prima* were in the same year burned at the Old Bailey by the common hangman. The patriot Lord William Russell was tried here in 1683, Jack Sheppard in 1724, Jonathan Wild in 1725, the poet Savage in 1727, Dr Dodd in 1777, Bellingham, the assassin of the statesman Perceval, in

1812, the Cato Street conspirators in 1820. The Old Bailey dinners given by the sheriffs to the judges were long famous. However else varied, they always included beefsteaks and marrow puddings, and were served twice a day. The Old Bailey adjoins the site on which, till it was pulled down in 1903, Newgate Prison used to stand, between Holborn Viaduct and Ludgate Hill. See Charles Gordon, *The Old Bailey and Newgate* (1902).

Old Believers. See RASKOLNIK.

Oldbury, a busy manufacturing town of Worcestershire, $5\frac{1}{2}$ miles WNW. of Birmingham, stands in the midst of a rich mineral district, and has iron and steel works, besides factories for railway plant, edge-tools, chemicals, &c.; pop. 37,000.

Old Calabar. See CALABAR.

Old Castile. See CASTILE, SPAIN.

Oldcastle, SIR JOHN, once popularly known as the 'good Lord Cobham,' whose claim to distinction is that he was the first martyr among the English nobility, was born in the reign of Edward III. He acquired the title of Lord Cobham by marriage with the heiress, and signalled himself by the ardour of his attachment to the doctrines of Wyclif. At that time there was a party among the nobles sincerely, even strongly, desirous of ecclesiastical reform, led by John of Gaunt. Oldcastle was active in the same cause, and took part in the presentation of a remonstrance to the English Commons on the subject of the corruptions of the church. At his own expense he got Wyclif's works transcribed, and widely disseminated among the people, and paid a large body of preachers to propagate the views of the Reformer throughout the country. In 1411 he commanded an English army in France, and forced the Duke of Orleans to raise the siege of Paris; but in 1413 he was examined by Archbishop Arundel, and condemned as a heretic. He escaped from the Tower into Wales, but after four years' hiding was captured. He was brought to London, and—being reckoned a traitor as well as a heretic—was hung upon a gallows, and, fire being put under him, was burned, December 1417, whether alive or not is uncertain. His supposed authorship rests on no good authority. Halliwell-Phillipps first proved in 1841 that Shakespeare's Sir John Falstaff was originally Sir John Oldcastle—a view endorsed in Gairdner and Spedding's *Studies* (1881). See Barske, *Oldcastle-Falstaff in der englischen Literatur bis zu Shakespeare* (1905).

Old Catholics (Ger. *Altkatholiken*) is the title assumed by a number of Catholics, led by Döllinger and Friedrich, who at Munich protested against the new dogma of the personal infallibility of the pope in all *ex cathedra* deliverances, proclaimed by the Vatican Council in 1870. The leaders of the movement met at Nürnberg and drew up a declaration. The German bishops, though they had given warning of the dangerous consequences of the proclamation of the new dogma, submitted to the decision of the Vatican Council, and the refractory were suspended from their functions and excommunicated. Local committees in furtherance of the cause were, however, formed in towns of Bavaria and the Rhine country. At a general Old Catholic Congress, held in 1871 at Munich, it was resolved to draw the bonds of union close with the church of Utrecht (see JANSEN), which offered the possibility of priestly consecration and confirmation. The congress propounded the far-reaching principle that the decisions of an ecumenical council, to be valid, must be in agreement with the existing faith of the Catholic people and with theological science. The hope was also expressed of a reunion with the Greek Oriental Church

and a gradual understanding with the Protestants. At a second congress at Cologne, 1872, Professor Friedrich declared that the Old Catholic movement was now directed not merely against papal infallibility, but 'against the whole papal system, a system of errors during a thousand years, which had only reached its climax in the doctrine of infallibility.' Döllinger, the leader of the movement which led to the formation of the new communion, at first disapproved of the establishment of a new sect, but ultimately approved of the action of his friends. Yet till his death he never formally joined the community.

At Cologne in 1873 Professor Reinkens of Breslau was elected bishop of the Old Catholics in the ancient fashion, by 'clergy and people'—by all the Old Catholic priests and by representatives of the Old Catholic congregations. He was consecrated at Rotterdam by the bishop of Deventer, and formally acknowledged by the governments of Prussia, Baden, and Hesse. The Bavarian government declined to forbid Bishop Reinkens holding confirmations in its territory. The Old Catholics adopted the vernacular for church services, abolished auricular confession, compulsory fasting, and the celibacy of priests. After 1875 the numbers declined. The movement in France headed by Père Loyson came to little; see HYACINTHE.

See DÖLLINGER; Miss Scarth's *Story of the Old Catholic and Kindred Movements* (1883); German works by Forster (1879), Bühler (1880), Beyschlag (1882), and Reinkens (1882); *Old Catholic Missal and Ritual*, ed. A. H. Mathew (1909).

Oldenbarneveldt. See BARNEVELDT.

Oldenburg, a republic, till 1918 a grand-duchy, of northern Germany, consisting of three distinct and widely separated territories—viz. Oldenburg Proper, the former principality of Lübeck, and the former principality of Birkenfeld; total area, 2500 square miles (less than Devonshire); pop. (1919) 518,148. Oldenburg Proper, which comprises most of this area, is bounded by the German Ocean and Hanover. The principal rivers are the Weser, the Jahde, and the Haase, Vehnne, and other tributaries of the Ems. The country is flat, belonging to the great sandy plain of northern Germany, and consists for the most part of moors, heaths, marsh or fens, and sandy tracts. The occupations are mainly agricultural. The old principality of Lübeck, consisting of the secularised territories of the former bishopric of the same name, does not contain the city, whose territory bounds it to the south, as does Holstein on other sides. Its area is about 200 sq. m. The territory of Birkenfeld (q.v.) lies among the Hunsrück Mountains, in the very south of Rheinland, by which it is surrounded; its area is 192 square miles.

Oldenburg, like the other German states, became a republic at the revolution of November 1918. A constitution was adopted in June 1919. A diet (Landtag) of forty-eight deputies is elected for three years by universal, equal, secret, direct vote. The system of proportional representation is in use.

Oldenburg became an independent state in 1180. The family that then established its power continued to rule until the monarchy came to an end, giving, moreover, new dynasties to Denmark, Russia, Sweden, Greece, and Norway. On the death, in 1667, of Count Anton Günther, the wisest and best of the Oldenburg rulers, his dominions fell to the Danish reigning family, and continued for a century to be ruled by viceroys nominated by the kings of Denmark. This union was, however, severed in 1773, when by a family compact Christian VII. made over his Oldenburg territories to the Grand-duke Paul of Russia, who represented the Holstein-Gottorp branch of the family. Paul

having given up Oldenburg to his cousin, Frederick-Augustus, of the younger line of the House of Oldenburg, the emperor raised the united Oldenburg territories to the rank of a duchy. For a time the duchy was a member of Napoleon's Rhenish Confederation. The Lübeck territories were added in 1803; Birkenfeld at the Congress of Vienna, when Oldenburg became a grand-duchy. The grand-duchy concluded in 1866 a treaty with Prussia, by which the grand-duke renounced his claims to the Holstein succession. See SLESWICK-HOLSTEIN.

The capital, OLDENBURG, is pleasantly situated on the banks of the Hunte, 30 miles WNW. of Bremen by rail. It is the focus of the commercial activity of the country, and has a public library, a picture-gallery, museum, &c. The palace is worthy of note for its fine gardens, its art collections, and its library. The principal church, St Lambert's (1270), contains the burying-vaults of the late reigning family. Oldenburg is the seat of an active river-trade, and is noted for its great cattle and horse fairs. Pop. 30,000. See Runde's *Oldenburgische Chronik* (3d ed. 1863), and books by Kollmann.

Oldenburg, HENRY, a native of Bremen, born in 1626, was consul for his native city in London during the period of the Long Parliament and the protectorship of Cromwell. Besides being tutor to Lord Henry O'Brien and Lord William Cavendish, he was elected one of the very first members of the Royal Society, and, as assistant-secretary, edited its *Transactions* from 1664 to 1677, maintaining an extensive correspondence with Spinoza, Leibniz, Bayle, and many other learned men of the age. Milton also knew him, and addressed him in the *Epistole Familiares*. Oldenburg died at Charlton, near Greenwich, in August 1678.

Old English. See ENGLISH LANGUAGE.

Old Faithful. See GEYSER.

Oldfield, ANNE (1683-1730), actress, born in London, made her début in 1700, and stood high in public favour both in comedy and in tragedy. See Robins, *Palmy Days of Nance Oldfield* (1898).

Oldham, JOHN (1653-83), a heavy and uncouth Juvenalian satirist, son of a nonconformist minister at Shipton-Moyne, Gloucestershire, studied at Oxford, taught at Croydon, and became a private tutor. His vigorous satires (against the Jesuits, &c.) are largely translation and paraphrase, from Horace, George Buchanan, Ben Jonson, and others. He also wrote odes.

Oldham, a parliamentary, municipal, and county borough of Lancashire, on the Medlock, 7 miles NE. of Manchester, 5 SSE. of Rochdale, and 38 ENE. of Liverpool. It has grown since 1760 from a small village, such growth being due to its proximity to the Lancashire coalfields and to the marvellous extension of its cotton manufactures. It has hundreds of mills. Other manufactures include fustians, velvets, silks, machinery, &c. Hat-making was once a leading industry. The town-hall (1841) is a good Grecian edifice; and there are the lyceum (1854-80), a school of science and art (1865), public baths (1854), an infirmary (1870-77), and the Alexandra Park of 72 acres (1865). Oldham received its charter of incorporation in 1849. It was enfranchised by the Reform Bill of 1832, and returns two members. Pop. (1801) 12,024; (1841) 42,595; (1881) 111,343; (1891) 130,463; (1911) 147,483; (1921, in holiday season) 144,983.

Oldhamia, a genus of fossils of unknown affinities met with in the Cambrian system. Oldhamia assumes various forms, sometimes consisting of short radiating branches or umbels, which spring at regular intervals from a central thread-

like axis; at other times the branches radiate in all directions from a central point. Some palæontologists have supposed the fossil to be a Serpularian zoophyte; others have referred it to the polyzoa; while yet others think it may be a seaweed. Possibly it is not a fossil at all, but merely an inorganic structure.

Oldhaven Beds. See EOCENE SYSTEM.

Oldmixon, JOHN (1673-1742), author of dull histories of England, Scotland, Ireland, and America, and of works on logic and rhetoric, is known chiefly as one of the heroes of Pope's *Dunciad*.

Old Mortality. See PATERSON (ROBERT).

Old Point Comfort, a village and watering-place of Virginia, at the mouth of James River, on Hampton Roads, is the site of Fortress Monroe.

Old Red Sandstone and Devonian System, the name given to certain series of strata that are intermediate in age between the Silurian and Carboniferous systems. These, known respectively as 'Old Red Sandstone' and 'Devonian,' are nowhere seen together, but they are believed to be contemporaneous.

Old Red Sandstone.—This series, which underlies the Carboniferous system, was so called to distinguish it from another set of red sandstones which rests upon the Carboniferous strata, and was formerly known as the *New Red Sandstone* (see PERMIAN, and TRIASSIC). In Scotland the Old Red Sandstone comprises three groups of strata—Lower, Middle, and Upper. The Lower Old Red Sandstone attains its greatest thickness (18,000 feet) in the Midland Valley; it is also found in the Cheviot region and in Argyll. It consists of coarse conglomerates, red, gray, brown and purplish sandstones, and gray flagstones, with occasional beds of nodular limestones or 'cornstones.' Associated with these are great accumulations of interbedded tuffs and lavas (rhyolites, trachytes, andesites, and basalts). The igneous rocks attain a vast thickness in the Cheviot Hills, the Pentlands, the Ochils, the Sidlaws, in Ayrshire, and in the country around Ben Nevis and Glen Coe. At Stonehaven the Lower Old Red Sandstone passes conformably into the Downtonian, the highest division of the Silurian system; elsewhere in Scotland it rests unconformably on older strata. The Middle Old Red Sandstone is known to occur only north of the Grampians, occupying detached areas in Aberdeenshire, along the shores of the Moray and Dornoch Firths, in Caithness, and in the Orkneys and Shetland Isles. It has not been found superposed on the lower group, in which it was formerly included, but the nature of its fossils has led palæontologists to regard it as younger than the latter. The sediments of this middle group again include conglomerates, sandstones and cornstones, but the dominating rocks are flagstones, often calcareous and bituminous. Contemporaneous volcanic rocks are here much less in evidence, but lavas and tuffs of types similar to those found in the lower group occur in Aberdeenshire and Banffshire and in the Shetlands. The Middle Old Red Sandstone attains a thickness of about 18,000 feet. The Upper Old Red Sandstone strata consist mainly of sandstones, often with the grains well rounded by the action of wind and probably formed under arid conditions. These are associated with marls, cornstones, and conglomerates. Interbedded volcanic rocks are absent, except in the Orkneys, where lavas and tuffs are found near the base of the series. There is everywhere a strong unconformability between the Upper Old Red Sandstone and the rocks of the lower and middle groups, and a conformable passage upwards into the Carboniferous system.

The Old Red Sandstone of South Wales and the bordering counties of England gives evidence of continuous sedimentation throughout the period. Contemporaneous volcanic rocks are not known to occur. The Old Red Sandstone of Ireland has been divided into two groups separated by a strong unconformity.

Devonian.—In Devon and Cornwall we meet with a very different series of strata occupying the same stratigraphical position as the Old Red Sandstone. The Devonian strata pass up conformably into the Carboniferous system, but the base of the series is not seen, so that the relation of the strata to the Silurian is not known. The English Devonian probably does not exceed 10,000 or 12,000 feet in thickness. It consists of three groups (Lower, Middle, and Upper), the rocks being principally gray and brown slates, brown, yellow, red, and purple sandstones, grits, conglomerates, calcareous slates, and limestones. The calcareous members of the series are generally well charged with fossils of marine types, and are developed chiefly in the middle group.

Devonian rocks occupy wide areas at the surface on the Continent. They appear in the north of France, and extend from the Boulonnais eastwards through Belgium to Westphalia. In northern Russia they extend over more than 7000 miles, and crop up along the flanks of the Urals. But the areas exposed to view probably bear but a small proportion to those which lie buried underneath later formations. In central Europe the strata have the general aspect of the English Devonian, and contain relics of the same marine fauna. In Russia the strata are remarkable for showing alternations of calcareous and arenaceous rocks—the former of which contain an assemblage of fossils of a Devonian facies, while the latter are charged with the remains of a fish fauna resembling that of the Scottish Old Red Sandstone. It may be noted that volcanic rocks are here and there associated with the Devonian strata of central Europe. In North America both types of strata appear; the arenaceous type occurring in Nova Scotia and New Brunswick, while the Devonian type is met with in New York State and the Appalachian region, and is largely developed in the Mississippi basin.

Life of the Period.—The discovery at Rhynie in central Aberdeenshire a few years ago of a silicified peat-bog of Middle Old Red Sandstone age has opened a new chapter in palæobotany. The genera of vascular plants found there, *Rhynia*, *Hornea*, and *Asteroxylon*, belong to an entirely new class of plants and to the earliest known flora in which detailed internal characters can be determined. Other plants, known only from impressions, include *Parka* and *Psilophyton* from the lower and the fern-like *Palaeopteris* from the upper division. Among the lower forms of life that swarmed in the seas of the period were rugose and tabulate corals. Of the former the most characteristic were Cyathophyllum, Cystiphyllum, Calceola, &c., while the honeycomb corals (Favosites) are the most common of the tabulate forms. Echinoderms abounded, especially crinoids (Cupressocrinus, Cyathocrinus) and pentremites. Trilobites, which formed so marked a feature in the life of the Silurian seas, were now reduced in number and variety—among the more notable forms being Phacops, Homalonotus, and Bronteus. Some of the eurypterids (most of which are small) attained a large size, one of these (Pterygotus) being 5 or 6 feet long. They occur chiefly in the Old Red Sandstone. From the same strata in North America have come the remains of insects—neuropteroid and orthopteroid wings of ancestral forms of May-fly, &c. Myriopods have also been recognised. Brachiopods are among the most common

Devonian fossils, although they were not quite so numerous as in the seas of the preceding Silurian period. Very characteristic forms are Uncites, Stringocephalus, and Rensseleria. Lamellibranchs were well represented, some of the notable genera being Pterinea, Megalodon, Cucullæa, Avicula. The earliest fresh-water lamellibranch, *Ammigenia* (*Archonodon*) *Jukesii*, occurs in the Upper Old Red Sandstone. The marine gasteropods call for no particular mention, for they belong chiefly to types which had come down from earlier Palæozoic times. The straight Orthoceras and other old genera of cephalopods continued to flourish, but coiled forms (Clymenia, Goniatites) began to predominate in Devonian times. From the Old Red Sandstone chiefly come the remains of numerous ganoid fishes—a group feebly represented in existing waters. Among these are the Ostracodermus, Cephalaspis, Pteraspis, Pterichthys, and Coccoosteus, and the true ganoids Osteolepis, Diplopterus, Holoptychius, Cheirolepis, &c. Coccoosteus and the gigantic Dinichthys of North America, now placed in the sub-class Arthrodira, have affinities with the Dipnoi. According to Dr Newberry, the latter was probably not less than 15 feet long, 'encased in armour, and provided with formidable jaws, which would have severed the body of a man as easily as he bites off a radish.' Other forms (such as Dipterus, and possibly Phaneropleuron) appear to have relations with the modern Ceratodus and are classed as Dipnoi.

It is obvious that in the Old Red Sandstone and Devonian we have two distinct types of sedimentation; the two series must have accumulated under different physical conditions. The Devonian strata are unquestionably of marine origin, while the Old Red Sandstone beds are believed to have been deposited under continental conditions. Hence we meet with the latter in a few more or less isolated basins, while the former extends over enormous regions. From the geographical distribution of the marine Devonian in Europe we gather that during the period in question the sea covered the south of England and the north-east of France, whence it extended eastwards, occupying the major portion of central Europe, and sweeping north-east through Russia, and how much farther we cannot tell. North of that sea stretched a wide land surface, in the hollows of which lay great lakes and inland seas, which seem now and again to have communicated with the ocean. It was in these broad sheets of water that the Old Red Sandstone strata were accumulated. Several of these old lakes in Scotland were traversed by lines of volcanoes, the relics of which are seen in many of the hill-ranges of the central and southern regions of that country. Volcanic action also at the same time manifested itself in some parts of Germany, but on a smaller scale apparently than in the Scottish area. The land, as we have seen, was clothed for the most part with a monotonous flowerless vegetation, but pine-like Cordaitales grew on the drier uplands, whence they were occasionally carried down by rivers to the lakes and seas. Very little is known of the terrestrial animal life of the period; most of the fossils met with in the lacustrine sediments of the period consisting of the remarkable ganoids and eurypterids already referred to. These (the fishes especially) appear to have abounded in the lakes, whence, however, they now and again descended by the rivers to the sea. The general facies and the geographical distribution of the life of the Devonian and Old Red Sandstone are suggestive of genial climatic conditions. Some geologists, however, have thought that the coarse breccias and conglomerates which occur in the Old Red Sandstone may be indicative of somewhat cold conditions; for these masses have often quite the aspect

of morainic accumulations. It is possible, therefore, either that local glaciers may have existed in certain regions, or that the temperature may have been lowered for some time over wider areas. However that may be, the presence of the Devonian fauna in the Arctic regions seems to show that the temperature of the ocean must have been more equable in Devonian times than it is now.

Old Sarum. See SALISBURY.

Old Style. See CALENDAR.

Old Testament. See BIBLE, BIBLICAL CRITICISM, APOCRYPHA, GENESIS, &c.

Oldys, WILLIAM, an industrious bibliographer, a natural son of Dr Oldys, Chancellor of Lincoln, was born in 1696. Most of his life was spent as bookworm and bookseller's hack. He suffered by the South Sea Bubble, and lost the property left by his father. For about ten years he was librarian to the Earl of Oxford, whose valuable collection of books and MSS. he arranged and catalogued; and by the Duke of Norfolk he was appointed Norroy King-of-arms. He died 15th April 1761. His chief works are *The British Librarian* (1737, anonymously); a *Life of Sir Walter Raleigh*, prefixed to Raleigh's *History of the World* (1738); *The Harleian Miscellany* (8 vols. 1753); besides many miscellaneous literary and bibliographical articles.

Oleaceæ, a family of dicotyledons, consisting of trees and shrubs, with opposite leaves, and flowers in racemes or panicles. About 500 species are known, mostly natives of temperate countries, especially in Asia. Among them are the olive, lilac, privet, ash, jasmine, &c. Between some of these there is a great dissimilarity, so that this family is apt to be regarded as a very heterogeneous group; but the real affinity of the species composing it is manifested by the fact that even those which seem most unlike can be grafted one upon another, as the lilac on the olive. Bitter, astringent, and tonic properties are prevalent in this family.

Oleander (*Nerium*), a genus of plants of the natural order Apocynaceæ. The species are evergreen shrubs with leathery leaves, which are opposite or in threes; the flowers in false umbels, terminal or axillary. The Common Oleander (*N. Oleander*), a native of the south of Europe, the

Common Oleander (*Nerium Oleander*).

north of Africa, and many of the warmer temperate parts of Asia, is frequently planted in temperate countries as an ornamental shrub, and is not uncommon in Britain as a window-plant. It has

beautiful red, or sometimes white flowers. The English call it Rose Bay, and the French Rose Laurel (*Laurier Rose*). It attains a height of eight or ten feet. It delights in moist situations, and stream-courses can be traced for long distances by the glow of its flowers. All parts of it contain a bitter and narcotic-acrid juice, poisonous to men and cattle, which flows out as a white milk when young twigs are broken off. Cases of poisoning have occurred by children eating its flowers, and even by the use of the wood for spits or skewers in roasting meat. Its exhalations are injurious to those who remain long under their influence. A decoction of the leaves or bark is much used in the south of France as a wash to cure cutaneous maladies. *N. odorum*, an Indian species, has larger flowers, which are very fragrant.

Oleaster, a name belonging properly to the true wild olive, has been transferred to *Elæagnus*, also misnamed wild olive. The plants are botanically remote. See ELÆAGNACEÆ, OLIVE.

Olefiant Gas, or ETHYLENE, C_2H_4 , is the most abundant illuminating constituent in coal-gas. It may be obtained by the destructive distillation of coal, but more readily by the action of sulphuric acid on alcohol. It is a colourless gas with a faint odour, but little soluble in water or alcohol. It may be liquefied by cold and pressure. With air it forms a powerfully explosive mixture, which, on being burned, yields water and carbonic acid gas. When mixed with an equal volume of chlorine, and kept cool and in the dark, the two gases unite, with the production of drops of an oily liquid called Dutch Liquid (q.v.).

Olefines. See HYDROCARBONS.

Oleic Acid is one of the acids present in olive, almond, and other oils, in which it is united to glyceryl. At temperatures above $14^{\circ}C$. it exists as a colourless limpid fluid, of an oily consistence, devoid of smell and taste, and (if it has not been exposed to air) exerting no action on vegetable colours. At $4^{\circ}C$. it solidifies into a firm, white, crystalline mass, and in this state it undergoes no change in the air; but when fluid it readily absorbs oxygen, becomes yellow and rancid, and exhibits a strong acid reaction with litmus paper. It is very difficult to obtain the acid in a state of purity, in consequence of the readiness with which it oxidises. It is obtained in a crude form, as a secondary product, in the manufacture of stearin candles; but when the pure acid is required a lengthy process, starting with almond oil, must be adopted. Oleic acid forms normal (or neutral) and acid salts; but the first compounds of this class that require notice are the normal salts of the alkalies. These are all soluble, and by the evaporation of their aqueous solution form soaps. Oleate of potash forms a soft soap, which is the chief ingredient in Naples soap; while oleate of soda is a hard soap, which enters largely into the composition of Marseilles soap. Of recent years a large number of oleates have come into use in medicine, which depend for their activity on the remarkable ease with which they are absorbed by the skin. Such are the oleates of zinc, mercury, lead, tin, morphia, &c., which, in this form, produce more rapid results than when applied as ointments.

Olein is a compound of oleic acid with glyceryl, and constitutes the bulk of olive-oil. Along with it are associated stearin and palmitin, similar compounds of stearic and palmitic acids. See FATS.

Olenellus, a genus of trilobites characteristic of the Lower Cambrian.

Olenus, a genus of Cambrian trilobites highly characteristic of the upper members of the system.

Oleograph, a name given to an ordinary chromo-lithograph which has been 'roughed' after printing, mounted on canvas, and varnished so as to imitate an oil-painting. See LITHOGRAPHY.

Oleomargarine. See BUTTER, MARGARINE.

Oleometer, or ELAÏOMETER, an areometer or balance for ascertaining the densities of fixed oils. It consists of a very delicate thermometer-tube, the bulb being large in proportion to the stem, so weighted and graduated as to adapt it to the densities of the leading fixed oils. On the scale are marked the principal oils of commerce, with their specific gravity opposite. The standard temperature of the oleometer is 59° F.

Oléron (anc. *Uliarus*), an island lying 2 to 10 miles off the west coast of France, and forming part of the department of Charente-Inférieure. It is 19 miles long by about 5 broad, and is unusually fertile. The people are mostly Protestants. On Oléron are the port of Le Château, and the small towns of St Pierre d'Oléron and St Georges d'Oléron.

The *Laws or Judgments of Oléron* were a code of maritime law compiled at the instance of Eleanor of Guienne before she married Henry II. of England, modelled on the *Book of the Consulate of the Sea* (a maritime code regulating commerce in the Levant), but drawn from the decisions of the maritime court of Oléron, in the duchy of Guienne. It was intended for the use of mariners in the Atlantic waters, was introduced into England in the end of the 12th century and into Flanders in the 13th. The usages and decisions upon which it was based were those observed in the wine and oil trade between Guienne and the ports of England, Normandy, and Flanders. An English translation was published as *Rutter of the Sea*, by T. Petyt in 1536. See INTERNATIONAL LAW.

Olga, St, a saint of the Russian Church, wife of the Scandinavian (Varangian) Duke Igor of Kieff, who, after her husband's death (946), governed during the minority of her son, till 955. Thereafter she repaired to Constantinople, and was baptised, assuming the name of Helena. Returning to Russia, she laboured with much zeal for the propagation of her new creed. After her death (968) she was canonised, and is now held in high veneration in the Russian Church. Her festival is held on July 21.

Olgerd, or OLGIERD, prince of Lithuania (q.v.) from 1345 to 1377, and ancestor of the Jagellons (q.v.).

Olhão, a seaport of southern Portugal, 4 miles E. of Faro, engaged in sardine and tunny fishing; pop. 10,000.

Olibanum, a gum-resin which flows from incisions in several species of *Boswellia* (q.v.), growing on bare limestone rocks in the mountains of Somaliland and the south of Arabia. These trees send their roots to a great depth into the crevices of the rock. Olibanum is the *lebonah* of the Hebrews, *libanos* or *libanotos* of the Greeks, *thus* or *tus* of the Romans, of all which terms the ordinary English translation is Frankincense (q.v.). The true frankincense seems to come from *Boswellia socotrana*. It occurs in commerce in semi-transparent yellowish tears and masses; has a bitter nauseous taste; is hard, brittle, and capable of being pulverised; and diffuses a strong aromatic odour when burned. It was formerly used in medicine, chiefly to restrain excessive mucous discharges; but its use for such purposes is now rare. It sometimes enters as an ingredient into stimulating plasters. It is chiefly employed for fumigation, and is used as incense in Roman Catholic churches and Indian temples. Its odour is obnoxious to mosquitoes and other

insects. Aden is the great port where it is chiefly received. Besides ordinary olibanum, there is a kind termed Mayeti, from the name of the port in Somaliland from which it is received. This is the produce of *B. Frereana*, and resembles Tacamahac. The inner layers of the bast of *B. Frereana* are transparent, resembling oiled paper, and are used by the natives for writing on. Much olibanum is used in India. Some is sent to China, and some comes to England.

Olifant River, a forked stream of South Africa, rises in the mountains north-east of Capetown, and, after a north-westerly course of 150 miles, enters the Atlantic. Area of drainage basin, 13,000 sq. m.—Another stream bearing the same name rises in the Transvaal, and goes east to join the Limpopo.

Oligarchy (*oligos*, 'few,' and *archō*, 'I govern'), a term applied by Greek political writers to that perversion of an aristocracy in which the efforts of the dominant and ruling party are chiefly devoted to their own aggrandisement and the extension of their power and privileges. Thus it bears the same relation to aristocracy that despotism does to monarchy and ochlocracy to democracy.

Oligocene System. The British strata belonging to this system occur only in Hampshire, the Isle of Wight, and Devonshire. The series is as follows:

4. HAMSTEAD BEDS: fresh-water marls and clays overlaid by marine septarian clays. About 260 feet.
3. BEMBRIDGE BEDS: marls and limestone; fresh-water below, estuarine above. About 110 feet.
2. OSBORNE BEDS: fresh-water clays, marls, sands, and limestone. About 100 feet.
1. HEADON BEDS: variable series of clays, marls, sands, and limestones. The lower division is of fresh- and brackish-water origin; the middle partly marine, partly fresh-water; the upper fresh-water. About 150 feet.

Usually included as Oligocene are the lacustrine beds of Bovey Tracey in Devonshire, consisting of sands and clays with lignites. Between the lowest basalts composing the denuded plateaus of Antrim and the Inner Hebrides (Mull, &c.) occur thin layers of clay and lignite—the so-called *leaf-beds*—formerly regarded as Oligocene, now as Eocene.

Foreign Equivalents.—Oligocene strata, chiefly of fresh- and brackish-water origin, but containing intercalations of marine beds, overlie the Eocene of the Paris basin and that of Belgium. They likewise appear in Germany, where they form the oldest Tertiary deposits—no Eocene having yet been detected in that region. The German Oligocene is mainly of fresh-water origin in its lower and upper portions, while marine deposits predominate in the middle of the series. It is noted for its beds of lignite or brown coal. In Switzerland the Oligocene attains a thickness of several thousand feet, chiefly conglomerates and sandstones, known as *Molasse*, and mostly of fresh-water origin; the basal portions, however, are marine and brackish-water. Other areas of fresh-water Oligocene more or less notable are met with in Alsace, Breisgau, and Württemberg. In Auvergne, central France, lacustrine deposits of the same age are well developed, and, like most of the Oligocene strata, have yielded great numbers of organic remains.

Life of the Period.—The flora of Oligocene times was abundant and varied. Palm-trees (*Sabal*, *Flabellaria*), both large and small, seem to have grown over all Europe. Amongst conifers were various American types (*Libocedrus*, *Chamaecyparis*, *Sequoia*, *Taxodium*) and other forms, such as *Glyptostrobus*, like *G. heterophyllus* of China, *Widdringtonia*, a genus now found only in South Africa and Madagascar. There were also proteaceous plants (*Dryandra*) of Australian affinities, and species of custard-apple, gum-tree, spindle-tree, maple, acacia, mimosa, lotus, aralia,

camphor-tree, cinnamon-tree, evergreen oak, laurel, &c., besides such familiar forms as birch, hornbeam, elder, elm, poplar, walnut, &c. Evergreens were the prevalent forms. The invertebrate fauna needs but little notice. Amongst notable molluscs were volutes, cowries, olives, cones, spindle-shells, &c. Cerithium was particularly plentiful in the estuaries of the period; while lamellibranchs were well represented by modern types of marine and fresh-water habitats. Amongst the birds common in Europe were paroquets, trogons, marabouts, cranes, flamingoes, ibises, pelicans, eagles, secretary-birds, sand-grouse, &c. At the beginning of the period many mammals of extinct types lived in Europe, such as Palæotherium and Anchitherium, survivals from the Eocene; certain transitional forms of ungulates, such as Cainotherium (a small animal somewhat resembling the living chevrotains in outward appearance), Xiphodon (a slenderly built deer-like animal), and Anoplotherium (a long-tailed animal about the size of an ass, with two toes on each foot); various tapiroid animals, small rhinoceroses, Hyænodon (a carnivore), also forms of squirrel, civet, martin, mole, musk-rat, &c.

Physical Conditions.—During Oligocene times a wide land surface appears to have extended over all the British area. In the region lying between what is now Antrim and the west coast of Scotland the great fissure-eruptions, begun in the Eocene, gave rise to a succession of basaltic lavas which built up broad plateaus extending northwards beyond Skye. In the intervals between successive eruptions these plateaus became clothed with vegetation, the debris of which has been here and there preserved in the deposits of shallow lakes that dotted the surface of the volcanic country. It is probable that at this time there was land-connection between Europe and North America by way of the Faroe Islands and Iceland, in both of which tracts similar basaltic plateaus occur, containing intercalated layers of lignite, &c. like those of Antrim and the Western Islands of Scotland. The Oligocene strata of the south of England and the Franco-Belgian area are evidence that the sea or estuarine waters which occupied that region in Eocene times (see EOCENE SYSTEM) were gradually silted up. In Germany there existed great fresh-water lakes, fringed by wide marsh-lands and by dense forests of a subtropical character. As the lakes became partially silted or dried up vegetation encroached upon their deserted beds, only to be buried under fresh accumulations of sand and mud when the water had again risen. That these lakes were now and again in direct communication with the sea is shown by the occurrence of thick layers of marine origin intercalated amongst the fresh-water beds. For some time, indeed, the lacustrine areas were entirely usurped by the sea, which may have entered them from submerged regions in the east of Europe. In Switzerland, in like manner, we have evidence of changing conditions. At first the sea covered a considerable portion of the country, but eventually it disappeared, and its place was taken by a series of brackish-water lagoons and fresh-water lakes. The deposits accumulated in those lakes now form considerable mountains at the base of the Alps (Rigi, Rossberg). In central France, as in Germany, lacustrine conditions were characteristic of the period, one or more great lakes having occupied a considerable area in Auvergne. In southern Europe the Mediterranean had withdrawn from wide regions which were deeply submerged by it in Eocene times, but it still covered a more extensive area than at present. The climate of the Oligocene period was uniformly genial, but hardly so tropical as that of the preceding period.

Oligochæta. See CHETOPODS.

Oligoclase. See FELSPAR.

Olinda, an archiepiscopal city and seaside resort of Brazil, 4 miles N. of Pernambuco; pop. 10,000.

Oliphant, LAURENCE, traveller, novelist, and mystic, was born in 1829, son of Sir Anthony Oliphant, afterwards Chief-justice of Ceylon. In early youth he travelled with Jung Bahadur to Nepal, and after his return was admitted to the Scottish bar, and later to the English bar at Lincoln's Inn. His first work, *A Journey to Khatmandu* (1852), was followed by *The Russian Shores of the Black Sea* (1853), the fruit of his travels in Russia in 1852. He next became private secretary to the Earl of Elgin, Governor-general of Canada, whom later he accompanied on his special embassy to China, thus finding material for his books *Minnesota and the Far West* (1855) and *A Narrative of the Earl of Elgin's Mission to China and Japan in 1857-59* (1860). In 1861, while acting as Chargé d'Affaires in Japan, he was severely wounded by assassins, and consequently resigned his post. From 1865 to 1867 he sat in parliament for Stirling burghs. Profoundly influenced by certain peculiar religious opinions, he renounced London society, joined for a time the community of T. L. Harris (q.v.) in the United States, and finally settled at Haifa (q.v.) in Palestine. He died at Twickenham, 23d December 1888. The religious opinions of his later years he gave to the world in *Sympneumata* (1886) and *Scientific Religion* (1888), as well as in his novel *Masollam* (1886), while they already formed the background of his earlier novel, *Altiora Peto* (1883). His *Piccadilly* (1870) was a book of altogether exceptional promise, bright with wit, delicate irony, and, above all, individuality; but its promise was never fulfilled. See Life by Mrs Oliphant.

Oliphant, MRS MARGARET, novelist, was born (Margaret Wilson) in 1828 at Wallyford, near Musselburgh, Midlothian. In 1849 she published her first work, *Passages in the Life of Mrs Margaret Maitland*, which instantly won attention and approval. Its most distinctive charm is the tender humour and insight which regulate its exquisite delineation of Scottish life and character at once in their higher and lower levels. The novels of the next few years, some of which appeared in *Blackwood's Magazine*, are of somewhat various merit, but in all of them the peculiar talent of the writer is marked. They are rich in minute detail; have nice and subtle insights into character, a flavour of quiet humour, and frequent traits of delicacy and pathos in the treatment of the gentler emotions. It was, however, by the *Chronicles of Carlingford* (first published in *Blackwood's*, 1861-64) that her reputation as a novelist was first secured. In the first of the series, *The Doctor's Family*, the character of little Netty, the heroine, vivifies the whole work, and may rank as an original creation. The next in the series, *Salem Chapel*, perhaps indicates a wider and more vigorous grasp than is to be found in any other of her works. Certain of the unlovelier features of English dissent, as exhibited in a small provincial community, are here graphically sketched, and adapted with admirable skill to the purposes of fiction. After more than forty years of novel-writing Mrs Oliphant's powers showed no decadence. She died 27th June 1897. Besides numerous novels, she wrote many historical, biographical, and other works, including an Autobiography (1899).

Olivarez, GASPARO DE GUZMAN, COUNT OF, Duke of San Lucar, was born 6th January 1587, at Rome, where his father was ambassador. He became the friend of Philip IV., his confidant in his amours,

and afterwards his prime-minister, in which capacity he exercised almost unlimited power for twenty-two years. Olivarez showed ability for government; but his constant endeavour was to wring money from the country that he might carry on wars against Portugal, France, and the Netherlands. His attempts to rob the people of their time-honoured privileges provoked insurrections in Catalonia and Andalusia, and roused the Portuguese to shake off the Spanish yoke in 1640. But the continued ill-success of the arms of Spain at length thoroughly roused the nation, and the king was obliged to dismiss his favourite in 1643. He was ordered to retire to Toro (Zamora), and died there, 22d July 1645. See De la Rocca, *Histoire du Ministère du Comte-Duc d'Olivares* (1673).

Olive (*Olea*), a genus of trees and shrubs of the natural order Oleaceæ, having opposite, evergreen, leathery leaves, which are generally entire, smooth, and minutely scaly. The general character of the genus is well illustrated by the accompanying cut. It is widely distributed in the warmer temperate parts of the eastern hemisphere. The Common Olive (*O. europæa*), a native of southern Europe, northern Africa, and western Asia, is in its wild state a thorny shrub or small tree, but through cultivation becomes a tree of 20 to 30 feet high, destitute of spines. It attains a prodigious age; some plantations, as those at Terni, in Italy, are

Common Olive (*Olea europæa*), Branch in Flower :
a, ripe fruit ; b, section of same showing stone.
(Bentley and Trimen.)

supposed to have existed from the time of Pliny. Some trees have been credited with an age of 1200 years or more. There are two principal varieties of the common olive, one having narrow, willow-like leaves, gray-green above and silvery below. In the other the leaves are similar in all respects, only much broader. The latter has also much the larger fruit of the two, but the oil it yields is rank and coarse to the palate, and is rarely used on the Continent out of Spain, in which country it is the variety chiefly cultivated. The narrow-leaved variety is preferred by the French and Italian olive-growers, the more bland and agreeable oil from which is better appreciated, especially by the British. Olive-oil may be said to form the cream and the butter of Spain, Italy, and some other countries, as it takes the place of both in cookery and table use. Highly nutritious, it is thought more wholesome than animal fats in warm climates. The finest quality is got from Tuscany. The oil is contained in the fleshy part of the fruit—not

in the stone—from which it is extracted by pressure. The ripe fruit is crushed to a paste, put into woollen bags, and subjected to moderate pressure. Thus is obtained in considerable quantity the finest quality of oil, which is named 'Virgin Oil.' The pulp is then moistened with water and again pressed, the result being an oil of inferior quality, yet quite fit for table purposes. A further residue of oil is extracted from the pulp after it has been steeped in water; but it is only fit for soap-making and other manufacturing purposes. The refuse forms olive-cake. Olive-oil is often adulterated with cotton-seed, walnut, sesamum, arachis, and other oils. Unripe olives are pickled both for home consumption and for export. They are eaten before meals as a whet to the appetite. Dried olives are used for the same purposes as pickled olives. The wood is much prized by cabinet-makers, being beautiful in colour and grain, and capable of taking a fine polish; that of the root is, most in demand for the making of snuff-boxes and ornaments.

The olive has been cultivated in the East from the remotest times, is associated with much mythical lore, and has been regarded in all ages as the bounteous gift of heaven, as the emblem of peace and plenty, and the highest reward that could be given to the honourable and the brave. As Athena's gift to Athens, it was valued above the horse which was offered by Poseidon. It is largely cultivated in Greece, Anatolia, and the Levant, in Morocco and Tripoli, as well as Spain, France, and Italy; and attention is paid to its culture in South Australia, Queensland, and South Africa. It grows luxuriantly in Chile, whither it was brought by the Spaniards. Jesuit missionaries introduced it into Mexico in the 17th century, and into California, where it grows freely. It has also been grown in Florida and other southern states. The culture of the olive has been attempted in England, but without success. Against south walls it lives, with slight protection in winter, in the neighbourhood of London, and in the same way it produces fruit in exceptionally favourable seasons in Devonshire; but it is generally unsuited to the British climate. Even in those countries in which its culture may be profitably pursued the tree is somewhat fastidious as to soil, aspect, and position. It does not succeed well in elevated situations, prefers sloping ground facing and not far removed from the sea, and thrives best in calcareous soil. It is very generally propagated by suckers, but where great care is bestowed on it inarching is practised. It bears an abundant crop only once in several years. There are other species of *Olea* more remarkable for the hardness and usefulness of their timber than for their fruits. *O. verrucosa*, *O. capensis*, and *O. laurifolia*, natives of the Cape of Good Hope, are small trees or shrubs with wood of such density and toughness as to rival in strength and durability iron itself, and they are all named Ironwood. The timber is used for wagon and carriage building. The fruit of some of these is eatable, as is also that of *O. americana*. The Fragrant Olive of Japan and China—*O. (Osmanthus)* of some *fragrans*—is a handsome shrub with sweet-scented flowers, which are said to be used by the Chinese for flavouring some kinds of tea. The genus is found also in New Zealand and Polynesia.

Olive, PRINCESS, the title assumed in 1820 by an impudent pretender, Mrs Olivia Serres, who claimed to have been born at Warwick on 3d April 1772, the granddaughter of the Rev. Dr Wilnot, her mother being his only daughter, her father Henry Frederick, Duke of Cumberland, the youngest brother of George III. In 1791 she had married John Thomas Serres, painter, but had separated

from him in 1803; and between 1805 and 1819 she had published ten trashy volumes of poetry and fiction. She resembled the royal family, and found some people ready to believe her to be really Princess of Cumberland and Duchess of Lancaster; but she died in poverty, within the 'rules' of the King's Bench, in November 1834. Lavinia, the elder of two daughters by her husband (there seems to have been at least one son by someone else), married Anthony Thomas Ryves, the adopted son of William Combe ('Dr Syntax'), only, however, also to separate. She died 7th December 1871, five years after a jury, in Ryves and Ryves v. the Attorney-general, had decided that Olive Serres was *not* the legitimate daughter of the Duke of Cumberland, and that eighty-two documents produced in evidence were forgeries.

See the *Life of John Thomas Serres* (1826); *Notes and Queries*, *passim*; and an article by E. Walford in the *Gentleman's Magazine* for August 1873.

Olivenite, a mineral, consisting of hydrous copper arsenate. The name was given in allusion to the colour, which is typically some shade of olive-green, less frequently wood-brown or yellow. It is found along with different ores of copper in Cornwall and elsewhere. It is often crystallised in oblique four-sided prisms, of which the extremities are acutely bevelled, and the obtuse lateral edges sometimes truncated, or in acute double four-sided pyramids; it is sometimes also spherical, kidney-shaped, columnar, or fibrous, which latter variety is known as *wood-arsenate*, and is greenish gray in colour.

Olivenza, a fortified town of Spain, near the Portuguese frontier, 20 miles SSW. of Badajoz, is claimed by Portugal; pop. 12,000.

Oliver, the comrade in arms of Roland (q.v.).

Olives, MOUNT OF, called also MOUNT OLIVET, a limestone ridge, lying north and south on the east side of Jerusalem (q.v.), from which it is separated only by the narrow Valley of Jehosaphat. It is called by the modern Arabs Jebel-al-Tôr, and takes its familiar name from a magnificent grove of olive-trees which once stood on its western flank, but has now in great part disappeared. The road to Mount Olivet is through St Stephen's Gate. Immediately beyond, at the foot of the bridge over the brook Kedron, lies the Garden of Gethsemane; and the road here parts into two branches, northwards to Galilee, and eastwards to Jericho. The ridge rises in three principal summits, that to the north being 361 feet above Jerusalem (2725 above the sea), the central summit, crowned with a village (Olivet proper), 286, and the third summit on the south 46 feet. David fled from Absalom by way of the Mount of Olives, which was also the scene of the idolatrous worship established by Solomon. The northern peak is the supposed scene of the appearance of the angels to the disciples after the resurrection, and is remarkable in Jewish history as the place on which Titus formed his encampment in the expedition against the fated city of Jerusalem. But it is around the central peak, which is the Mount of Olives properly so called, that all the most sacred associations of Christian history converge. On the summit stands the Church of the Ascension, on the site of a church built by St Helena; and near it are shown the various places where, according to tradition, our Lord wept over Jerusalem, where the apostles composed the apostles' creed, where our Lord taught them the Lord's Prayer, &c. Near the Church of the Ascension are a mosque and the tomb of a Mohammedan saint.

Olivetans, a religious order of the Roman Catholic Church, whose full title is the Congregation of Our Lady of Mount Olivet. They are an

offshoot of the Benedictine Order (q.v.), and were founded in 1313 by Giovanni Tolomei, a native of Siena, and professor of Philosophy in the university of that city, who believed himself to have been miraculously cured of blindness. The order was confirmed by pope John XXII., and Tolomei was chosen the first general.

Olivine. See CHRYSOLITE, IGNEOUS ROCKS.

Olla Podrida (lit., 'putrid pot'), a Spanish national dish, consisting of flesh, fresh and salted, poultry, vegetables, &c., well seasoned with pepper and garlic, and stewed together in a closed pot. The term is applied figuratively to literary productions of very miscellaneous contents. The French equivalent is *pot-pourri*, and the Scots *hotch-potch*, both of which, but especially the former, are also employed in a figurative sense.

Ollendorf, HEINRICH GOTTFRIED (1803-65), born at Rawitsch, in Posen, became a teacher in Paris, and developed a simplified 'method' for learning modern languages which became very popular, familiarity being gained by the multiplication of progressive examples and exercises.

Ollivier, OLIVIER ÉMILE (1825-1913), French statesman, was born at Marseilles, and, having studied law at Paris, began to practise as an advocate in that city. By clever pleading he established a reputation at the bar, and after 1864 acquired influence as a member of the Legislative Assembly. In 1865 the viceroy of Egypt appointed him to a high juridical office in that country. But he still took an active interest in French politics, and in January 1870 Napoleon III. charged him to form a constitutional ministry. But the real authority of the ministers was practically *nil*. Ollivier was an unsuspecting tool in the hands of the Imperialists. 'With a light heart' he rushed his country into the war with Germany, himself to be overthrown, after the first battles, on 9th August. He withdrew to Italy for a time. He wrote books on *Lamartine* (1874) and *Thiers* (1879), and *L'Église et l'État au Concile du Vatican* (2 vols. 1879), *Principes et Conduite* (1875), *Nouveau Manuel de Droit Ecclésiastique Français* (1885); and his *L'Empire Libéral* (16 vols. 1894-1912) was an apology for his administration, and an attempt to throw the blame of the war wholly on Germany.

Olmütz (Czech *Olomouc* or *Holomauc*), a town of Czechoslovakia, in Moravia, on the March, 129 miles NNE. of Vienna. Notable are the 14th-century cathedral (restored 1887); the church of St Maurice (1472), whose organ has 48 stops and 2342 pipes; the noble town-hall, with a steeple 255 feet high; the archiepiscopal palace; and the lofty Trinity column on the Oberring. The former university (1581-1855) is reduced to a theological faculty, with a valuable library. Olmütz was formerly strongly fortified. The trade is more important than the manufactures. Pop. 57,000. Olmütz, which in 1640 was superseded by Brünn as the capital of Moravia, suffered severely in both the Thirty and the Seven Years' War. In 1848 Ferdinand I. signed his abdication here. See the local history by W. Müller (Vienna, 1895).

Olney, a pleasant little town of Buckinghamshire, on the Ouse, 11 miles W. by N. of Bedford and 10 SE. of Northampton. At the corner of the market-place still stands the house where Cowper (q.v.) lived from 1767 to 1786, writing with John Newton the *Olney Hymns* (1779). The place besides has memories of Scott the commentator, William Carey, and many more missionaries. Brewing and bootmaking are industries.

Olomouc. See OLMÜTZ.

Olonetz, a former government of Russia, adjoining Finland. The western part, with Petro-

savodsk, the capital, is included in the autonomous Karelian republic.

Oloron, a town in the French department of Basses-Pyrénées, on the Gave d'Oloron, 14 miles SW. of Pau. It has two interesting Romanesque churches. Pop. 10,000.

Olshausen, HERMANN, theologian, was born at Oldeslohe in Holstein, 31st August 1796, studied at Kiel and at Berlin under Neander, and became professor at Berlin (1821), Königsberg (1827), and Erlangen (1834). He died 4th September 1839. His principal work was a complete commentary on the New Testament, completed by Ebrard and Wiesinger (1830 *et seq.*; Eng. trans. 4 vols. 1847-49; rev. ed. 6 vols. New York, 1856-58). His younger brother Justus (1800-82) was a distinguished Orientalist; and Theodore (1802-69) took a prominent part in the Sleswick-Holstein rising, 1848.

Olympia, the scene of the celebrated Olympic games, is a beautiful valley in Elis, in the Peloponnesus, through which runs the river Alpheus. As a national sanctuary of the Greeks, Olympia contained, within a small space, many of the choicest treasures of Greek art belonging to all periods and states, such as temples, monuments, altars, theatres, and multitudes of images, statues, and votive-offerings of brass and marble. In the time of the elder Pliny there still stood here about 3000 statues. The Sacred Grove (called the *Altis*) of Olympia enclosed a level space about 660 feet long by nearly 580 broad, containing the sanctuaries connected with the games. It was finely wooded, and in its centre stood a clump of sycamores. The *Altis* was crossed from west to east by a road called the 'Pompic Way,' along which all the processions passed. The Alpheus bounded it on the south, the Cladeus, a tributary of the former, on the west, and rocky but gently swelling hills on the north; westward it looked towards the Ionian Sea. The most celebrated building was the *Olympieion*, or *Olympium*, dedicated to Olympian Zeus. It was designed by the architect Libon of Elis in the 6th century B.C., but was not completed for more than a century. It contained a colossal statue of the god, the masterpiece of the sculptor Phidias, and many other splendid figures; its paintings were the work of Panæus, a relative of Phidias. Next to the *Olympieion* ranked the *Heræum*, dedicated to Hera, the wife of Zeus and Queen of Heaven, containing the table on which were placed the garlands prepared for the victors in the games. The *Pelopium*, the *Metroum*, the ten *Thesauri* or Treasuries, built for the reception of the dedicatory offerings of the Greek cities, the temples of Eileithyia and Aphrodite also deserve mention. The *Stadium* and the *Hippodrome*, where the contests took place, stood outside and east of the *Altis*; the *Gymnasium* and *Palæstra* were also outside and to the west. Explorations were carried on in 1875-81 by the German government at a total expense of £40,000, and threw much light on the plans of the buildings. Many valuable sculptures, bronzes, coins, and other objects were discovered. The greatest find was the Hermes of Praxiteles, a most beautiful and marvellous piece of sculpture. The results of these excavations have been published officially in *Die Ausgrabungen zu Olympia* (5 vols. 1875-81, with 118 plates).

Olympic games were the most splendid national festival of the ancient Greeks, and were celebrated every fifth year in honour of Zeus, the father of the gods, on the plain of Olympia. Their origin goes back far beyond 776 B.C., the year in which the custom of reckoning time by Olympiads (q.v.) began. We may, however, believe that the games became a truly national festival for the first time

in that year. At first, it is conjectured, only Peloponnesians resorted to the Olympic games, but gradually the other Greek states were attracted to them, and the festival became *Pan-Hellenic*. Originally, and for a long time, none were allowed to contend except those of pure Hellenic blood; but after the conquest of Greece by the Romans the latter sought and obtained this honour, and both Tiberius and Nero figure in the list of Roman victors. Women—with one exception, the priestess of Demeter Chamyne—were forbidden to be present, on pain of being thrown headlong from the Typæan Rock. The games were held at the first full moon of the summer solstice, when first throughout Elis, and then throughout the rest of Greece, heralds proclaimed the cessation of all intestine hostilities; while the territory of Elis itself was declared inviolable. The competitors were required to undergo a preparatory training for ten months in the gymnasium at Elis, and during the last of these months the gymnasium was almost as numerously attended as the games themselves. Much uncertainty prevails as to the manner in which the contests were distributed over the different days. Krause (*Olympia*, p. 106) suggests the following order: On the first day the great initiatory sacrifices were offered, after which the competitors were properly classed and arranged by the judges, and the contests of the trumpeters took place; the second day was set apart for the boys who competed with each other in foot-races, wrestling, boxing, the pentathlon, the pankration, horse-races; the third and principal day was devoted to the contests of men in foot-races of different kinds (as, for example, the simple race, once over the course; the *diavulos*, in which the competitors had to run the distance twice; and the *dolichos*, in which they had to run it seven or twelve times), wrestling, boxing, the *pankration* (in which all the powers and skill of the combatants were exhibited), and the race of *hoplites*, or men in heavy armour; on the fourth day came off the *pentathlon* (contest of five games—viz. leaping, running, throwing the discus, throwing the spear, and wrestling), the chariot and horse races, and perhaps the contests of the heralds; the fifth day was set apart for processions, sacrifices, and banquets to the victors (called *Olympionikoi*), who were crowned with a garland of wild olive-twigs cut from a sacred tree which grew in the *Altis*, and presented to the assembled people, each with a palm branch in his hand, while the heralds proclaimed his name, and that of his father and country. On his return home he was received with extraordinary distinction: songs were sung in his praise (14 of Pindar's extant lyrics are devoted to *Olympionikoi*); statues were erected to him, both in the *Altis* and in his native city; a place of honour was given him at all public spectacles; he was in general exempted from public taxes, and at Athens was boarded at the expense of the state in the *Prytaneion*. The regulation of the games belonged to the Eleans, from whom were chosen the *hellenodikai*, or judges, at first two in number, but latterly ten or twelve. Theodosius I. prohibited the games in 394 A.D. Theodosius II. ordered the buildings, which had suffered at the hands of the Romans and of various Byzantine Emperors, as they afterwards did from Goths and Slavs, to be burnt. Olympic games (including bicycle races, and no longer exclusively Greek) were in a fashion revived at Athens in 1896, and continued (at intervals of four years) at Paris, &c.

See Krause's *Olympia* (1838); Bötticher's *Olympia* (1882); Baumeister's *Denkmäler*; Frazer's *Pausanias* (1898); Gardner's *New Chapter in Greek History* (1892); and Curtius and Adler, *Olympia* (5 vols. 1891-97).

Olympia, capital of Washington state, on a peninsula at the south end of Puget's Sound, some 65 miles from the Pacific Ocean, and 121 miles by rail N. of Portland, Oregon. The Des Chutes River, which enters the sound here, provides abundant water-power, and the town has lumber industries, &c. Pop. 8000.

Olympiad, the period of four years between two successive celebrations of the Olympic games, a mode of reckoning among the Greeks apparently first employed systematically by Alexandrian writers in the 3d century B.C. It is used only by writers, and is never found on coins and very seldom on inscriptions. The first recorded olympiad dates from the 21st or 22d of July 776 B.C., and is frequently referred to as the Olympiad of Corœbus; for historians, instead of referring to the olympiad by its number, frequently designate it by the name of the winner of the foot-race in the Olympic games belonging to that period. The first year of our present era (1 A.D.) corresponded to the last half of the fourth year of the 194th with the first half of the first year of the 195th olympiad. See CHRONOLOGY.

Olympias, the wife of Philip II., king of Macedonia, and mother of Alexander the Great. She was the daughter of Neoptolemus I., king of Epirus. She was a woman of great vigour and capacity, but was passionate, jealous, and ambitious. When Philip married Cleopatra, niece of Attalus, she left Macedonia, and she was believed to have instigated his assassination by Pausanias (337 B.C.). On the accession of Alexander she returned to Macedonia, and brought about the murder of Cleopatra and her daughter. Alexander treated her with respect, but he never allowed her to meddle with his political schemes. After his death she obtained the support of Polyperchon, and in 317 the pair defeated and put to death Philip Arrhidæus, the weak-minded step-brother and successor of Alexander, together with his wife Eurydice. Her cruelties soon alienated the minds of the people, whereupon Cassander besieged her in Pydna, and on its surrender put her to death, 316 B.C.

Olympiodorus, one of the latest of the Alexandrian Neoplatonists, flourished in the first half of the 6th century after Christ, during the reign of the Emperor Justinian. Regarding his life nothing is known. Of his writings we possess a *Life of Plato*, with commentaries or scholia on the *Gorgias*, *Philebus*, *Phædo*, and *Alcibiades I*. In these he appears as an acute and vigorous thinker and as a man of great erudition.—Another Olympiodorus, of the Peripatetic school, flourished in Alexandria in the 5th century B.C., and was the teacher of Proclus (q.v.).—A third Olympiodorus, from Thebes in Egypt, wrote in Greek a history of the western empire from 407 to 425 A.D., abridged by Photius.

Olympus, the ancient name of several mountains or chains of mountains—e.g. in Mysia, Cyprus, Lycia, Elis, Laconia, Arcadia, and one, the most famous of all, between Thessaly and Macedonia. Its eastern side, which fronts the sea, shows a line of vast precipices, cleft by ravines filled with forest trees. Oak, chestnut, beech, and plane trees are scattered along its base, and higher up grow forests of pine, as in the days of the old poets of Greece and Rome. Its highest peak is 9750 feet above the sea. It was regarded by the ancient Greeks as the chief abode of the gods, and the palace of Zeus was supposed to stand upon its broad summit. According to Greek legend it was formerly connected with Ossa, but was separated from it by an earthquake, allowing a passage for the Peneus through the narrow vale of Tempe to

the sea. The philosophers afterwards transferred the abode of the gods to the planetary spheres.

Om is a Sanskrit word which, on account of the mystical notions that even at an early date of Hindu civilisation were connected with it, acquired much importance in the development of Hindu religion. Its original sense is that of emphatic or solemn affirmation or assent. Later it became the auspicious word with which the spiritual teacher had to begin, and the pupil had to end, each lesson of his reading of the Veda. In the Upanishads it appears as a symbol of the absolute and the object of meditation, and ultimately (as equal to *Aum*) it came to be regarded as an abbreviated method of naming the Hindu Trinity, Vishnu, Siva, and Brahmā. In the Lamaist form of Buddhism the 'formula of six syllables,' *Om mani-padme hūm*, which is variously interpreted, is the most solemn and sacred of invocations, the first thing taught to Tibetan and Mongolian children, the last prayer breathed by the dying man. It is found engraved on rocks, flags, and praying-wheels, and is looked on as the essence of religion and wisdom, and the means of attaining eternal bliss.

Omagh (Gael. *Oigh magh*, 'seat of the chiefs'), the county city of Tyrone, on the Strule, 34 miles S. of Londonderry and 110 NNW. of Dublin. It grew up around an abbey founded in 792, but is first heard of as a fortress in the end of the 15th century, when it was forced to surrender to the English. It formed part of James I.'s 'Plantation' grants, and was strongly garrisoned by Mountjoy. On its being evacuated by the troops of James II. in 1689 it was partially burned, and a second fire in 1743 completed its destruction. But it has been well rebuilt, and is now a neat and prosperous town. Pop. 4800.

O'maha, the chief city of Nebraska, is on the right bank of the Missouri, about 440 miles W. by S. of Chicago and 460 NW. of St Louis. It is the terminus of many important railways, and the Missouri is spanned by three great bridges (two railway) to Council Bluffs, Iowa, where a number of others start. It is especially important as being practically the eastern terminus of the Union Pacific, and so the gate of the West. The city is built on a plateau 80 feet above the river, and on hills behind it, and has wide streets. A belt line of railway encircles it. There are numerous large buildings, including the city hall, United States courthouse, federal building, and high schools; the city has also the University of Omaha, the Creighton University, medical and theological colleges, a large public library, and public parks of great extent. The manufactures include the making of linseed-oil, white-lead, bricks, machinery, &c.; there is a large grain trade; above all, Omaha possesses large lead-smelting works (said to be the largest in the country), railway works, one of the largest meat-packing businesses in the United States, and an enormous trade, due to its extensive facilities for transportation. There are numerous daily and weekly newspapers published in English, German, Swedish, Danish, and Czech. Omaha is the headquarters of a military corps area. The city was founded in 1854. Pop. (1860) 1912; (1870) 16,083; (1880) 30,518; (1900) 102,555; (1920) 191,601. South Omaha is now included.

Omahas, a tribe of American Indians, of the Dakota stock, settled in northern Nebraska.

Oman, the most easterly portion of Arabia, a strip of maritime territory, extending between the Strait of Ormuz and Ras-el-Had, and bounded on the SW. by the deserts of the interior. At a distance of from 20 to 45 miles inland a chain of mountains runs parallel to the coast, reaching 6000 feet in Jebel Akhdar. There are some richly fertile

tracts in this region, especially where water exists for irrigation, but no roads except camel and donkey tracks. The coast is hot and not very healthy. The country is in disorder. The area of the sultanate is about 82,000 sq. m. Pop. (estimated) 500,000—chiefly Arabs, with many negroes and Baluchis; capital, Maskat or Muscat (q.v.). Zanzibar (q.v.) was once part of the sultan's dominions.

Omar. See KHALIF.

Omar Khayyám, the astronomer-poet of Persia, was born at Nishapur, the capital of Khorasan, about the middle of the 11th century, and took his *takhallus* or poetical name, 'Khayyám,' from his father's calling of tent-maker. He was brought up under the great Sunni teacher, Imám Muaffik, and formed a close friendship with two of his fellow-pupils, Nizám-ul-Mulk and Hassan-ibn-Sabbah, of whom the one became vizier to the sultan Alp-Arslan, and the other founded the sect of the Assassins. Omar himself had an offer from his old friend of a place at court, but accepted instead a yearly pension of 1200 gold pieces. He, however, obeyed the summons of Malik Shah to Merv, and during his sultanate helped to reform the calendar. The result was the *Jalálí* era—a computation of time, says Gibbon, 'which surpasses the Julian, and approaches the accuracy of the Gregorian style.' To appease the *odium theologium* that he had roused against himself he is said to have made the pilgrimage to Mecca; and he died in 1122 at Nishapur.

Of some mathematical treatises by him in Arabic, one on algebra has been edited and translated by Woepke (Paris, 1851); and it was almost solely as a mathematician that he was known to the western world, until in 1859 Edward FitzGerald (q.v.) published his 'translation' of seventy-five of his *Rubáiyát* or quatrains. The poet of Agnosticism, such was Omar Khayyám, though some in his poetry see nothing save the wine-cup and roses, and others read into it that Sufi mysticism with which, indeed, it was largely adulterated long after Omar's death. He was a true poet; yet FitzGerald's translation is so much finer that the value of the original is such mainly as attaches to Chaucer's or Shakespeare's prototypes.

There are editions of the *Rubáiyát* by Nicolas (464 quatrains; Paris, 1867), Monbir Muhammad Sadik Ali (nearly 800 quatrains; Lucknow, 1878), and Whinfield (500 quatrains, 1883; 3d ed. 1902), with a metrical translation. Payne's (1898) verse translation is more important than the partial ones by Johnson, J. H. McCarthy, and Le Gallienne. Heron-Allen published a fac-simile of the text with a literal translation (1899), J. Pollen, a literal translation (158 quatrains) in 1915. There is an issue of FitzGerald's translation, with a commentary by Batson and others (New York, 1900); and there is a vast bibliography by Dele (Boston, 1896). Doubt has been cast on the authenticity of many of the quatrains; the work, in fact, is regarded as an anthology of which little or nothing may be by Omar. See vol. iii. of FitzGerald's *Letters and Literary Remains* (1889).

Omar Pasha (1806-71), Turkish general, was born at Plaski, in Croatia. His real name was Michael Lattas; he was educated for the Austrian army at the military school of Thurn, near Carlstadt. Having by a breach of discipline rendered himself liable to punishment he fled to Bosnia, and, embracing Mohammedanism, became writing-master to Abdul-Medjid. On his pupil's accession to the Ottoman throne in 1839 he was made colonel, and in 1842 military governor of the Lebanon. He suppressed insurrections in Albania, Bosnia, and Kurdistan. On the invasion of the Danubian Principalities by the Russians in 1853, Omar Pasha with 60,000 men crossed the Danube in presence of the enemy, intrenched himself, and defeated the Russians. In 1855 he repulsed the Russians at

Eupatoria. He was sent too late to relieve Kars. In 1861 he again pacified Bosnia and Herzegovina, and overran Montenegro in 1862.

Ombre (through the Fr. from Span. *hombre*, 'man'), a game of cards borrowed from the Spaniards, and usually played by three persons, though sometimes by two and by five. The game is played with 40 cards (the eights, nines, and tens having been removed), and each player receives nine cards, three by three.

Omdurman. See KHARTUM, MAHDI.

O'Meara, BARRY EDWARD (1786-1836), physician to Napoleon on St Helena, was born in Ireland. He served as surgeon in the army, but was dismissed the service in 1808 for a discreditable share in a duel at Messina. Later he entered the naval service, was on the *Bellerophon* when Napoleon came on board, and went with him as his private physician to St Helena. He took part with Napoleon in his squabbles with the governor, Sir Hudson Lowe, and was imprisoned and compelled to resign his post in 1818. On his return to England he was dismissed for asserting in a letter to the Admiralty that Sir Hudson Lowe had dark designs against his captive's life. His *Napoleon in Exile* (1822) made a great sensation, and is still valuable if read with caution.

Omen (perhaps originally *osmen*, for *ausmen*; root, *audio*, 'I hear'); also **PRODIGY** (Lat. *prodigium* for *prodicium*, from *prodico*), names given by the Romans to signs by which approaching good or bad fortune was supposed to be indicated. The former applied particularly to signs received by the ear and spoken words; the latter, to phenomena and occurrences, such as monstrous births, the appearance of snakes, the striking of the foot against a stone, the breaking of a shoe-tie, sneezing, and the like. It was supposed that evil indicated as approaching might be averted by various means, as by sacrifices, or by the utterance of certain magic formulas; or by an extempore felicity of interpretation, as when Cæsar, having fallen upon the ground on landing in Africa, exclaimed: 'I take possession of thee, Africa.' Occasionally we read of a reckless disregard of omens; as, for example, when P. Claudius in the first Punic war caused the sacred chickens, which refused to leave their cage, to be pitched into the sea, saying: 'If they won't eat, let them drink.' The belief in omens in one form or other has existed in all ages and countries, and traces of it linger in the folklore of all countries. And, indeed, there is no little philosophy in the Scots proverb: 'Them that follow freits, freits follow.' See AGURIES, DIVINATION, and FOLKLORE.

Omichand (properly Amin Chand). See CLIVE.

Ommiades. See KHALIF.

Omnibuses, vehicles 'for all,' the well-known public conveyances. In 1662 Blaise Pascal (q.v.), assisted by some noblemen, obtained a patent from the French king for the privilege of running public coaches, containing six persons, each along certain streets of Paris, and preserving its own route, for five sous per passenger. For two years the scheme proved a great success, but the death of Pascal and other causes occasioned its disuse. The first omnibus, built in Paris in 1820, was drawn by three horses, and soon became popular. In England at the beginning of the 19th century stage-coaches were used by business men to reach London from its suburbs. These were succeeded by the omnibuses started in London, July 1829, by Mr Shillibeer, formerly a coachmaker in Paris, drawn by three horses, conveying twenty-two persons inside. Smaller and more convenient buses were introduced

in 1849, which conveyed twelve inside and two out. Outside seats along the centre of the roof followed in 1857, and the vehicle was subsequently much improved by Mr Miller of Hammersmith. Many improvements were made in the arrangement of seats outside facing forward, the greater accommodation of the interior, and the lightness of the vehicle. The London General Omnibus Company, founded in 1855, took over 580 omnibuses, and in 1903 had about 1400 running. After that date a rapid development of motor omnibuses took place in the streets of London and elsewhere, and they soon superseded horse-drawn vehicles.

Omnium, JACOB. See HIGGINS.

Omphacite (Gr. *omphaka*, 'unripe grape'), a grass-green granular variety of Pyroxene (q.v.), one of the constituents of Eclogite (q.v.).

Omphale. See HERCULES.

Omphalos (Gr., 'navel'), a sacred stone at Delphi (q.v.), supposed to mark the centre of the world. The actual stone (as is supposed) was discovered in 1915.

Omsk, an important town of Siberia, at the confluence of the Om with the Irtysh, 1800 miles E. of Moscow. It was built in 1716 as a defence against the Kirghiz, but is now of no importance as a fortress. It has a Greek and a Roman Catholic cathedral, a museum, governor's palace, &c. It is a considerable river-port. Seat of Koltchak's government, Omsk fell to the Bolsheviks, 15th November 1919. Pop. 140,000.

On. See HELIOPOLIS.

Onager. See ASS, BALLISTA.

Onagraceæ, ONAGRARIÆ, or ÆNOTHERACEÆ, a family of dicotyledons, consisting chiefly of herbaceous plants, but including also a few shrubs, with simple leaves and axillary or terminal flowers. There are about 500 known species, natives chiefly of temperate climates, among which are some much cultivated for the beauty of their flowers, particularly those of the genera *Fuchsia*, *Ænothera* (Evening Primrose), *Clarkia*, and *Godetia*. The British genera are *Epilobium* (Willowherb), *Circæa* (Enchanter's Nightshade), *Ænothera*, and *Ludwigia*. A few produce edible berries, and the roots of one or two are eatable; but none are of economic importance. The root of *Ludwigia alternifolia*, found in the marshes of Carolina, and called *Bouman's Root*, is emetic. Some species of *Jussiaea* are used in dyeing in Brazil.

Oncidium. See ORCHIDS.

Onega, a small seaport in the north of Russia, at the point where the river Onega empties into the White Sea, 87 miles SW. of Archangel.

Onega, LAKE, in the north of Russia, after Ladoga, to the north-east of which it lies, the largest lake in Europe, is 50 miles in greatest breadth, 146 miles in length, and 400 feet in depth in parts. Area, 3764 sq. m. It is fed by numerous rivers, and finds an outlet by the river Swir, which flows south-west into Lake Ladoga. The northern end is studded with islands and deeply indented with bays. The shores in other parts are flat and regular. Although the water is ice-bound generally for 156 days in the year, the lake is the scene of busy traffic at other seasons. Communication is promoted by a canal cut parallel to the southern shore. Fish abound. Mirages are frequent.

Oneglia, a town on the Gulf of Genoa, 3 miles NE. of Porto Maurizio by rail; pop. 12,000.

Oneida. See PERFECTIONISTS, IROQUOIS.

O'Neill. See TYRONE, IRELAND.

O'Neill, EUGENE, an American dramatist born in 1888. Before turning to writing he was a gold prospector, an actor, a journalist, and for two

years an able seaman. His time at sea had a great influence on him. *Thirst* (1914) was followed by *In the Zone* (1917), and *Moon of the Caribbees* (a series of seven small pieces dealing with the sea, 1919); *Beyond the Horizon* (1919) and *Diff'rent* (1920) reveal great dramatic gifts, but are on the same lines as many other conventional plays. 1920, however, saw the appearance of *The Emperor Jones*, a wonderful study of negro temperament. It is in eight short scenes; is practically a monologue, and creates an amazing effect when acted. *Gold* (1921) and *Anna Christie* (1923) carry on what may be called his more ordinary work, while *The Hairy Ape* (1923) shows much of that originality and force which made *The Emperor Jones* so striking a production. Without question Eugene O'Neill may be considered the greatest figure in modern American dramatic art.

Onion (Fr. *oignon*; Lat. *unio*, 'a pearl'), the name given to a few species of the genus *Allium* (q.v.), and particularly to *A. Cepa* (Lat. *cepa*), a biennial bulbous plant. The bulb is simple, and in the common variety is solitary, showing little tendency to produce lateral bulbs. The native country of the onion is shrouded in obscurity. It is supposed to be indigenous to India, whence it passed into Egypt, where it was cultivated 2000 years before the Christian era. Thence probably it was transmitted to Greece and Italy, and gradually spread over Europe, in most countries of which it has been cultivated from time immemorial. The onion contains a white acrid volatile oil, holding sulphur in solution, albumen, uncrystallisable sugar and mucilage, phosphoric acid, both free and combined with lime, acetic acid, citrate of lime, and lignin. The acrid qualities, while present in every part of the plant, are most concentrated in the bulb. When it is cultivated in warm countries the acidity decreases, while the saccharine qualities increase; hence the comparative mildness of Spanish and Portuguese onions. It is very nutritious and easily digested, yet does not agree with all stomachs when cooked otherwise than boiled. In boiling, the essential oil is dissipated and the onion thereby rendered more agreeable to delicate stomachs. The onion is stimulant, diuretic, expectorant, and rubefacient. The acid of the juice has the reputation of dissolving calculus in the bladder. The pulp of the bulb by fermentation is converted into vinegar, and with the addition of dregs of beer yields by distillation an alcoholic liquor. The pulp of roasted onion with olive-oil forms an excellent anodyne and emollient poultice to suppurating tumours. There are many varieties of the onion in cultivation in Britain, which have been obtained by natural seminal variation and by careful selection; some under good cultivation surpass even the large Spanish onion of the shops in size, but they lack its delicate flavour. Varieties with small compact bulbs keep best and longest. By a proper selection of sorts home-grown onions may be had either green or matured all the year round. The onion delights in rich, moist soil deeply trenched; when very large bulbs are desired it is hardly possible to overdo manuring. When the crop ripens, which is known by the central leaves ceasing to grow and the lower ones going to decay, the bulbs are taken up and spread out thinly on a dry surface in the open air till they are quite dry; they are then stored in a loft where, in mild weather, they may have plenty of air but be protected from frost and damp.—The potato-onion, so called because it reproduces itself underground by division of the bulb, is a perennial variety of the onion which also bears the names Egyptian and Ground Onion. It is much favoured by cottagers, in Scotland particularly. A legend that it was first brought to Britain by the British army

from Egypt in 1805 is without foundation, as it was cultivated long before that time in the country. Pickling onions are usually obtained by sowing the small silver-skinned variety on poor soil in spring. The Tree-onion, in which, instead of producing seeds after flowering, the ovaries develop viviparous bulbs by which the plant is propagated, is rarely cultivated except as a curiosity. The so-called Welsh Onion, or Cibol (*A. fistulosum*), produces no bulb, but merely a fleshy stem like the leek. It is a native of Siberia, and, being very hardy, was formerly grown in gardens to supply green onion-tops in spring for salads and the flavouring of soups and sauces. Being rather coarse in flavour, however, it has been superseded by the milder-flavoured kinds, which are sown in August. It is the true *syboe* of the Scots, although the term has come to be applied to green or young onions of whatsoever kind.

Onkelos, the reputed author of an Aramaic Targum of the Pentateuch. See TARGUM.

Onnes, HEIKE KAMERLINGH, born at Groningen, 21st September 1853, became professor of physics at Leyden. He obtained liquid helium, and discovered that the electrical resistance of metals cooled to near absolute zero practically disappears. See ELECTRICITY, p. 266.

Onobrychis. See SAINFOIN.

Onomacritus, a religious poet of ancient Greece, lived at Athens in the time of the Pisistratidæ. He exercised great influence on the development of the Orphic mysteries, and collected the prophecies or oracles of Musæus (q.v.), but was banished by Hipparchus for falsifying them. He followed the Pisistratidæ into Persia, and was by them induced to repeat to Xerxes all the ancient sayings that seemed to favour his invasion of Greece. He helped to arrange the Homeric poems, and is suspected of having introduced interpolations into the text of them.

Onomatopœia, a term used in Philology (q.v.) to denote the formation of words in imitation of natural sounds, as in *cuckoo*, *pee-wit*, and the like.

Onondagas. See IROQUOIS.

Ononis. See REST-HARROW.

Onopordon, or COTTON-THISTLE. See THISTLE.

Ontario, the easternmost and smallest (7540 sq. m.) of the five great lakes of North America, receives at its south-west corner the waters of the upper lakes by the Niagara River, and at its north-east corner it discharges into the St Lawrence. Its surface, which is subject to periodical variations (4 to 7 years) of about $3\frac{1}{2}$ feet, which it is attempted to explain on the supposition of there being a subterranean river out of the lake, is 326 feet below the surface of Lake Erie and 246 feet above the ocean-level. Its mean depth is about 300, its maximum depth 738, feet. It is 180 miles long, 53 wide in its widest part, and over 500 in circumference. It has many thriving ports, of which the chief are Kingston, Coburg, Port Hope, Toronto, and Hamilton on the Canadian shore, and Sackett's Harbor, Oswego, and Charlotte in the United States. It is connected with Lake Erie by the Welland Canal, with the Erie Canal and river Hudson by the Oswego Canal, and by the Rideau Canal with the Ottawa River. There is a complete system of lighthouses. Lake Ontario is subject to violent storms, and it is probably owing chiefly to the constant agitation of its waters that it freezes only for a few miles from the shore. It is entered by numerous rivers, the largest being the Genesee, Oswego, and Black. The shores are generally very flat, but the Bay of Quinte, near Kingston, a long, crooked arm of the lake, which

stretches about 50 miles, possesses some attractive scenery.

Ontario, the most populous and wealthy province of the Dominion of Canada, is bounded E. by Quebec; SE., S., and SW. by the St Lawrence and the great lakes; N. by James Bay and Hudson Bay; and NW. and W. by Manitoba. Area, 407,262 sq. m. (including 41,382 sq. m. of water); pop. (1881) 1,926,922; (1891) 2,114,321; (1901) 2,182,947; (1911) 2,523,274; (1921) 2,933,662. The surface is generally undulating, and there are no elevations of any considerable height. The Laurentian Hills run westward from the Thousand Islands near Kingston, and extend north of Lake Simcoe, forming the coasts of Georgian Bay and Lake Huron. In the middle of Eastern Ontario the high land forms a watershed, separating the rivers flowing into the great lakes from those entering the Ottawa and the St Lawrence. Further to the north is the east and west divide between the river systems flowing into James Bay and Hudson Bay and those emptying into Lakes Huron and Superior. The Ottawa forms the north-eastern boundary of the province, and the St Lawrence divides the eastern portion from the United States. It is bounded on the south by the great lakes, and among the smaller lakes are Simcoe, Nipissing, Nipigon, and many others.

Ontario is largely an agricultural country, and its resources are very great. Farming, stock-raising, dairy-farming, and fruit-growing are important industries. Immense crops are raised of all the products of a temperate climate; in Southern Ontario Indian corn is a regular crop, and grapes, peaches, and tomatoes ripen in the open air in perfection and in great quantities.

In minerals the country is also very rich. Iron is found in many parts; copper, lead, cobalt, plumbago, apatite, mica, corundum, felspar, talc, arsenic, gypsum, marble, and building-stone are abundant; there are also gold and silver deposits, the latter very extensive. The mines at Cobalt have yielded in some years about one-eighth of the world's production of silver. The nickel deposits at Sudbury are probably the most extensive in the world. There are petroleum-wells in the south-west part of the province, and the salt-wells on the shores of Lake Huron contain apparently inexhaustible supplies. Coal is brought mainly from Pennsylvania by the lakes. There are numerous waterfalls from which power can be generated on a large scale, notably at the Falls of Niagara, the extensive development of which will very favourably affect manufactures. A very extensive transmission line system, constructed by the Ontario government, conveys power to Western Ontario.

There are numerous manufactures and industries. The principal are lumber, iron and steel, cement, implements, wagons and carriages, railway rolling-stock (including locomotives), motor-cars, electrical and heating apparatus, cottons, woollens, leather, furniture, musical instruments, paints and oils, iron and hardware, wood-pulp and paper, soap, wooden-ware, canned goods, flavours.

There is only one large city, Toronto, which has over half a million inhabitants; but smaller cities and towns—Ottawa, Hamilton, London—are scattered all over the southern half of the province, and are usually manufacturing or agricultural centres. The farms in these districts are well cultivated and fenced, with houses as a rule superior to those found in Great Britain.

The southerly or well-settled portion of Ontario has a perfect network of steam railways, which has proved of great advantage in the development of its manufacturing and agricultural industries. The transcontinental routes, of course, pass from end to end of the province. (See CANADA.)

The inland navigation is very important. The

route from Montreal to Port Arthur by way of the St Lawrence River, Lake Ontario, Welland Canal, Lake Erie, the St Clair River, Lake Huron, Sault Ste Marie Canal, and Lake Superior embraces 1230 miles of continuous navigation. This system has a minimum depth of water of 14 feet. The Great Lakes Waterway Scheme, involving the improvement of the upper St Lawrence, the avoidance of its rapids by canals, and the enlargement of the Welland Canal, would put the ports of Ontario in direct communication with the ocean. Toronto and Port Arthur therefore see it in a different light from Montreal. The Rideau Canal from Ottawa to Kingston (126 miles), the Ottawa River, the Trent Valley Canal, and many similar systems carry on a large local trade.

By far the larger proportion of the imports comes from the United States. The exports, mostly to Great Britain, include agricultural products, animals and their products, minerals and manufactured goods, and timber.

The school system of Ontario is admirable, and is under the control of a Minister of Education. The schools are supported by a tax on property, with state grants, and are free to all. Roman Catholics may, if they wish, establish separate schools, and are then exempted from supporting the public schools, receiving a separate grant from the government. The principal institutions for higher education are the University of Toronto; Queen's University, Kingston; Ottawa University, Ottawa; Western University, London; McMaster University, Toronto; Trinity and Victoria Universities (affiliated with the University of Toronto); Knox College, Wycliff College, St Michael's College, and others in affiliation with the University of Toronto. There is a notable College of Agriculture at Guelph. In Ontario the Protestant religious bodies predominate; the Methodists are the most numerous, followed by the Church of England, then by the Presbyterians. The Roman Catholics are about 19 per cent. of the population.

Public affairs are administered by a lieutenant-governor, a cabinet, and a Legislative Assembly of 111 members, elected every four years. In the Dominion parliament the province is represented by twenty-four members in the Senate, and eighty-two members in the House of Commons. The municipal system is one of the most perfect in the world, and affords a pattern which has been followed in many other countries.

History.—Ontario was largely founded by immigration of United Empire Loyalists into Canada after the achievement of independence by the United States in 1783. It was made into a separate province and called Upper Canada in 1791 (see CANADA). The two provinces were reunited in 1840 as the result of the disturbances in 1837 and 1838, and remained in that position until confederation in the year 1867, when the province received the name of Ontario. Since that time it has undergone rapid development. The great northern forests have been opened up during the first decades of the 20th century by several new railways. That region has already given ample proof of possessing great mineral wealth and great agricultural resources. The area was much increased in 1912 by the addition of about 146,000 sq. m. north of the Albany River, between the borders of Manitoba as then extended and Hudson Bay.

Ontology. See METAPHYSICS, PHILOSOPHY.

Onus Probandi, i.e. the burden of proof, is often a difficult question in litigation; but as a rule the plaintiff who institutes the suit is bound to give proof of the allegations on which he relies.

Onyx, an agate formed of alternating white and black, or white and dark-brown, stripes of chalced-

ony. More rarely a third colour of stripes occurs. The finest specimens are brought from India. Onyx is in much esteem for ornamental purposes. The ancients valued it very highly, and used it much for cameos. Many of the finest cameos in existence are of onyx. The name onyx, however, appears to have been applied by the ancients more extensively than it now is, and even to striped calcareous alabaster, such as is now called Onyx Marble. The *Sardonyx* of the ancients is a variety of onyx in which white stripes alternate with stripes of a dark-red variety of carnelian, called *sard* or *sarda*. It is one of the rarest and most beautiful kinds of onyx, and is more valued than carnelian.

Oodeypore. See UDAIPUR.

Oojein. See UJJAIN.

Oolachan. See CANDLE-FISH.

Oolite (Gr., 'egg-stone'), a variety of limestone, composed of spherical granules of calcium carbonate, which have a concentric and often a fibrous radiating structure. In many cases these granules contain a nucleus or kernel of some foreign substance, such as a grain of sand, round which the successive layers or encrusting coats of calcium carbonate have been formed. Sometimes their origin is mechanical, the layers having been deposited round a nucleus from a saturated solution; often, however, tubular structures indicative of the former presence of organisms are observed in microscopic sections of the older oolites, and in the Sprudelstein of Carlsbad and the oolitic sands of the Great Salt Lake, modern equivalents of oolitic limestones, it has been proved that calcareous algæ are active agents in the formation of the granules. The coarser varieties of oolite are termed *Peastone* or *Pisolite*.—For Oolite as the name for a group of strata, see JURASSIC SYSTEM.

Oonalashka. See ALEUTIAN ISLANDS.

Oosterzee, JAN JAKOB VAN, theologian, was born in 1817 at Rotterdam, studied at Utrecht, was a pastor in Rotterdam, and in 1862 became a theological professor at Utrecht, being the leader of the Evangelical school in Holland. He died 29th July 1882. He wrote many works, amongst them a *Life of Christ*, a *Christology*, a work on John's Gospel (in German), commentaries on Luke and the Pastoral Epistles in Lange's Commentary; also a *Theology of the New Testament* (1867; Eng. trans. 1870, 4th ed. 1882); *Christian Dogmatics* (1872; trans. 1874); *Moses* (trans. 1876); *Practical Theology* (trans. 1878).

Ootacamund, or UTAKAMAND, the chief town in the Neilgherry (q.v.) Hills, the principal sanatorium of the Madras Presidency, and the summer headquarters of the governor of Madras. It stands on a plateau, in an amphitheatre surrounded by hills, 7228 feet above the sea, 350 miles from Madras city, and since 1899 has railway connection with Madras. There are a public library (1859), the Lawrence Asylum (1858) for the children of British soldiers, and botanical gardens. The mean annual temperature is 58° F. The first house was built in 1821. Pop. 20,000.

Ooze, a term technically applied to some kinds of deposits found covering the bottom of the deeper parts of the sea. It is not only the depth of the water but the distance from the land which determines the occurrence of ooze. As we pass from the shore out to sea we find a succession of deposits, shingle, sandy mud, mud—all derived from the land; but at a distance varying from 60 to 300 nautical miles from the shore, and at a depth of 2000 feet or more, lie the various oozes, which consist of the remains of numerous small organisms, but especially of the shells of Foraminifera. A whitish deposit, containing enormous numbers

of Globigerina shells, which in dying have sunk from the surface, is very widely distributed till depths of about 2000 fathoms are approached. There the Globigerina ooze wanes away, and is replaced in the deeper regions by so-called 'red clay.' At the surface above there are of course here as elsewhere abundant Foraminifera which still doubtless sink, but the physical conditions of the great depths are such that their shells are dissolved in falling. But in certain of the deepest parts—e.g. at 4575 fathoms—the *Challenger* explorers found another kind of ooze, composed of the flint shells of Radiolarians. Besides this, in other regions the shells of Pteropods and Diatoms are abundant enough to form a characteristic ooze.

It is to be understood, however, that the various oozes (Globigerina, Radiolarian, Pteropod, Diatom, &c.) pass into one another, and that the names usually express simply the predominance of one or other kind of shell, and also that the colours—white, yellow, brown, and red—mainly denote the proportion in which the 'red clay' is present. The latter owes its colour to the oxides of iron and manganese, and is composed of disintegrated materials of volcanic origin, such as pumice, and also of meteoric dust. These, after being carried by winds and floated on ocean currents, sink and are distributed at the bottom. But as to the ooze in the strict sense, it ought also to be noted that the dead or dying organic material, which the rain of these organisms brings to the bottom, serves as the fundamental food-supply of deep-sea animals, while the shells not only accumulate as ooze, but aid in the elevation of submarine volcano-tops to the level at which corals can grow. Finally, the results of the ooze of incalculably distant ages are seen in chalk, which is composed almost entirely of Foraminifera, or in such Radiolarian deposits as Barbados Earth. See CHALK, DIATOM, FORAMINIFERA, GLOBIGERINA, PTEROPOD, RADIO-LARIA, SEA, and the concluding volume of the *Challenger* Reports by Murray and Renard.

O.P., that is, 'Old Prices,' was the war-cry of the O.P. riots. Covent Garden Theatre was burned to the ground 20th September 1808, rebuilt, and opened 18th September 1809 with a performance of *Macbeth*, the cast including John Philip Kemble (manager and part-proprietor) and Mrs Siddons. An increase in prices had been announced, and the play was performed in pantomime amid uproar. For the next three months or so O.P. badges and placards were seen everywhere, and the issue was fought in the press and the law-courts as well as the theatre, where the introduction of prize-fighters friendly to the management failed to gain a hearing for the stage. A compromise was at last agreed to.

Opacite, name given by petrologists to minute black, opaque, amorphous aggregates, grains, and patches of indeterminate mineral matter, which are seen in many igneous rocks when these are viewed in thin slices under the microscope. Opacite is probably in most cases hematite, limonite, magnetite, or other iron oxide, and is a product of the chemical alteration of one or other of the original mineral constituents of the rock in which it occurs.

Opah, or KING-FISH (*Lampris luna*), the sole representative of the family Lampridæ, the affinities of which are uncertain. The body is deep and laterally compressed, sometimes reaching a length of 4 feet. It shows minute scales and vivid colours. The back is bluish gray; the sides violet, becoming red underneath; there are scattered spots of silver; the fins and tail are deep scarlet. The mouth-opening is narrow, and there are no teeth. Little is known of the opah's habits;

it seems to feed on open-sea fishes and on cuttle-fish. Its distribution is wide—e.g. North Atlantic, Pacific, and Mediterranean. Occasional specimens are caught off British coasts. The rich palatable flesh is reddish or yellowish in colour,

Opah (*Lampris luna*).

intermediate between that of the salmon and that of the tunny. The opah is also called sea-perl, carl, and Jerusalem haddock, and again a sun-fish—a name likewise given to *Orthogoriscus* (see SUNFISH) and to the basking shark (see SHARK)—because it comes to the surface in calm weather.

Opal, a mineral which differs from quartz in containing generally 3 to 10—in some cases only 1, in others as much as 21—per cent. of water, its only other essential constituent being silica, although a little alumina, oxide of iron, &c. is often present. The water is readily driven off on the application of heat, and some opals contain so small a proportion of water that they might be described simply as jelliform quartz. Not infrequently minute scales or plates of tridymite (a crystallised variety of silica) are present in opal. The latter is never found crystallised, and does not exhibit a crystalline structure like quartz. It has a conchoidal fracture, and is very easily broken. There are many varieties, which pass into one another, so that their precise limits cannot be defined, from which has arisen no little confusion of names. The finest kind is called *Precious Opal* or *Noble Opal*, and sometimes *Oriental Opal*. It is semi-transparent or translucent, usually of a bluish or yellowish-white colour, yellow by transmitted light. Its brilliant play of colour is due to refraction of light in curving layers of varying composition. It is much valued for setting in rings, brooches, &c., and is polished with a convex surface, never cut into facets, both because of its brittleness and because its play of colours is thus best exhibited. The ancients valued opals very highly. The Roman senator Nonius preferred exile to giving up an opal to Mark Antony. This opal was still to be seen in the days of Pliny, who ascribes to it a value equal to more than £20,000 sterling. The imperial cabinet of Vienna contained the most celebrated opal now known to exist. It is 5 inches by 2½ inches. The finest opals were formerly all brought from Czerwenitz, between Eperies and Kassa, in Slovakia, where they are found disseminated as alteration-products in andesitic breccia. They are mostly very small, but even a very small opal, if really beautiful, is worth four or five pounds; and the price increases very rapidly with increase of size. Precious opal is found also in Queensland, New South Wales, &c. When the colours are not equally diffused, but in detached spots, jewellers call it *Harlequin Opal*. There is a dark or blackish variety, apparently tinged by oxide of iron, which occasionally exhibits very beautiful reflections, and is then much prized. *Girasol* (q.v.) and *Cacholong* (q.v.) are varieties of opal. What lapidaries call *Prime d'Opal* is porphyrite or other igneous rock, containing many small amygdulæ of opal. It is

cut into slabs, and made into boxes and other ornamental articles; the stone which contains the opals being often artificially blackened by boiling in oil, and afterwards exposing to a moderate heat. — *Common Opal* is semi-transparent, white, yellow, green, red, or brown, and does not exhibit any play of colours. It is not a rare mineral, and is chiefly found in veins and cavities or diffused (as an alteration-product) through the mass of various igneous rocks. *Semi-opal* is more opaque. *Wood Opal* is a petrification, and exhibits the form and structure of wood, the place of which has been taken by the siliceous mineral. *Hyalite* and *Menilite* are varieties of opal.

Opatija, Slovenian name of Abbazia (q.v.).

Opava. See OPPAU.

Opera is a drama which is sung throughout to the accompaniment of a full orchestra. The various forms of aria or song, recitative or declamation, duet, trio, &c., concerted piece or instrumental interlude, are used as the exigencies of the situation demand. The whole is usually introduced by an introduction, *vorspiel*, or Overture (q.v.), and often one of the acts contains a ballet or pantomimic dance. It is a direct development from the discovery by the Florence Academy (see MUSIC) of Monody or the musical expression of a single individuality by a single voice. As every country, every school since 1600 has felt the fascination of the art problem, and nearly every great composer has been ambitious to solve it, the opera is a universal possession, and its range is almost as wide and varied as the history of music itself. *Italian Opera* is marked by its spontaneity and melodious character, and even more by the honour of priority; *German Opera* is the product of greater geniuses than any other can boast, but lacks the continuity which makes the *French* school so interesting to the student.

Italian School.—The experiments in scena-writing (1582-90) culminated at Florence in the first real opera, *Dafne* (1594), by Peri and Caccini, the more successful *Euridice* (1600), and the very advanced work of Monteverde. The new departure in music soon spread its influence beyond Florence to Venice, where Monteverde spent the last thirty years of his life, and to Naples, where Alessandro Scarlatti (1659-1725) took up the work and founded the Neapolitan or 'beautiful' school. Scarlatti, by the prominence he gave to melody, may be said to be the founder of Italian opera, which to this day is noted for so-called melody in profusion, and the comparative indifference to other as important qualities, such as harmony, orchestration, and dramatic unity. No Italian work of the 18th century has survived save Cimarosa's *Il Matrimonio Segreto* (1792), which, very similar in style to Mozart's greater works, has been overshadowed by these. The most famous modern Italian composer is Rossini, a brilliant vocal writer, whose charming *Barber of Seville* (1816) is a model of *opera buffa*, and whose serious opera, *William Tell* (1829), also keeps a place in the repertoire of the European stage. Bellini's *Norma*, *La Sonnambula*, *Puritani*, and Donizetti's *Lucia di Lammermoor* and *Lucrezia Borgia* still survive out of more than 100 melodious works. The earlier operas of Verdi are quite Italian in style (*Trovatore*, 1851; *Traviata*, 1853, &c.). *Aida* (1871) shows a leaning to, and *Otello* (1887) complete adhesion to the modern music drama. To Verdi succeeded Mascagni (*Cavalleria Rusticana*, 1890), Leoncavallo (*Pagliacci*, 1892), and Puccini (*La Bohème*, 1896; *La Tosca*, 1900; *Madame Butterfly*, 1904; *Gianni Schicchi*, 1918).

German Opera.—During the 17th and early part of the 18th century the opera in southern Germany

was purely Italian. Dresden, where Hasse reigned supreme, and Vienna were the two centres. It was in Hamburg that the National school was founded by Keyser, who wrote (1694-1734) over 100 operas in which a high dramatic ideal is apparent. Gluck, though a German, belongs more to the school of French Grand Opera. Mozart, after beating the Italians on their own melodic ground in *Idomeneo*, *Die Entführung*, *Figaro*, and *Don Giovanni* (1781-87), wrote the first national romantic opera, *The Magic Flute* (1791). Beethoven, desiring nobler plots of a more serious and moral character than had satisfied the light-hearted Mozart, chose Bouilly's *Léonore* as the foundation of his single opera *Fidelio* (produced 1805, rewritten 1814). The operas of Weber were deeply imbued with the romanticism of the early 19th century, and in *Der Freischütz* (1821) he uses the national folklore with immense effect. To this new Romantic school also belong the operas of Marschner and of Spohr, the beauty of whose music is buried, like Weber's *Euryanthe* and Schubert's *Rosamunde*, under absurd libretti.

Melodrama in opera is an effective device which originated in Germany. The singer recites his part in an ordinary speaking voice accompanied by orchestral music, which seeks to convey the meaning of the situation and scene to the audience. Benda first used it (*Ariadne*, 1774), and Mozart, who heard it in 1778, was much impressed by its possibilities. The most successful example is the grave-digging scene in Beethoven's *Fidelio*; Weber in *Der Freischütz* and Mendelssohn in *A Midsummer Night's Dream* have also used it with happy effect.

The *French Grand Opera School* is extremely important, not only on account of its continuity and consistence, but because at various times, and for various reasons, great men were attracted from foreign countries to it as a centre. It was founded by the Florentine Lully, reformed by the German Gluck; and Italians like Cherubini, Spontini, Rossini, Belgians like Grétry, Germans like Meyerbeer and Wagner have both learned from it and contributed to its various stages of development. Lully (born 1633) arrived in Paris a boy of thirteen in the train of the Chevalier de Guise, and by his diplomatic and social, no less than by his musical talents, he gradually pushed his way to the very summit of musical success, and lived in great favour with King Louis XIV. In 1672 he obtained a patent conferring the sole right of producing operas in Paris, and this monopoly he held till his death in 1687. Musical Paris was sharply divided between his followers and those of Rameau (1683-1764), until the arrival of an Italian company made them unite their ranks in opposition to the foreigners. The characteristic of this French school from its beginning was its attention to rhetoric and dramatic requirements. The treatment of recitative in particular has always been a feature since Lully's time, and he it was also who invented the overture. Gluck arrived in Paris in 1774, and produced his *Iphigénie en Aulide* and *Iphigénie en Tauride* there; and the ideal expressed by Peri and Monteverde, embodied to a considerable extent in these and other works (see GLUCK), has at last found its goal in the music drama of Wagner. Cherubini's seriousness and nobility of style (*Les Deux Journées*, 1800), Méhul's fine ear for effect (*Joseph*, 1807), Spontini's magnificence of conception (*Vestale*, 1805), and Halévy's dramatic truth (*Juive*, 1835) were all ranged under Gluck's banner, and the roll of French grand opera is brought to a gorgeous close with the name of Wagner's predecessor, Meyerbeer (*Robert le Diable*, 1831, *Huguenots*, 1836, *Le Prophète*, 1843). The new blood he brought with him from the schools of Germany and Italy invigorated it, and the time

was ripe when the experiment of *Rienzi* was made in 1842. Other important contributions to grand opera were Auber's *Masaniello* (or *Muette de Portici*, 1828) and Rossini's *Guillaume Tell* (1829).

Opéra Comique (by no means comic opera) is a title applied to all works which, on account of spoken dialogue, were not eligible for performance at the Grand Opéra. Grétry's *Cœur de Lion* (1784), Méhul's *Joseph*, Boieldieu's *La Dame Blanche* (1825), Hérold's *Pré aux Clercs* (1832), and Auber's *Le Maçon*, *Les Diamants de la Couronne*, &c. are the most famous. This *Opéra Comique*, so purely French, had a large share in the development of the modern lyric opera, of which Gounod's *Faust* (1859), Thomas's *Mignon* (1871), and Bizet's *Carmen* (1875) are good examples.

The *Ballet* (entirely pantomimic) attained a very high pitch of development in Paris, where Delibes (1836-91) produced his charming *Coppélia* and *Sylvia*.

Comic opera proper (*Opera Buffa*) is represented in Italy by Rossini's *Barbiere*, Donizetti's *Figlia del Reggimento* (1840), and Verdi's last great work, *Falstaff* (1893); in Germany by Flotow's *Martha* (1847), Nicolai's *Merry Wives* (1849); in France (*Opéra Bouffe*) by Offenbach's *Orphée aux Enfers* (1858), *Grande Duchesse* (1867), &c., Le-cocq's *Madame Angot* (1873), &c., and numberless other bright works; and in England worthily by the charming Gilbert-Sullivan series (*Pinafore*, 1878; *Patience*, 1881; *Mikado*, 1885).

Music Drama is the ideal which Wagner has sought to embody in *Tristan und Isolde* (1865), *Meistersinger* (1868), *Ring des Nibelungen* (1876), and *Parsifal* (1882). *Rienzi* (produced in Dresden in 1842) establishes his connection with the Grand Opéra of Meyerbeer, and in the *Flying Dutchman* (1843), *Tannhäuser* (1845), and *Lohengrin* (1849) the growth of his method is distinctly seen, as well as his indebtedness to many predecessors, especially, in orchestration, to Berlioz. Wagner seeks to make the 'Art Work of the Future,' as he calls it, equally dependent on music, drama, and scenic art—the requirements of none being sacrificed to the demands of the other, but all contributing to one perfect unity. His influence is clearly traceable in all modern operas—e.g. Goldmark's *Queen of Sheba*, *Merlin*, Boito's *Mefistofele*, Ponchielli's *Gioconda*, Verdi's *Otello*, Humperdinck's *Hänsel und Gretel*.

English Opera.—Purcell's early work, *Dido and Æneas*, written at the age of seventeen, his chef d'œuvre *King Arthur* (1691), and other works gave promise of such an English school of opera as the 'Masques' of Lawes and others had suggested (1613-75), but no one was ready to carry on the work after his early death in 1695 (aged thirty-seven). Dr Arne's *Artaxerxes* (1762), out of thirty-four operas, is the only other English opera which calls for mention. Italian opera became the fashion in London (Handel wrote forty-four, 1710-39), and England's attention was divided between that school and the highly inæsthetic and, from an operatic point of view, worthless form of *Ballad Opera*, founded by Dr Pepusch (*Beggar's Opera*, 1728), until late in the 19th century, when Mac-kenzie's *Colomba* (1883), Villiers Stanford's *Canterbury Pilgrims* (1884), Goring Thomas's *Esmeralda* (1883), Sullivan's *Ivanhoe* (1891), and works by Cowen, MacCunn, and others sought to win recognition for English opera. The development has been carried on by Ethel Smyth, Granville Bantock, Rutland Boughton, Gustav Holst, Vaughan Williams, &c.

Russian Opera comes to the world's notice with Glinka's *A Life for the Tsar* (1836) and *Russian and Liudmila* (1842). Mussorgski's *Boris Godunov* was produced in 1874. His *Khovantchina* (1880),

like Borodin's *Prince Igor*, was completed by Rimski-Korsakov, himself well known as a composer of operas (*The Golden Cockerel*, &c.). Tschai-kowsky's best-known opera is *Eugen Onegin* (1879).

New tendencies are seen in Germany in Strauss's *Salome* (1905), *Elektra* (1909), *Rosenkavalier*, *Die Frau ohne Schatten* (1919), and in France in Debussy's *Pelléas et Mélisande* (1902).

See histories of opera by Elson (1901), Apthorp (1901), and Streatfeild (1896; new ed. 1925); and the articles on GLUCK, MOZART, WEBER, and WAGNER in this work.

Opera-glass, a double telescope, used for looking at objects that require to be clearly seen rather than greatly magnified, such as adjoining scenery and buildings, the performers at a theatre or opera, &c. The opera-glass is short and light, and can be easily managed with one hand. Its small magnifying power (from two to three at the most), and the large amount of light admitted by the ample object-glass, enable it to present a bright and pleasant picture, so that the eye is not strained to make out details, as in telescopes of greater power, which generally show a highly-magnified but faint picture. It allows the use of both eyes, which gives to the spectator the double advantage, not possessed by single telescopes, of not requiring to keep one eye shut (a somewhat unnatural way of looking), and of seeing things stand out stereoscopically as in ordinary vision.

The opera-glass is the same in principle as the telescope invented by Galileo. It consists of two lenses, an object-lens and an eye-lens. The object-lens is convex, and the eye-lens concave. They are placed nearly at the distance of the difference of their focal lengths from one another (see TELESCOPE). The opera-glass need not be set to a precise point, as is necessary with ordinary terrestrial telescopes, for the lengthening or shortening of the instrument does not produce so decided an effect on the divergence of the light; the change of divergence caused by screwing the opera-glass out or in is so slight as not much to overstep the power of adjustment of the eye, so that an object does not lose all its distinctness at any point within the range of the instrument. There is, however, a particular length at which an object at a certain distance is most easily looked at. The two telescopes of the opera-glass are identical in construction, and are placed parallel to each other. The blending of the two images is easily effected by the eyes, as in ordinary vision. Opera-glasses form an important article of manufacture, of which Paris is the great seat. The cheapest opera-glasses consist of single lenses; those of the better class have compound achromatic lenses. A very ordinary construction for a medium price is to have an achromatic object-glass, consisting of two lenses, and a single eye-lens. In the finest class of opera-glasses, which are called *field-glasses*, both eye-lenses and object-lenses are achromatic. Plössl's celebrated field-glasses (Ger. *Feldstecher*) have twelve lenses, each object-lens and eye-lens being composed of three separate lenses.

Of late years attention has been paid to prismatic binoculars, the principle of which is simply that the two tubes instead of being straight and parallel are given a  form and are fitted with

total reflexion prisms at the angles. The effective tube-length is thus increased and the instrument somewhat widened; and, the object-lenses being farther apart than the two eyes, a somewhat exaggerated sense of perspective is induced, which conduces to accurate focussing. The virtually lengthened tube also lends itself to higher magnifications.

Ophicleide (Gr. *ophis*, 'serpent,' and *kleis*, 'key'), a brass bass wind-instrument, was developed from improvements on the Serpent (q.v.) about the beginning of the 19th century. It consists of a conical tube having a bell like that of the horn, a cup mouthpiece, and usually eleven holes stopped by keys like the old Kent bugle. It has the usual harmonic (see HARMONICS) open notes of all brass instruments, its fundamental, never used, being an octave lower. By means of its keys it has a range, including all the semitones, of a little over three octaves, and its music is written in the

bass clef. Alto and double-bass ophicleides have also been made, but not much used. It is much to be regretted that an instrument of such a characteristically rich tone, and capable of intonation so accurate as the ophicleide, has been allowed to fall completely out of use. It has been superseded by the simpler three-valved instruments of the Saxhorn (q.v.) type.

Ophidia. See SNAKES.

Ophicleide.

Ophioglossaceæ, a family of Filices or Ferns (q.v.), consisting of a few rather elegant little plants with an erect or pendulous stem, which has a cavity instead of pith, leaves

with netted veins, and the spore-cases (*thece*) collected into a spike whose morphology is doubtful, 2-valved, and without any trace of an elastic ring. They are found in warm and temperate countries, but abound most of all in the islands of tropical Asia. Several species are European, and two are British, the *Botrychium Lunaria*, or Moonwort (q.v.), and the Common Adder's-tongue (*Ophioglossum vulgatum*), which was at one time supposed to possess magical virtues, and was also used as a vulnerary, although it seems to possess only a mucilaginous quality—on account of which some of the other species have been employed in broths. It is a very common plant in England, its abundance in some places much injuring pastures.

Adder's-tongue
(*Ophioglossum vulgatum*).

Ophir, a region, frequently mentioned in the Old Testament, from which the ships of Solomon, fitted

out in the harbours of Edom, brought gold, precious stones, sandalwood, &c. The voyage occupied three years. Where Ophir was situated has been a much-disputed question. Arias Montanus fixed on Pern, Raleigh on the Moluccas, and Calmet on Armenia. Probably, however, Ophir was either

on the east coast of Africa about Sofala, or in Arabia, or in India, but in which of the three countries is disputed. On the whole, the balance is strongly in favour of Arabia.

Ophites (Gr. *ophitai*, from *ophis*, 'a serpent'), a class of Gnostics, who, while they shared the general belief in dualism, the conflict of matter and spirit, the emanations, and the Demiurgos, were distinguished by giving a prominent place in their systems to the serpent. Some of their divisions were the Sethiani, the Naaseni (Heb. *nahash*, 'serpent') in Phrygia, and the Peratæ, who honoured the serpent which tempted Eve, as having introduced knowledge and revolt against the bondage of the Archon. We owe our knowledge of them mainly to Irenæus, Clement, Origen, and Hippolytus: the last also contains an account of two other Ophite systems, that of the Sethians and of Justinus. Already in his day the sect was fast dying out, although Theodoret mentions serpent-worship as still existing in the 5th century.

See GNOSTICISM, and the books named there; also Lipsius in the *Zeitschr. für Wissenschaftl. Theol.* (1863); Gruber, *Die Ophiten* (1864); King, *The Gnostics, their Remains* (1887); Adolph Hönig, *Die Ophiten* (1889); and E. F. Scott's article in *Hastings's Ency. of Rel. and Ethics*.

Ophitic Structure, a name given by petrologists to a structure seen in various crystalline igneous rocks, in which large plates of pyroxene are penetrated and divided, as it were, into small portions, by crystals of felspar. The separated portions of the pyroxene, however, are in crystalline continuity, since they all possess the same optic orientation.

Ophiuroidea. See BRITTLE-STARs.

Ophthalmia was originally and still is sometimes used to denote inflammation of the eye generally; but it is at the present time usually restricted to inflammations of the conjunctiva or mucous coat of the eye (*conjunctivitis*); and to sympathetic inflammation or ophthalmia (see under EYE). *Ophthalmia neonatorum* is a serious form of conjunctivitis found in new-born infants, which is apt, if untreated, to result in blindness.

Ophthalmoscope, an instrument by which the interior of the eye can be examined. It was first invented in 1847 by Charles Babbage (q.v.); but, as unfortunately the ophthalmic surgeon to whom he showed it did not recognise its importance, he laid it aside without making it generally known; and its principle had to be rediscovered by Professor Helmholtz, to whom belongs the credit of bringing it before the medical and scientific world in 1851. The value of the instrument depends on the circumstance that by illuminating and examining an eye in the same direction its deeper parts can be rendered visible. All forms of ophthalmoscope are adaptations of this principle. The form now generally in use resembles more that of Babbage than that of Helmholtz. It consists of a concave mirror of about 10 inches focus, $\frac{1}{2}$ to $1\frac{1}{2}$ inches in diameter, with a small hole in the centre, and certain lenses to use with it, the most important of them a separate convex lens of $2\frac{1}{2}$ inches focus, and $1\frac{1}{2}$ to $2\frac{1}{2}$ inches in diameter. Examination is facilitated by dilating the pupil of the observed eye with atropine; and for a complete examination this is often indispensable. The person whose eye is to be examined is seated in a darkened room, with a bright light—e.g. a good gas-burner—on a level with his eye by the side of his head. The observer sits opposite him, and, placing the mirror close to his own eye, and about 18 inches from the eye to be examined, reflects the light upon the latter, while he looks at it through the hole. The pupil in a healthy eye appears of a bright red or orange instead of its usual deep black. In short-sighted

and long-sighted eyes, but not in normal ones, the vessels of the retina, the entrance of the optic nerve, &c. can be more or less distinctly seen, and by their movements the deviation from the normal refraction can roughly be estimated. Opacities in the lens (Cataract, q.v.) or vitreous humour appear black, and are discovered by this method more certainly and easily than by any other. The details of the retina, choroid, &c. (or *fundus*) can be seen in two different ways. In the *indirect method* the observer, seated as above described, holds the 2½-inch convex lens about 3 inches from the eye under examination, between it and his own, when a clear real image of part of the fundus, inverted and magnified about four diameters, appears in the red light of the pupil. In the *direct method* the observing eye must be placed as close to the observed as the intervention of the mirror will allow, when a virtual image of a smaller part of the fundus is seen, but erect and magnified about fourteen diameters. The fundus appears of an orange or red colour, varying much in different individuals; the blood-vessels of the retina are seen as darker red lines coursing over it. The entrance of the optic nerve, commonly called the *disc*, from which these vessels diverge, appears as a round area of a much paler colour. An *electric ophthalmoscope* carrying a dry cell and minute lamp is also used by the direct method, and dispenses with a separate light. The ophthalmoscope has revolutionised the examination of the optic nerve, choroid, and retina. Some deep-seated affections have, moreover, important relations to general diseases—e.g. Bright's disease, diabetes, syphilis, diseases of the brain and spinal cord—and general medicine has benefited accordingly. The ophthalmoscope has also much facilitated the discovery and correction of errors of refraction (short- and long-sightedness, Astigmatism, q.v.; see under EYE).

Opie, AMELIA, daughter of a Norwich physician, Dr Alderson, was born in 1769, and while very young wrote songs and tragedies, and was acquainted with Godwin, Mrs Inchbald, Mrs Siddons, and much of the literary society of the time. She married the painter Opie (q.v.) in 1798. In 1801 her first novel, *Father and Daughter*, appeared; the following year, a volume of poems. *Adeline Mowbray* and *Simple Tales* were her next works. On her husband's death she returned to Norwich, and published his lectures with a memoir prefixed. She wrote also *Temper*, *Tales of Real Life*, *Valentine's Eve*, *Tales of the Heart*, and *Madeline*. Having been long acquainted with the Gurneys, Mrs Opie became a Quaker in 1825, and afterwards published *Illustrations in Lying, Detraction Displayed*, and articles in periodicals, but no more novels. She died at Norwich, 2d December 1853. See her *Memoirs* by Miss Brightwell (1854), and Lady Richmond Ritchie's *Book of Sibyls* (1883).

Opie, JOHN, R.A., was born at the village of St Agnes, 7 miles from Truro, Cornwall, in May 1761. His father, a master-carpenter, wished him to follow the same trade, but his bias for art was strong; and his attempts at portrait-painting secured the friendly help of Dr Wolcot ('Peter Pindar'). In 1780 he was taken to London by Dr Wolcot, and immediately came to be acknowledged by the fashionable world as the 'Cornish Wonder.' This tide of good-fortune soon ebbed, but not before Opie had realised a moderate competency. The loss of popular favour, however, only served to bring out Opie's manly independence and strong love of art, and he calmly entered on that department of painting which was then regarded as the only style of high art, namely, historical or scriptural subjects, executed on a large scale. His pencil was employed by Boydell

in his well-meant and magnificent scheme to elevate British art; he also painted a number of works in the illustration of Bowyer's English History, Macklin's Poets and Biblical Gallery, and other similar undertakings. His pictures of the 'Murder of James I. of Scotland,' 'The Slaughter of Rizzio,' 'Jephtha's Vow,' 'Presentation in the Temple,' 'Arthur and Hubert,' 'Belisarius,' and 'Juliet in the Garden' are his most noted works. Opie was elected an Associate of the Royal Academy in 1786, and Academician in the following year. He wrote the 'Life of Reynolds' in Dr Wolcot's edition of Pilkington's *Dictionary of Painters*, and *An Inquiry into the Requisite Cultivation of the Fine Arts in Britain*; and delivered lectures on Art at the Royal Institution. Opie was twice married. He obtained a divorce from his first wife; his second was the novelist, Amelia Opie (q.v.). He died 9th April 1807. See A. Earland's *Opie and his Circle* (1911).

Opisthocomus, or HOATZIN (*O. hoazin*), perhaps the most remarkable living bird, inhabiting the banks of the Amazon and some other South American rivers. It is the only representative of its order, and has a very isolated position, though affinities with rails and with cuckoos have been suggested. It is about the size of a pigeon. The crop, unequally muscular and glandular, is extraordinarily enlarged, and this is associated with remarkable peculiarities in the breast-bone and pectoral girdle. The food consists of leaves and fruit. The wings are large, but the flight is laboured and short. A conspicuous, loose, twig-nest, with softer lining, is placed on a branch overhanging the water, and the precocious rail-like nestlings dive and swim off when molested. They

Hoatzin (*Opisthocomus hoazin* or *cristatus*).

creep about in a reptilian fashion on the branches, using not only their bill and feet, but well-developed claws on the thumb and first finger. The adult plumage is olive above with white marking, dull rufous below; the crest and the tip of the tail are yellowish. A musky odour accounts for the name 'Stinking Pheasants.' The sharp, shrill note is described as a hissing screech. A fine account is given in C. W. Beebe's *Jungle Peace* (1918).

Opitz, MARTIN, German poet, born on 23d December 1597, at Bunzlau on the Bober, in Silesia, for a century or more after his death was extravagantly praised as the 'Swan of Bober,' the 'Swan of Silesia,' the 'Father and Regenerator of German poetry.' This inflated reputation he had earned by toadying to the princes of Germany, by writing adulatory poems in their honour, by praising third and fourth rate poetasters, who recompensed him in kind. Although himself a

Protestant, he worked and wrote for one Count Hannibal von Dohna, a cruel persecutor of the Protestants; but then Count Dohna helped him to get (1628) from the emperor a patent of nobility, and Ferdinand II. had with his imperial hand previously (1625) crowned him with the laurel crown of the poet—recognitions of his talent that Opitz valued above all things. He was summoned (1622) by Bethlen Gabor, Prince of Transylvania, to fill the chair of Philosophy and Polite Literature at Weissenburg; but at the year's end was so homesick, so wearied of the rude, martial people, and so famished through lack of the kind words of his friends, that he returned to Germany. Then he curried favour successively with the Duke of Liegnitz (1624), Count von Dohna (1626), and King Ladislaus IV. of Poland (1634), who made him his secretary and historiographer of Poland. But fate was against him: in 1620 he had fled from Heidelberg to Holland to escape war and the plague; now in Danzig, where he was living, he caught the plague from a beggar, to whom he gave a coin in the street, and died 20th August 1639. The poems Opitz wrote are like his ordering of his life, calculated: they owe their origin to the understanding, have no imagination, and little feeling, and are cold, formal, pedantic. The fact is, Opitz, originally a schoolmaster, schoolmastered poetry into lifeless imitation of pseudo-classic models. Poetry must, he propounded, in his most original work, *Buch von der deutschen Poeterei* (1624; new ed. 1876), teach and instruct as well as please. Hence his favourite pieces are purely didactic—*Trostgedicht in Widerwärtigkeit des Kriegs*, *Zlatna oder von der Ruhe des Gemüths*, *Vielgut oder vom wahren Glück*, *Vesuvius*, and others—such as the 'good boy' writes who wishes to please a pedantic master. Yet Opitz is entitled to the credit of having championed the use of his mother-tongue as against Latin, and of having actually used it. He also insisted upon the difference between the classical prosody of feet and quantity and the modern prosody of accent and rhyme, emphasising the use of the last for German poetry, and recommending the Alexandrine form of verse as that best suited to the genius of his native tongue. His works include translations from classic authors (Sophocles and Seneca, whom he puts on exactly the same rank as dramatists), the Dutchmen Heinsius and Grotius (whom he sets up as models of style), and from the Bible. Through the men who swore by him—the so-called first Silesian school—Opitz reigned for nearly a century as a sort of posthumous literary dictator, a worthy rival of Gottsched.

Opium, one of the most valuable of medicines, is the dried juice of the unripe capsules of *Papaver somniferum*, a species of Poppy (q.v.), of which several varieties are cultivated, the most usual being the variety *album*. As a commercial article opium is of great importance, exceeding indeed that of any other drug in use. The opium poppy is cultivated not merely for its yield of opium, but also for its seed or oil and other properties, concerning which see POPPY.

Papaver somniferum requires for its profitable cultivation a rich and well-manured soil, which ought to be fine and loose when the seed is sown. Subsequent cultivation consists chiefly in thinning and weeding. Irrigation is practised. Mild moist weather, with night-dews, is deemed most favourable during the time of the collection of the opium. Very dry weather diminishes the flow of the juice, and much rain is injurious. In different countries, of course, different methods of production are adopted. The general nature of these methods can, however, be gathered from an outline of the course of procedure in India.

There the seed is sown in the beginning of November; it flowers in the end of January, or a little later; and in three or four weeks' time the capsules or poppy-heads are about the size of hens' eggs, and are ready for operating upon. The collectors each take a little instrument (fig. 1),

Fig. 1.

made of three or more small knives tied together, the blades appearing like the teeth of a comb; with these they wound each half-ripe poppy-head (fig. 2) as they make their way through the field. This is always done in the afternoon, and on the following morning the milky sap is scraped off with a scoop, and transferred to an earthen vessel. When this is full it is carried home and placed in a shallow open earthenware dish, and left for a time tilted on its side, so that any watery fluid may drain out; this watery fluid is very detrimental to the opium unless removed. The opium now requires daily attention, and has to be turned frequently, so that the air may dry it equally, until it acquires a tolerable consistency, three or four weeks being necessary; it is then packed in small earthen jars, and taken to the factories, where the contents of each jar are turned out and carefully weighed, tested, valued, and credited to the cultivator. The opium is then thrown into vast vats, which hold the accumulations of entire districts, and the mass being kneaded is again taken out and made into balls or cakes. After being fully dried these balls are packed in chests for the market.

Fig. 2.

India ranks as one of the world's chief opium producers. The area of cultivation, which varies from year to year, is practically confined to the United Provinces, and to certain of the Indian states of Rājputāna and of Central India. In the United Provinces cultivation is only permitted under licence, and there is a government monopoly in manufacture, cultivators being obliged to sell their opium exclusively and at a fixed price to a government agent. There is a central factory at Ghazipur. That at Patna was closed in 1911. In the Indian states production was formerly quite unfettered, but a heavy duty was imposed on all opium exported into or through British territory. This duty has now been abolished, following an agreement by the Indian states to conform to British regulations relating to the production of opium. The opium produced in the United Provinces is known as Bengal opium, that in the Indian states as Malwa opium. Within India itself large quantities of the drug are consumed, but only medicinally, for except in Burma the smoking of opium is counted bad form. The great bulk of opium produced in India is exported, mostly from Bombay. China was for long the greatest market. In 1908, however, the British government offered on certain conditions to co-operate with China in her attempt, inaugurated by various edicts in 1906, to suppress the opium traffic. The export of Indian opium was to be diminished annually by one-tenth till export had completely ceased. In 1911 an acceleration of this

rate of cessation was agreed on, while in 1912-13 certain stringent anti-opium measures adopted in China led to an almost entire suspension of sales of Indian opium destined for the markets of China. In 1913-14 the export of opium from India to China altogether ceased, though an illicit trade of considerable dimensions arose. Export proper now takes place mainly to various countries in the Far East. To the governments of the Straits Settlements, the Dutch East Indies, and Hong-kong, opium is sold direct on public account, but on private account to Indo-China, Java, Siam, &c. At one time Indian opium was hardly ever seen in the West. During the Great War, however, India became the sole source almost for the Western supply of morphine and other drugs, with the result that a very large export trade in opium for medicinal purposes arose between India and Europe and America. But with the return to conditions of peace the trade was not fully maintained. Formerly opium provided one of the chief sources of Indian revenue, but with the discontinuance of the China trade returns under this head were greatly reduced.

Outside India, Turkey, Macedonia, Persia, and China are notable as opium producers. In Turkey about three-quarters of the opium prepared is produced in Anatolia. It is exported in large quantities by way of Smyrna, mostly for medicinal purposes. In Macedonia, where a very pure opium is produced, the industry centres principally at Štip and the surrounding districts of Kotchava, Strumica, Tikvish, and Veles. In Persia, where the trade is greatly increasing, opium is most largely produced in the districts of Isfahān, Shiraz, Yezd, and Khonsar, and to a less extent in those of Khorasan, Kermanshah, and Fars. It is of good quality, and exported chiefly from Bushire and Bandar-Abbas in the Persian Gulf. In China opium has always been largely produced. Even when the Indian trade was at its height the native production of opium was held to be quite as large as the whole amount of any foreign import. The total abolition of opium-growing within a period of ten years was part of the anti-opium policy adopted by the Chinese government in 1906. For several years considerable reductions were effected, but from 1912 onwards the growth of the opium poppy has again been very greatly extending.

In Europe (apart from Macedonia) opium has been produced in England, France, Italy, Switzerland, Greece, Bulgaria, Spain, Germany, Sweden; and in North America, in Virginia, Tennessee, California. Neither in Europe, however, nor in North America has production been on a large or remunerative scale. Attempts at cultivation have also been made in Australia and in Africa. The use of opium in Europe is mainly for medicinal purposes, and large quantities of it undergo further manufacture, in order to separate from it the active principles morphine, codeine, narcotine, &c. In Great Britain the chief manufacture of these salts of opium is carried on in Edinburgh.

Chemical Properties, &c.—All kinds of opium have a bitter, nauseous taste, and a peculiar narcotic, heavy odour. Chemically it is a gum-resin containing a very large number of alkaloids, meconic and other acids, and the ordinary constituents of a plant juice. Its exact composition varies greatly, but is somewhat as follows: *Alkaloids*—morphine (4-15 per cent.), narcotine (2.5-9 or more per cent.), thebaine, codeine, narceine, pavarine (of each from about $\frac{1}{2}$ to 4 per cent.), cryptopine, rheadine, laudanine, laudanosine, pseudomorphine, codamine, meconine, protopine, lanthopine, papaveramine, oxynarcotine, hydrocotarnine, gnoscopine, tritopine, and others, all in very small amount. They exist free or in combination with

meconic, lactic, sulphuric, and phosphoric acids. There is about 8 per cent. of saccharine matter, about 35 per cent. of gum, resin, fat, albumen, &c., various inorganic bases, and a variable amount of water. It may be adulterated with sugar, gum, or molasses, and sometimes contains nails, lead, or stones in the centre of the mass.

The chief and most easily applied chemical test for opium depends on the presence of meconic acid, which is an organic acid peculiar to it. A watery or alcoholic solution turns blood-red in colour on the addition of a solution of perchloride of iron, and this colour is discharged by a solution of protochloride of tin. Its smell and taste are also very characteristic. Turkey opium is generally considered the best, and in the British Pharmacopœia it alone was formerly directed to be used for making the official pharmaceutical preparations. Now, however, Persian opium is also widely employed, and the use of Indian opium is considerable. A method of assaying the amount of morphine in opium is given with great detail in the British Pharmacopœia.

Action and Medicinal Uses.—The action of opium depends on its alkaloids, and is chiefly determined by the morphine present in it. Ordinary medicinal doses ($\frac{1}{4}$ to 3 grains) depress the activity of the brain and cause deep sleep with contracted pupils, slow respiration, and insensibility to pain. On awakening there are usually disagreeable after-effects, such as loss of appetite, slight nausea, constipation, mental fatigue, and headache. When minute doses are taken there ensue symptoms of excitement and stimulation, as shown by increased mental and bodily activity, restlessness and sleeplessness. The imagination is more active, and mental work can be accomplished with greater ease and celerity. It is disputed whether these effects are due to actual stimulation of the brain, or whether the higher centres are blunted, and thus allow the imaginative faculties to have fuller play. Most probably the latter is the case. Self-consciousness and self-criticism are lulled, the judgment is less controlled by the higher centres and by impressions from without, and left to itself part of the brain lapses into uncontrolled activity. It is for these reasons that opium is habitually used by some brain-workers. Individual susceptibility and race influence its effects very largely. The Teutonic races and phlegmatic people in general tend to sleep after it, while Easterns and persons of highly nervous temperament tend to become excited. Man, owing to the greater development of his brain, is somewhat differently affected from the lower animals. Frogs, after a primary stage of narcosis, pass into a condition of exquisite tetanic spasm from stimulation of the spinal cord, and the lower mammalia exhibit the same condition to a lesser degree. In adult man tetanic convulsions are rarely seen, and only occasionally after enormous doses; but in children convulsions are not infrequent, the explanation given being that in them the spinal cord is relatively largely developed in proportion to the brain. Opium diminishes all the secretions except the sweat, and thus causes constipation. It does not materially affect the heart or circulation in medicinal doses.

When opium is used habitually a tolerance for it becomes established, and enormous doses may be taken without any special effects. In medicine it is used chiefly to procure sleep and relieve pain. For these purposes it has no equal. It is also employed to arrest secretions, to allay irritation, and in diarrhoea. In diabetes, heart disease, hæmoptysis, and many other conditions it is given with great advantage. Probably no remedy has such wide and universal applications.

It must be given with great caution to young

children, but many other factors, such as pain, habit, idiosyncrasy, and various diseases influence its action and dosage.

Poisoning.—About half the deaths from poison which occur in the United Kingdom are due to opium or its preparations. When the effects of a large dose become fully developed the person lies in deep coma and in a state of complete insensibility. Respiration is slow, noisy, and stertorous, the pupil is contracted to a 'pin-point,' and insensible to light, the pulse is rapid and weak, or sometimes full and slow, the face and skin generally are pale and livid, and covered with cold perspiration. Constant stimulation may rouse the patient partially, but he always tends to relapse into stupor. Death is due to paralysis of the respiratory centres in the brain, but may be due to apoplexy or collapse. Such are the usual symptoms, but many cases present peculiar features, such as convulsions, vomiting, diarrhoea, delirium, dilated pupils, and other anomalous symptoms. The *post-mortem* appearances are not characteristic, but the cerebral blood-vessels are usually very full, and there may be effusion of serum into the ventricles. The smallest fatal dose recorded for an adult is four grains, but enormous quantities are often taken without serious symptoms. In infants very minute doses ($\frac{1}{8}$ to $\frac{1}{4}$ grain) may prove fatal. Death may occur in about two hours or even less; few cases are prolonged beyond twenty-four hours.

The treatment consists in making the patient vomit, and in washing out the stomach with large quantities of water. Owing to the state of insensibility emetics sometimes fail to act. Atropine is often given subcutaneously, while coffee or tea or caffeine may be also freely given. The patient may be further aroused by keeping him moving; about supported by attendants, by cold cloths applied to the chest, and by electric stimulation. Any violence or measures which tend to exhaust the patient should be carefully avoided.

Opium-eating.—The habitual consumption of opium or any of its preparations by persons otherwise in good health is known as opium-eating, the opium habit, morphine habit, or morphinism. Opium, laudanum, chlorodyne, black drop, nepenthe, morphine, and other forms are all used. They are most commonly taken by the mouth, the subcutaneous injection of Morphine (q.v.) being almost entirely confined to the more cultured and educated classes. Its habitual use is usually begun to relieve pain or sleeplessness, and one month's constant use is said to be sufficient in many cases to confirm the habit. The amount consumed by different individuals varies greatly. Of morphine most habitués take about three grains daily, some five or six grains, while a few go much higher. De Quincey says that at one time of his life he consumed 8000 drops of laudanum daily, but his ration was very excessive. The immediate effects are a feeling of stimulation and well-being, but as soon as these have passed off there ensues a state of despondency, to banish which a fresh dose is taken. It is a craving brought on by indulgence, and is to be ranked with such habits as drinking, smoking, gambling, &c. Many persons indulge this craving during their whole life, and do their daily work well. Such persons do not, however, go to any great excess, although they may have the craving as markedly as others who suffer intensely from well-developed symptoms of chronic opium poisoning. The typical opium-eater is lean and pale, with dull, glazy eyes; he suffers from chronic dyspepsia, from nervous irritability, and disturbances of the circulation. Albuminuria, glycosuria, and various other disorders are sometimes present. Sudden deprivation causes severe nervous disturbances and not seldom alarming collapse. For successful treat-

ment of the opium craving the patient had better be removed from his own home and friends to some institution where he can be under strict and constant medical supervision. There is a difference of opinion as to whether the opium should be abruptly or gradually withdrawn. Recovery is generally complete in a few weeks, but relapses into the habit are exceedingly apt to occur.

Opium-smoking.—The smoking of opium as a stimulant-narcotic is practised chiefly in China and the Far East. In China opium-smoking began in the 17th century. The habit, however, developed very rapidly, and soon became a national evil. Historically, many attempts have been made to stop the practice, but always without success. Fines, penalties, and even death, have all proved equally ineffective. A determined attempt at suppression was made in 1906, when opium-smokers were registered and their supplies limited, and restrictions were placed on opium cultivation and import. The early success of these measures, however, proved to be only temporary, and opium-smoking as a habit would appear to be increasing rather than decreasing.

Opium prepared for smoking is called *chandu*, which is simply a watery extract, about twice the strength of the original drug. A special form of pipe is used, and a piece of prepared opium about the size of a pea is placed, by means of a small flattened iron pen, into a small cup at one end; this is ignited and the smoke inhaled, and then slowly exhaled through the nostrils. As a result, Easterns experience mental and physical excitement, followed by a pleasant sense of well-being and content, and then by narcosis. Europeans, as a rule, are not affected by it to any appreciable extent. In the pipe the opium is destructively distilled, and chiefly the products of destructive distillation come over in the smoke—pyridine, collidine, and similar bases. There is probably scarcely a trace of morphine. The flavour of the smoke is mild and aromatic. There is great difference of opinion regarding the hurtfulness of the habit. Some authorities hold that in moderation it is not more hurtful than tobacco, while missionaries and others maintain that the habit is fraught with moral, social, and individual degradation. This seems to depend largely on the extent to which it is carried, and the question is probably on all-fours with that of alcohol. Many Chinese smoke opium all their lives in strict moderation without apparent harm, while others have excessive debauches lasting a week or more, and often become confirmed in its excessive use. The latter without doubt wreck their constitutions, and suffer in much the same way as confirmed alcoholics do.

In Japan the importation and transportation of opium were forbidden in 1858, its use, sale, and distribution after 1868, in consequence of which, and other regulations, the opium evil ceased to exist; and in her possessions, notably in Formosa, Japanese policy, carried out with success, has been totally to prohibit opium-smoking except in the case of existing addicts, the ultimate aim being complete suppression. In the Philippine Islands, where the habit of opium-smoking rapidly extended from the Chinese to the Filipinos, the reformatory policy of the United States has been modelled on that of Japan in Formosa.

From time to time the opium evil has been the subject of international action. At the instigation of the United States of America an international commission met in 1909 at Shanghai. This was followed by the Opium Convention of 1912, and the preparation of a special protocol, to be signed by the Third International Conference at The Hague in 1914. The intervention of the Great War, however, prevented further action till the inclusion in the

Treaty of Versailles of certain provisions restricting the trade in opium. The enforcing of these provisions is in the hands of the League of Nations (q.v.); speaking generally, the limitation of the world-production of opium to an amount equal to the world's medical and scientific needs is aimed at. The solution of the opium problem has always been complicated by various economic and other considerations, especially by the unwillingness of governments to sacrifice their opium revenues.

See the articles LAUDANUM, MORPHINE, POISONS; the reports of various commissions, especially that of the Opium Convention (1912), the relevant publications of the League of Nations; and Gavit, *Opium* (1925). For the Opium Wars, see CHINA.

Opodeldoc is a popular synonym for soap *liniment* (q.v.). The origin of the term, which was apparently applied by Paracelsus to various forms of liniments or local applications, is not known. The *opo* is the same as the *opo* of *opopanax*, *opobalsamum*, &c., and is doubtless derived from the Greek *opos*, 'juice.' See *Notes and Queries*, October 1888, p. 316.

Opo'panax, a gum-resin obtained in Persia, which comes to Europe at rare intervals. It has an unpleasant odour resembling bruised ivy leaves. Holmes suggests that it may be the produce of some Araliaceous plant, but nothing is known of its botanical origin. The ancient physicians attached great importance to it as an antispasmodic medicine; Hippocrates, Theophrastus, and Dioscorides have each left descriptions of it. The plant (*Opopanax Chironium*), from which it was supposed to be obtained, grows generally throughout southern Europe. The perfume known as opopanax is not derived from this gum-resin. There is a commercial opopanax, a kind of perfumed myrrh, obtained from a Commiphora, largely imported into Germany, where an essential oil is distilled from it.

Oporto (Port. *O porto*, 'the port'), the second city of Portugal, stands on the steep, rocky, right bank of the Douro, high above its waters, which reach the sea 3 miles to the west. 'The houses, as they rise confusedly from the river's edge, some painted in strong reds, blues, or greens, some left whitewashed, and the majority retaining the granite gray of the stone they are built with, make up a very strange and beautiful panorama, ringed as the city is by the encircling pine-covered mountains' (Oswald Crawford); and many of these houses stand embowered in the greenery of gardens. One of the crags overlooking the river is crowned with a Crystal Palace (1865), surrounded by gardens. Many of the former monasteries are still standing, though put to other uses: one is a citadel, another the Exchange, with splendid marquetry of wood in floor and walls, a third barracks, and so on. There are seven principal churches, including the cathedral (built by Henry the Navigator), the old Gothic church of Cedofeita (originally founded in 559), and the Church dos Clerigos, with a tower 213 feet high. The English factory (1785), the bishop's palace, and the hospital of St Antony are the most noticeable amongst the secular buildings. Oporto possesses a polytechnic academy, with observatory, scientific collections, &c., a medical school, a fine art academy, a commercial museum, an industrial institution, a library and picture-galleries. On the south side of the river, immediately opposite Oporto, and connected with it by a lofty bridge, is the suburb of Villa Nova de Gaia, with extensive wine-cellars. The railway to Lisbon (209 miles) crosses the river a little higher up, on a very fine steel arch bridge; the arch spans a horizontal distance of 549 feet, and its centre is 203 feet above the river. Pop. (1878)

105,838; (1900) 172,421; (1911) 194,009; (1920) 203,981, who are chiefly engaged in the manufacture of cloth and silks, hats, porcelain, ribbons, tobacco, soap, and candles, in metal-casting, tanning, brewing, distilling, cork-cutting, sugar-refining, and brick-making, and in commerce and shipping. Oporto is the principal place of export for Port Wine (q.v., and see also PORTUGAL). The remaining exports of moment are cattle, oranges and other fruits, cork, copper, onions, meat, hides, and wool. The imports consist chiefly of corn and flour, cod-fish, metals, machinery, textiles, rice, raw sugar, coal, and timber. Leixões, its seaport, is 3 miles N. of the Douro's mouth.

Originally the *Portus Cale* of the Romans (whence Portugal), this city was the stronghold of the Christians in the north-west of the Iberian peninsula against the attacks of the Moors, and more than once changed hands between the 8th and the 12th century. The people are noted for their sturdy patriotism and liberal sentiments; in 1808 they were especially hostile to the French; they stoutly opposed the usurper Miguel (1828), who in revenge executed great numbers of them, but without breaking their spirit, for they supported Pedro of Brazil, and withstood the besieging troops of Miguel thirteen months (1832-33). Oporto was the scene of frequent riots in the republican movement that culminated in 1910. See C. Sellers, *Oporto Old and New* (1900).

Opossum (*Didelphys*), a genus of Marsupialia, having ten incisors in the upper jaw, and eight in the lower, one canine tooth on each side in each jaw, three compressed premolars, and four sharply-tuberculated molars on each side—fifty teeth in all; the tail generally very long, prehensile, and

Virginian Opossum (*Didelphys virginiana*).

in part scaly; the feet plantigrade; five toes on each foot, their claws long and sharp; but the inner toe of the hind foot converted into a thumb, destitute of a claw, and opposable to the other digits. The pouch, so characteristic of marsupials, is generally absent, sometimes rudimentary, rarely complete. The unwebbed feet and non-aquatic habits distinguish this genus from Cheironectes (see YAPOCK), also belonging to the family Didelphidae. The name opossum has also been applied to certain Australian forms. Except *Cænolestes*, the Didelphidae are the only marsupials found in America. They range from the United States to Argentina. There are numerous species, sometimes assigned to several genera, with a considerable range in size, varying from that of a large cat to that of a mouse. The best known is the Virginian Opossum (*D. virginiana*). Among the marsupials they are nearest allied to the Dasyuridae, from which they are doubtfully separable; if it were not for their geographical range, they would undoubtedly be placed in the same family. Although there are

now no opossums found anywhere but in America, they existed formerly in Europe, as is shown by their fossil remains. The opossums are all carnivorous, one species, the Crab-eating Opossum, feeding—as its name denotes—upon crabs; in order to capture its prey it frequents marshy places. It is a native of tropical America. Merian's Opossum (*D. dorsigerus*) is remarkable for the fact that it carries its young on its back, their tails being twined round the tail of the mother; many other species carry the young on the back; this is due in many cases to the fact already mentioned—that there is no pouch. The Virginian Opossum is a foe to poultry-yards in the United States; but it can put up with frogs if there is nothing better to be had. The opossums, like other marsupials, have a lowly organised brain; but they are remarkably cunning in robbing poultry-yards; on the other hand, their stupidity in walking straight into the simplest and most obvious trap is more in accord with their brain structure. Hunting the opossum with dogs by night is a favourite sport in the southern states, especially in autumn, when the body has a thick layer of fat all over. The animal takes refuge in a tree, and is either shaken down or shot as it hangs by the tail. The expression 'playing possum' refers to the opossum's habit of feigning death when caught. At such times, though usually very timid, it will endure almost any amount of torture, and give no sign of its suffering. See PHALANGER.

Oppeln, or **OPPOLIE**, a town in Upper Silesia (Prussia), on the Oder, 51 miles SE. of Breslau. Since 1816, when it was erected into a seat of government for Upper Silesia, the town has been much beautified both with new edifices and with parks and gardens. Its church of St Adalbert was founded in 995; and there is an old castle on an island in the Oder. The manufactures include chemicals, pottery, cigars, cement, beer, leather, &c., and there is a considerable trade in grain and cattle. Pop. (1875) 12,498; (1885) 15,975; (1919) 35,483.

Oppenheim, a town of Hesse, on the left bank of the Rhine, 20 miles SSE. of Mainz by rail, with fine vineyards. On the site of the Roman castle of Bauconica, Oppenheim became a free city of the empire, and was repeatedly besieged, especially in the Thirty Years' War. Pop. 4000.

Oppert, **JULIUS** (1825–1905), orientalist, was born at Hamburg, and studied at Heidelberg and Bonn. In 1847 he settled in France as a teacher of German, and remained there till his death. In 1852 he joined Fresnel's archaeological expedition to Mesopotamia. He became professor of Sanskrit in 1857, and of Assyrian philology and archæology in 1869. Oppert was a voluminous writer, producing many works on Assyrian mythology and jurisprudence, and other subjects connected with the ancient civilisations of the East.

Oppolie. See **OPPELN**.

Opportunists, in French politics, are those who, like Gambetta, Ferry, and others like-minded, oppose doctrinaire as well as extreme views, accommodate themselves in great measure to the circumstances of the hour, and aim only at what can obviously be carried through.

Opsonins, a bacteriological term denoting constituents of the blood serum (see **BLOOD**), which act upon bacteria, and make them more susceptible to the destructive action of the phagocytes. By comparing the number of bacteria ingested by the phagocytes in different conditions, what is called the opsonic index is obtained.

Optical Illusion. An object appears large or small, near or distant, according as the rays

from its opposite borders meeting at the eye form a large or a small angle: when the angle is large, the object is either large or near; when small, the object must be small or distant. Experience alone enables us to decide whether an object of large apparent size is so on account of its real size, or of its proximity; and our decision is arrived at by a comparison of the object *in position* with other common objects, such as trees, houses, &c., which may chance to be near it, and of which we have by experience come to form a correct idea. The same is, of course, true of apparently small objects. But when all means for comparison are removed our judgment is at fault. Similarly, we erroneously infer spherical solids at a distance to be flat discs; and, by reason of Irradiation (q.v.) in the eye, the sun appears larger than he would if illumined by a fainter light, and a man in a white habit seems larger than he would if he wore a dark dress. Illusions are also produced by external causes; and instances of this sort are given under **MIRAGE**, **REFLECTION**, and **REFRACTION**.

The persistence of impressions on the retina for about one-sixth of a second after the object which produced the impression has been removed produces another class of illusions. Common examples of this are the illuminated circle formed by the rapid revolution of an ignited carbon point, piece of red-hot iron, or other luminous body, and the fiery curve produced by a red-hot shot projected from a cannon.

Another form of illusion is produced to a person who is seated in a vehicle in motion; and it is very deceptive when the motion is so equable as not to be felt by the person himself. The illusion is most complete when the attention is riveted on an object several yards off; this object then appears to be a centre round which all the other objects revolve, those between the observer and the object moving backwards, and those beyond the object moving forwards. This illusion occurs on a large scale in the apparent motion of the heavenly bodies. Other illusions arise from a disordered state of the organs of vision: e.g. the seeing of things double or movable, or of a colour different from the true one (see **COLOUR-BLINDNESS**); the appearance as of insects crawling over a body at which the eye is directed, &c.

Optic Nerve. See **EYE**.

Optics is the science of the phenomena of light. This science is usually treated under two heads: (1) Physical Optics, which treats of the nature of Light (q.v., as also **MAGNETISM** and **UNDULATORY THEORY**), and explains the phenomena of Colour, Reflection, Refraction, Interference and its consequences, such as the colours of thin plates and films, Diffraction, Dispersion, the Spectrum, Polarisation and the properties of polarised light, for which see separate articles; and (2) Geometrical or Mathematical Optics. The leading idea in physical optics is to trace the progress of an alternating or oscillatory disturbance in the Ether (q.v.); this disturbance, which may be termed a wave, has an advancing wave-front; the direction along which this wave-front advances through a given point is a geometrical conception, which, so long as the disturbance travels in homogeneous media, it is convenient to use in diagrams, more convenient than it would be to draw a series of successive wave-fronts; this direction of propagation through any given point is called a ray; and geometrical optics traces, by mathematical reasoning, the course of a given set of 'rays' under specified conditions, particularly under those which have reference to Reflection and Refraction (q.v.). The part of geometrical optics which deals with reflection of light is often called **Catoptrics** (based

on such laws as that the angle of reflection is equal to the angle of incidence); that which deals with refraction is called Dioptrics. For these see the articles REFLECTION and REFRACTION respectively.

Though the Greeks and their disciples the Arabs had made some progress in mathematical optics, their knowledge was confined to the law of reflection and its more immediate consequences. Euclid, Aristotle, Archimedes, Hero, and Ptolemy were acquainted with the fact that light is transmitted in straight lines; but, with the important exception of Aristotle and some of his followers, the ancient philosophers believed that rays proceeded from the eye to the object, instead of in the contrary direction. Ptolemy was well acquainted with atmospheric refraction. Alhacen (1070) and Vitellio the Pole (1260) were almost the only cultivators of this science during the middle ages, and their additions to it were unimportant. The lens, though known from early antiquity, was not applied as an aid to defective eyesight till after the time of Roger Bacon. Jansen, Metius, and Galileo separately invented the telescope about the beginning of the 17th century; and the last-mentioned philosopher by its means made various important astronomical discoveries. Kepler, a short time after, gave the true theory of the telescope, explained the method of finding the focal length of lenses, and applied it to find the magnifying power of the telescope, besides pointing out the mode of constructing an instrument better adapted for astronomical purposes than that of Galileo; he also made some useful experiments on the nature of colours, and showed that images formed on the retina of the eye are inverted, a fact previously discovered by Maurolycus of Messina. From this period the science of optics steadily advanced, and its treasury of facts received numerous additions through the labours of De Dominis, Snell (the discoverer of the law of refraction in 1621), Descartes, Fermat, Barrow, Mariotte, and Boyle. Up to the time of Newton it was generally believed that colour was produced by refraction, but that philosopher showed by a beautiful series of experiments that refraction only separates the colours already existing in white light. There is, however, as is now known, no proper sense in which it can be said that the various colours pre-exist in white light, which is due to extremely irregular disturbances, analysed by the prism into rhythmical components of all frequencies, and therefore capable of producing a continuous Spectrum (q.v.) on the screen. In Newton's hands the theory and construction of the telescope underwent many valuable improvements, and in 1672 the description of his reflecting telescope was submitted to the Royal Society. Gregory had constructed an instrument on similar principles some years before. About the same time Grimaldi made his interesting series of experiments on the effects of diffraction, and noticed the remarkable fact of the interference of one pencil of light with the action of another. The theory of the rainbow, with an elegant analysis of the colours of thin plates, and the hypothesis concerning the nature and propagation of light, now known as the 'corpuscular' theory (see LIGHT), completed Newton's contributions to the science. The important services of the ingenious but eccentric Hooke cannot be easily stated in a brief abstract, as he discovered a little of everything, completed nothing, and occupied himself to a large extent in combating faulty points in the theories of his contemporaries. It must not, however, be forgotten that he has as much right as Huygens to the credit of originating the undulatory theory. The double refraction of Iceland spar was discovered (1669) by Bartholin, and fully explained in 1690 by Huygens, the propounder of the undulatory theory, who also

aided the progress of mathematical optics to a considerable extent. The velocity of light was discovered by Römer (1675), and in 1720 the aberration of the fixed stars and its cause were made known by Bradley, who likewise determined with accuracy the amount of atmospheric refraction. Bouguer, Porterfield, Euler, and Lambert rendered essential service to physical optics; the same was done for the mathematical theory by Dollond (the inventor of the achromatic telescope), Clairaut, D'Alembert, Boscovich, &c.; while in later times the experiments of Delaval on the colours produced by reflection and refraction; the discussion of the phenomena arising from unusual reflection or refraction carried on by Vince, Wollaston, Biot, Monge, and others; the discovery of polarisation of light by Malus (1808), and its investigation by Brewster, Biot, and Seebeck; of depolarisation by Arago (1811), and of the optical properties as connected with the axes of crystals (1818) by Brewster; and the explanation of these and other optical phenomena in accordance with the undulatory hypothesis by Young—the discoverer of the *Interference* (q.v.) of rays—and Fresnel, went far to give optics a width of scope and a symmetry which are possessed by few other sciences. The development of the undulatory theory and of optical science generally has been carried on to the nineteenth and twentieth centuries by Lloyd, Airy, Cauchy, Clerk-Maxwell, Hertz, Rayleigh, and others.

Wood's *Physical Optics* (2d ed. 1911); Southall's *Geometrical Optics* (1911); Drude's *Theory of Optics* (1902); Curry's *Electromagnetic Theory of Light* (pt. i. 1905); the articles LENSES, MICROSCOPE, TELESCOPE, PHOTOGRAPHY, &c., and the works mentioned there and under LIGHT.

Optimism (Lat. *optimus*, 'best'), the doctrine that the existing order of things, whatever may be its seeming imperfections of detail, is nevertheless, as a whole, the most perfect or the best which could have been created, or of which it is possible to conceive. Some of the advocates of optimism content themselves with maintaining the absolute position, that, although God was not by any means bound to create the most perfect order of things, yet the existing order is *de facto* the best; others contend that the perfection and wisdom of Almighty God necessarily require that his creation should be the most perfect which it is possible to conceive. The philosophical discussions of which this controversy is the development are as old as philosophy itself, and are dealt with in the article on the origin of Evil (q.v.). But the full development of the optimistic theory as a philosophical system was reserved for Leibniz (q.v.), in his *Théodicée*, the main thesis of which is that, among all the systems which presented themselves to the infinite intelligence of God as possible, God selected and created in the existing universe the best and most perfect, physically as well as morally, regard being had to the universe as a whole. The *Théodicée* was designed to meet the sceptical theories of Bayle, and its theories were ridiculed in Voltaire's *Candide*. Modern discussion on this question usually assumes the form of assertion or denial of the opposite doctrine of Pessimism (q.v.).

Optophone, an instrument invented in 1914 by Dr Fournier d'Albe, enabling the blind to read ordinary printed matter. It depends on the fact that the electric conductivity of selenium is greater in light than in darkness. By directing a number of rays upon different points of the paper, and interrupting each in the manner of a siren, different sounds can be got by means of a telephone-receiver, according to the pattern of black and white given by the letter on which the rays fall.

Opuntia. See PRICKLY PEAR.

Opus Operatum (Lat., literally 'the work wrought') is the phrase employed in the Catholic theological schools to describe the manner of operation of the sacramental rites in the production of grace. It is intended to imply that the ministration of the rite (*opus*) is in itself, through the institution of Christ, an efficient cause of grace, and that, although its operation is not infallible, but requires and presupposes certain dispositions on the part of the recipient, yet these dispositions are but *conditiones sine qua non*, and do not of themselves produce the grace. Hence, when the sacraments are administered to dying persons in a state of apparent insensibility, this is done in the hope and on the presumption that the dying person may, though seemingly unconscious, be nevertheless really disposed to receive the sacrament; but it is by no means held that if these dispositions be wanting the sacrament will itself justify him.—The phrase *Opus Operantis* is frequently used as denoting that the effect of a particular ministration or rite is primarily and directly due, not to the rite itself (*opus*), but to the dispositions of the recipient (*operans*). Thus, in the act of kissing or praying before a crucifix, of sprinkling one's self with holy water, of telling the prayers of the rosary upon blessed beads, the fervour and personal piety of the supplicant, and not the material object of the religious use, is held to be the efficient cause of the grace which is thereby imparted.

Orache (*Atriplex*), a genus of plants of the natural order Chenopodiaceæ, having male and female flowers on the same plant. The species are numerous and widely spread over the maritime or saline parts of the earth, scarcely any species except the Common Orache (*A. patula*) being ever found inland or away from saline influence. Five species, including the Garden Orache (*A. hortensis*), are natives of Britain. Although formerly much cultivated in Britain, orache is now displaced as a pot-herb by spinach (*Spinacia oleracea*), a species of a closely allied genus. All the species have similar qualities, and may be used as spinach.

Oracle, the response delivered by a deity or supernatural being to a worshipper or inquirer; also the place where the response was delivered. These responses were supposed to be given by a certain divine afflatus, either through means of mankind, as in the oracles of the Pythia and the dreams of the worshipper in the temples; or by its effect on certain objects, as the tinkling of the caldrons at Dodona, the rustling of the sacred laurel, the murmuring of the streams; or by the actions of sacred animals, as exemplified in the Apis or sacred bull of Memphis, and the feeding of holy chickens among the Romans. Such responses were, however, closely allied to augury, which differed in this respect, that auguries could be taken anywhere, while the oracular spots were defined and limited. Oracle dates from the highest antiquity, and gradually declines with the decline of Animism (q.v.) and with the increasing knowledge of mankind. Among the Egyptians all the temples were probably oracular. In the hieroglyphic texts the gods speak constantly in an oracular manner, and their consultation by the Pharaohs is occasionally mentioned. In later days the most renowned of these oracles was that of Ammon in the Oasis, where oracular responses were rendered either by the shaking of the statue of the god or by his appearance in a certain manner. Oracles were also used by the Hebrews, as in the consultation of the Urim and Thummim by the high-priest, and the unlawful use of Teraphims, and consultations of the gods of Phœnicia and Samaria. The Hebrew oracles were by word of mouth, as the speech of God to Moses, dreams, visions, and prophetic denunciations;

besides which there were oracles in Phœnicia, as that of Beelzebub and others of the Baalim. They were also in use throughout Babylonia and Chaldæa, where the responses were delivered by dreams given to the priestesses, who slept alone in the temples as concubines of the gods. The most renowned of all Greek oracles was the Delphic oracle (see DELPHI), which was Panhellenic or open to all Greece. Sacrifices were offered by the inquirers, who walked with laurel crowns on their heads, and delivered in questions inscribed on leaden tablets (of which many have been recently discovered); the response was deemed infallible, and was usually dictated by justice, sound sense, and reason. Other oracles of Apollo were at Abæ in Phocis; at Ptoon, which was destroyed in the days of Alexander the Great; at Ismenus, south of Thebes; and in Delos. In Asia Minor the most reputed were those of Branchidæ, close to Miletus, celebrated in Egypt, and of Gryneum. Besides that of Dodona, Zeus had another at Olympia; and those of various other deities existed elsewhere. A secondary class of oracles of heroic or prophetic persons existed in Greece, the two most celebrated of which were those of Amphiaraus and Trophonius. The first mentioned was one of the five great oracles in the days of Croesus, and was situate at Oropus in Attica. Those who consulted it fasted a whole day, abstained from wine, sacrificed a ram to Amphiaraus, and slept on the skin in the temple, where their destiny was revealed by dreams. That of Trophonius was at Lebadea in Boeotia, and owed its origin to a deified seer. It was given in a cave, into which the votary descended, bathed and anointed, holding a honeyed cake. There were some other oracles of minor importance. Besides these oracles, written ones existed of the prophecies of celebrated seers, as Bacis and Mæseus, which were collected by the Pisistratidæ, and kept in the Acropolis of Athens. Others of the Sibyls (q.v.) or prophetic women were popular, and at a later period Athenais and others prophesied in the days of the Seleucidæ. Amongst the oriental nations, as the Arabs and others, divination was and is extensively practised, but there are no set oracles. The Celtic Druids are said to have delivered responses, and the oracle of the Celtic god Belenus or Abelio was celebrated.

Oradia Mare, Rumanian name of Grosswardein (q.v.).

Oran (Arab. *Waran*), a seaport of Algeria, stands on the Gulf of Oran, 130 miles by sea S. of Cartagena in Spain. It climbs up the foot of a hill, is defended by detached forts, and possesses a Roman Catholic cathedral (1839), a grand mosque, a large military hospital, a college, a seminary, and two citadels or castles. Oran is a naval station. The outer harbour, east of the old one, was begun in 1905; alfa and cereals are the chief exports. Pop. 141,000 (124,000 Europeans). Oran was built by the Moors. During the second half of the 15th century it was a highly-prosperous commercial town, and was celebrated for its cloth and arms and fine public buildings. But it was taken by the Spaniards in 1509 and made a penal settlement. It was captured by the Turks in 1708, but retaken by the Spaniards in 1732. In 1790 it was destroyed by an earthquake, and shortly after was altogether abandoned by the Spaniards, the Turks

occupying it again in 1792. The French took possession in 1831, and, mostly rebuilt by them, the town has a thoroughly French appearance.—The department of Oran has an area of 23,000 sq. m., and a pop. of 1,300,000 (353,000 Europeans).

Orang, or ORANG-UTAN (*Simia satyrus*), an anthropoid ape, found only in the forests of Sumatra and Borneo. There is only one species, though it has been said that a smaller variety (*S. morio*) occurs in Borneo. The orang is distinguished from other anthropoid apes by its reddish-brown colour; and it has been noticed that the colour corresponds to that of its human neighbours, just as the black colour of the chimpanzee and gorilla answers to

Orang-utan (*Simia satyrus*).

that of the African tribes inhabiting the same country. The Malays never use their words *Orang utan* ('man of the woods') for any ape, but for an uncultured tribe of Malays living in the woods.

Like other anthropoids the orang is arboreal in habit, and can move with considerable swiftness through a forest, passing from tree to tree; on the ground it is awkward. It has a curious habit of building among the branches a temporary hut or nest as it is usually called. The orang was formerly regarded as capable of all manner of iniquities, such as carrying off women and children, and throttling people with its hind-foot as they passed under the trees. When these beliefs were proved to be false they were transferred to the chimpanzee, and particularly to the gorilla. They were mainly dispelled by Wallace, who stated, however, of the orang that 'there is no animal in the jungle so strong as he;' but strength does not necessarily imply ferocity, and the orang seems to be a very tamable creature.

Hornaday, an American traveller, observed the orang in the act of making its nest. He thus describes the process: 'I got there just in time to see the orang build a large nest for himself. He took up a position in a fork which was well screened by the foliage, and began to break off small branches and pile them loosely in the crotch. There was no attempt at weaving, nor even regularity in anything. He reached out his long, hairy arm, snapped off the leafy branches with a practised hand, and laid them down with the broken ends sticking out. He presently got on the pile with his feet, and standing there to weight it down, he turned slowly, breaking branches all the while

and laying them across the pile in front of him until he had built quite a large nest. When he had finished he lay down upon it, and was so effectually screened from us that I could not dislodge him, and after two or three shots I told the natives that they would have to cut down the tree.' During one day's travel in Borneo thirty-six old nests and six fresh ones were seen; there appears to be nothing like house-building, which has been stated by some to exist among the orangs.

The structure of the orang shows its near relationship to the other anthropoids and to man. The curvature of the spine, which is an important character, appears, according to D. J. Cunningham, to be different from that of a full-grown man, but to correspond to that of a boy of six years old. The extension of the cerebral hemispheres in the brain backwards over the cerebellum is about equal to what is found in the chimpanzee; naturally this is considerably less than in man, but greater than in the new-born child. The orang comes nearest among the anthropoids to man in certain other characters, e.g. the form of the ear; but, as the gorilla and chimpanzee also show a nearer approximation in various other points, it would not be safe to call the orang the most man-like of apes. See ANTHROPOID APES.

Orange (Arabic *nāranj*, from Sanskrit *na-grungo*), the name of one or more species of *Citrus* (q.v.), of which the fruit is much prized. Botanists generally regard all the oranges as of one species, *Citrus Aurantium*, but some make the Sweet Orange, the Bitter Orange, the Bergamot Orange, &c., distinct species. The wild state of the orange is not certainly known, although its characters may be pretty confidently inferred from the degeneration of cultivated varieties; and no cultivated plant shows a greater liability to degenerate, so that seedling oranges are almost always worthless. From a remote antiquity it has been cultivated in India; and thence it seems to have spread into western Asia and Europe. It has been alleged that the orange is a native of North America, near the Gulf of Mexico; but the probability rather seems to be that it has been introduced, and has become naturalised.

The Common Orange, or Sweet Orange (*Citrus Aurantium*), is an evergreen tree of moderate size, with greenish-brown bark; the leaves oblong, acute, sometimes minutely serrated, the leaf-stalks more or less winged, the flowers white, the fruit roundish, the oil-cysts of the rind convex, the juice sweet and acid. It is cultivated in almost every part of the world of which the climate is warm

Sweet Orange (*Citrus Aurantium*),
Branch in Flower;
a, fruit; b, transverse section of same.
(Bently and Trimen.)

enough, but succeeds best in the warmer temperate or subtropical climates, as in the south of Europe, where it is very extensively cultivated as far north as the south of France. The orange

does not seem to have been cultivated by the Greeks or Romans, but was probably brought to Europe by the Moors, and is supposed to have been introduced into Italy so recently as the 14th century, fully 1000 years after the citron. In the north of Italy oranges are sometimes grown in conservatories, but often in the open air, except during winter, when they are covered with temporary houses of boards. In the south of England they are sometimes in like manner grown in the open air, with a shelter of boards or matting in winter, but trained against a south wall; they attain a large size, and yield good fruit. The abundant importation of the fruit, however, renders the cultivation of the orange in Britain unnecessary; and, in general, only small plants are to be seen in green-houses or conservatories, as mere objects of interest.

There are many varieties in cultivation, which are perpetuated by grafting upon seedling orange stocks and by layers. Of the varieties of the Sweet Orange perhaps the most deserving of notice are the Portugal or Lisbon Orange, the most common of all, having the fruit generally round or nearly so, and a thick rind; the China Orange, said to have been brought by the Portuguese from China, and now much cultivated in the south of Europe, having a smooth thin rind and very abundant juice; the Maltese or Blood Orange, remarkable for the blood-red colour of its pulp; the Egg Orange, having fruit of an oval shape; the Mandarin Orange, or Clove Orange (*C. nobilis*), has fruit much broader than long, with a rind very loosely attached to the flesh, and small leaves; and the Tangerine Orange, apparently derived from the Mandarin. The St Michael's Orange is a sub-variety of the China Orange. The Jaffa Orange has now a great reputation. The Majorca Orange is seedless. The Kum-quat (*C. japonica*), from China and Japan, is little bigger than a gooseberry, and grows well in Australia.

The Bitter Orange, Seville Orange, or Bigarade (*C. Aurantium*, var. *amara*, otherwise *C. vulgaris*, or *C. bigaradia*), is distinguished from the sweet orange by the more truly elliptical leaves, the acid and bitter juice of the fruit, and the concave oil-cysts of its rind. Its branches are also spiny, which is rarely the case with the sweet orange. The varieties in cultivation are numerous. The bitter orange was extensively cultivated by the Moors in Spain, probably for medicinal purposes, as stomachic and tonic. Its chief use, however, is for flavouring puddings, cakes, &c., and for making marmalade. The Bergamot Orange (*C. Aurantium*, var. *Bergamia*) is noticed in a separate article.

Orange-leaves are feebly bitter, and contain a fragrant volatile oil, which is obtained by distilling them with water, and is known in the shops as *Essence de Petit Grain*. Orange-flowers yield, when distilled with water, a fragrant volatile oil, called *Oil of Neroli*, which is used in making *Eau de Cologne* and for other purposes of perfumery. The flowers both of the sweet orange and of the bitter orange yield it, but those of the bitter orange are preferred. Dried orange-flowers, to be distilled for this oil, are an article of export from the south of Europe. They are packed in barrels, and mixed with salt. The dried flowers have a yellowish colour; the fresh flowers are white and very fragrant. The use of them as an ornament in the head-dress of brides is common throughout great part of the world. The small green oranges, from the size of a pea to the size of a cherry, which fall from the trees, both of the sweet orange and the bitter orange, when the crop is too great to be brought to maturity, are carefully gathered and dried, and are the *Orange berries* of the shops. They are used in making Curaçoa, and yield a fragrant oil on distillation, the original *essence de petit grain*. The dried and candied rind of the

ripe bitter orange, well known as *Orange-peel*, is used as a stomachic, and very largely for flavouring puddings and articles of confectionery. The rind of the sweet orange is sometimes employed in the same way, but is inferior. A fragrant essential oil is obtained from the rind of the orange by distillation with water, and is sold by perfumers as *Oil of Sweet Orange*, or *Oil of Bitter Orange*, according as it is obtained from the one or the other, although the two kinds of oil are very similar. The rind of the orange is used in the preparation of a fine liqueur called *Orange Rosoglio*, which is an article of export from some parts of Italy. Besides the use of the sweet orange as a dessert fruit, and as a refrigerant in cases of sickness, its juice is extensively used as a refrigerant beverage, and is valuable in febrile and inflammatory complaints. The wood of the orange-tree is yellowish-white and close-grained. It is used for inlaying and for turnery.

Orange trees are often extremely fruitful, so that a tree 29 feet high and occupying a space of little more than 12 feet in diameter sometimes yields from 3000 to 4000 oranges in a year. One tree in Florida has often borne 10,000 oranges in a single season. The orange tree attains the age of at least 100 to 150 years. Young trees are less productive than old ones, and the fruit is also less juicy, has a thicker rind, and more seeds. The orange may be successfully cultivated where the winter temperature does not fall below 40°. It prefers strong loam or clayey soil, but succeeds in any kind of soil if well fertilised. It is much grown in the Azores, Malta, Sicily, Spain, Portugal, the Syrian coast, in Florida, Louisiana and California, and in parts of Australia. Superior perhaps to all are the Mandarin Orange of China, and the Navel Orange of South America. The latter is nearly twice the size of an ordinary orange, and has a navel-like formation on the top of the somewhat oval fruit. Oranges when gathered for export must not be quite ripe; those fully formed and with the colour just turning from green to yellow are chosen.

The Mock Orange is the tree known botanically as *Philadelphus* and popularly as *Syringa* (q.v.). The latter name properly belongs to the lilac.

Orange, or GARIEP, the largest river of South Africa, rises in the Kathlamba Mountains, in the east of Basutoland, and flows west, with an inclination to the north, to the Atlantic Ocean. It describes numerous wide curves in its course of 1000 miles, and separates the Cape Province, on the south, from the Orange Free State, Griqualand West, Bechuanaland, and Great Namaqualand, on the north. There are great falls at Aughrabies. Area of basin, 325,000 sq. m. Its principal tributaries are the Caledon and the Vaal, both joining it from the right. Its volume varies greatly between the dry season, when it is not navigable, and the rainy season, when it overflows its banks in the upper parts of its course. Its mouth is, moreover, obstructed by a bar.

Orange, a town in the French department of Vaucluse, on the left bank of the Aigue, 18 miles by rail N. of Avignon. The *Arausio* of the Romans, which contained 40,000 inhabitants, it retains two splendid Roman remains—a triumphal arch, 72 feet high, and a theatre whose façade was 340 feet long by 118 high. A neighbouring circus has been swept away. There is a Romanesque cathedral, and statues of two of the counts. Pop, 10,000.

Orange was the capital of a small independent principality, which was ruled by its own sovereigns from the 11th to the 16th century. The last of these sovereigns, Philibert de Chalons, died in 1531 without issue. His sister, however, had married a

Count of Nassau, and to that house the estates and titles passed. The Count of Nassau who obtained the principality of Orange was the father of William the Silent (see *HOLLAND, History*). William III., Prince of Orange and king of England, having died in 1702 without issue, there began a long-continued controversy as to the succession between Frederick I. of Prussia (as grandson of one of the last Princes of Orange), the representative of the older branch of the House of Nassau (q.v.), and the head of the younger line. At the Peace of Utrecht (1713) the king of Prussia took the settlement into his own hands, so far as the territory of Orange was concerned, by making it over for certain equivalents to the king of France. The title Prince of Orange, however, remained with the younger Nassau line, afterwards sovereigns of Holland. See Bastet's *Histoire d'Orange* (1856).

Orange, a city of New Jersey, 12 miles W. of New York by rail, and 3 miles by tram-car from Newark. The slope of Orange Mountain is laid out in beautiful parks and ornamented with villas. There are manufactures of phonographs, hats, &c. Pop. 33,000 (or with East, South, and West Orange, 100,000).

Orange Free State, an original province of the Union of South Africa, lying between the Vaal and Orange rivers, surrounded by the Cape Province, the Transvaal, Natal, and Basutoland. This region is a plateau, rising from 3000 to 5000 feet above the sea-level, with very little wood, except alongside the numerous watercourses. Its vast undulating plains of magnificent pasture-land slope down to the Vaal and the Orange, and are dotted over with the isolated hills called 'kopjes.' Area estimated at 50,400 sq. m.; pop. (1921) 628,360—189,142 being whites and 439,220 coloured. About 200,000 are members of the Dutch Reformed Church. Education is compulsory up to a certain standard, and fees are always charged; in 1922 the pupils numbered about 65,000. Except where parents object, Dutch and English are equally taught. Merino sheep, cattle, horses, goats, and ostriches are reared; corn (wheat, maize, Kaffir corn) is grown chiefly in the east. Coal is mined in the north and diamonds in the south-west. The climate is healthy and temperate. Railways connect Bloemfontein (q.v.), the capital, with the chief ports and other towns of South Africa. The chief exports are wool, diamonds, hides, ostrich-feathers, and live animals; the principal imports, cottons, woollens, boots and shoes, iron and steel manufactures. When the Dutch Boers left the Cape Colony (1836) and took possession of this country it was inhabited by Bushmen, Bechuanas, and Korannas. The Cape government appointed a resident in the republic in 1845, and three years later it was annexed to the British crown as the Orange River Sovereignty; but in 1854 it was given up to the Boers, who formed themselves into the independent republic of the Orange River Free State. President Sir J. H. Brand (1863-83) cherished the friendliest relations with Britain, and mediated in 1881 between Britain and the Transvaal. In 1899 President Steyn allied the State with the Transvaal in the ultimatum of 9th October, and the consequent war (see *TRANSVAAL*); the country was occupied by the British in 1900, and from Bloemfontein in May Lord Roberts proclaimed the annexation. At the peace (1902) the Free State became part of the British Empire as the Orange River Colony; and in 1907 the colony was granted responsible government similar to that of the Transvaal (q.v.). It joined the Union of 1910 as the Orange Free State.

See **BOERS**, **TRANSVAAL**, **CAPE OF GOOD HOPE**; **NORRIS-NEWMAN**, *With the Boers in the Transvaal and Orange*

Free State (1882); Anthony Trollope, *South Africa* (1878); numerous works on the Transvaal war (1899-1900); Somerset Playne, *The Orange Free State* (1912); Theal's historical works on South Africa; and South African guides, handbooks, and annuals.

Orangemen, an association of Protestants to support and defend the Protestant succession to the British throne and the Protestant religion in Church and State, as settled by the Bill of Rights and Act of Settlement of 1688. It had its origin in William, Prince of Orange—hence its name—on his arrival in England to accept the crown. The first declaration of its objects and principles was drawn up in November 1688 at Exeter by the prince's chaplain, the famous Dr Burnet, at the suggestion of Sir Edward Seymour, and subscribed by the leaders who had invited the prince to England—pledging themselves 'to stand by the prince and one another,' and to 'persevere until the liberties and religion of England should be effectually secured.' This declaration was in force till 24th February 1696, when a scheme for the invasion of England by James, helped by France, was revealed to both houses of parliament. This led to a second declaration of the association, which was signed by 420 members of the House of Commons, by 83 peers, by the corporation of London, and other municipalities and counties in England, and thus 'four-fifths of the nation were combined in one vast club.' It was also signed by every member of the Irish House of Commons except one. After the death of William the association remained quiescent till the reign of George III., when in 1795 it was vigorously revived in consequence of the discovery of treasonable societies in England and an approaching rebellion in Ireland. It has existed ever since. It cherishes the memory of William and holds anniversaries of the principal struggles in Ireland, such as the siege of Londonderry, the battles of the Boyne (1st July) and Anghrim (12th July), and the day of the landing of William at Torbay (5th November). The structure of the organisation is similar to that of freemasonry, although it is not a secret society. In consequence of the tactics of its opponents it has been most prominent in Ireland, but wherever ultramontane principles are propagated within the British dominions the Orange Society exists, as in Canada and Australia. Its membership is extensive. Its objects are carried out by lodges, individual or private, district, county, or provincial and national—all united by one grand lodge in each country. Every lodge is opened by prayer and reading of a portion of Scripture. Each member must be a Protestant. A lodge is guided by a master, secretary, treasurer, and other office-bearers. The grand lodge is representative, and is held usually every twelve months, although power is given to summon it in any case of emergency. There is also an imperial grand council, composed of delegates from the grand lodge of every country within the British dominions. It meets every three years.

Oratorio, a sacred story set to music, which, like opera, requires soloists, chorus, and full orchestra for its performance, but dispenses with the theatrical adjuncts of scenery, costumes, and acting. It is named from the oratory or mission-hall in Rome, where on feasts St Philip Neri (q.v.), prompted by the same spirit as had in the mediæval miracle and mystery plays sought to interest and educate the unlearned, arranged the performances (1571-94), which developed into the modern oratorio.

The effort to find a more dramatic vehicle of expression which had proved in Florence the germ of Opera (q.v.) was also being made in Rome by Emilio del Cavaliere. And by a curious coincidence the first oratorio and the first opera (properly so called)

were produced in the same year (1600) in these two cities. Cavaliere's oratorio, which was written throughout in recitative style, was called *La Rappresentazione di Anima e di Corpo*, and the directions for acting, dressing, and dancing, as well as singing, show how entirely the conception of oratorio has changed since its first rude beginning. During the 17th century Carissimi and Scarlatti wrote many works full of expression, but the Italians were, as a rule, more engrossed with the development of opera. Indeed, save in such expressive works as Carissimi's *Jephtha*, Stradella's *John the Baptist*, and the like, there is no difference between opera and oratorio composition, and it was among the graver nations of the North that the oratorio was to arrive at its maturity. There the first and almost universal subject was the Passion; and to illustrate the story and direct the meditations of the devout, Schütz, Graun, Handel, and Bach employed all their skill in musical construction, and all the resources which counterpoint, harmony, and orchestration could afford them. Solid part-writing for voices is absolutely necessary for such impressive and serious works as oratorios, and it is the neglect among the Italians of the art they had brought to such perfection during the 16th century which has caused the crown to pass from Italy to Germany. The greatest 'Passion Music' is the *St Matthew*, written for service on Good Friday, 1729, by Seb. Bach. It contains choruses, solos, and chorales (in which the congregation took part), all of surpassing interest and beauty, and showing when requisite great dramatic truth and force. And as this work is the climax, so it is the close of passion music development.

The next and most important phase of oratorio was the *Epic*, which became in Handel's giant hands such a powerful instrument. Before he wrote *Saul and Israel in Egypt* (1739) he had written an early oratorio in the Italian, and Passions, &c. in the German style. Between his arrival in England (1710) and his abandonment of the opera he had in no fewer than forty-four operas accustomed himself to all the possibilities of vocal expression; and his Italian training, his studies in Germany, and his varied experience eminently fitted him for his task. In twelve years he composed fifteen grand oratorios (*Israel in Egypt*, *Messiah*, *Samson*, *Judas Macabæus*, *Joshua*, *Solomon*, *Jephtha*, &c.), besides several cantatas and anthems of almost oratorio dimensions. The greatest is *Israel in Egypt*, with its massive double chorus-writing and its grand effects; but the *Messiah* is a work which stands out not only among oratorios, but in all musical literature as a great inspiration. Pure inspiration it must indeed have been, for it was written in twenty-four days! The great admiration for Handel's compositions in England finds expression every three years in the Handel Festival, held in London, at which the *Messiah*, *Israel in Egypt*, and a 'selection' are performed on a gigantic scale (about three thousand singers and five hundred instrumentalists).

Haydn heard Handel's works when he visited England in 1791-92, and was incited to the composition of his great oratorio, the *Creation* (and also the charming pastoral the *Seasons*, which should scarcely be called an oratorio); in fact, Handel has been the inspiration and model of nearly all succeeding oratorios, as England, his adopted country, has been oratorio's peculiar home. There the unequalled choruses and the general custom of choral festivals on a large scale offer numerous opportunities for producing familiar masterpieces and inducements to compose new works. For the Birmingham Festival of 1846 Mendelssohn wrote his masterpiece, the *Elijah*, a work of great originality, which, however,

owes more to the influence of Bach than of Handel. *St Paul* was produced at Düsseldorf ten years earlier.

Daring orchestral colour and original effects characterise Spohr's oratorios, *Last Judgment* (1826), *Calvary* (1835), and *The Fall of Babylon* (1842). Modern oratorios take advantage of the dramatic element which became so strong in the music of the 19th century, and in many works the name is modified (e.g. Dramatic Oratorio—Mackenzie's *Rose of Sharon*, Parry's *Judith*, &c.) or avoided (Sacred Trilogy—Gounod's *Redemption*, Berlioz's *Childhood of Christ*, &c.). Dvořák's *St Ludmila* and Liszt's *St Elizabeth* and *Christus* lean more and more to the form of dramatic cantata, of which Beethoven's *Mount of Olives* (miscalled an oratorio), Schumann's *Paradise and the Peri*, Sullivan's *Golden Legend*, and Mackenzie's *Dream of Jubal* and *Sayid* are fine examples.

A new period in English oratorio began with Elgar's *Dream of Gerontius* (1900) and *The Apostles* (1903).

Oratory of St Philip Neri. CONGREGATION OF THE. The origin of the Congregation of the Oratory has been described in the article on St Philip Neri, its founder (see NERI). Here something must be said of its constitution and work. The primary idea on the institution was that its members should be bound by no religious vows. They were to be secular priests living together under a common rule, and practising obedience as free subjects, with liberty to quit the community if they so willed. Each father must contribute an annual pension towards the upkeep of the house, and have, moreover, a sufficiency of private means for his personal expenses. Otherwise he has absolute control over his own property. The government of the congregation is of a remarkably republican character. Each community is entirely independent, being subject to no mother-house or general-superior. The community is composed of three classes—the novices, triennial and decennial fathers. A member after passing his novitiate becomes a triennial father, with a consultative voice in the affairs of the congregation. On the completion of his tenth year he becomes a decennial father, with a decisive vote. The superior, who is generally spoken of as 'the Father,' is elected every three years, and with him are elected four deputies, who form a committee which meets weekly, has the appointment of the other officers, distributes the ecclesiastical work, and controls the ordinary expenditure. But no large expenditure or new undertaking can be entered upon without the consent of the general congregation, where in all cases the voting is by ballot. The father superior, *primus inter pares*, has no privileges and is exempt from no rules. He takes his turn in the waiting at table in the refectory, and has his share in the work of the church. The principal religious exercise of the community, beyond the duties common to all priests, is half-an-hour's mental prayer in the evening followed by the litanies, for which three times a week is substituted the taking of 'the discipline' or self-flagellation in a darkened room. The ceremonial for this exercise will be found described in Hone's *Ancient Mysteries*. The ministerial work of the Oratory consists chiefly in constant attendance in the confessional and in the characteristic daily preaching. Another essential part of the institute is an external brotherhood similar in some respects to the 'Third Orders' of the older religious orders, but consisting of men only, who meet in a separate chapel called the Little Oratory, under the direction of a father prefect. The brothers, as a rule, observe the same exercises as the fathers. It is in the Little Oratory that the musical services which originated the ora-

torio are held. Music was so often performed in the oratory at Seville that Blanco White speaks of it as the 'spiritual opera-house.' Philip Neri, who governed the community at Rome as long as he lived, committed no rule to writing. The traditional rules drawn up at a later time were approved by Paul V. in 1612.

The Oratory spread rapidly through the chief cities of Italy, and there were several houses in Spain. In Germany it never took root. In France Cardinal de Bérulle took the institute as his model in a new foundation (1611), approved by Paul V. in 1614, under the name of the 'Congregation of the Oratory of our Lord Jesus Christ in France.' But it differs essentially from the Oratory of St Philip Neri. It was governed by a superior-general, and was mainly concerned with the institution of seminaries for the training of priests.

The life in the Roman Oratory admitted leisure for private study; and the founder, in encouraging Cesare Baronio to write his great work on church history, set an example which was followed by many distinguished scholars—Bozio, Gallonio, Aringhi (*Roma subterranea*), Bianchini (*Evangelium quadruplex*), Gallandi (*Bibliotheca patrum*), and others. It was natural that the character of Philip Neri and the community life which he established should have a particular attraction to a number of men from the English universities, who were led by the Oxford movement to the Church of Rome. Dr Newman when at Rome obtained from the pope a brief (26th November 1847) authorising him to establish the Oratory in England. Shortly afterwards F. W. Faber, who had founded a new order, 'the Brothers of the Will of God,' generally known as 'Wilfridians,' joined, with his whole community, the Oratory at Birmingham. In 1849 Father Faber was sent to London with some other fathers to set up a house in King William Street, Strand, which in October 1850 was constituted an independent congregation, and in 1854 was transferred to its present abode in Brompton.

There seems to have been a project of introducing the Oratory into England in the reign of James II., and there is in the British Museum an extremely rare if not unique copy of an English translation of the Rule printed in 1687.

The early history of the Oratory was written in 5 vols. folio by Marciano, *Memorie Storiche*, &c. (1693–1702). Compare *Newman e la Religione Cattolica in Inghilterra, ovvero l'Oratorio Inglese*, by Capeceletro (Naples, 1859), and *Life and Letters of F. W. Faber*, by J. Bowden (1869). The *Instituta Congregationis Anglicæ* was printed in Rome at the Propaganda Press in 1847.

Orbis Pictus. See COMENIUS.

Orbit, in Astronomy, is the path described in space by a heavenly body in its revolution round its primary. The path so described is of an elliptic form, and would be accurately an ellipse were it not for the disturbing influence of the other heavenly bodies (see PERTURBATIONS). The complete determination of a planet's orbit is of the last importance to astronomers, as it enables them to predict the planet's place in the heavens at any period, and thus determine the exact date of eclipses of the sun and moon, of transits and occultations of the planets, and of the appearances and disappearances of comets. For the determination of a planet's orbit it is necessary to know three things: (1) The situation of the *plane* of the orbit in space; (2) the position of the orbit in this plane; and (3) the situation at a given epoch, and rate of motion, of the planet in its orbit. Since the plane of the ecliptic is for convenience taken as the reference plane, the position of the plane of a planet's orbit is known when (1) its inclination to the plane of the ecliptic and (2) the line of intersection of the two planes are known.

Orcagna, or ARCAGNUOLO, nickname of *Andrea di Cione*, a painter, sculptor, and architect, as well as a maker of poems. Born, about 1316, the son of a Florentine worker in silver, he was early imbued with artistic tastes. Sculpture he learned in the studio of Andrea Pisano, and in painting was helped by an elder brother. In 1355 he was appointed architect to the church of Or San Michele in his native city; his greatest artistic triumph exists in the marble tabernacle in this church. 'This, in its combined splendour of architectural design, sculptured reliefs and statuettes, and mosaic enrichments, is one of the most important and beautiful works of art which even rich Italy possesses. It combines an altar, a shrine, a reredos, and a baldacchino' (Middleton). From 1358 to 1360 he was chief architect of the cathedral at Orvieto, for which he designed some mosaic pictures. In Florence he planned a mint, piers in the cathedral, and other works. His earliest achievement with the painter's brush was to execute, in conjunction with his elder brother Nardo, several frescoes in the church of Santa Maria Novella at Florence. Some of these have perished; but a 'Last Judgment' and 'Christ and the Virgin enthroned in Heaven' still survive, though greatly restored. Other frescoes in the cemetery at Pisa that were attributed to Orcagna are now believed to have been by a painter or painters of the Siennese school. Orcagna painted several panel pictures, including a retable for the altar in the Strozzi chapel of Santa Maria Novella; another for the church of San Pietro Maggiore in Florence, now in the National Gallery, London; an altarpiece in the chapel of the Medici (Santa Croce), Florence; and 'St Zenobius Enthroned,' in the cathedral of Florence. Orcagna's death is usually given as 1389; but 1376 seems a more likely date, or even 1368. See the article by Professor J. H. Middleton in *Ency. Brit.*; and Crowe and Cavalcaselle, *Painting in Italy*, vol. i. (1864).

Orchard (O.E. *ort-gearde*, from Latin *hortus* with its English equivalent *geard*, modern English *yard*, added in explanation, showing in the Miltonic form *orchat* confusion with Gr. *orchatos*) is a space of ground employed for the growth of hardy tree-fruit, such as apples, cherries, pears, and plums. By common usage and the force of climate the word in Great Britain has now become suggestive of apples only; and if the fruit be of any other staple a special prefix is generally employed, except in the counties (and few they are) in which cherries, pears, or plums are grown thus largely, such as Kent, Hereford, and Worcester. In some parts of the United States peaches are grown in vast quantities upon orchard-trees, and that fruit can be ripened thus in the southern counties of England when the spring and summer have been favourable. But in the main with us the orchard is a plot of ground planted with apple-trees, and thus we shall chiefly regard it.

In England, as well as the more fruitful parts of Scotland, the manor-house, vicarage, manse, or farm, or other well-enviored dwelling-place, has its own orchard not far from the house, and capable of producing fruit, unless too much discouraged. Too often the orchard is treated with contempt, as a space where the children, turkeys, calves, or pigs may roam at pleasure; and if there are any apples they are regarded as a windfall of some rarity. This is not as it ought to be. Orchards were laid out at a time when there was room enough to move freely, and people knew less than they seem to know now. Accordingly we find on these old trees either no fruit at all, or very little, and of that the chief part worthless. There is no greater puzzle to the farmer or squire farming his own land than the sad condition of his

orchard and his own deep ignorance about it. Amid the more important works the trees have too often been neglected; and the space which should yield its fair share of profit, as well as of picturesque enjoyment, has become a frowsy wilderness.

Much of the blame for this would fall on those who are now beyond it. Seldom indeed can we find an orchard planted by our ancestors with any common sense or judgment. The trees have been placed there anyhow, without any knowledge of their habit, growth, fertility, use, or requirements. And for this the nurserymen of that time must also be held accountable, their ignorance of their own produce having been equal to that of their customers. In this particular a vast advance has been made in the last half-century, and the planter of an orchard now has himself to thank if he plants amiss. For of late years it has been imagined largely that profit, equally speedy and heavy, can be secured very pleasantly by the growth of fruit in Britain. In spite of all experience this may be so, as we find the laws of nature overcome now and then by superhuman effort. And when everything comes to pass exactly as it should, the orchard takes occasion sometimes to pay its way. With a view towards this we may consider first the formation and planting of an orchard; secondly, the renewal of an old and not too hale plantation.

(1) Situation and soil are the first two questions, the former being even the more important in the colder parts of Britain. A slope towards the south or south-east is best of all; but if that cannot be found a fair level will do, unless it be in the bottom of a valley or too near some broad river. A damp situation is always bad; and especially evil is the spot—though it may be the warmest in summer—where the fog of the morning draws and packs from the marshes or from a tidal river. For the worst of all enemies to British fruit is the late spring frost, which settles chiefly in the valley or along the plain; whence the bleak hillside is often fruitful when the sheltered dale is barren. Also the soil must be fairly good, neither too sandy nor of very heavy clay. When the site has been chosen the ground should be trenched to the depth of two feet if possible, and drainage provided where needful, as in all but the most favoured spots it is. Time for settlement should be allowed after the trenching; and then the stations may be prepared for the standard-trees. The distance from tree to tree and row to row ought to be governed by the choice of kinds, and this again depends upon the object of the planter. He may plant for home use, or for sale, or for both; and in either case for table use or for cider. If he plants for his own table use—he be it for cooking or dessert—his chief concern is quality combined with fair fertility. If he plants for market he must first consider productiveness and appearance and the common opinion of his neighbourhood; for if he took into the market the best apple ever grown, but as yet of no reputation, he would have to take it home again until the trees grew old. Also, he would rather sell good fruit than bad; but generally speaking this is difficult without much self-sacrifice. For the finer kinds are, with few exceptions, less fertile than the inferior. But whatever his objects be, and whatever varieties he selects, the planter must be guided by the habit of the trees as to the space allowed them. It is better to allow too much room than too little; and in a plantation intended to endure, 25 feet from tree to tree is not one too many. The permanent trees should be straight standards, worked upon the crab-stock, and with 6 feet of stem from the root to the spread of the branches. Let them be planted almost upon the surface, then banked up with good soil, and staked securely,

until they can hold their own against the wind. Of pruning little or none is required during the first year of their growth, except that any weak shoot should be cut out, or rival to the leader repressed at once, if the tree is to be carried up in conical form. No manure should be given as yet, unless it be in the way of mulching, where the soil is very droughty. When all the standards are planted and staked, and seen to 'cut true,' as gardeners term it, both along and across the rows, the temporary crop may be planted among them, whether of dwarf-trees, or of bushes, vegetables, clover, or anything else; but a clear space must be reserved at all times of at least a yard around the orchard-tree. And throughout the next year the young plantation must be heeded frequently, disfruited (if any rash produce form), watered in case of protracted drought, restaked or rebound if any break loose, and watched that no grub or other vermin bore the slender stem, or injure bark, branch, or foliage. In the second year judicious pruning will be needed, for which see our article on that subject. The ground between the trees may be cropped with grass or clover (not allowed to become too long), which can be broken up for the purpose of manuring, and at other times saves the dropping fruit from bruises. With regard to varieties it is quite impossible to offer useful advice without a knowledge of each special case. If the planter is providing for his own household he generally knows what suits it best and befits the situation. If he grows for market he can have recourse to the counsel of some good nurseryman acquainted with the neighbourhood, its wants and suitabilities; he will probably find his trees true to name, clean, well grown and healthy; for in no line of business has there been more advance during the last half-century than in that of the nurseryman.

(2) With regard to the renewal of an ancient fruit-grove or the way to make the best of it, any one coming into possession or management of a decrepit orchard may wisely allow one fruiting season to show what good there is in it. All trees of valuable kind may then be marked for better cultivation, while the rest are divided into those worth grafting and those that are worthy of the domestic hearth; and the last will perhaps be more numerous. The trees that have goodness or beauty of fruit, with vigour sufficient to carry it, should at once be relieved of all moss and decay, straggling or worn-out or ill-placed members, or thickety growth of feeble wood, and perhaps in some places be cut back with discretion. Then the ground should be opened around the trunk, with tender avoidance of all upper roots (if any still live as a rarity), and a mulching of good, rich manure should be laid on in the winter-time; or, failing such encouragement, a frequent supply of good liquid strength, when the roots are on the feed in summer-time. The difficulty is to get this new supply to the parts that are fit to take it up, and then to provide the proper dose. And none but a man who knows the nature of a tree should be permitted to attempt it. Too often the roots of these old trees are prongs that strike downwards mightily, in the manner of a well-grown carrot, leaving nothing with a mouth for better feeding reasonably near the surface. Little improvement must be looked for during the first season, but even then there should be symptoms of increasing vigour, and in the second year the tree should be making healthy growth again.

Those that are of inferior kind, but have kindly wood for grafting, should be headed back or shortened home, with the dry and ragged wood removed. Then in the spring let fair stout scions of the better sort be inserted, chosen from strong growers, such as impart their own vigour to the

stock; for it is vain to work a feeble kind upon a long-established tree. The result will sometimes be a great success and sometimes downright failure, according to the harmony of stock and graft, upon which point the most experienced gardener as yet knows very little.

Many old trees, as before suggested, will be fit for nothing but firewood. These should be grubbed up at once, not with a feeble hand, but following every root as if you hated it. Then let a large space be excavated and filled in with abundant fresh soil trodden at every layer, and upon this young standards of vigorous kind must be planted, as shallow as may be, and banked up and staked. None but the strongest and most rapid growers can hope to make good these gaps among the elders, and even so they will be long about it. The virtue of patience must be highly cultivated by the owner of an ancient orchard. Even for renewal of an old plantation little can be said as to choice of sorts without thorough knowledge of locality. Many apples that become a picture in Kent or Surrey or Devonshire are plain little dowdies in Yorkshire, and unsightly scrubs in Scotland; while others that are comely and good in the north are rapid in the southern counties. Again, few or none of the American kinds, so handsome and fine when imported, can be grown to perfection in Britain.

See the Royal Horticultural Society's prize essays on hardy fruit-growing; Hogg's *Fruit Manual* (new ed. 1885); Scott's *Orchardist*; Bunyard's *Fruit Farming for Profit*; books by Burbidge, Fish, Grindon, and Cheal (1892); and for America, books by Thomas (1897) and Bailey (*Cyclopædia of American Horticulture*, and other works). And see the articles in this work on APPLE, PEAR, CHERRY, PLUM, FRUIT, GARDENING, PRUNING, &c. Good work in fruit-growing has been done by Luther Burbank, since 1875 at Santa Rosa, California, in 'originating' new and superior types of plums, apples, peaches, and other fruits, for which see his own books.

Orchardson, SIR WILLIAM QUILLER (1832-1910), a genre-painter and portraitist distinguished for his accuracy, expression, and dexterous execution, was born in Edinburgh, where he studied under Scott Lauder at the Trustees' Academy. He became A.R.A. in 1868, R.A. in 1877, and was knighted in 1907. Best known among his exquisite and highly-popular pictures are 'The Challenge' (1865), 'The Duke's Ante-chamber' (1869), 'Casus Belli' (1870), 'The Protector' (1871), 'The Bill of Sale' (1875), 'The Queen of the Swords' (1877), 'A Social Eddy' (1878), 'Hard Hit' (1879), 'On board H.M.S. *Bellerophon*, July 23, 1815' (1880; bought by the Chantrey Bequest), 'Mariage de Convenience' (1884), 'After' (1886), 'The Salon of Madame Récamier' (1885), 'The First Cloud' (1887), 'The Young Duke' (1889), 'Sir Walter Gilbey' (1891), 'Trouble' (1893), 'Blossoms Fair' (1901), and Sir Samuel Montagu (1904). See monographs by Sir W. Armstrong (1895), and J. S. Little (1897).

Orchestra, the part of the Greek theatre where the chorus danced; with us, the part set apart for the band; hence the band itself, in a theatre or at a concert. For the development of the orchestra in this latter sense, and the partition of instruments in a representative orchestra, see MUSIC, and Carse, *History of Orchestration* (1925). See also BAND, THEATRE.

Orchids (ORCHIDÆE or ORCHIDACEÆ), a family of monocotyledons distinguished from all others in the same alliance by their irregular gynandrous flowers and parietal placentæ. The essential peculiarities of the family are due to the consolidation of the stamens and style into one body called the *column*; to the suppression of all the anthers but one in all the genera except those comprising the tribe Cyripediæ, in which

there are two anthers; to a peculiar condition of the pollen and the structure of the anthers containing it; and to the remarkable forms and development generally assumed by the lip (*labellum*)—one of the inner members of the perianth which often plays an important mechanical part in the fertilising of orchids. The species are perennial herbaceous plants or shrubs of terrestrial habit in the temperate and colder parts of the world, but in warmer countries become epiphytal, adhering to the stems and limbs of trees, or fixing themselves on rocks by their strong fasciculate roots without penetrating the structure of these, or having any direct connection with the soil. Hence they have been popularly named air plants, as those which assume the epiphytal habit derive the greater part of their nutriment from the atmosphere. Their roots are fibrous or fasciculate or fleshy and tuber-like, the latter being peculiar to the terrestrial species. Their stems are annual, herbaceous, perennial, and woody, and very often pseudo-bulbous. Their leaves are flat or round, equitant, and generally sheathing, often leathery, and having parallel nerves. The flowers are irregular, extremely variable in form, often beautifully coloured, and deliciously fragrant, and are either solitary or in spikes, racemes, or panicles. They are composed of six usually petal-like segments: the three outer ones are called sepals, and two of the inner ones, which are usually alike in form and colour, are called petals; the third inner one, which differs in shape and also generally in

Fig. 1.—*Paphiopedilum Boxallii*.

direction from the others, is the lip. It is really the posterior petal, but the twisting or bending of the flower brings it to the front. Facing the lip is the *column*, bearing the anther or anthers and the stigma variously situated relatively to each other. The more obvious features described are well illustrated in the accompanying figures of *Paphiopedilum* (see also LADY'S SLIPPER, Mormodes, Odontoglossum, and Oncidium, in which the six segments of the perianth are so conspicuous as to reveal at a glance their structural relation to each other.

Orchids are found in almost all parts of the world, except in extremely dry climates and on the borders of the frozen regions. In Britain there are found eighteen genera and about forty species. In Europe, the temperate parts of Asia, in North America, and the Cape of Good Hope they are common inhabitants of groves, marshes, and meadows; and in these regions they are invariably terrestrial in habit. But in the hot damp parts of the West and East Indies, in Madagascar, and other islands in

the same region, in the moist forests of Brazil, the warm parts of Central America, and western Mexico they abound in the greatest profusion, no longer dependent on the soil for their nutriment, but clinging to the trunks and branches of trees,

Fig. 2.—*a*, *Masdevallia Chimæra*;
b, *M. Schlimii*.

to stones and crags, where they vegetate among ferns and other shade-loving plants, or occupy by themselves exclusively the places which they affect. The family is a very numerous one, there being perhaps 10,000 species known to botanists, largely owing to the zeal of collectors. Of exotic species Linnæus knew only about a dozen. The beauty and the fragrance of the flowers, the singularity and almost endless variety of form which they exhibit, and their interesting structure botanically, along with the rarity of many of the most beautiful, place orchids among the most remarkable of the families of the vegetable kingdom. Darwin, who devoted much attention to the family, particularly in regard to their fertilisation, says of the peculiarity of the structure of the flowers of orchids that 'an examination of their many beautiful contrivances will exalt the whole vegetable kingdom in most persons' estimation,' and that 'hardly any fact has struck him so much as the endless diversities of structure—the prodigality of resources—for gaining the same end, namely, the fertilisation of one flower with pollen from another

Fig. 3.—*Mormodes Ocanæ*.

plant.' This part of the history of orchids is, like every other point connected with them, too wide to be dealt with here in detail. Those, however, who desire to study the matter closely should see the work quoted from—*The Fertilisation of Orchids*, by Charles Darwin.

Since the middle of the 19th century the cultivation of orchids in Britain, on the Continent, and in America has become an absorbing pursuit with wealthy amateurs. The possession of a rare or unique species or variety is an ambition that can only be attained by the millionaire; the prices of such are quite beyond the means of those possessed only of moderate wealth. Syndicates are formed for the purpose of collecting and

importing orchids from all countries in which rare or otherwise valuable species are known to exist, and private persons and several of the leading London and Continental nurserymen send experts in orchid-collecting to those countries at great expense with the same object in view. There is thus considerable commerce in orchids, and large sums of money are spent. Among genera in greatest request among amateurs are *Cypripedium*, *Dendrobium*, *Masdevallia*, *Odontoglossum*, *Cattleya*, *Lælia*, *Oncidium*, *Chysis*, *Cymbidium*, *Calanthe*, *Phalænopsis*, *Cœlogyne*, *Angræcum*, *Vanda*, *Anguloa*, *Epidendrum*, *Sophranitis*, *Renanthera*, *Saccolabium*, *Miltonia*, *Peristeria*, *Lycaste*.

Fig. 4.—*Odontoglossum Harryanum*.

The cultivation of orchids is accounted a difficult branch of the gardener's art. When the value of a considerable collection of rare kinds is considered, their successful management is at least a responsible undertaking. To be successful in their treatment the cultivator should above all things be well informed regarding the conditions under which each species grows in its native habitat. The prevailing temperature and other atmospheric conditions during the periods of growth and of rest, and the amount of shade or of light to which they are exposed at those seasons, must be known to and comprehended by the cultivator before he can adapt his means to the end in view. Houses or compartments of houses are set apart for the accommodation of species which are natives of the more hot and humid parts of the world, such as tropical East India, Madagascar, and Brazil, and a similar arrangement is made for those from Mexico and Central America.

Fig. 5.—*Oncidium Kramerianum*.

The management of the atmosphere of these houses is then based on such knowledge as the cultivator possesses regarding the temperature and moisture, light and shade, that prevail in the countries the several species are natives of. The plants of truly epiphytal habit are usually cultivated on blocks of oak, teak, or other timber, with or without moss about their roots for the retention of moisture. All classes are also grown in pots or lattice-baskets, in rough fibrous peat and Sphagnum moss largely intermixed with charcoal and porous crocks, to secure abundant drainage. Only the terrestrial species are grown in soil proper, and as there are exceedingly few of

such that require the accommodation of special houses, space need not here be taken up with their needs. The propagation of orchids is effected by division of the root-stocks, by separating the pseudo-bulbs in some cases, by cuttings in the case of *Dendrobiums* and some others with similar forms of growth, and by seed in all cases when it can be obtained, which rarely occurs with cultivated plants unless they have been artificially fertilised. Since about 1860, when Mr Dominy of London gained his first success, many hybrid orchids have been in cultivation; certain species of *Calanthe*, *Cattleya*, *Cypripedium*, *Dendrobium*, and *Epidendrum* being the first to yield to the hybridist's art.

Few orchids yield products useful to man. Of these *Vanilla* (q.v.) is perhaps the best known in commerce. The leaves of *Angræcum fragrans*, a native of the Mauritius, where it is called *Fahum*, and by the French *thé de Bourbon*, are delightfully fragrant, having the odour of Tonquin bean with the flavour of bitter almonds. The tubers of *Aplectrum hyemale* are so viscid that they are called Putty-root in the United States, and are there used for cementing broken earthenware.

See Sander's *Reichenbachia*; Veitch's *Manual of Orchids*; *The Amateur's Orchid Guide*, by Britten and Gower; Watson, *Orchids: their Culture and Management* (1890; ed. Chapinan, 1903); Ames, *Orchidaceæ* (7 vols., 1905-22).

ORCHIS is a genus of Orchidææ, to which, as now restricted, ten of the British species are referred. Some of them are among the most common of British Orchidææ, adorning meadows and pastures with their flowers in summer. It is a rather numerous genus, chiefly spread over Europe, northern Asia, and a very few of the species belong to North America. The British species have mostly red or lilac flowers, sometimes white or green, and often beautifully mottled. The roots of some of the species when dried constitute the salep of commerce, which reduced to a fine powder, and mixed with boiling water, sugar, and milk, makes an excellent diet drink. *O. mascula* and other British species yield such an excellent fecula that it has been suggested the production of salep might be made a profitable industry in England. The accompanying figure gives an idea of the general features of the genus.

Orchis mascula:
a, the lip of the perianth.

Orchil. See ARCHIL.

Orchom'enos, an ancient city of Bœotia, the capital of the kingdom of the Minyæ, was situated at the north-western corner of Lake Copaïs, where it was joined by the Cephissus, and extended from the marshy edges of the lake up the face of a steep rocky hill, on which stood the acropolis. It sent thirty ships to the Trojan war, and at a later date became a member of the Bœotian confederacy. Its government was thoroughly aristocratic, and after

the Peloponnesian war the jealous democratic Thebans destroyed it by fire, and sold its inhabitants as slaves. It was rebuilt in the reign of Philip of Macedon, but never recovered its position. It was famous for its musical festival in honour of the Graces, who were specially worshipped in the city. In 1880 Schliemann excavated there the 'treasury of Minyas,' or rather a royal beehive tomb slightly smaller than the 'treasury of Atreus' at Mycenæ (q.v.); it dates from about 2000 B.C., and is notable for its ornamentation. In 1903 Furtwängler laid bare various dwellings of the same period, including a large decorated palace. See works by O. Müller (1844), and Schliemann (1881); and Bulle in the *Abh. Kgl. Bayr. Akad.* (1907).—There was a second Orchomenos in Arcadia, lying NNW. of Mantinea.

Orcin, or **ORCINAL**, $C_6H_3(CH_3)(OH)_2$. This substance is found in the free state in the lichens from which Archil and Litmus (q.v.) are prepared. It is formed when the acids which occur in these plants are boiled with baryta water or submitted to dry distillation. It is also prepared artificially from the nitro-derivatives of the hydrocarbon toluene. As shown by the formula, orcinal is a di-acid phenol, and appears in large colourless crystals which turn a reddish-brown colour when exposed to the air. By the action of ammonia and the oxygen of the air it is converted into orein, $C_7H_7NO_3$, which is the colouring matter of archil.

Ordeal (O.E. *ordél*, *ordāl*, the prefix *or-* meaning 'out,' and *dél*, *dāl*, 'a dealing'; cognates are the Dutch *oordeel*, and Ger. *Urtheil*, 'judgment'), a practice which has prevailed largely among various widely-separated nations, of referring disputed questions, particularly such as relate to the guilt or innocence of an individual, to the judgment of God, determined either by lot or by the success of certain experiments. And there need be no doubt that it is often successful in the detection of a criminal whose trepidation before the dreaded ordeal betrays him, conscious of his guilt, and more than half afraid of the occult influences he is about to outrage. Of its existence among the ancient Jews we have an instance in Numbers v., where a Hebrew woman, accused of adultery, is required to drink the waters of jealousy as a test of innocence; a similar ordeal for incontinence is still in use among the natives of the Gold Coast of Africa. Compurgation of accused persons by fire, as existing among the Greeks, is referred to in the *Antigone* of Sophocles. Among the Hindus the ordeal has been in use to be practised in nine different ways—by the balance, by fire, by water, by poison, by the *cosha* or drinking water in which images of the sun and other deities had been washed, by chewing-rice, by hot oil, by red-hot iron, and by drawing two images out of a jar.

Livingstone describes the practice of ordeal with a bark infusion of *Erythrophloeum guineense* as common among all the negro races north of the Zambezi. 'When a man suspects that any of his wives have bewitched him he sends for the witch-doctor, and all the wives go forth into the field, and remain fasting till that person has made an infusion of the plant (called *goho*). They all drink it, each one holding up her hand to heaven in attestation of her innocence. Those who vomit it are considered innocent, while those whom it purges are pronounced guilty, and put to death by burning. The innocent return to their homes and slaughter a cock as a thank-offering to their guardian spirits.' The women themselves eagerly desire the test on the slightest provocation; each is conscious of her own innocence, and has the fullest faith in the *muavi* ('the ordeal') clearing all but the guilty. There are varieties of procedure

among the different tribes. The Barotse pour the medicine down the throat of a cock or dog, and judge of the innocence or guilt of the person accused by the vomiting or purging of the animal. The Calabar Bean (q.v.) is also used for the ordeal; as was Tanghinin (q.v.) in Madagascar.

Throughout Europe in the dark ages the ordeal existed under the sanction of law and of the church, and was closely related to the oath. The most prevalent kinds of ordeal were those of *fire*, *water*, and the *wager of battle*. *Fire ordeal* was only allowed to persons of high rank. The accused had to carry a piece of red-hot iron for some distance in his hand, or to walk nine feet barefoot and blindfolded over red-hot ploughshares. The hand or foot was bound up and inspected three days afterwards; if the accused had escaped unhurt he was pronounced innocent; if otherwise, guilty. Under such a judicial system there were probably few acquittals; but there can be little doubt that in the severer kinds of ordeal precautions were taken by the clergy to protect those whom they wished to clear from suspicion. And the feats of modern jugglers suggest possibilities of official trickery which may at once have saved the credit of the ordeal and cleared those meant to be acquitted. Queen Emma, mother of Edward the Confessor, when suspected of a criminal intrigue with Alwyn, Bishop of Winchester, triumphantly vindicated her character by walking unhurt over red-hot ploughshares. *Water ordeal* was the usual mode of trial allowed to bondsmen and rustics, and was of two kinds—the ordeal of *boiling water* and of *cold water*. The ordeal of *boiling water*, according to the laws of Athelstan, consisted of taking a stone out of boiling water, where the hand had to be inserted as deep as the wrist; what was called the triple ordeal deepened the water to the elbow. The person allowed the ordeal of *cold water*—the usual mode of trial for witchcraft—was flung into a river or pond; if he floated without any appearance of swimming he was judged guilty; while if he sank he was acquitted. The *wager of battle* was a natural accompaniment of a state of society which allowed men to take the law into their own hands. The defeated party, if he craved his life, was allowed to live as a 'recrunt,' that is, on retracting the perjury which he had sworn to.

Other kinds of ordeal were practised in particular circumstances in different parts of Europe. In the ordeal of the *beer*, a suspected murderer was required to touch the body of the murdered man, and pronounced guilty if the blood flowed from his wounds. Undoubtedly this touched a primitive time, when death was not fully understood, and the lifeless body was supposed still capable of thought and action. And to this day English peasants expect every one who sees a corpse to touch it to show that he bears the dead no ill-will. The ordeal of the *eucharist* was in use among the clergy: the accused party took the sacrament in attestation of innocence, it being believed that, if guilty, he would be immediately visited with divine punishment for the sacrilege. A somewhat similar ordeal was that of the *corsned*, or consecrated bread and cheese: if the accused swallowed it freely he was pronounced innocent; if it stuck in his throat he was presumed to be guilty. Godwin, Earl of Kent, in the reign of Edward the Confessor, when accused of the murder of the king's brother, is said to have appealed to the ordeal of the *corsned*, and been choked by it. There can be no doubt that the popular English asseveration 'May this bit choke me if I lie!' is a distinct survival. An early form of ordeal, abolished by Louis le Debonnaire in 816, was that of the *cross*: the accuser and accused stood upright before a cross, and he who first fell, or shifted his

position, was pronounced guilty. It was done away with as being irreverent towards the mystery of the cross. Besides these, there was the ordeal by *lot*, dependent on the throw of a pair of dice, one marked with a cross, the other plain.

Trial by ordeal at first carried with it the sanction of the priests as well as of the civil power, though the clergy in the course of time came to discountenance it. In England it seems to have been continued till the middle of the 13th century. On the Continent it was, generally speaking, abolished rather earlier, although as late as 1498 we find the truth of Savonarola's doctrine put to the test by a challenge between one of his disciples and a Franciscan friar to walk through a burning pile. In Scotland in 1180 we find David I. enacting, in one of the assemblies of the frank tenantry of the kingdom, which were the germ of parliaments, that no one was to hold an ordinary court of justice, or a court of ordeal, whether of battle, iron, or water, except in presence of the sheriff or one of his sergeants; though, if that official failed to attend after being duly summoned, the court might be held in his absence. The first step towards the abolition of this form of trial in Saxon and Celtic countries seems to have been the substitution of compurgation. See COMPURGATORS.

See the articles BATTLE (WAGER OF), DIVINATION; also the works of Bastian, Grimm, Tylor and Waitz *passim*; Tylor's article 'Ordeals and Oaths,' in *Macmillan's Magazine* for 1876; H. C. Lea's *Superstition and Force* (Phila. 1866; new ed. 1892); and George Neilson's *Trial by Combat* (1890).

Ordericus Vitalis, a mediæval historian, born at Atcham near Shrewsbury in 1075. He was the son of Odeler of Orleans, who in Roger de Montgomery's train had accompanied the Conqueror to England, and from childhood was dedicated to God. At ten he was sent to Normandy to be educated for the monastic life in the abbey of St Evroul. Here he spent all his life, although he made several visits to England to collect historical materials. He became a priest in 1107, and died most probably about 1143. Between the years 1130 and 1141 Orderic compiled his *Historie Ecclesiastice*, an elaborate work on the history of Normandy and England, preceded by a brief chronicle of events from the birth of Christ down to his own time. The work is a singular mixture of important history and trivial gossip, marred by absolute lack of order, grotesque style, and laboured grandiloquence; but its writer possessed the seeing eye and the sympathetic heart, and the result is that his confused book remains a precious storehouse to the historian, abounding in those truthful photographic glimpses of reality which are beyond the reach of all the laborious erudition of a later age. With the Conquest it becomes of great value as an honest and trustworthy contemporary source.

The first edition of the *Historie Ecclesiastice* was published by Duchesne, in his *Hist. Norm. Scip.* (1619). The best edition is that by A. le Prevost (5 vols. Paris, 1838-55). It was translated into English by T. Forester (4 vols. 1853-56) in Bohn's *Antiquarian Library*. See the introduction by Delisle in Prevost's edition, and chap. vi. of Dean Church's *St Anselm* (1870).

Orderlies are non-commissioned officers or soldiers employed as messengers or attendants. Thus in the British army each general or commanding officer has an orderly always at his disposal; a *Post-office Orderly* fetches the letters of each corps; and when a court-martial or board of officers is convened, a non-commissioned officer is appointed as *Court-orderly* to attend upon it. The men of the medical staff corps, when on duty with the sick, are also called *Hospital-orderlies*. The *Orderly-officer* is the officer on duty for the day

in each corps. He attends all parades, inspects rations, visits the barrack-rooms at the dinner-hour, hospital, cells, guardroom, &c., remaining in uniform and on duty in barracks the whole day. Similarly, an *Orderly Non-commissioned Officer* of each corps is on duty for the week, calls the roll, warns men for parade, copies orders, &c. The regimental *Orderly-room* is the office where the lieutenant-colonel, assisted by the adjutant and a staff of clerks, transacts his business and sees prisoners daily. Each troop, battery, or company has a similar *Orderly-room* for the use of its commander. The *Orderly-book* or *Order-book* contains the general or regimental orders, which are copied into it as they are issued.

Orders, HOLY, an institution, regarded in the Greek and Roman churches as a sacrament, by which ministers are specially set apart for the service of religion. While some of the reformed churches altogether deny the distinction of ranks in the ministry, none of them admits more than three ranks, of bishop, priest, and deacon. But in the Roman and Greek churches a distinction is made between the major or holy orders and the minor orders. The major orders are those of Bishop, Priest, and Deacon (q.v.). A fourth rank of sub-deacons is generally regarded as one of the major orders, but its functions closely resemble those of the deacon. Some theologians, it should be noted, regard the episcopate not as a separate order, but as the completion and extension of the priesthood. The minor orders in the Roman Church are four in number—those of doorkeeper, reader, exorcist, and acolyte. To none of these orders is any vow of celibacy annexed. Some of their functions had their origin in the peculiar religious conditions of the early church. Preparatory to the receiving of these orders candidates are initiated in the *Tonsure* (q.v.). In the Roman Church the sacrament of holy orders is held to produce an indelible character, and therefore to be incapable of being forfeited and of being validly repeated. The Greek Church has also the distinction of major and minor orders; but all the functions of the four minor orders of the Roman Church are united by the Greeks in one single order, that of reader (*anagnōstēs*).

In the Anglican and other Reformed Episcopal churches the three higher orders of bishop, priest, and deacon are alone retained. An Anglican clergyman may be deprived of his benefice, or suspended by his bishop for various ecclesiastical offences. But, in the usual case of deprivation, the clergyman does not forfeit his status of priest or deacon, which can only be lost by deposition or *degradation*. A bishop may be deprived of his see by his metropolitan, but it has been questioned whether he can be lawfully deprived of his orders as bishop. Till 1870, a clergyman of the Church of England, as technically always a person in holy orders, could not become, under any circumstances, a member of the House of Commons. Not so now, however, all clergy in 1870 having been granted the statutory right to divest themselves of their orders. In the Presbyterian and other non-episcopal churches the ceremony of ordination is not held to impart any indelible character. A minister found guilty of heresy or immorality is deprived of his office by *deposition*, by which his clerical status is forfeited. A minister deposed ceases altogether to be a minister, and is no more capable of any of the functions of the office than if he had never been ordained. There is nothing to prevent a minister of any presbyterian or non-episcopal church from sitting in the House of Commons, with the exception only of ministers of the Church of Scotland, who are disqualified by Act of Parliament from doing so. No Roman Catholic clergyman may sit.

The use of a ceremonial for ordination is traceable among the Jews, and the New Testament contains frequent reference to the specific ceremonial of 'laying on of hands' (Acts, vi. 1-7, xiii. 1-4, xiv. 23; 1 Tim. iv. 14, v. 22; 2 Tim. i. 6). In the Roman, the Greek, and the other eastern churches this rite of ordination is held to be sacramental, and it is reserved, at least as regards the major orders, exclusively to bishops. In extraordinary cases it was permitted to cardinals and to certain abbots to confer the minor orders. Considerable controversy exists among Catholic writers as to what are the essential portions (*Materia Sacramenti*) of the rite of ordination. Some place it in the 'imposition of hands,' some in the 'presentation of the instruments' symbolical of each order. As regards the *validity* of the rite of ordination, the mere fact of its being conferred by a bishop suffices; but there is not any part of the Roman discipline which is more jealously guarded by laws than the administration of orders. The candidate can only be *lawfully* ordained by 'his own bishop' (*proprius episcopus*), or with the authority of his own bishop, who is 'his own' in respect of birth, of domicile, of benefice, or of connection by personal service.

In the Church of England and other Reformed Episcopal churches the rules of the ancient canon-law are retained, by which no one could be ordained without previous examination of his fitness, or who was disqualified by bodily infirmity, illegitimacy, immorality, or simony, or who was unprovided with a title (i.e. an appointment to serve in some church) which should provide him with a maintenance; or who, being a candidate for deacon's orders, was under twenty, and for priest's, under twenty-four years of age; but the age for admission to deacon's orders is changed to twenty-three.

In other Reformed churches ordination is performed by the presbytery by imposition of hands, or by one or more ordinary ministers. Some smaller Protestant denominations have no ceremony of ordination whatever.

Orders in Council, orders by the sovereign with the advice of the Privy-council. The Privy-council of Great Britain has no power to legislate, except so far as authorised to do so by parliament; but in periods of emergency it has nevertheless occasionally issued and enforced orders of a legislative kind; those who were concerned in passing, promulgating, or enforcing the orders trusting to parliamentary protection, and taking on themselves the personal responsibility of the proceeding. In such cases an act of indemnity afterwards passed has relieved from liability those who advised the order or acted under it, and given compensation to all who suffered by its enforcement. This course was adopted in 1766 with regard to an embargo on the exportation of corn, issued in consequence of a deficient harvest and prospect of famine. An important constitutional question was raised by the famous Orders in Council issued by Great Britain in 1807 and 1808, in reprisal for Napoleon's Berlin and Milan decrees. See CONTINENTAL SYSTEM.

Orders of Knighthood, of Chivalry, or of Merit.—From very early times we find a tendency in mankind to form associations for the purpose, among others, of the social amelioration of the human race, incentives to military prowess, or the reward of personal merit. The knights of the chivalric orders which came into being anterior to the Crusades had at least two of these objects in view: the religious orders like that of the Temple or of the Hospitaliers took vows of chastity, poverty, and obedience; the other more secular orders had also solemn initiatory cere-

monies, and one of their more special purposes was the redressing of wrongs, the protection of the oppressed, and the succouring of those in distress. Their ideals were lofty, and though in course of time these became of no practical value, it is but just to say that in their day the orders did appreciable service to the cause of humanity. The introduction of gunpowder rendered personal feats of arms obsolete, but many of the chivalric orders still continued to grant admission to members as a reward of personal merit, and as the grand-mastership of the surviving orders was ultimately invested in the reigning sovereign, it followed that all creations of these knights emanated from the regal authority.

It is only in Europe that the old chivalric orders are to be found. The orders of even the more ancient Eastern nations, such as Japan, only date from their comparatively recent contact with Europeans. The reconstitution of many European nations since the Great War on a republican basis has led to the abandonment (whether temporary or permanent remains to be seen) of the practice of bestowing orders as rewards for services to the state, though France, indeed, has its Legion of Honour. Across the Atlantic America still retains officially its pristine simplicity, but it abounds in societies—patriotic, genealogical, and otherwise—which are modelled on and named after or similar to the old chivalric orders.

The following columns contain a list of the principal orders in Europe and elsewhere. Even where the countries mentioned have ceased to bestow any orders, the descriptions of the latter have been retained as being of use to the historian, antiquary, genealogist, or collector.

AUSTRIA-HUNGARY.—The *Order of the Golden Fleece* (see **GOLDEN FLEECE**).—*Imperial Military Order of Maria Theresa*, founded by the Empress Maria Theresa in 1757 for 'officers distinguished in war.' Badge, a cross pattée moline enamelled white, in the centre a circle with the arms of Austria, viz. gules a fess argent, within a white band edged gold and inscribed 'Fortitudini' in gold letters. Ribbon, white watered silk with red edges.—*St Stephen*, founded by the Empress Maria Theresa in 1761. Badge, a cross pattée concave, enamelled green, edged gold, surmounted by the crown of Hungary: on a red enamelled centre within a white band with gold edges and inscribed with the motto 'Publicum meritorium premium' a green mount, thereon a patriarchal cross silver, issuing from a golden crown between the letters M and T. Ribbon, red with green border.—*Order of the Iron Crown*, instituted by Napoleon in 1805, abolished 1814, revived by the Emperor Francis I. in 1816. Badge, the Iron Crown on which is the Austrian double-headed eagle pendant from an imperial crown all gold: on the breast of the eagle a shield azure charged with the letter F. in gold. Ribbon, orange with two green stripes.—*Order of Leopold*, instituted by Francis I. 1808. Badge, red cross pattée concave with white border and gold edge pendant from the imperial crown: on a red centre the monogram F. I. A. surrounded by a white band inscribed 'Integrate et Merito.' Ribbon, red with two white stripes.—*Order of Elizabeth Theresa*, instituted 1750, renewed 1771. Badge, on an oval escutcheon surrounded by eight rays each enamelled per pale from the points argent and gules edged gold the monograms E. C. and M. T., above them the imperial crown, and round them the motto 'M. Theresia parentis gratiam perennem voluit.' Ribbon, black.—*Order of the Community of Noble Ladies of the Starry Cross*, an order for ladies of noble birth instituted by the Empress Eleanor in 1668. Badge, on an oval silver medallion surrounded by a blue band entwined by a silver ribbon the imperial Austrian eagle, charged with a green Latin cross edged gold, resting on a similar cross of brown wood. Ribbon, black.—*The Teutonic Order*, an ancient order of uncertain origin, abolished by Napoleon in 1809, but renewed in 1840. Badge, an elongated cross pattée slightly molined, black upon white with gold edging, surmounted by a black helmet affrontée, visor closed, and ducally crowned gold with a plume of white ostrich feathers. Ribbon, black.

Baden.—*Order of Military Merit of Charles Frederick*, instituted 1807. White Maltese cross resting on green laurel wreath surmounted by a gold crown: on a red centre surrounded by blue band inscribed 'Für Badens Ehre' the monogram C. F. Ribbon, yellow with two red stripes and outside edges white.—*Order of Loyalty, or Fidelity*, founded 1715, renewed 1803. Badge, red Maltese cross, on the points gold knobs, in the angles two C's reversed gold, all pendant from a gold crown. Ribbon, orange with silver borders.—*Order of the Lion of Zaehringen*, instituted 1812. Badge, green Maltese cross, with ornamental gold clasps between the angles:

on a red centre a lion rampant contourné in gold, the arms of Zaehringen within a white fillet, with the motto 'Für Ehre und Wahrheit.' Ribbon, green with two orange stripes.

BAVARIA.—*Order of St Hubert*, founded 1444 by Gerhard V., Count of Ravensburg, to commemorate his victory over Arnold, Count of Egmont, confined to members of the royal house, foreign sovereigns, &c. Badge, white Maltese cross with knobs on the points and three golden rays between the angles: in the centre is a representation of the conversion of St Hubert, within a red border inscribed 'In Trau Vast.' Ribbon, red with green border.—*Order of St George*, supposed to have been founded in the 12th century, renewed in 1494, modified in 1827 and 1871. Exclusively Roman Catholic. Badge, a blue Maltese cross with white border and edges of gold, and between the arms of the cross four projecting points coloured like the cross, and on them the initials V. I. B. I. (Virgini Immaculatæ Bavaria Immaculata): on a gold centre within a white border a representation of the Immaculate Conception: the cross is surmounted by a lion's head and gold ornament. Ribbon, blue with white stripes on which are narrow black stripes.—*Order of Maximilian Joseph*, founded 1797, modified 1806. Badge, a white Maltese cross with gold knobs on the points and gold rays in the angles: on a blue centre the royal cypher, all pendant from a gold crown. Ribbon, black with a broad white stripe with narrow blue stripes on it.—*Order of the Bavarian Crown, or of Civil Merit*. Badge, a white Maltese cross surmounted by a smaller one in saltire, a golden ray between the arms of the crosses, all encompassed by a green oak wreath: the centre is paly-bendy argent and azure charged with a royal crown gold, the whole pendant from a gold crown. Ribbon, blue with white border.—*Royal Order of Louis*, founded 1827. Badge, a cross wavy gold, on a white centre the portrait of the founder, on the four limbs of the cross the inscription 'Ludwig König von Bayern.' Ribbon, crimson with blue border.—*Order of Maximilian*, founded 1853, for Germans only; two sections, science and art. Badge, a blue cross botonée inscribed with the date of foundation and having a gold ray in each angle: in the centre a portrait of the founder: the cross rests on a gold laurel and oak garland, all being pendant from a crown. Ribbon, dark blue with white border.—*Order of Military Merit*, founded 1866. Badge, a blue Maltese cross with silver rays in the angles: in the centre on a blue ground the letter L surmounted by a crown in gold and surrounded by a white band bearing the word 'Merenti' in gold. Ribbon, white with blue edges. Bavaria had three orders for ladies.—*Order of Elizabeth*, founded 1766. Confined to Roman Catholic ladies of noble descent, having 'seize quartiers' on their own or their husband's side. Badge, white cross pattée concave surmounted by the electoral crown: in the centre St Elizabeth giving alms. Ribbon, blue with red borders.—*Order of St Anne*, founded 1783. Badge, blue Maltese cross with white border, and gold annulets in the angles: on a white centre the Virgin in gold, and on the arms of the cross the motto 'Sub tuum præsidium patronus noster.' Ribbon, light blue with white borders.—*Order of Louis*, founded 1814. Badge, small black cross pattée, on a blue centre the letter L. surrounded by stars. Ribbon, white with two black stripes.—*Order of Theresa*, founded 1827. For unmarried noble ladies. Badge, light blue Maltese cross with white border, and in the angles a fusil, fusilly of four argent and azure: in the centre the letter T surrounded by a white band charged with a wreath of rue. Ribbon, white with two blue stripes.

BELGIUM.—*Order of the Iron Cross or of Civil Merit*. Black Maltese cross with gold knobs on points: on a gold centre the Belgian lion in relief. Ribbon, crimson with black stripe, and yellow border with black stripe.—*Order of Leopold*, founded 1832. Badge, white Maltese cross, between the angles on the dexter side a laurel branch and on the sinister side an oak branch: on a black centre the Belgian lion surrounded by a red band with the motto 'L'union fait la force.' Ribbon, crimson watered silk.

BRUNSWICK.—*Order of Henry the Lion*, founded 1834. Badge, blue Maltese cross: on three of its limbs peacock's feathers, and on the bottom limb a helmet: in the angles the ducal cypher crowned: on a red centre a pillar crowned between two sickles, over all a horse courant silver, all pendant from a lion passant guardant within two laurel branches with royal crown above. Ribbon, dark red with yellow borders.

BULGARIA.—*Military Order of St Alexander*, founded 1879. Badge, white Maltese cross, in the angles two swords in saltire: on a red centre the Bulgarian lion encircled by a green band with the words 'For Bravery' in Bulgarian characters.

DENMARK.—*Order of the Elephant*, a very old order renewed in 1458 and revised in 1693. Badge, a white elephant, tusked gold with a castle on its back and an Indian sitting on its head. Ribbon, light watered blue.—*Order of Dannebrog*. Badge, white oblong Maltese cross with red border slightly concave, in the centre a crowned W (Waldemar), and on the four arms the words 'Gud-og-Kongen' (God and the King): in the angles of the cross a gold crown, and above the cross the king's initials surmounted by the royal crown. Ribbon, white with crimson edges.

FRANCE.—The only order bestowed by the French Republic is that of the Legion of Honour (q.v.).

GREAT BRITAIN.—The orders of the *Garter* (the oldest extant chivalric order), the *Thistle*, *St Patrick*, *Bath*, *St Michael* and *St George* are all described under their respective titles. See also **INDIAN ORDERS.**—*Order of Merit*, instituted in 1902, limited to twenty-five members, exclusive of such foreign members as may be admitted, for persons who have rendered exceptionally meritorious service in the navy and army or towards the advancement of art, literature, and science. Badge, a hollow

Maltese cross of red and blue enamel of eight points, having within a laurel wreath upon a centre of blue enamel the words *FOR MERIT* in gold. Ribbon, Garter blue and crimson.—*The Royal Victorian Order* was founded in 1896 as a reward for special services personally rendered to the sovereign. There are five classes—Knights Grand Cross, Knights-Commanders, Commanders, and members of the fourth and fifth classes.—King Edward VII. in 1904 founded a special decoration styled the *Royal Victorian Chain*, which is only conferred on a few individuals of eminence. Badge, a white enamelled Maltese cross of eight points: on the oval centre of crimson enamel the royal and imperial cypher (V.R.I.), within a blue enamelled circle with the motto 'Victoria' in gold.—*The Most Excellent Order of the British Empire*, founded 1917. This is the most widely conferred of all the British orders. It is open both to men and women, and is divided into five classes: Knights Grand Cross and Dames Grand Cross, Knights-Commanders and Dames-Commanders, Commanders, Officers and Members. Badge, a cross patonce enamelled pearl fimbriated or, and surmounted by a gold medallion with a representation of Britannia seated within a circle gules inscribed with the motto 'For God and the Empire' in gold. The officers of the order wear a silver-gilt badge and the members a silver one. Ribbon, purple.—*Order of Companions of Honour*, instituted 1917. The membership is limited to fifty males and females who may have rendered conspicuous service of national importance. Badge, an oval-shaped gold medallion with representation of an oak-tree and pendant from a branch a shield of the royal arms, in the dexter a representation of a knight armed and in armour mounted on a horse, the whole within a circle azure inscribed with the motto 'In action faithful and in honour clear.' Ribbon, carmine with a border interlaced gold.—*The Distinguished Service Order*, founded 1886, for conspicuous services rendered by officers of the navy, army, and air force. Badge, a gold cross enamelled white edged gold, having on one side within a wreath of laurel green the imperial crown in gold upon a red ground, and on the reverse within a similar wreath on a similar ground the royal cypher.—*Imperial Service Order* for meritorious service extending over at least twenty-five years by members (male and female) of the Civil service. Badge, a medallion bearing the imperial and royal cypher for the current reign, and the words 'For faithful service' both in dark blue enamel on a gold plaque surrounded by a seven-pointed star of silver surmounted by the imperial crown. In the case of women members the plaque is surrounded by a wreath of laurel in place of the star. Ribbon, a stripe of blue between two stripes of crimson of equal size.

HESE, GRAND DUCHY OF.—*Order of the Golden Lion*, founded 1770, revived 1870. Badge, red Maltese cross with white border: on an oval centre azure a lion rampant gold surrounded by a red band with the motto 'Virtute et Fidelitate.' Ribbon, crimson.—*Order of Louis*, founded 1807. Badge, black Maltese cross with red border: on a red centre the letter L. between two laurel branches gold surrounded by a white band with the motto 'Für Verdienste.' Ribbon, black with red borders.—*Order of Merit of Philip the Magnanimous, or the House of Philip-le-Bon*, founded 1840. Badge, white cross pattée slightly concave: on a blue oval centre the full-length effigy of Philip-le-Bon surrounded by a white band inscribed 'Si Deus nobiscum quis contra nos.' Ribbon, red with blue borders.—*Order of Military Merit*, founded 1870. A cross pattée nowy-lozengey of gilt bronze resting on a laurel wreath: on the arms of the cross the words 'Gott Ehre Vaterland' and in the middle a crowned L. Ribbon, light blue with deep scarlet edges.—*Order of the Military Sanitary Cross*, founded 1870. A twelve-pointed variety of the cross pattée: in the centre an old English L crowned, and in the limbs of the cross 'Für Pflege der Soldaten' 1870. Ribbon, scarlet with narrow silver edges.

ITALY.—*Order of the Annunciation*, founded 1862, revived 1818, and modified 1869. Badge, gold medallion with a representation of the Annunciation surrounded by interlaced love-knots. Ribbon, blue.—*Order of St Maurice and St Lazarus*, formed by the union of two orders, the first dating from the 15th century and the latter claiming to have been in existence in Jerusalem 1000 A.D. After several changes it was ultimately revised by Victor Emmanuel II. in 1855. Badge, white cross botonné for St Maurice surmounting a green Maltese cross placed saltireways, all pendant from a royal crown. Ribbon, green watered silk.—*Order of Military Merit*, founded 1815, revised 1855. Badge, white cross urdee resting on a wreath of laurel and oak banded gold: on a round centre gules two swords in saltire points upwards or, in chief the date '1855.' Ribbon, blue with red stripe in centre.—*Civil Order of Savoy*, founded 1831, revised 1861, limited to sixty knights 'who have contributed to the service of the king and the welfare of the state': a blue Savoy [Latin] cross, in the centre a round white shield with the cypher 'C. A.' (Charles Albert). Ribbon, pale blue with two white stripes.—*Order of the Iron Crown*, established in 1868 to commemorate the annexation of Venetia. Badge, white cross pattée convex, the arms of the cross connected by laces of gold cord: on a circular blue centre a representation of the old Iron Crown of the Longobardian kings in gold. Ribbon, red with white strip in centre.

JAPAN.—*Order of the Rising Sun*, instituted 1874. Badge, a red sun with thirty-two double-pointed rays of gold and white enamel: it is suspended from three blossoms and a leaf of the Paulownia; the lowest class of the order wear the Kiui leaf in place of the Paulownia. Ribbon, white with red borders.—*Order of the Chrysanthemum*, instituted 1876, mostly conferred on princes of the blood and foreign sovereigns. Badge, very much the same

as that of the Rising Sun, with the addition that the rays rest on a wreath of chrysanthemums, having green leaves with gold veins: the badge is suspended by a gold ring from a yellow chrysanthemum. Ribbon, crimson with purple border.

LIPPE AND SCHAUMBURG-LIPPE, PRINCIPALITY OF.—*Order of the Cross of Honour*, founded 1869. Badge, white Maltese cross with eight-rayed gold star in the centre for Schaumburg and Sternberg: in the centre of the star a white circle charged with a red rose for Lippe, surrounded by a blue band inscribed 'Für Treue und Verdienst.' Ribbon, red with gold edges.

LUXEMBURG, GRAND DUCHY OF.—*Order of the Oak Leaf Crown*, founded 1841. Badge, a silver cross pattée: in a green centre within a red band encircled with an oak wreath the letter W in gold with crown above. Ribbon, orange with three green stripes.

MECKLENBURG-SCHWERIN AND STRELITZ, GRAND DUCHIES OF.—*Order of the Cross of Military Merit*, founded 1814. Silver cross pattée with gold centre for 1st class, silver for 2d, copper with silver centre for 3d, all copper for 4th class: in the centre the cypher P. F. M. with crown above. Ribbon, crimson, blue stripes with yellow edges.—*Order of the Crown of the Wendes*, founded 1864. Five classes, the first being open to ladies of noble rank; 96 members apportioned to Schwerin and 32 to Strelitz. Badge, white Maltese cross with gold knobs on points, in each angle of the cross a griffin passant gold: on the blue centre the crown of the Wendes gold within a red band with the mottoes 'Avito viret honore' for Strelitz, and 'Per aspera ad astra' for Schwerin; above the cross the double cypher T interlaced with W surmounted by the crown of the Wendes in gold. Ribbon, red with yellow stripes and blue borders.

NETHERLANDS.—*Military Order of William*, founded 1815. Badge, white Maltese cross with gold knobs on the points, in each angle an oak leaf green edged gold, and distributed on the wings of the cross the words 'Voor-Moed-Belief-Trouw': in the centre the Burgundian fire-steel gold, all pendant from a gold crown. Ribbon, orange with two blue stripes near the edge.—*Order of the Netherlands Lion*, founded 1815. Badge, a white Maltese cross with gold knobs on the points: in each angle the letter W gold: on a blue centre the motto 'Virtus Nobilitat,' the cross ensigned with a gold crown. Ribbon, blue with two orange stripes.

NORWAY.—*Order of St Olaf*, founded 1847. A white Maltese cross with the Gothic letter O crowned gold in the angles of the cross; the centre of the badge is surrounded by circles of gold, white, blue, and white, and within there is the Norwegian lion rampant carrying an axe on a red ground. Ribbon, red with blue and white border.

OLDENBURG, GRAND DUCHY OF.—*Order of Merit*, founded 1838. White cross pattée: on a white centre with gold border the dual arms with mantle and crown: on the top of the cross two swords in saltire surmounted by a gold crown: on the limbs of the cross '17 Jan. 1755,' '6 July 1755,' '21 May 1829,' '21 March 1838.' Ribbon, red with blue stripes near the edges.

PERSIA.—*Order of the Lion and Sun*. Star of eight points each adorned with emeralds, rubies, and diamonds: upon a blue enamelled field a green mount, thereon a lion couchant contourné proper, the Sun rising from behind the Lion gold, the star suspended by two gold rings from a green ribbon. There is also a badge with a gold border jewelled and ornamented: a Lion and Sun as in the centre of the star. Ribbon, green.

PONTIFICAL.—*Order of Christ*, instituted 1320. Badge, red cross charged with a plain Latin cross white, edged gold, the cross surmounted by a gold crown. Ribbon, red.—*Order of the Holy Sepulchre*, said to have been founded 1099, confirmed 1746 and 1868. Badge, a cross potent gold cantoned with a similar cross on each angle, surmounted by a royal crown. Ribbon, black.—*Order of St Gregory the Great*, founded 1831. Red Maltese cross with gold knobs on points: on a blue centre the bust of St Gregory gold surrounded by a gold band inscribed 'S. Gregorius Magnus.' Ribbon, red with yellow borders.—*Order of Pius*, founded 1847. Badge, blue star of eight points: on a circular white centre 'Pius IX.' surrounded by a gold band with the motto 'Virtuti et Merito.' Ribbon, dark blue with red double border.—*Order of St Cecilia*, founded 1847. Blue cross, surmounted by a laurel wreath green, attached to the cross by a gold chain: on a white centre within an arch of blue the Papal tiara.—*Order of St John of Jerusalem*, see HOSPITALIERS.

PORTUGAL.—*Order of Christ*, instituted 1317 by Dionysius of Portugal, transferred to the Portuguese crown 1522, and reorganised 1789. Badge, a red cross batune, the extremities of the arms bevelled inwards from the outside points, charged with a white Latin cross edged gold, surmounted by a white star of eight points with gold rays in the angles: on the centre of the star a gold circle charged with a red heart inflamed and wreathed in fess: above the heart and issuing from the flames a Latin cross sable edged gold. Ribbon, crimson watered silk.—*Military Order of St Benedict of Aviz or of Ivora*, originated in 1143 in a society of noble Portuguese for the purpose of opposing the Moors. Badge, a green cross fleury, with the ends of the arms reflexed, ensigned with a white star of eight points with gold rays: in the centre of the star a gold circle charged with a red heart inflamed and wreathed in fess: above the heart a black Latin cross edged gold. Ribbon, green watered silk.—*Order of St James of the Sword*, founded 1112, remodelled 1789. Badge, a red lily cross, the lower arm terminating in the form of a sword-blade. Ribbon, violet. The grand crosses have the badge surmounted by the Sacred Heart as in the Order of Christ.—*Order of the Tower and Sword*, founded

1459, revived 1808, reconstructed 1832. Badge, a white star of five points resting on an oak-wreath fructed : between the two upper rays of the star a gold tower : in a white centre a green laurel wreath on which rests a sword : both surrounded by a blue band with the motto 'Valor Lealdade e Merito.' Ribbon, blue.—*Order of St Isabella*, founded 1801. Badge, on a gold medallion St Isabella dispensing alms, on the edge a laurel wreath with ribbon entwined, surrounded by a border of roses and ribbons tied in chief issuing from a cherub, surmounted by a golden crown : in base overlaying the rose border a blue ribbon with the motto 'Pauperum solatio.' Ribbon, pink with white stripes.—*Order of Our Lady of the Conception of Villa-Vieosa*. Badge, a white enamelled star of nine points, in the centre a gold disc with the monogram M. A. within a blue band having the motto 'Padroeira do Reino' : between the points of the star golden rays on which are placed nine white stars of five points, with plain gold lines from the centre of each point, the whole surmounted by a royal crown jewelled with rubies and emeralds. Ribbon, blue with white edges.

PRUSSIA had no very ancient order. The *Order of the Black Eagle* was founded in 1701 in commemoration of the Elector of Brandenburg as King of Prussia (Frederick I.). It was limited to thirty knights (exclusive of princes of the royal blood), who must prove noble descent for four generations. Badge, a blue Maltese cross with a black eagle, crowned gold, displayed on each angle : on a gold centre the royal cypher F. R. within a white band bearing the motto 'Suum cuique' in chief and two green laurel branches in base. Ribbon, orange.—*Order of the Red Eagle*, founded 1705, with frequent subsequent alterations. Only those holding this order could receive the Black Eagle. Badge, same as the Black Eagle, save that the cross is white and the eagles red : the cypher is F. W. R., and the motto 'Sincere et Constante.' Ribbon, white with two orange stripes.—*Order of Merit*, originally a reconstitution in 1740 of an older order. It had a military and civil division, and in 1842 a special division for science and art was included. Badge, the Prussian eagle in gold on a white circle edged gold and surrounded by a white band charged with four double cyphers F. adorsed gold, and between them II in Roman numerals, the whole encircled by a blue band inscribed 'Pour le Mérite' : outside the band four gold crowns at top, bottom, and sides. Ribbon, white with two black stripes at the borders.—*Order of Military Merit*, founded 1740. Badge, blue Maltese cross, on its upper arm the letter F. crowned and on the other three arms the motto 'Pour le Mérite' : between the angles of the cross a golden eagle displayed and crowned. Ribbon, black with two white stripes.—*Order of the Iron Cross*, founded 1813, and modified 1870. Badge, an iron cross pattée with silver edges : on its upper arm the letters F. W. crowned : in the centre three oak leaves, on the bottom limb '1813.' Ribbon, military division, black watered silk with two white stripes ; civil division, white watered silk with two black stripes.—*Order of the House of Hohenzollern*, founded 1841, incorporated with the Prussian orders 1851, and revised 1861. Badge, white cross pattée slightly convex with black border edged gold surmounted by the royal crown : in the angles of the cross an oak and laurel wreath : on a white circular centre within a blue band inscribed 'Vom Fels zum Meer' the Prussian eagle charged on the breast with the arms of the House of Hohenzollern.—*Order of the Crown*, founded 1861. Badge, a white cross pattée slightly concave edged gold imposed on a similar but larger one : on a gold centre surrounded by a blue band inscribed 'Got mit Uns' in German characters a royal crown. Ribbon, dark blue.

RUSSIA, PRINCIPALITIES OF.—*Order of the Cross of Honour*. Badge, white Maltese cross with seven rays on each angle : on a circular centre the arms of the princely house surmounted by a crown. Ribbon, purple.

ROMANIA.—*Order of the Star* (1877), a blue cross crosslet with golden rays in the angles (the military division has the cross ensigned with two swords in saltire with crown above) : on a red centre with blue band inscribed 'In Fide Salus' and surrounded by a green oak leaf an eagle displayed and crowned gold. Ribbon, red with two blue stripes near the borders.—*Order of the Crown of Rumania*, founded 1881. Badge, red Maltese cross with white border and gold edges, between the arms of the cross the royal cypher C reversed : on a red circular centre within a white band inscribed 'Prin noi insine—14 Martie 1881' the crown of Rumania in silver. Ribbon, bright blue with gray borders with blue edges.

RUSSIA had no very ancient orders, though the entry into any of them created nobility.—*Order of St Andrew*, instituted 1698. Badge, the double-headed Russian eagle crowned and ensigned by two swords in saltire surmounted by the imperial crown : superimposed on the eagle is a blue St Andrew's cross with the figure of the saint on it, the initials S. A. P. R. distributed on the arms of the cross. Ribbon, blue.—*Order of St Catherine*, founded 1714, for ladies only. Badge, on an oval enriched with diamonds, resting on a diamond cross the figure of St Catherine. Ribbon, scarlet with two silver stripes, embroidered with the words in Russian 'For Love and Fatherland.'—*Order of Alexander Nevsky*, founded 1725. Badge, a red cross pattée, on the angles a crowned double-headed eagle gold : on a white centre St Alexander Nevsky on horseback. Ribbon, red.—*Order of St Anne*, instituted 1735. Badge, a red cross pattée, the arms of which are connected by gold ornaments : on a white centre the effigy of St Anne. Ribbon, red with yellow stripes at borders.—*Order of St George*, founded 1769. Badge, a white cross pattée : on a red centre St George and the Dragon. Ribbon, orange with three black stripes.—*Order of Merit*, founded 1792, revived 1807. Badge, a black cross pattée concave, with

gold knobs on the points, the whole ensigned by an imperial crown : on a gold centre encircled by a green laurel wreath an eagle displayed silver crowned gold : on the arms of the cross the words 'Mili-tari, vir-tute.' Ribbon, dark blue with three black stripes.—*Order of St Vladimir*, founded 1782 (for saving life from fire or water). Badge, a black cross pattée edged gold, the centre of each arm being red edged gold : on a black centre with gold border a heraldic mantle crowned and charged with the initial of the saint. Ribbon, red with black border. Two Polish orders were incorporated with those of Russia in 1831.—*The Order of the White Eagle*, said to have been first instituted in 1325, and revived in 1705. Badge, a red Maltese cross with white borders edged with gold and with gold knobs on the points : on the face of the cross the white eagle displayed and crowned, gold flames on the corners of the cross, which is ensigned with the imperial crown. Ribbon, light blue.—*Order of St Stanislaus*, founded 1765, and revived 1807. Badge, a red Maltese cross edged gold and with gold knobs on the points, the Polish eagle on each angle, the wings falling over each arm of the cross : golden rays issuing from the hollow of the arms : on a white centre surrounded by a green laurel wreath the effigy of St Stanislaus. Ribbon, red with white edges and two white stripes.

SAN MARINO.—*Order of San Marino*, founded 1859, modified 1860. Badge, white cross moline, at each end of the centre of the extremities a gold ball, and between the arms of the cross gold towers : in the centre a red shield charged with a triple-towered castle gold standing on a green mound and surrounded by a blue band with the motto 'Merito Militari.' Ribbon, blue with red borders.—*Order of St Agatha*, founded 1923.

SAXE-COBURG-GOTHA, DUCHY OF.—*The Saxon Ernestine Order*, instituted 1690, restored 1833. Badge, white Maltese cross edged and knobbed gold, pendant from a gold crown : on each angle of the cross a lion passant guardant gold : on the upper limb the cypher of the reigning duke : on a gold centre the bust of Duke Ernest within a blue enamelled band on which is inscribed 'Fideliter et Constante' : the band is surrounded by a wreath of oak green. Ribbon, dark red watered silk with two narrow green stripes.

SERBIA.—*The Order of St Sava* (1883) has a representation of that saint on its badge. Ribbon, white with pale blue borders.—*The Order of Takova* (1865). The badge is rather peculiar, consisting of a Maltese cross surmounting a cross saltire surrounded by a wreath of palm and in the centre of the badge and within a blue motto ribbon is on a red ground the monogram M. O. (Prince Michael Obrenowitch III.), a royal crown above and III. below in gold.

SIAM has no ancient orders. That of the *White Elephant*, instituted in 1861, is considered the highest. Badge, a white elephant caparisoned in red and gold on a dark blue field and surrounded by a triple circlet of leaves yellow, red, and green, and surmounted by the Siamese crown. Ribbon, red with green borders, having on its inside edge narrow stripes of blue and yellow.—*The Order of the Crown* (1869) has for badge a red and green enamelled vase supporting the golden crown of Siam between conical royal emblems, the whole encircled by a border of red and green nenuphar leaves. Ribbon, blue with green borders separated by three red and yellow lines. There are also two very limited family orders of *Chulachondiao*.

SPAIN.—Besides the Golden Fleece (which is treated separately) Spain has several ancient orders. That of *Calatrava* was at first a religious Order of Knights, and was founded in 1147 to commemorate the recovery of Calatrava from the Moors, but ultimately lost this character and became a purely military order. Badge, on a green lozenge a red cross of fleurs-de-lys. Ribbon, red.—*Order of St James of Compostela*, founded in 1175, was also originally a religious order, but was secularised by Ferdinand and Isabella in 1493. Badge, on a white ground a red enamelled sword fitchée (practically a dagger) with a hilt of fleurs-de-lys. Ribbon, red.—*Order of Alcántara* was originally the Society of the Knights of St Julian, and was raised by Pope Alexander III. into a knighthood order, but was secularised in 1495 by Ferdinand V. Badge, the same as Calatrava, but in green. Ribbon, green.—*Order of Our Lady of Montesa*, founded in 1317 by James II. of Aragon under Benedictine rule. The grand-mastership was annexed to the crown of Spain in 1587. Badge, on a white ground a Greek cross couped, red, fimbriated gold (the fimbriation is unnecessary and wrong as it puts metal on metal against all heraldic rule). Ribbon, red. The other Spanish orders are comparatively modern. They include the *Order of Charles III.*, or the *Immaculate Conception*, founded 1771. The badge contains a figure of the B.V.M. : the ribbon is white with broad blue border.—*Order of Maria Louisa*, founded in 1792 'for noble ladies.' The badge has in the centre a representation of St Ferdinand royally crowned and robed. Ribbon, violet with white centre.—*Order of St Hermenegilde*, founded by Ferdinand VII. in 1814 for officers of the army and navy. The badge has in the centre a figure of the eponymous saint of the order. Ribbon, violet with two white stripes.—*Order of St Ferdinand*, founded in 1811 for all classes in the army and navy. The badge has in its centre the figure of St Ferdinand in royal robes. Ribbon, red with yellow borders.—*Order of Isabella the Catholic* bears on its badge the Pillars of Hercules on the dexter side and an imperial orb of blue ensigned with a gold crown.

SWEDEN.—*The Order of the Seraphim*, or blue ribbon, is said to have been instituted by Magnus II. in 1334, but was reconstituted by Frederick I. in 1748. Badge, white cross pattée with seraphs heads between the arms of the cross, bears on a blue ground the holy monogram I.H.S. between three crowns and

issuing from the centre of the H in pale a patriarchal cross, all gold.—*Order of the Sword*, or yellow ribbon, has a badge bearing on a blue ground a sword in pale point upward between three gold crowns. It was originally instituted in 1532 by Gustavus Vasa, and after being dormant for a considerable time was revived by Frederick I. in 1748 as a military order.—*Order of Vasa*, or green ribbon, founded by Gustavus III. 1776. The badge has on a white ground the Vasa crest, a gold vase.—*Order of the Pole Star*, or black ribbon, founded 1748. The badge has on a blue ground a white cross charged with a silver star surrounded by the motto 'Nascit occasum.'—*Order of Charles XIII.*, founded 1811, has on its badge the number XIII. between two C's, the last reversed.

See *The Orders of Chivalry, War Medals and Crosses, &c.*, with illustrations, by Charles Norton Elvin (1893); *The Orders of Chivalry*, by Major J. H. Lawrence-Archer (1887); Carlisle's *Foreign Orders of Knighthood* (1889); Favine's *Theater of Honour* (trans. 1628), &c.

Ordnance Survey. By this term is understood the various operations undertaken by the British government for preparing maps and plans of the whole kingdom and its parts, the term 'ordnance' being applied from the fact that during its earlier days the survey was carried out under the direction of the Master-general of the Ordnance. The idea of a general map of any portion of the country to be executed by the government was first proposed after the rebellion in 1745, when the want of any reliable map of the northern parts of Scotland was much felt by the officers in command of the royal troops. Its execution was entrusted to Lieutenant-general Watson, the deputy quartermaster of North Britain; but it was mostly carried out by Major-general Roy, an officer of engineers. The drawing, on a scale of $1\frac{1}{2}$ inch to the mile, was completed in 1755; but, in consequence of the war which broke out in that year, was never published. In 1784, with the object of calculating the difference of longitude between the observatories of London and Paris, a base-line was measured by General Roy, R.E., on Hounslow Heath, from which started a series of triangles extending to Dover. This triangulation was connected with that carried out in France in 1786. The government shortly afterwards decided on having, for military purposes, a general survey on the 1-inch scale of the United Kingdom, and the triangulation carried out by General Roy in the south-eastern counties became the basis of the general triangulation. In 1794 the survey for the 1-inch map was begun, and the first sheet was published in 1801. As the series of principal triangles was extended westwards towards the Land's End, it was thought right to measure another base on Salisbury Plain in 1794; and two base-lines for verification were subsequently measured—one in 1801 at Misterton Carr, and the other in 1806 on Ruddlan Marsh. Though first intended chiefly as a military map, the publication of the survey soon created a desire on the part of the public for better maps, and surveyors were then hired to hasten its progress. This, however, was very slow, the map being at one time entirely suspended during the war in the beginning of the 19th century, and even the parts which were executed, having been done by contract, were found very inaccurate. In this condition the survey of England continued during the first quarter of the century, sometimes delayed by the government from motives of economy, at other times urged on by the county gentlemen, who wished the map either as a hunting-map or for local improvements.

In Scotland the principal triangulation was

begun in 1809, but was discontinued in the following year, to enable the persons who had been employed there to carry forward the subordinate triangulation required for constructing the detail maps in England. In 1813 it was resumed, and continued steadily up to 1819; a new base-line having been measured on Belhelvie Links, near Aberdeen, in 1817, and the great sector used at various stations, both on the mainland and in the islands. In 1820 it was again suspended, was resumed in 1821 and 1822, and anew broken off in 1823, the large theodolite being wanted in order to proceed with the principal triangulation in South Britain. In 1824 the survey of Ireland was begun, and nothing more was done in Scotland till 1838, except that some detail surveying for a 1-inch map was continued for a few years in the southern counties. The chief strength of the surveying corps was now transferred to Ireland. A map of that country was required for the purpose of making a valuation which should form the basis of certain fiscal arrangements and other improvements which the social evils and anomalies of Ireland urgently demanded. For this map a scale of 6 inches to the mile was adopted, as best suited for the purposes in view. On this scale the whole map was completed, and published in 1845, though the first portions were in an imperfect form, and needing revision, which was proceeded with in 1873.

The triangulation of Scotland was resumed in 1838, and in 1852 the whole of the primary triangulation of the United Kingdom was completed. It comprises, in all, 250 trigonometrical stations, and the average length of the sides of the triangles is 35.4 miles, the longest being that from Scaw Fell to Slieve Donard, which measures 111 miles. During the triangulation of Ireland a base-line had been measured on the border of Lough Foyle. As a test on the general accuracy of the triangulation the length of this base was afterwards calculated through the series of triangles from the base on Salisbury Plain; the length so found differed from the measured base by only a little more than 5 inches. The distance apart of these two bases is about 360 miles, and their length about 41,641 and 36,578 feet respectively.

The survey of Ireland having been finished in 1840, surveys for a 6-inch map were begun for the northern portions of England which had not been previously mapped on the 1-inch scale. In 1841 some secondary operations for a map of Scotland, also on a 6-inch scale, were begun, but proceeded so slowly that in 1850 only the map of Wigtownshire and some parts of Lewis were completed. Much dissatisfaction having been expressed in Scotland by the press and public bodies as to the slow progress of the map and the 6-inch scale on which only it was published, a committee of the House of Commons (Lord Elcho's) recommended in 1851 the 6-inch maps to be stopped, and the 1-inch map completed as speedily as possible. This change produced much discussion as to the relative value of the 1-inch and 6-inch scales then in use, and the expediency of adopting a still larger scale as more valuable to the public. Circulars were issued, asking the opinion of various public bodies, and of scientific and practical men, as to the proper scale for a great national survey. The great preponderance of opinion was in favour of a scale of $\frac{1}{25000}$ of nature, or nearly 1 square inch to the acre. This scale was therefore ordered by a treasury minute of 18th May 1855 (Lord Palmerston's), and though subsequently stopped, in consequence of a motion by Sir Denham Norreys in the House of Commons in June 1857, was again recommended by a royal commission (December 1857), and ordered to be resumed by another treasury minute (11th September 1858). In 1861

a select committee was again appointed, and reported that it was desirable that the cadastral survey on the scales directed by the treasury minute of the 18th May 1855 be extended to those portions of the United Kingdom that have been surveyed on the scale of 1 inch to the mile only. This recommendation was presently adopted by the government, and, generally speaking, the whole of the United Kingdom was surveyed on the $\frac{1}{250000}$ scale, but large tracts of moorland and uncultivated districts were surveyed on the 6-inch scale only. London was surveyed on a scale of $\frac{1}{10560}$, or 5 feet to a mile; whilst other towns exceeding 4000 inhabitants, of which the buildings are fairly concentrated, on a scale of $\frac{1}{1056}$, or about 10 feet to a mile.

All these original surveys were completed by 1890, when the first revision commenced, and this was completed as regards Great Britain in 1907. During this first revision in Ireland the work previously done on the 6-inch was re-surveyed on the $\frac{1}{250000}$ scale. This first revision and re-survey of Ireland was finished in 1914.

The normal work of the survey consists now of revision. The $\frac{1}{250000}$ scale maps are revised every twenty years for urban areas, and forty years for country districts. The 1-inch map is revised independently every fifteen years.

Of the maps on the larger scales only that on $\frac{1}{250000}$ is revised at the cost of the state. Should a corporation require a town revised on the $\frac{1}{1056}$ scale, a portion of the cost has to be borne by the town itself.

For a long time the 1-inch was the smallest scale employed, but increased speed of locomotion has created a demand for maps on smaller scales, and those on 2 miles, 10 miles, and 16 miles to an inch are now published.

The maps on the 25 and 6 inch scales are drawn on rectangular projections for each county or groups of counties. The 1-inch map is projected on one central meridian, likewise the smaller scale maps, which are photographically reduced from that map.

Originally the Survey Department was under the War Office; in 1870 it was transferred to the Office of Works, and in 1890 to the then newly constituted Board of Agriculture. The appointment of the officers of Royal Engineers, as well as the organisation and discipline of the Royal Engineer Companies employed on the survey, has always remained in the hands of the Secretary of State for War.

On the sheets of the $\frac{1}{250000}$ map is shown the area of each plot of ground, and on this scale 1 square inch represents approximately 1 acre. The elevations are shown by lines of levels along certain roads; as a rule, one mile and a half of levelling is run on each plan of 960 acres. On the 6-inch scale areas of plots are not shown, but the configuration of the country is indicated by contours as well as by the lines of levelling.

The second Geodetic levelling of England and Wales was commenced in 1912, and completed in 1921. Zeiss precise levels and special staves graduated on invar were used. The mean sea-level datum was determined by hourly readings of a tide-gauge at Newlyn extending over a period of six years. The probable accidental error per mile of this second levelling is ± 0.0077 feet, as compared with a probable error of ± 0.03 feet in the original levelling carried out between 1840 and 1860. A feature of this second levelling is the system of fundamental bench-marks spaced about 30 miles apart. These bench-marks are of special construction, and their sites are selected that they may be, so far as possible, permanent and stable. They should be available for determining

in future years the vertical movements of the earth's crust and the relative movements of land and sea. In 1910 some special work was commenced near Lossiemouth, in Scotland, with the view of investigating the accuracy of the principal triangulation of the United Kingdom. A detailed account of this work is given in Ordnance Survey Professional Papers, New Series, No. 2.

For further general information about the survey, see a book published in Edinburgh in 1886, entitled *The Ordnance Survey of the United Kingdom*, by Colonel T. P. White, Royal Engineers. The state of revision on the various scales is shown in the Report of Progress made annually by the Director-General, and published by H.M. Stationery Office. The Survey Department issues a comprehensive catalogue containing indexes of all the plans and sheets of the survey; specimens of the various styles in which the maps are printed and coloured; lists of technical works dealing with the work of the survey, as well as lists of other works on subjects indirectly connected with the survey proper, such as facsimiles of old county and baronial maps of Ulster, copies of the Domesday Book of England, the Jerusalem and Sinai surveys, and many others.

Ordovician, a name sometimes given to a geological formation intermediate between Cambrian and Silurian; otherwise accounted the Lower Silurian strata. It is so called from the Ordovices, an ancient British tribe.

Örebro. See CEREBO.

Ore-deposits. An ore is a mineral from which, under existing economic conditions, one or more elements may be extracted at a profit. A mineral containing a large proportion of a metal is not necessarily an ore of that metal. For example, common iron pyrites (sulphide of iron) is rich in iron, but is not an ore of iron, because that metal cannot be profitably extracted from it. Some minerals become ores because of a valuable impurity; the pyrite deposits of Río Tinto and Tharsis, South Spain, are of this kind; they are worked for the small proportion of copper they contain. A mineral, formerly worthless, may become an ore because of progress in technology. Thus wolfram, at one time thrown away in large quantities in Cornwall, is now much prized as the chief ore of tungsten. Ores are met with in various forms and positions in the earth's crust. Sometimes they are found in gravel, sand, and other alluvial deposits. Examples of this class are afforded by the placers of Alaska (see GOLD), the now exhausted stream-tin works of Cornwall, and the bog iron ores of Sweden and elsewhere. In other cases the ores occur disseminated through igneous rocks. Tin ore and magnetic iron ore occur in this way. When the whole rock is permeated with mineral matter, accumulated in minute veins, the deposit is termed a *stockwork*. Examples of stockworks of tin ore occur in Cornwall and Saxony. Again, ores may occur in detached masses. Such, for instance, are the red hæmatite deposits of Furness, North Lancashire, the brown hæmatite of the Forest of Dean, the iron mountains of Gellivara and Taberg in Sweden, and the rich hæmatite deposits of Michigan. Ores may occur in regular parallel beds or seams interpolated between rocks of sedimentary origin, as in the case of the ironstone of the Coal-measures, and in that of the cupriferous shale of Mansfeld in Prussian Saxony, a seam not more than 5 inches thick which has been worked since the 14th century. Lastly, ores are met with in tabular masses, known as mineral veins or *lodes*, differing in character from the enclosing rocks. (See MINING for classification and definitions of deposits.)

Lodes are very variable in thickness, from a mere film up to 500 feet or more. Their longitudinal extent is equally variable. The great Mother Lode of California has been traced for a distance of 70 miles. In tabular deposits, whether beds or lodes, two dimensions predominate, and the third or smallest dimension, the perpendicular distance between the two bounding planes, is termed the thickness. The adjacent rock on both sides of these two planes is termed the *country*; the portion on which the deposit lies is the *foot-wall*, and that covering it is the *hanging-wall*. With beds or seams, these are known as the *floor* or *roof* respectively. The *strike* of a deposit is the direction of a horizontal line drawn in the plane of the deposit, and its *dip* is the inclination downwards measured in degrees from the horizontal. As the dip of lodes is usually considerable, it is often measured from the vertical, and is then termed *underlie* or *hade*. The portion of a mineral deposit occurring at the surface is known as the *outcrop*, *basset* or (in the United States) *apex*. The contents of lodes vary, some parts containing worthless vein matter or *gangue*, others being filled with ore. The productive portions are termed *courses*, *bunches*, *shoots* (U.S. *chutes*), or *pipes* of ore. Cross-courses are veins with a direction nearly at right-angles to the chief lodes of any particular mining district. Experience shows that the productiveness of lodes is affected by intersection with other veins, by the nature of the adjacent rock, and by changes of dip or of strike.

The origin of mineral veins is a much debated subject which has long occupied the attention of geologists. The close connection, direct or indirect, of veins with igneous rock masses is now generally admitted. Many deposits originated with the final phases of solidification of large *magmas*, or masses of once molten rock, generally deeply buried. In certain instances valuable ore is found in *dykes*, or sheet-like deposits of igneous rock (*pegmatites*) traversing other igneous rocks; in other cases the lode is nothing else than a mineralised zone extending through an igneous mass. The great copper deposit at Sacramento, South Arizona, is of the latter description, and so, on a much smaller scale, are many of the tin lodes of Cornwall. These Cornish lodes lie in granite; they have no definite walls or boundaries, the ore (cassiterite with other minerals) having spread or been *disseminated* from a narrow fissure in the granite into the rock on each side. They are considered to have resulted from the chemical attack of the granite by hot vapours rising up the fissure, and bearing volatile tin and other compounds. Other veins, occupying fissures of all sizes, have undoubtedly been formed of minerals deposited out of aqueous solution. Though these minerals are generally designated insoluble, they are all slightly soluble in water. Moreover, hot water under great pressure is a relatively powerful solvent. In many cases—perhaps the majority—of the kind now under consideration, the water originated in deep-seated hot igneous masses from the margins of which it dissolved mineral matter. As the very weak solution rose up the fissure it gradually cooled and deposited the minerals in their order of solubility. Most veins show by their structure that they were not formed at one period, but that the fissure opened and reopened, permitting of the ascension of different solutions at different times. Some vein-quartz has been carried in by downward percolation and some from the wall-rocks or ‘country.’ Certain shallow cracks in limestone (*gash-veins*) are found to contain iron ore, which must have been carried into the cracks from above. *Contact-deposits*, generally very irregular in width and roughly lenticular in plan, occur at the contact of two different rocks.

Some contact-deposits are of great importance as, for instance, those of Rio Tinto, which occur along the junction of slate and intrusive porphyry.

The scientific study of mineral deposits has made great headway of late years, and none of the earlier works repay perusal, except by those interested in the historical aspect of the subject. This branch of geology is systematically treated in Rastall's *Geology of the Metalliferous Deposits* (Cambridge, 1923), and Thomas and MacAlister's *Geology of Ore Deposits* (London, 1920).

Ore-dressing embraces those preparatory operations to which crude ore is submitted till any further work to extract the metalliferous content is best conducted by metallurgical operations. The two arts of dressing and metallurgy have this relation, that the former effects a mechanical and preparatory concentration of the valuable constituents, while metallurgy effects a chemical and final concentration.

The place of dressing, therefore, is definite. It receives the crude ore from the mine and delivers it suitably cleaned for metallurgical treatment. On the side of the mine the line between mining and dressing is distinct: dressing begins upon arrival at the shaft top. On the side of metallurgy there is some overlapping of the two arts. Ore-dressing is, for instance, taken to include such roasting or calcining as may be necessary to induce magnetism preparatory to dressing by magnetic separation; such also as may be necessary to break up a sulphide or arsenide preparatory to dressing by water; and such drying or other heat-treatment as may be preparatory to a directly-following dressing operation.

That there should be this place for dressing lies in certain physical and mineralogical differences between crude ore and ore suitable for metallurgical treatment, and in certain economic advantages accruing as the result of dressing. The certain differences are: firstly, in the matter of lump size; secondly, in that of the relative amount of valuable mineral present; thirdly, in the possible presence of valuable minerals of two metals, these minerals requiring separation before metallurgical operations may proceed; and, fourthly, in that of the possible presence of worthless minerals actively injurious to the success of the subsequent metallurgical operations. The advantages which accrue as the result of dressing are that there is less material to be submitted to the more expensive metallurgical treatment, or to transport if transport be necessary, and that the material so submitted is more regular in value and character. Against these advantages have to be set the actual cost of dressing, which is not high—generally 1s. to 6s. per ton treated—and the loss of mineral in the operation, this loss tending to be high, and being generally about 10 to 25 per cent. of the valuable content of the ore.

In greater detail, the broken ore sent from underground to the surface contains pieces of all sizes, from large lumps to powder, yet metallurgical operations cannot accept large lumps, and sometimes require complete pulverisation. It is not uncommon, therefore, for dressing to consist mainly of a reduction in size of the pieces, as witness the complete pulverisation required in the cyanidation of precious-metal ores.

Not less important is the necessity to raise the low mineral content of crude ore. Crude copper ore may, for instance, contain as little as 1.5 per cent. of copper, yet copper-smelting, by which the great bulk of copper is produced, generally requires more than 5 per cent. or there is too great a loss in the slag, and the present range is 10 to 35 per cent. The same may be said of lead; lead ore may sometimes contain as little as 4 per cent. of

lead, but smelting is rarely undertaken on material containing less than 10 per cent., a much higher content than this being usual. With zinc the necessity for a high zinc content is even more pronounced; though a large proportion of the world's production of zinc may be from ore containing as little as 5 per cent. metallurgy generally requires not less than 33 per cent., while common practice has a range of 40 to 60 per cent. With tin the case is extreme; crude tin ore does not often contain more than 2 per cent. of tin, yet metallurgical operations for the production of metal are rarely conducted upon material containing less than 55 per cent., and a still higher content is usual. With the precious metals, gold and silver, when these are associated with pyritic sulphides, the concentration of these sulphides into a much smaller bulk would permit their submission to a metallurgical treatment impossible by reason of expense to the great bulk of the original crude ore. It is common knowledge that even with such minerals as ironstone and coal, where the mineral content is very high, some amount of dressing or cleaning is necessary nowadays.

Then, in the matter of the complexity of many crude ores by reason of the presence of different valuable metalliferous minerals demanding separate metallurgical treatment, the sulphides of lead and zinc are close associates in deposits, yet only in proportion to the completeness of their separation by dressing can they be recovered metallurgically. More than that, not only is the unseparated portion of the interfering mineral lost, but, whether lead in zinc ore or zinc in lead ore, difficulties in subsequent treatment are caused by the presence of the one or the other. Similarly, lead present in copper ore is lost in smelting.

Finally, there is the presence of minerals not worthy of separation for themselves alone, but necessitating separation because of their active interference with subsequent metallurgical operations. Zinc is not infrequently present as an impurity with lead and copper ores, making the slags pasty when present above a certain proportion; an excess of alumina or silica has the same effect, necessitating greater heat to keep the slags fluid. On the other hand, iron must be removed from zinc ores, and so must fluorite; the retorts used in volatilising the zinc would suffer from the iron, and the mass would fuse in the presence of fluorite. Copper renders tin less suitable for plating, while iron alloys itself with tin to the loss of that metal. Copper and antimony minerals are liable to prejudice the success of the recovery of gold by cyanidation by destroying the cyanide or robbing the solutions of oxygen.

Obviously the natural associations of valuable and worthless minerals in ore-deposits make dressing necessary. Though that be so, it must be said that the differences in the physical properties of these minerals make dressing possible. These properties are: specific colour, lustre, general appearance, density, surface energy, magnetic permeability, electric conductivity, &c.

Of the first three properties advantage is taken in hand-picking and sorting. All minerals have distinctive colour and characteristic lustre, by which they largely declare themselves; upon that there is no need to insist. Where, however, these are masked by the sparse distribution of the mineral, the ore itself may have a distinctive appearance, as, for instance, is strikingly the case with the 'banket' of the Witwatersrand gold-fields, no difficulty being experienced in picking out pieces of this auriferous conglomerate from among the pieces of quartzite broken with it.

The remaining properties are those of which advantage is taken in mechanical dressing.

Of these the most important is specific density, commonly expressed in terms of specific gravity; most metalliferous minerals are of relatively high density. This property, it is true, can be appreciated by the human intelligence, and advantage of it may be taken in hand-picking; the sense of weight in the hand would declare the metalliferous nature without assistance from sight. In mechanical dressing, however, it is not by greater pressure upon a support that higher density usually takes effect, but by a more rapid rate of fall in a resistant medium, generally water, or by the greater inertia of the denser particle. Differences in density are the basis of that most important means of dressing, Water Concentration, as well as of Pneumatic Concentration.

Next in importance comes specific surface energy. As with liquids, each solid, and accordingly each mineral, possesses a surface energy peculiar to itself. This energy, unlike liquid surface energy, cannot be directly measured, but it manifests itself when a solid is brought to an interface between two fluid phases, say, that between air and water. Then, according to the equilibrium obtaining between the three interfacial energies present, the solid will become wetted and sink, or it will hold back the water and float, provided it be fine enough. With sulphide ores crushed to a pulp with water the solid-liquid interfacial energy of the mineral particle is relatively high, or by the addition of suitable agents can so be made, and the particle forming part of a system containing potential energy and being free to move will break upwards through an air-liquid interface to bring the potential energy to a minimum. With gangue it is the other way; the solid-liquid interfacial energy is relatively low or can so be made, and the particle finds its condition of stability in the liquid. The dressing operations, which in this manner make use of differences in surface energy, constitute Flotation Concentration.

Next, but no longer of primary importance, come the magnetic properties of minerals. Each mineral has a specific power to concentrate lines of magnetic force within its mass (and thus to develop polarity), that is, to become magnetic; this property is known as its magnetic permeability. Some minerals, such as magnetite, have a high permeability—that is, they are highly magnetic; others, such as wolframite, are feebly magnetic; while others again, such as cassiterite, are non-magnetic. Differences in magnetic permeability are the basis of Magnetic Separation.

Specific electric conductivity is made use of in Electrostatic Separation. Most of the ore-minerals are good conductors, and in consequence quickly become charged and repelled when placed in contact with a charged body. Contrariwise, most of the gangue-minerals are non-conductors, and, becoming charged only at the actual contact, are not so vigorously repelled. Differential paths may thus be forced upon mineral and gangue, and a separation thereby be effected. It is possible that the future may see specific inductive capacity a means of separation.

As indicated above, a reduction in the size of the crude ore—this reduction being spoken of as Comminution—is an essential part of dressing. With ores suitable for direct smelting or for direct treatment by chemicals in solution comminution may constitute the whole of dressing, the crude ore being thereby prepared for fusion or for the intimate play of solutions. Where, however, mechanical separation follows, comminution, accomplishing the release of the mineral grains from those of the gangue or worthless material, is but a part of dressing; dressing, then, includes the important separating operations

which follow, from which operations the mineral is obtained clean—that is, in a concentrated condition.

The machines used in comminution may apply pressure, as with rock-breakers and rolls; or pressure and attrition, as with roller-mills and grinding-pans; or attrition and impact, as with cylinder-mills; or they may apply impact practically alone, as with falling stamps. Water concentration requires release of the mineral without excessive pulverisation. To that end the separating operations should begin in as coarse a stage as possible, that the coarse mineral may be withdrawn before the finer stages of comminution begin. With flotation no similar necessity to avoid fine comminution exists, but comminution proceeds better when the material already crushed fine enough is withdrawn from a succeeding crushing operation; moreover, by dividing the crushing into stages the machine chosen for each stage may be better suited to the size of material at that stage. Finally, with treatment by chemical solutions the finest comminution is desirable, and this again is most economically achieved by crushing in stages. Comminution, therefore, generally proceeds in stages defined by sizing appliances, screens in the coarser sizes, and water-sizing appliances, known as classifiers, in the finer sizes.

Water concentration is effected either with the aid of the vertical movement of water as in jigs, or by its horizontal flow in a thin film as on inclined tables, the streaming action of the flow being generally supplemented by a shake or oscillation, as on shaking tables and oscillating belts, the latter being known as vanners. Vertical movements of water are applied to coarse material, the mineral falling by its greater density; gentle flow down an inclined plane is applied to fine material, the mineral particles remaining while those of gangue are rolled away; and the shake is applied to an intermediate size which has sufficient ponderability to respond to an applied impulse. Water concentration is employed with every success to recover coarse mineral; it is also successful with fine mineral so long as the material retains some granularity; but the recovery diminishes with the particle size, till eventually, from material having the size-condition of slime, it is quite unsatisfactory. With sulphide ores fine material is best treated by flotation; with oxide ores, such as tin ores, there is as yet nothing to do but to continue to treat such fine material by water. Speaking generally, it is seen that water concentration proceeds by stages, and with machines suited to each stage; this division of the work is again effected by sizing appliances, screens with the coarse sizes and classifiers with the fine sizes.

Flotation recovers fine particles of mineral sulphides in a froth which forms after agitation in water to which a soluble contaminant has been added. This contaminant permits a mist of minute air-bubbles to be maintained in the water, which bubbles being brought into contact with the particles by agitation make selection of those which are of mineral, leaving those of gangue alone. To reinforce this natural tendency an oily contaminant for the mineral particles is added, this contaminant spreading itself as a tenuous film over the sulphide particles, the gangue particles again being left alone. The two contaminants, that for the water and that for the sulphide particles, are generally found in the soluble and insoluble portions respectively of a single oily substance, natural or compounded. Rising to the surface the air-bubbles merge themselves into what is essentially a mineral froth, the mineral particles endowing the relatively large bubbles with the elasticity necessary for their permanence.

This froth is scraped away, or it builds itself so high that it overflows. Flotation is successful on fine mineral and on the finest, but it cannot be employed with mineral coarser than about a third of a millimetre. Where the ore is fine-grained, flotation may accomplish the whole work of separation; but ordinarily the grain is such that the dressing system finds water concentration and flotation in combination, the former to recover the coarser, the latter to recover the finer mineral.

These two methods of concentration, water and flotation, are the prime methods of dressing, sharing between them, and with little help from other methods, the brunt of maintaining for dressing a useful place is the beneficiation of ore deposits. The other methods are quite subsidiary; magnetic concentration may be applied to the recovery of magnetite from a crude magnetite ore, but its most useful application is in the cleaning of concentrates already obtained by water concentration, the removal of iron from a zinc concentrate, for instance; the separation of wolfram from a tin concentrate; the recovery of monazite from beach sands.

Dressing, it is seen, is essentially a middle operation, of which the raw material, crude ore, may be considered as purchased at the cost of mining, and the finished article, dressed ore, as saleable at the price it is worth to the metallurgist. As such, greatest profit is the over-riding consideration, and not perfect cleanliness nor complete recovery. The extent of dressing, accordingly, varies considerably. Dressing is only pursued as long as the better terms received for the concentrate more than make good the extra cost and the extra loss of mineral involved in prolonging the operation. Rich ores allow more equipment and a more extensive dressing; poor ores have to be content with the simplest dressing—a simple washing may be all.

The choice, grouping, and arrangement of the machines employed constitutes the dressing system, which, when represented graphically, gives what is described as the flow sheet.

Oregon, one of the Pacific states of the American Union, was named from the Oregon River (an Indian name), now known as the Columbia (q.v.), and is bounded N. by Washington, E. by Idaho, and S. by California and Nevada. Area, 95,600 sq. m., or almost twice that of England. Oregon on the west is literally rock-bound by the Coast Range of mountains, having, however, numerous indentations which furnish good harbours for sea-going vessels. The Columbia River affords the largest and deepest entrance. Seventy miles east of the Coast Range is the Cascade Range, rising to a height of 6000 to 8000 feet, and at almost regular intervals surmounted by snow-capped peaks of nearly double that altitude. From the Cascade Range eastward to the Blue Mountains, about 70 miles, and farther on to the eastern boundary of the state, the surface is diversified by mountains and valleys, rolling plains, and tablelands. Here the soil and climate are suitable for agriculture and grazing. In Western Oregon is the Willamette valley, 130 miles long and 60 miles wide, every foot of which is arable and fertile—adapted by soil and climate to grain and fruit. The valley is situated between the Coast Range and the Cascade Range of mountains. South of this are the Umpqua and Rogue River valleys, both of which produce large quantities of fruit.

The climate of Oregon is mild, in spite of its northerly situation, owing first to the oceanic current from Japan, which, starting with a temperature of 90°, is from 49° to 54° off the coast here. Moreover, the cold Arctic winds are warded off by the Cascade Range, and no blizzard can cross the Rocky Mountains. The range of temperature from

summer to winter is small. On the coast the climate is mild and varies little, but there is fog in summer and excessive rain in winter; in the Willamette valley the summers are pleasant, the winters wet, and spring and autumn foggy in the mornings; the Umpqua valley has a delightful climate, with some snow in winter; and the same, with greater heat and cold, is true of the Rogue River valley, the lake region in the south-east, and Eastern Oregon, where there is a good deal of snow in winter. The average mean temperature is 50° F., the rainfall 36 inches—17 at Linkville, in the interior, and 59 at Astoria, on the coast.

The grain-crops of Oregon are wheat, oats, barley, maize, and rye, in this order. Flax-seed, hay, potatoes, tobacco, sugar-beet, and hops (principally along the rivers Willamette and Mackenzie) are also raised. Several million pounds of butter and cheese are produced annually. Great quantities of fruit, both green and dried, are annually shipped from the state, especially from the western districts; but in Eastern Oregon, too, excellent fruit is produced, and, as the bunch-grass is fast disappearing, and the herds of cattle are diminishing, agricultural and horticultural pursuits are receiving more attention. The lands best suited for fruit-farming are mainly limited to the valleys and foot-hills; but these are of vast extent, and the extreme richness of the soil and the mildness of the climate make the state's productive powers almost inconceivably great. The demand abroad for Oregon fruits continues steadily to increase. The most successful fruits are the Italian prune, apples (Oregon is called 'the land of red apples'), pears, peaches, grapes, and cherries (the Royal Ann cherries grow too large for one bite). Oregon possesses one-sixth of the standing timber of the United States. The Oregon Pacific Railroad, in crossing the Cascade Range, passes through a great timber belt extending for 90 continuous miles; and it is stated that careful examination shows in one locality enough timber on one square mile to supply for twenty years a mill cutting 150,000 feet a day.

Among the other industries of Oregon may be mentioned the catching and tinning of salmon (which the Columbia River has long yielded in great abundance); the rearing of sheep (the eastern part of the state producing large quantities of wool of good quality); and mining. The minerals of the state comprise coal, iron ore, gold (declining in yield of late years), copper, nickel, quicksilver, fireclay, chrome, silver, manganese, zinc, lead, and platinum. Trade is facilitated by numerous lines of railway, and the navigable rivers have steamers running all the year. Politically the state is notable as being the chief seat of the Initiative and Referendum, which have worked successfully.

Under the title of Oregon was formerly included all the land between the Rocky Mountains and the Pacific Ocean north of 42° N. lat. John Jacob Astor established Astoria (q.v.) in 1811; in 1813 it was sold to the North-western Fur Company, and it afterwards passed into the possession of the Hudson Bay Company. Great Britain's claim to the territory was based on Drake's discovery of the coast in 1579, Cook's visit to Juan de Fuca Strait in 1778, the explorations of Captain John Meares in 1788-89, and Vancouver's survey of the entire coast from 30° to 60° N. lat., and discovery and ascent of the Columbia River, in 1792. A treaty of joint occupation was agreed to between Britain and the United States in 1818, and endured until 1846. Settlement by the New Englanders began in 1832, and an Indian mission was planted at Salem by the Methodists in 1834. The Oregon question was a prominent feature of the presidential

contest in 1844. In 1846 the dispute was compromised, the boundary line with British America being fixed at 49° N. lat. Oregon became a territory in 1848, and, with reduced limits, a state in 1859. It has thirty-six counties, and sends three representatives and two senators to congress. The judges of the supreme court are elected by popular vote. In 1919 the total expenditure on public school education was about fifteen million dollars. The public school system consists of district schools free to all between the ages of four and twenty, the state university at Eugene, the state agricultural college at Corvallis, and normal schools, besides institutions for the blind, deaf and dumb, and orphans. There are also many private and denominational institutions, including the Willamette University, Pacific University, &c. The principal cities are Portland (population 258,000), Salem, the capital (18,000), Astoria (14,000), Eugene (10,600). Pop. of the state (1860) 52,464; (1880) 174,768; (1900) 413,536; (1910) 672,765; (1920) 783,389.

Oregon River. See COLUMBIA.

Orel, a town of Russia, stands on the Oka, 222 miles by rail SSW. of Moscow, has manufactures of ropes, tallow, bricks, machinery, and verdigris, and a busy trade in grain, ropes, tallow, hemp, and timber. It was burned down in 1848 and again in 1858. A university was established in 1919. Pop. 72,000.

O'Rell, MAX. See BLOUET.

Orellana. See AMAZON.

Orelli, KASPAR VON, scholar, was born at Zürich, 13th February 1787. Ordained in 1806, he next year became a Reformed preacher at Bergamo; in 1813 a teacher in the cantonal school at Chur; in 1819 professor at Zürich, and in 1833 professor of Classical Philology in the newly-founded university. He died at Zürich, 6th January 1849. Orelli edited many classical authors with great learning, taste, and acute discrimination, in particular Horace (1837-38), Tacitus (1846-47), and Cicero (1826-31). His *Onomasticon Tullianum* (1836-38) and *Inscriptionum Latinarum Selectarum Collectio* (1828) also deserve mention.

Orelli, KONRAD VON (1846-1912), theologian, born at Zürich, studied at Lausanne, Zürich, Erlangen, Tübingen, and Leipzig, and was professor at Basel.

Orenburg, a town of Russia, capital of the Kirghiz republic, stands on the river Ural, by rail 727 miles ESE. of Moscow. Founded (1743) as a frontier fortress, it is now of importance for its commerce; it imports cotton, silk-stuffs, cattle, hides, &c. from Bokhara, Khiva, and Tashkent. Corn, metals, sugar, woven goods, camel-hair are the principal exports. The Orenburg and Tashkent railway was opened in 1905. Pop. 100,000.

Orense, capital of the Spanish province of Orense, near the frontier of Portugal, on the left bank of the Minho, and 60 miles from its mouth. It has hot sulphurous springs, and manufactures woollens, linens, and chocolate. Pop. 18,000.

Oreodaphne, an old genus now mostly included in *Ocotea* (q.v.).

Oreodonts, an extinct family of ungulates, the remains of which occur in the Tertiary deposits of North America.

Oreodoxa. See PALM.

Orestes, son of Agamemnon and Clytemnestra. When his father was murdered by his mother and her paramour Ægisthus, he was saved by his sister Electra, who sent him secretly to Phocis to the court of Strophius, husband of Agamemnon's sister. Here he formed a romantic friendship with the king's son, Pylades, and as soon as he had grown up the pair went secretly to Argos, and slew Clytemnestra

and Ægisthus. Madness seized him after the matricide, and he fled from land to land, ever haunted by the avenging Erinyes or Furies. At Athens, whither he had fled by advice of Apollo, he was purged of guilt by the Areopagus. Learning from Apollo, according to another story, that he could only recover from his madness by carrying off the statue of Artemis from the Tauric Chersonesus, he journeyed thither along with Pylades, but the friends were seized by the natives to be sacrificed to Artemis. Her priestess Iphigenia recognised her brother in Orestes, and all three escaped together, carrying the statue with them. Orestes recovered his father's kingdom at Mycenæ, slew Neoptolemus, and married his wife Hermione, who had been formerly promised to himself. The story of Orestes afforded a favourite theme to the great tragedians—to Æschylus in the extant trilogy, the *Oresteia*; to Sophocles in his *Electra*; to Euripides in his *Orestes* and *Electra*. See Becker, *Die Orestes-sage der Griechen* (1858).

Orfa. See EDESSA.

Orfila. MATHIEU JOSEPH BONAVENTURE, founder of the science of toxicology, was born at Mahón in Minorca, 24th April 1787, and studied at Valencia, Barcelona, and Paris (whither he was sent by the junta of his province). In October 1811 he received the degree of Doctor of Medicine, and immediately commenced a private course of lectures on chemistry, botany, and anatomy, which was largely attended, and, along with his successful practice, soon rendered him famous. In 1813 appeared the first edition of his celebrated work on poisons, entitled *Traité de Toxicologie Générale* (Paris). In 1819 he was created a citizen of France, and became professor of Medical Jurisprudence; and in 1823 he was transferred to the chair of Chemistry, to which in 1831 was added the deanship of the faculty. On the outbreak of the revolution of 1848 he was deprived of his place in the medical faculty on account of his conservative opinions, but retained his professorship. He died at Paris, March 12, 1853. Other works were on medical chemistry (1817) and on forensic medicine (1825). He also contributed largely to various journals, dictionaries, and encyclopædias.

Orford. See WALPOLE.

Organ (Gr. *organon*, 'an instrument'), a musical instrument played by keys, and generally also by pedals, and consisting of metal and wood pipes, which sound by wind stored in bellows, and admitted into them at will. The following description is necessarily restricted to the most fundamental arrangements of this very complicated instrument. As met with in cathedrals and large churches, the organ comprises four departments, or sometimes more, each in most respects a separate instrument with its own mechanism—the *great-organ*, the *choir-organ*, the *swell-organ*, the *pedal-organ*, sometimes the *solo-organ*, possibly also the *echo-organ*. Each has its own keyboard, but the different keyboards are brought into juxtaposition, so as to be under the control of one performer. Keyboards played by the hands are called *manuals*; by the feet, *pedal-boards*. Three manuals, belonging to the choir, great, and swell organs respectively, rise above each other like steps in front of the performer, while the pedals by which the pedal-organ is played are placed on a level with his feet. The condensed air supplied by the bellows is conveyed through a *wind-trunk* into a *wind-chest*. Each department of the organ, it may be mentioned, has its wind-chest. Attached to the upper part of the wind-chest is the *upper board*, an ingenious contrivance for conveying the wind at pleasure to any individual pipe, or pipes, exclusively of the rest.

In the upper board are set the *pipes*, of which a number of different quality, ranged behind each other, belong to each note. Beneath the upper board is a row of parallel *grooves*, running horizontally backwards, corresponding each to one of the keys of the instrument. On any of the keys being pressed down, a valve is opened which supplies wind to the groove belonging to it. The various pipes of each key stand in a line directly above its groove, and the upper surface of the groove is perforated with holes bored upwards to them. Were this the whole mechanism of the sound-board the wind on entering any groove would penetrate all the pipes of that groove; there is, however, in the upper board another series of horizontal grooves at right angles to those beneath, supplied with *cross-slides*, which can be drawn out or pushed in at pleasure by a mechanism worked by the *draw-stops* placed within the player's reach. Each slide is perforated with holes, which, when it is drawn out, complete the communication between the wind-chest and the pipes: the communication with the pipes immediately above any slide being, on the other hand, closed up when the slide is pushed in. The pipes above each slide form a continuous set of one particular quality, and each set of pipes is called a *stop*. Each department of the organ is supplied with a number of stops, producing sounds of different quality. The *great-organ*, some of whose pipes appear as show-pipes in front of the instrument, contains the main body and force of the organ. Behind it stands the *choir-organ*, whose tones are less powerful, and more fitted to accompany the voice. Above the choir-organ is the *swell-organ*, whose pipes are enclosed in a wooden box with a front of louvre-boards like Venetian blinds, which may be made to open and shut by a pedal, with a view of producing *crescendo* and *diminuendo* effects. The *pedal-organ* is sometimes placed in an entire state behind the choir-organ, and sometimes divided and a part arranged on each side. The opening of the valve on the pressing down of the key may be effected by a mechanism of rods, levers, and rollers, moved either directly by the energy of the organist or by pneumatic apparatus brought into play when the key is down (thereby lightening the touch); but since 1867 tubular pneumatic and electro-pneumatic actions have come into use. These substitute air-tubes or an electric cable for the old 'trackers.' Greater freedom in the distribution of an organ about a building is thereby obtained, an advantage not always unmixed. Depressible stop-keys take the place of draw-stops.

Organ-pipes vary much in form and material, but belong to two great classes, known as *flue-pipes* and *reed-pipes*. A section of one of the former is represented in the figure. Its essential parts are the *foot* *a*, the *body* *b*, and a flat plate *c*, called the *language*, extending nearly across the pipe at the point of junction of foot and body. There is an opening, *de*, in the pipe, at the spot where the language is discontinuous. The wind admitted into the foot rushes through the narrow slit at *d*, and, in impinging against *e*, imparts a vibratory motion to the column of air in the pipe, the result of which is a musical note, dependent for its pitch on the length of that column of air, and consequently on the length of the body of the pipe: by doubling the length of the pipe we obtain a note of half the pitch, or lower by an octave. Such is the general principle of all flue-pipes, whether of wood or of metal, subject to considerable diversities of detail. Metal pipes have generally a cylindrical section, wooden pipes a square or oblong section. A flue-pipe may be stopped at

the upper end by a plug called a *tompion*, the effect of which is to lower the pitch an octave, the vibrating column of air being doubled in length, as it has to traverse the pipe twice before completing its course. Pipes are sometimes half-stopped, having a kind of chimney at the top. The *reed-pipe* consists of a reed placed inside a metallic pipe. This *reed* is a tube of metal, with the front part cut away, and a tongue or spring put in its place. The lower end of the tongue is free, the upper end attached to the top of the reed; by the admission of air into the pipe the tongue is made to vibrate, and, in striking either the edge of the reed or the air, produces a musical note, dependent for its pitch on the length of the tongue, its quality being determined to a great extent by the length and form of the pipe or bell within which the reed is placed. When the vibrating tongue does not strike the edge of the reed, but the air, we have what is called the *free reed*, similar to what is in use in the Harmonium (q.v.). To describe the pitch of an organ-pipe terms are used derived from the standard length of an open flue-pipe of that pitch. The largest pipe in general use in a large organ is the 32-feet C, which is an octave below the lowest C of the modern pianoforte. By a 32-feet or 16-feet stop we mean one whose lowest note (C) is produced by a pipe 32 feet or 16 feet in length.

The stops of an organ do not always produce the note properly belonging to the key struck; sometimes they give a note an octave, or, in the pedal-organ, even two octaves lower, and sometimes one of the harmonics higher in pitch. The variety of stops, of course, gives an organ a much greater compass than the two and a half octaves of its manuals promise. *Compound* or *mixture stops* have several pipes to each key, corresponding to the different harmonics of the ground-tone. There is an endless variety in the number and kinds of stops in different organs; some are and some are not continued through the whole range of manual or pedal. Some of the more important stops are called *open* or *stopped diapason* (a term which implies that they extend throughout the whole compass of the keyboard). The stops on an organ are principally of 8 feet in the manuals. The *dulciana* is an 8-feet manual stop, of small diameter, so called from the sweetness of its tone. Among the reed-stops are the *clarion*, *oboe*, *bassoon*, *vox humana*, *trumpet* or *posauene*, and *trombone* or *ophicleide*, deriving their names from real or fancied resemblances to these instruments and to the human voice. Of the compound-stops the most prevalent in Britain is the *sesquialtera*—more frequently called *mixture*—consisting of three to five ranks of open metal pipes, often a 17th, 19th, 22d, 26th, and 29th from the ground-tone. The resources of the organ are further increased by appliances called *couplers*, by which a second manual and its stops can be brought into play, or the same manual can be united to itself in the octave below or above.

Organs are now generally tuned on the equal temperament (see TEMPERAMENT). The notation for the organ is in three staves, consisting of a treble and two bass clefs; but in old compositions the soprano, tenor, and alto clefs are used.

The organs used in antiquity were principally water-organs. Large water-organs were employed to accompany the performances at the Roman theatres, and similar instruments were to be found in the hippodromes of Constantinople. The scope of the instrument was therefore originally secular, and one of the earliest patrons of the organ was the Emperor Nero. Ctesibius of Alexandria must be credited with the invention of the organ. Taking the idea from a peculiar sort of clepsydra or water-clock which he had invented, and one function of

which was to tell the hours of the night by musical notes, he worked onwards from invention to invention until he constructed the earliest water-organs. The instruments shown to Nero and the first organs ever seen in Rome were from the designs of Ctesibius. The water mechanism in the 'water-organs' was connected solely with the blowing, and seems to have been insisted on so strongly by the early organ-builders in order to render that operation equable and steady. By means of pistons working in cylinders the wind was pumped through water into the wind-chest, where were set the pipes, furnished on the bottom with slides, which were connected with iron keys by strings or trackers. Such was the main difference between the water-organ and the wind-organ. The water-organ became the rage of Rome and increased in favour as the empire hastened to its decline. In the reign of Honorius (400 A.D.) no nobleman's house was considered complete without its organ, and portable water-organs were made in great numbers which could be carried by slaves from house to house, where concerts or musical gatherings were attended by their masters. After the overthrow of the western empire organ-building seems to have been lost, among other useful arts, under the influence of the barbarian inroads. Constantinople, however, remained what it had always been, the great home of organ-building in the ancient world. The magnificence of the organs in the Golden Hippodrome is spoken of with enthusiasm by the Byzantine historians. An organ which was brought by certain Byzantine ambassadors on a mission to Charlemagne is said to have served as a model for the first organ ever built in mediæval Europe, constructed by the orders of that emperor according to the Greek pattern. From Aachen the use of organs spread throughout Charlemagne's empire, and this instrument served as a model for the rest.

The application of bellows to the organ was known in the days of the later Roman emperors. On the obelisk of Theodosius we have a delineation of an organ blown solely by bellows. Probably the invention of the bellows mechanism dates from the time of the Emperor Julian. Yet this great secret of organ-building was rarely if ever acted upon; and until the end of the 9th century, when Germany had become the centre of organ-building, water-organs were the almost exclusive form of organ employed both in Europe and the East. Towards the end of the 9th century large bellows organs began to be built, in keeping with the large Romanesque churches of the times. Thirty bellows were employed in some of these organs; the outstretched arms of the organist could not span the compass of an octave; and the player or players struck each key with the fist. In the monasteries meanwhile, where size was not so much in demand, the mechanism of the organ was marvellously elaborated. The complete furnishings of the organ parts were manufactured in the monasteries, even down to the smelting of the metals whereof the pipes were made. Those diminutive organs, called *regals*, so small that they could be held on the palm of the hand, were the outcome of monastic ingenuity, and Pope Sylvester II. was a warm patron of organ-building, and himself no mean inventor in the art.

The family of the Antignati, in Brescia, had a great name as organ-builders in the 15th and 16th centuries. The organs of England were once in high repute, but the puritanism of the Civil War doomed most of them to destruction; and when they had to be replaced after the Restoration it was found that there was no longer a sufficiency of builders in the country. Foreign organ-builders were therefore invited to settle in England, the most remarkable of whom were Bernhard Schmidt

(generally called Father Smith), his nephews, and Renatus Harris. Christopher Schreider, Snetzler, and Byfield succeeded them; and, at a later period, Green and Avery, some of whose organs have never been surpassed in tone. Notable 19th-century organ-builders were Barker, Willis, and Hope-Jones. The German organs are remarkable for preserving the balance of power well among the various masses, but in mechanical contrivance they are surpassed by those of England.

Up till the middle of the 19th century little interest was taken in organ-building in America. The erection of the great organ in the Music Hall, Boston, by a German builder, Walcker of Württemberg, gave the first impetus to public interest in the matter.

For the structure of the organ, see Hopkins and Rimbault, *The Organ* (Lond. 1855-77); Audsley, *Art of Organ Building* (1913); Audsley, *The Organ of the 20th Century* (1920); W. and T. Reeves, *Organ-building* (1922). For the history of the organ, see Rowbotham, *History of Music*, vol. iii. (1887); Williams, *Story of the Organ* (1903). For organ-playing, see Archer's *Practical Organ Tutor*, Best's *School for the Organ*, Stainer's *The Organ*; Buck, *Organ Playing* (1912). There are also works on the organ by Warman (1882-87) and Elliston (1924). The American organ is discussed at HARMONIUM; and BARREL-ORGAN is a separate article.

Organ, Organic, Organism, terms derived from the Greek *organon*, 'an instrument,' and still retaining in some of their applications that significance. But the words have found special acceptance in connection with the forms of life; Linnæus described these, whether animals or plants, as *Organisata*; and we constantly speak of them as organisms, of their larger, well-defined, and integrated parts as organs, of their internal activity and its products as organic. Prior to the year 1828 it was believed that certain chemical compounds which were produced as the results of vital processes occurring within the tissues of animal and vegetable organisms could not be obtained by the ordinary methods of the chemical laboratory; and these compounds were, for this reason, designated as organic. Wöhler in that year, however, discovered that urea, the most important solid constituent of urine, could be obtained 'artificially,' as it has been called, from inorganic materials. Since that date a very large number of so-called organic compounds have been prepared artificially, so that the original signification of the term 'organic' does not hold any longer; and the old conception of an organism as an engine-like collection of organs with fixed functions is disappearing before the doctrine that it is the protoplasm or living stuff in all parts of the body that is the basis of all vital activities. The title of organic chemistry is now commonly applied to the chemistry of the compounds of carbon, whether these compounds are obtainable only as the products of vital processes or not; see the articles CHEMISTRY and ANALYSIS (ORGANIC). Organic impurities in water are those due to animalcules, bacteria, and decomposing organisms; while such phrases as 'organic disease,' 'organic connection,' refer to the relation between a living organism and its parts. See BIOLOGY, FUNCTION, MORPHOLOGY, PHYSIOLOGY.—For organic bases, see ALKALOIDS; for organic radicals, see RADICAL.

Organo-metallic Bodies. Under this term are included a large number of chemical compounds in which organic radicals, such as methyl, CH_3 , ethyl, C_2H_5 , &c., are united to metals. Amongst the earliest obtained of these substances were those derived from the metal zinc. Zinc-methyl, $\text{Zn}(\text{CH}_3)_2$, and zinc-ethyl, $\text{Zn}(\text{C}_2\text{H}_5)_2$, which may be taken as examples of the class, are colourless liquids, heavier than water, which boil at 46° and

118° C. respectively. They take fire spontaneously in contact with air, and burn with the production of a dense white smoke of oxide of zinc. In contact with the skin they give rise to severe wounds which are very difficult to heal. They are decomposed with great energy by water. Substances analogous to these zinc compounds have been prepared, containing cadmium, magnesium, antimony, arsenic, bismuth, tin, aluminium, mercury, lead, sodium, potassium, and some rare metals.

Organzine. See SILK (*Preparation of Silk*).

Orgies, secret rites or customs connected with the worship of some of the pagan deities; as the secret worship of Demeter, and the festival of Dionysus, which was accompanied with many customs of mystic symbolism, and much license. From this latter accident comes obviously the modern sense of drunkenness and debauchery implied in the word. See MYSTERIES.

Oribasius, a Greek medical author, and physician to Julian the Apostate (326-403 A.D.). He was born at Pergamus or Sardis, and his works are largely compilations from Galen (see MEDICINE). There is an edition of his works in 6 vols. by Buffemaker and Daremberg (Paris, 1852-76).

Oriel Movement. See KEBLE, NEWMAN.

Oriel Window, a projecting window in an upper story, supported on corbels, having more sides than one, usually three, and commonly divided into bays by mullions. It is one of the most picturesque features in mediæval and Elizabethan domestic architecture, and adds much to the convenience of the interior. The word oriel (Mid. Lat. *oriolum*, probably dim. from *os*, *oris*, as if a small opening or recess) formerly meant a chamber or apartment, and a window is so called which makes, as it were, a small apartment off a large room. By old writers oriels are called Bay Windows (q.v.).

Orientation, in Architecture, is the position of a church so that its chancel shall point towards the east. This was a fashion invariably adopted in northern countries, but not adhered to in Italy and the south. St Peter's at Rome, for example, has the choir to the *west*, and the principal entrance towards the east. The orientation of churches is not usually very exactly to the east, and it is supposed that the east end in some cases has been set so as to point towards the place where the sun rises on the morning of the patron saint's day. In other cases the choir and nave are not built exactly in a straight line, the choir having thus a slight inclination to one side, which in the symbolism of the middle ages was supposed to indicate the bowing of Christ's head upon the cross. This may be due to building at different dates, the direction of sunrise on the saint's day having perceptibly changed in the interval. Departure from the line of the true east, however, in many instances arose more probably from carelessness or ignorance. Attempts have been made to determine the dates of Egyptian temples and of such monuments as Stonehenge on the assumption that the sun or a star was observed along the axis of the building at rising or setting, on some particular date, as the solstice. Thus slight changes of direction of successive additions to the temple at Luxor have been supposed due to changing amplitude of the star. Such calculations begin with guesswork, and sometimes lead to unlikely conclusions. For kindred customs see EAST.

Oriflamme, the red silk banner first of the Abbey of St Denis, and afterwards of France, was so called because it was a flag (*flamme*) borne on a gilded (*or* = 'gold') staff. See FLAG.

Origanum. See MARJORAM.

Origen, the most learned and original of the early church fathers, and perhaps the noblest figure amongst them all, was born, probably at Alexandria, in 185 or 186. His full name was Origenes Adamantius. He was the son of the Christian martyr Leonidas, who was beheaded under Severus in 202. 'Origen was great even from his cradle,' says Jerome. In the early years when he was instructed by his father, Eusebius tells us, 'the simple and easy meanings of the sacred Scriptures were not enough for him, but he sought something deeper,' and Leonidas would often bend over his son's bed as he lay asleep and kiss his breast, 'which the Spirit of God had made His temple.' In the catechetical school of Clement he formed the friendship of Alexander, afterwards Bishop of Jerusalem. He encouraged his father to martyrdom, and his purpose of joining him in this was only frustrated by the artifice of his mother, who concealed all his clothes. After his father's death he supported his mother and six brothers by teaching 'grammar,' and from his eighteenth year he acted, with the consent of his bishop Demetrius, as master of the catechetical school. A collection of classical books which he had bought or copied out for himself he sold for a sum which yielded him four obols (or about 6d.) a day, which sufficed for his simple wants for many years. According to Eusebius he went so far in his asceticism as to mutilate himself, following a literal interpretation of Matthew, xix. 12, but by some this is doubted. His intercourse with heretics and educated heathens led him to devote himself to more thorough study of Plato, the later Platonists and Pythagoreans, and the Stoics, under the guidance of the Neoplatonist Ammonius Saccas. At Alexandria he taught for twenty-eight years (204-232), composed the chief of his dogmatic treatises, and commenced his great works of textual and exegetical criticism. The labours of those years were interrupted by journeys to Rome, Arabia, Antioch, and other places. During a visit to Palestine in 216 the bishops Alexander of Jerusalem and Theoctistus of Caesarea had employed him to deliver public lectures in the churches, and on a later occasion (in 230) had consecrated him as a presbyter without referring to his own bishop. A synod held at Alexandria under Demetrius forbade him to teach in that city, and a second Alexandrian synod (consisting of bishops only) deprived him of the office of presbyter. The churches of Palestine, Phoenicia, Arabia, and Achaea declined, however, to concur in this sentence. Origen then settled at Caesarea in Palestine, which was his chief home for twenty years. He there founded a school which afforded its disciples a thorough training in literature, philosophy, and theology. Among their number were Gregory Thaumaturgus and Firmilian of the Cappadocian Caesarea. In the latter city Origen took refuge for two years during the Maximian persecution. In the last twenty years of his life he made many other journeys. In the Decian persecution he was arrested at Tyre and cruelly tortured. He died there in 253 or 254.

Origen was a most voluminous writer. 'Which of us,' asks Jerome, 'can read all that he has written?' Yet the statement of Epiphanius that his works numbered 6000 is doubtless exaggerated. His exegetical writings extended over nearly the whole of the Old and New Testaments, and included *Scholía* (short notes), *Homilies*, and *Commentaries*. Of the Homilies only a small part has been preserved in the original, much, however, in the Latin translations by Rufinus and by Jerome; but unfortunately these cannot be relied upon, for the translators thought fit to modify and tamper with them. Of the Commentaries a number of books on Matthew and on John are extant in Greek, those on John of great value for the study of

his speculative theology. Origen's gigantic *Hexapla*, the real foundation of the textual criticism of the Scriptures, was too large to be preserved entire. The remains of its text of the Septuagint were collected by Bern. de Montfaucon (2 vols. fol. Paris, 1713) and Field (2 vols. Oxford, 1875). His *Eight Books against Celsus* (q.v.), written in his old age, are preserved entire in the original Greek. This, the greatest of early Christian apologies, effectively appeals to the Christian life as the most convincing proof of the Christian faith. The speculative theology of Origen is presented in his four books *Peri Archôn*, extant as a whole only in the somewhat garbled Latin translation of Rufinus. It is a bold attempt to evolve from the church's rule of faith, with the help of Scripture and reason, a science of Christian faith. Two books *On the Resurrection* and ten books of *Stromata* (in which he proved all the Christian dogmas by quotations from the philosophers) are lost. The eclectic philosophy of Origen bears the distinctive stamp of Neoplatonist and Stoic theories. God alone has being in the proper sense. It is essential to the Deity to will, work, and reveal Himself unchangeably and eternally. In the Logos, proceeding by eternal generation from God, and of the same substance with Him, all creative ideas are concentrated. He is the link between the oneness of Deity and the multiplicity of the world. All finite being is good only as it has part in the Divine. All created spirits are free. Their fall led to the creation of the material world, that in forms more or less material (*soul and body*) the renewing discipline of the *spirit* within might be realised. The idea of the procession of all spirits from God, their fall, their redemption, and return to God lies at the foundation of the whole development of the world, at the centre of which is the incarnation of the Logos for the revelation of redeeming truth and the union of divine forces with humanity. Origen's system is an elaborate web, of which Greek metaphysics is the warp, the gospel history the woof. All that was true in Greek philosophy Origen held to be traceable to the general revealing agency of the Logos, who in Christianity alone is fully and expressly manifested. The proper source of the knowledge of the Christian faith is the Word of Christ (i.e. the Scriptures). A living faith in those truths of Scripture which have been handed down as fundamental by the church's succession of bishops is itself sufficient for salvation. Beyond such 'unreasoning faith' there is the 'knowledge' or 'wisdom' which rises to the free love of God, and leaves behind it the historical contents of the church's teaching, which have served to it as the media of spiritual ideas in its progress from practical faith to the vision of God and likeness to Him. It is by entering more deeply into the successive senses of Scripture that this process is carried out. Scripture admits of a threefold interpretation, in correspondence to the tripartite nature of man. The 'bodily' (literal or historical) sense is always to be retained, except where it is unworthy of God or contradictory to reason; for God has intended such passages to be 'stumbling-blocks,' suggesting the necessity of seeking a deeper meaning. The *Psychical* (or ethical signification) is next; and beyond it is the *Pneumatic* (allegorical or mystical) sense.

Unhappily for the memory of Origen, his name was chiefly remembered in connection with the most erroneous part of his work. His fanciful method of interpretation was perpetuated alike in the east and the west, and the fruits of his gigantic labours were appropriated by orthodox theologians, who branded him as a heretic, and doubted of his salvation. Long after his death malignant falsehoods were heaped upon his name by unscrupulous enemies like Theophilus of Alexandria; and not

merely the heresy of maintaining the ultimate restitution of all mankind, but even heresy respecting the nature of Christ was triumphantly discovered in his writings. Yet, heterodox though he was, not one amongst those honoured by the church as saints surpasses him in saintliness or spiritual elevation of character. 'His whole life,' says Bishop Westcott, 'from first to last was fashioned on the same type. It was, according to his own grand ideal, "one unbroken prayer," one ceaseless effort after close fellowship with the Unseen and the Eternal. No distractions diverted him from the pursuit of divine wisdom. No persecution checked for more than the briefest space the energy of his efforts. He endured a double martyrdom: perils and sufferings from the heathen, reproaches and wrongs from Christians; and the retrospect of what he had borne only stirred within him a humbler sense of his shortcomings.'

There is an edition of Origen's works, edited by Kötschau and others for the Royal Prussian Academy (1899 *et seq.*); an earlier edition is that of the uncle and nephew De La Rue (4 vols. folio, Paris, 1733-59), reprinted by Lommatzsch (25 vols. Berlin, 1831-48), and by Migne, *Patrol. Curs. Compl.*, ser. Gr., vols. xi.-xvii. The work of P. D. Huet, *Origenis in sacras Scripturas Commentaria quaecunque Graece reperiri potuerunt* (2 vols. Rothomagi, 1668), was the foundation of the critical study of Origen. For an account of his theological opinions and the great controversies that these originated, see the works on church history by Baur, Neander, Dörner, Böhringer, Schaff, and E. de Pressensé; also E. W. Möller, *Geschichte der Kosmologie in der Griechischen Kirche bis auf Origenes* (Halle, 1860); Kahnis, *Die Lehre vom Heiligen Geist* (1847); and the following special books: Thomasius, *Origenes* (Nürnberg, 1837); Moehler, *Patrologie* (Regensb. 1840); and especially Redepenning, *Origenes, eine Darstellung seines Lebens und seiner Lehre* (2 vols. Bonn, 1841-46). See also Joly, *Étude sur Origène* (Dijon, 1860); Freppel, *Origène* (Paris, 1868); J. Denis, *La Philosophie d'Origène* (Paris, 1884); Harnack's *Dogmengeschichte* (new ed. 1905); Farrar's *Lives of the Fathers* (1889); Patrick, *The Apology of Origen* (1892); Fairweather, *Origen and Greek Patristic Theology* (1901).

Original Sin. See SIN.

Orihuela (the *Aurinelah* of the Moors), a town in the Spanish province of Alicante, on the Segura, 38 miles N. of Cartagena. Situated in a plain of great beauty and fertility, it offers an Eastern aspect with its palm-trees, towers, and domes, and has a cathedral, a college, and manufactures of silk, linen, hats, &c. Pop. 37,000.

Orinda, THE MATCHLESS. See PHILIPS (KATHERINE).

Orinoco, one of the great rivers of South America, has its origin on the slopes of the Sierra Parima, in the extreme south-east of Venezuela; its exact sources were only discovered in 1886 by M. Chaffanjon. It flows at first west by north, a mountain-stream, as far as 67° W. long. A little below Esmeralda (65° 50' W. long.) it divides and sends off to the south an arm, the Cassiquiare, which, after a course of 180 miles, enters the Rio Negro, a tributary of the Amazon. The other branch on reaching San Fernando (68° 10' long. and 4° 2' N. lat.) is met by the strong current of the Guaviare; the united stream then turns due north, and, after passing over the magnificent cataracts of Maypures and Atures (glowingly described by Humboldt), and picking up the Meta on the left, meets the Apure, which likewise strikes it from the left. Below the confluence with the Apure the Orinoco turns east and traverses the llanos of Venezuela, its waters, with an average breadth of 4 miles, being augmented from the right by the Caura and the Caroni. About 120 miles from the Atlantic, into which it rolls its

milk-white flood, its delta (8500 sq. m.) begins. Of the numerous mouths which reach the ocean over 165 miles of coast-line only seven are navigable. The waterway principally used by ocean-going vessels, which penetrate up to Ciudad Bolívar (Angostura), a distance of 240 miles, is the Boca de Navios, varying in width from 3½ to 23 miles. The total length of the river is some 1550 miles, of which 900, up to the cataracts of Atures, are navigable, besides a farther stretch of 500 miles above the cataracts of Maypures; area of drainage basin, 368,600 sq. m. Most of the larger affluents are also navigable for considerable distances, the Meta, for instance, to within 60 miles of Bogotá, the capital of Colombia. As a rule the river floods the districts adjoining its banks from May to January, the country under water sometimes measuring 100 miles across.

See A. von Humboldt and Bonpland, *Voyage au Nouveau Continent*, vol. ii.; Sir Robert Schomburgk, *Travels in Guiana* (1840); Michelina y Rojas, *Exploración Oficial* (Brussels, 1867); Mozans, *Up the Orinoco* (1910).

Oriole, a genus (*Oriolus*) and family (*Oriolidae*) of Passerine birds, confined entirely to the Old World, and characteristic of the Oriental and Ethiopian regions. The members of the family are generally of a bright yellow or golden colour, which is well set off by the black of the wings. Twenty-four species are enumerated under the genus. The best known is the Golden Oriole (*O. galbula*). The adult male is about 9 inches long. Its general colour is a rich golden yellow; the bill

Golden Oriole (*Oriolus galbula*).

is dull orange-red; a black streak reaches from its base to the eye; the iris is blood-red; the wings are black, marked here and there with yellow, and a patch of yellow forms a conspicuous wing-spot; the two middlefeathers of the tail are black, inclining to olive at the base, the very tips yellow, the base half of the others black, the other half yellow; legs, feet, and claws dark brown. The female is less yellow than the male, and the under parts are streaked with gray. This bird is somewhat rare in England, but it is an annual spring migrant to Cornwall and the Scilly Isles, and it has been found nesting in the south-eastern counties. In Scotland, especially in the southern districts, it has been reported several times; in Ireland it is more rare. In central and southern Europe it is common in summer in certain localities; it is abundant in Persia, and ranges eastwards through central Asia as far as to Irkutsk. It winters in South Africa, where it is found at the Cape, Damaraland, Natal, and Madagascar. In habit it is an unobtrusive bird, fond of the shade of woods, groves, and small ravines, and, although generally accounted very shy, it may be found building its nest in avenues in towns. Its food consists of insects and their larvæ, especially green caterpillars, and fruits such as currants, cherries, and mulberries. The song of the male is short, loud, clear, and flute-like; he has also a mewing call-note, and a harsh alarm-note. The nest is unlike any other

European bird's; it is placed in, and suspended from, a fork in a horizontal branch, sometimes of an oak, usually of a pine, in a shady grove or thick wood, and is made of bark, wool, and grass. The eggs number four or five, and are of a glossy, white colour, blotched with reddish purple. Other orioles are distinguished by having black on the head and nape. *O. kundoo* partly replaces the golden oriole in Turkestan, and extends eastwards to India. *O. auratus*, found in Africa between the Sahara and the equator, and *O. notatus*, found throughout south tropical Africa, have the lesser wing-coverts yellow, not black as in the European and Indian birds. The birds called 'Orioles' in the United States belong to a different family, the Icteridæ. See BALTIMORE BIRD.

Ori'on, in Greek Mythology, an unusually handsome giant and hunter, the son of Hyrieus of Hyria, in Bœotia. At Chios he fell in love with Merope, daughter of Enopion, but for an attempted outrage upon the maiden his eyes were put out by Dionysus. Orion recovered his sight by exposing his eyeballs to the rays of the rising sun, and afterwards hunted in company with Artemis. The cause and manner of his death are differently related. Some make Artemis slay him with an arrow, because Eos, enamoured of his beauty, had carried him off to Ortygia, and thereby offended the gods. Others say that Artemis, virgin-goddess though she was, cherished an affection for him that enraged her brother Apollo. One day pointing out to her at sea a black object floating in the water, he told her that he did not believe she could hit it. She took aim and hit the mark, which was the head of her lover swimming in the sea. A third myth makes him find his death from the sting of a scorpion. Æsculapius wished to restore him to life, but was slain by a bolt from Zeus. After his death Orion was placed with his hound among the stars, where to this day the most splendid of the constellations bears his name.

Orissa, an ancient kingdom of India, the authentic history of which goes back for probably more than one thousand years, extended from Bengal on the N. to the Godavari on the S.; on the E. it has the Bay of Bengal, and on the W. the Central Provinces. Orissa was long a Buddhist stronghold; in 474 a new dynasty made it Brahmanical, and introduced the worship of Siva; in 1132 this was replaced by Vishnuism and another dynasty. It ceased to be an independent state in 1568, being conquered and made an outlying province of the empire of the Great Mogul. Its next masters were the Mahrattas, who seized it in 1742; but they were forced to surrender it to the English in 1803. The British division of Orissa, together with twenty-four tributary states, were until 1912 accounted part of Bengal Presidency, when Orissa was formed with Bihar and Chota Nagpur into the province of Bihar and Orissa. The British portion has an area of 13,736 sq. m. and a pop. of 5,000,000; the tributary states, a hilly country with dense jungle, lying between the low coast districts and the interior plateau, have an area of 28,648 sq. m. and a population of 4,000,000. All this region was visited by severe famine in 1868-69. The principal river is the Mahanadi, and the chief towns Cuttack, Balasor, and Puri (Jagannath, q.v.). The entire district is sacred ground to the Hindus; evidences of the worship of Siva and Vishnu meet the eye at every turn. Great festivals are held in honour of this latter god and of his image called Juggernaut (q.v.). The most interesting of the aboriginal races are the Kandhs (Kondhs, Khonds), who number half a million, including those in the Central Provinces. Amongst these people agriculture and war are the only employments, the menial

offices of village life being performed by a subject, almost slave race. They pay profound reverence to the earth-god, and used to sacrifice human beings to secure his favour, until the practice was suppressed by the British (1837-50). The tribal government is strictly patriarchal. The tribesmen used to be summoned to arms by messengers bearing an arrow, who sped from glen to glen, like the bearers of the fiery cross in Scotland. Duelling was formerly in vogue. The irrigation of a large portion of Orissa is provided for by an extensive and costly system of canals, taken over by the government in 1868.

Oriza'ba, a city of the Mexican state of Vera Cruz, 82 miles WSW. of Vera Cruz City, and 181 ESE. of Mexico, lies in a fertile garden country, 4030 feet above the sea, and contains cotton and other factories; pop. 40,000.—The volcano of Orizaba, or Citlatpetel, 25 miles to the north, is a noble pyramid rising to an elevation of 18,250 feet, the highest peak in Mexico (Popocatepetl being 17,500); its last severe eruption was in 1566.

Orkhon, a tributary of the Selenga. For archæology see the last paragraph of MONGOLIA.

Orkneyinga Saga as a completed work may be placed with fair confidence in the first quarter of the 13th century. Commencing with the conquering of the Isles by Harald Harfagri in 872, it relates the history of the Earldom of Orkney under the long line of its Norse jarls, and is, for three centuries and a half, the principal authority for the history of northern Scotland. The narrative is mainly personal, and therefore picturesque, portraying the men in person and character, impartially recording their deeds and mentioning what was thought of them and their actions at the time, occasionally in the words of a contemporary skald. Skaldic songs were indeed the materials from which it was elaborated. These songs, sung as they were in the presence of kings and chieftains, tended to be laudatory, and in estimating the historical value of a record based on such materials, allowance must necessarily be made for this fact.

Orkney Islands, a group of ninety Scottish islands, islets, and skerries, of which only twenty-nine are inhabited, and which have an aggregate area of 376 sq. m., the largest being Mainland (207 sq. m.), Hoy (53), Sanday (26), Westray, South Ronaldshay, Rousay, Stronsay, Eday, Shapinshay, Burray, Flotta, &c. They extend 50 miles north-north-eastward, and are separated from Caithness by the Pentland Firth, 6½ miles wide at the narrowest. With the exception only of Hoy (q.v.), which has fine cliffs, and in the Ward Hill attains 1564 feet, the scenery is generally tame, the surface low and treeless, with many fresh-water lochs. The prevailing formation is the Old Red Sandstone, with a small granitic district near Stromness; and the soil is mostly shallow, incumbent on peat or moss. The mean annual temperature is 45°, the rainfall 34.3 inches. The holdings are generally small, and agriculture and fishing are the principal industries. Kirkwall (the capital) and Stromness, the only towns, are noticed separately, as also are the standing-stones of Stennis and the tumulus of Maeshowe. Orkney unites with Shetland to return one member to parliament, but it was dissevered therefrom as a county by the Local Government (Scotland) Act, 1889. Pop. (1801) 24,445; (1861) 32,395; (1921) 24,109. The Orkneys (Ptolemy's *Orcades*) were gradually wrested by Norse rovers from their Pictish inhabitants; and in 872 Harald Harfagri conquered both them and the Hebrides. They continued subject to the Scandinavian crown—under Norse jarls till 1231, and afterwards under

the Earls of Angus and Stratherne and the Sinclairs—till in 1463 they were given to James III. of Scotland as a security for the dowry of his wife, Margaret of Denmark. They were never redeemed from this pledge; and in 1590, on James VI.'s marriage with the Danish princess Anne, Denmark formally resigned all claims to the sovereignty of the Orkneys. The present landed proprietors are chiefly of Scottish descent, the islanders generally of mixed Scandinavian and Scottish origin. Scapa Flow, between Mainland and Hoy, was the headquarters of the Grand Fleet during the Great War, and was the scene also of the scuttling of the surrendered German High Seas Fleet, 21st June 1919.

Orkneys, SOUTH, a group of islands (Coronation Island, Laurie Island, &c.) in the South Atlantic, forming one of the several dependencies of the Falkland Islands Colony of the British Empire. The islands were discovered in 1821 by the English Captain Powell. Their temperature, even in the warmest months, scarcely ever rises above freezing-point. Whaling, which is carried on extensively in the southern seas, is the principal industry. There is a meteorological station belonging to the Argentine government, established with a view to forecasting the probable weather conditions in the maize and cereal growing districts of the Republic.

Orleans (Fr. *Orléans*), a city of France, the capital now of the department of Loiret, and formerly of the old province of Orléannais, which comprised the best part of the present departments of Loiret, Eure-et-Loir, and Loir-et-Cher, with portions of four others. It stands in a fertile plain on the right bank of the Loire, here crossed by a nine-arched bridge (1760), 364 yards long, and by rail is 75 miles SSW. of Paris. Close to it is the Forest of Orleans, covering nearly 150 sq. m., and planted with oaks and other valuable trees. The walls and gates have given place since 1830 to handsome boulevards, but the town as a whole wears a lifeless appearance, and its domestic architecture has much more interest than any of the public edifices. These include the cathedral, destroyed by the Huguenots in 1567, and rebuilt from 1601 onwards by Henry IV. and his three successors; the *Mairie* (1530); and the 15th-century *Musée* (till 1853 the *hôtel-de-ville*). Noteworthy are the houses of Agnes Sorel, Diane de Poitiers, and Joan of Arc, of whom there are three statues—the bronze equestrian one inaugurated in 1855. The commerce is far more important than the industries (of which the chief is market-gardening), Orleans possessing unusual transit facilities by road and railway, river and canal. Pop. (1872) 48,976; (1911) 72,096; (1921) 69,048. The Celtic *Genabum*, where in 52 B.C. the great Gallic rising broke out against Julius Cæsar, Orleans afterwards (about 272 A.D.) was renamed *Civitas Aureliani*, from which the present name is derived. It was besieged by Attila (q.v.) in 451; passed into the hands of the Franks; and was twice plundered by the Northmen (855 and 865). In 1428–29 it was besieged by the English under the Duke of Bedford, but was delivered by Joan of Arc (q.v.), called therefore the Maid of Orleans. Dunois (q.v.) was known as the Bastard of Orleans. The town suffered much in the wars of the Huguenots (q.v.); and in the Franco-German war it again figured prominently, being occupied by the invaders, October 11 to November 9, 1870, and becoming thereafter the headquarters of the great French Army of the Loire until its crushing defeat by Prince Frederick-Charles (December 3–5). Orleans was the death-place of the Earl of Salisbury (1429), of Francis II., Mary Stewart's husband (1560), and of the Duke of Guise (1563).

Orleans, DUKES OF. This title has belonged to three distinct dynasties of French princes of the blood. The title was first given in 1392 by Charles VI. to his dissolute brother Louis (1371–1407), who became regent on the king's madness, and was murdered in the streets of Paris at the instigation of the Duke of Burgundy in revenge for his father's death (see Jarry's *Louis de France*, 1890). His successor was his son Charles (1391–1465), the poet. Charles's son Louis succeeded to the throne as Louis XII. in 1498, whereupon the dukedom of Orleans merged in the crown. It was revived in 1626, when Louis XIII. created his ambitious and intriguing brother, Jean Baptiste Gaston (1608–60), Duke of Orleans and Chartres and Count of Blois. He died without male issue, whereupon Louis XIV. at once revived the title in favour of his brother Philippe (1640–1701), the husband of Henrietta, sister of Charles II., and, after her death, of the Princess Charlotte Elizabeth of Bavaria. His daughters married Charles II. of Spain, Victor Amadeus II. of Savoy, and Prince Charles of Lorraine; his son was the regent and debauchee, Philippe (1674–1723), and his great-grandson was the notorious *Égalité*, Louis-Philippe Joseph (1747–93). *Égalité*'s son, Louis-Philippe (1773–1850), bore the title during his exile, and until he became king of the French in 1830. His eldest son (1810–42) took the title; but it was not borne by his son, the Comte de Paris (1838–94), who in 1883 became head of the French Bourbons, his son, Louis Philippe Robert (born 1869; married an Austrian princess, 1896), assuming the old ducal title. For the Orleanist party, see BOURBON, FRANCE.

For the poet, CHARLES, DUKE OF ORLEANS, see CHARLES D'ORLÉANS.

JEAN BAPTISTE GASTON, DUKE OF ORLEANS, was the third son of King Henry IV., was born in 1608, and was granted the title in 1626 on his marriage with Marie of Bourbon, Duchess of Montpensier. His wife soon died, leaving one daughter, 'La Grande Mademoiselle.' He troubled France with incessant and bloody but fruitless intrigues against Richelieu, and but for his royal birth would have lost his head like Montmorency, Cinq-Mars, and De Thou. The validity of his marriage with Marguerite of Lorraine was only declared after a long disputation among jurists and theologians. After Richelieu's death a reconciliation was effected between him and the king, and he was appointed lieutenant-general of the kingdom during the minority of Louis XIV. The duke, finding himself impotent in the hands of Mazarin, placed himself at the head of the Fronde, but with his usual selfishness soon threw over his friends and made terms again with the court. After Mazarin's final triumph he was confined to his castle of Blois, where he died, 2d February 1660, leaving three daughters by his second marriage. See his *Mémoires* (Amsterdam, 1683).

PHILIPPE, DUKE OF ORLEANS, regent of France during the minority of Louis XV., was the son of the first Duke Philippe, and the grandson of King Louis XIII., and was born 4th August 1674. He possessed excellent talents, and acquired knowledge with rapidity, but his tutor, Dubois, afterwards cardinal, early demoralised him by ministering to his passions, and, hardly yet grown up, he gave himself up to debauchery. The king compelled him to marry Mademoiselle de Blois, his daughter by Madame de Montespan. The young prince now began to alarm the court by an unsuspected capacity for war, showed courage at Steenkirk and Neerwinden, and commanded with success in Italy and Spain. But his presence in Madrid after his victories was disliked both by Philip V. and by Louis XIV. For some years thereafter he

lived in complete exile from the court, spending his time by turns in profligacy, the practice of the fine arts, and the study of chemistry. Louis, having legitimised his sons the Duke of Maine and the Count of Toulouse, appointed the Duke of Orleans president of the regency only and not regent, giving the guardianship of his grandson and heir and the command of the household troops to the Duke of Maine; but this arrangement was set aside at his death (1715), and the Duke of Orleans became sole regent. He was popular, and his first measures increased his popularity; but the financial affairs of the kingdom were perplexing, and the regent's adoption of the schemes of Law led to disastrous results. He favoured an English and anti-Spanish alliance, and Anglomania, or a craze for everything English, was one of the features of his régime. His alliance with England and Holland, formed in 1717, was joined next year by the emperor, and this quadruple alliance succeeded in effecting the downfall of Alberoni and his wildly-ambitious schemes. At the instance of Lord Stair, the English ambassador, he expelled the Pretender from France. He put an end to the parliament of Paris meddling with financial or political affairs, and declared the legitimised sons of Louis XIV. incapable of succeeding to the throne. Dubois now became prime-minister, and ere long Archbishop of Cambrai and cardinal. To appease the Jesuits he sacrificed the Jansenists, compelling the parliament in 1722 to recognise the bull *Unigenitus*. Yet he was faithful to his trust, and the indolent young prince on his coming of age (1723) rewarded him by retaining him in power. But Dubois died in the August of the same year, and four months later, Philippe's frame gave way under the burden of his debaucheries, 2d December 1723. See the works by Piossens (5 vols. 1749) and Capefigue (2 vols. 1838).

LOUIS-PHILIPPE JOSEPH, DUKE OF ORLEANS, the famous *Egalité*, was born April 13, 1747, and succeeded to the title on his father's death in 1785, having been Duke of Chartres since 1752. He possessed good abilities, but early fell into a course of debauchery which he never quitted till the end of his career. In 1769 he married the heiress of the Duke of Penthièvre, and used her immense wealth to advance his political interest. But he was looked upon coldly at court, and still more so after the accession of Louis XVI. (1774), who abhorred his morals, while Marie Antoinette grudged him his wealth and independent position and hated the criticisms of the ring of witty reprobates who clustered round him. He fought at Ushant, but was prevented from further service and promotion to the rank of admiral by the jealousy of the court. He visited London frequently, became an intimate friend of the dissipated young Prince of Wales, afterwards inglorious as George IV., and infected young France with Anglomania in the form of horseracing and hard drinking. He made himself widely popular by profuse charity and by flinging open to the poor the splendid gardens of the Palais Royal. In the *lit de justice* of November 1787 he showed his liberalism boldly against the king, and was sent by a *lettre-de-cachet* to his château of Villers-Cotterets. As the States-general drew near he lavished his wealth in disseminating throughout France books and papers by Sieyès and other advocates of liberal ideas, and had himself put up in as many as five *bailliages*, but was elected in but three, Crépy-le-Valois, Villers-Cotterets, and Paris. In October (1788) he promulgated his *Délibérations*, written by Lacroix, to the effect that the *tiers état* was the nation, and in June 1789 he led the forty-seven nobles who seceded from their own order to join it. There is no doubt that, guided by Adrien Duport and others, he dreamed

of some day becoming constitutional king of France, or at least regent, but it is no less certain that the indolent debauchee was to a great extent the mere dupe of a party, and at no time the deep designing villain he was believed to be at court. There the blame of everything was cast upon his head, even of such great outbursts of the revolutionary fever as the fall of the Bastille and the march of the women on Versailles. Orleans gradually lost influence, and felt so hopeless of the Revolution that he would willingly have gone to America had his mistress, the abandoned Comtesse de Buffon, consented to accompany him. From October 1789 to July 1790 he was absent in England on a mission, and after his return he took a smaller share in political matters than before, while his efforts to come to an understanding with the court were still met with repulse. In September 1792 all hereditary titles being swept away, he demanded a new name from the Paris electors, and adopted that of Philippe Egalité, suggested by Manuel. He was elected the twentieth deputy for Paris to the Convention, and gave his vote of death for the king, which sent a shudder to the heart even of the Mountain. His eldest son, the Duke of Chartres, afterwards King Louis-Philippe, was a brave and active officer on the staff of Dumouriez, and rode over with his chief into the Austrian camp. Egalité was at once arrested with all the Bourbons still in France, and, after six months' durance at Marseilles, was brought to Paris for trial. He was found guilty of royalism and conspiracy and guillotined the same day, 6th November 1793, dying with courteous phrases on his lips and all the high courage of the old régime.

See Baschet's *Histoire de Philippe Egalité*, the elaborate work by Tournois (2 vols. 1840-43), and Mrs Elliott's *Journal* (1859).

Orloff, or **ORLOV**, a Russian family that first rose to eminence during the reign of Peter III., when one of its members, Gregory (1734-83), attracted the notice of the Grand-duchess Catharine, afterwards the Empress Catharine II., and succeeded Poniatowski as her favourite. It was this man who planned the murder of Peter III., and his brother Alexis (1737-1809) who committed the deed (1762). Both brothers were men of gigantic stature and herculean strength. The family of the Counts Bobrinski resulted from Gregory's intercourse with the empress. The legitimate line of Orloff soon became extinct; but Feodor, a brother of Gregory and Alexis, left four illegitimate sons, one of whom, Alexis (1787-1861), signalised himself during the French wars and in Turkey, negotiated the treaties of Adrianople (1829) and Unkiar-Skelessi (1833), and represented Russia at the London conference of 1832 on the affairs of Belgium and Holland. In 1844 he was placed at the head of the secret police, and stood high in favour with the Emperor Nicholas, who employed him in the negotiations with Austria previous to the Crimean war. In 1856 he sat in the congress of Paris as the representative of Russia, and on his return was made president of the grand council of the empire and president of the committee for the enfranchisement of the serfs.—For the Orloff diamond, see **DIAMOND**.

Orm, or **ORMIN**, versifier and spelling-reformer, born probably in Lincolnshire, was an Augustinian monk about 1200 A.D., author of the *Ormulum* (named after him), a series of homilies in verse on the gospel history, first printed by White in 1852 (new ed. by Holt, 1878).

Ormer. See **HALIOTIS**.

Ormerod, **ELEANOR ANNE** (1828-1901), entomologist, daughter of George Ormerod (1785-1873), the historian of Cheshire, in 1882-92 was consulting entomologist to the Royal Agricultural

Society. Her *Manual of Injurious Insects* (1881), *Guide to Methods of Insect Life* (1884), and *Agricultural Entomology* (2d ed. 1892) are well known. See her *Autobiography* (1904).

Or'molu, a name sometimes given to brass of a golden yellow colour.

Ormonde, an old name for what became afterwards East Munster, comprising Tipperary.

Ormonde, JAMES BUTLER, DUKE OF, of the ancient Anglo-Irish family of Butler, was born in London in 1610, and in 1632 succeeded to the earldom and estates of Ormonde. During the Strafford administration he greatly distinguished himself, and in the rebellion of 1640 was appointed to the chief command of the army; but when, in 1643, he concluded an armistice, his policy was condemned by both great parties. In the last crisis of the king's fortunes he retired to France, returned again to Ireland with the all but desperate design of restoring the royal authority, but after a gallant struggle was compelled (1650) to return to France. At the Restoration he was rewarded by the ducal title of Ormonde. He twice again returned to the government of Ireland. In 1679 an attempt was made on his life by the notorious Colonel Blood, supposed to have been instigated by the Duke of Buckingham. He escaped uninjured, and lived until 1688. See *Lives* by Carte (1736) and Lady Burghclere (1912).—JAMES BUTLER, second Duke of Ormonde, and grandson of the foregoing, was born in Dublin in 1665. As Earl of Ossory he served in the army against Monmouth. After his accession to the dukedom in 1688, he took his share in the Revolution conflict. He headed William's life-guards at the battle of the Boyne. In 1702 he commanded the troops in Rooke's expedition against Cadiz; in 1703 he was appointed lord-lieutenant of Ireland, and in 1711 commander-in-chief against France and Spain. Under George I. he fell into disgrace, and was impeached in 1715 of high-treason, his estates being attainted; he retired to France, spent years in the intrigues of the Pretender, and died abroad in 1746. Letters written by him in organising the attempt by Spain to invade England and Scotland in 1719 were in 1890 brought to light, and in 1896 published by the Scottish History Society.

Ormskirk, a market-town of Lancashire, 12 miles NNE. of Liverpool. It has a grammar-school (1612); a parish church, with embattled tower and spire, and the burial-vault of the Earls of Derby; and manufactures of cordage, iron, silk, cotton, &c. Pop. 7400.

Ormuz, or **HORMUZ**, a small town on the island of Jerun (12 miles in circuit), in the Strait of Ormuz, at the entrance of the Persian Gulf, 4 miles S. of the Persian coast. Three centuries before the Christian era there existed on the mainland, 12 miles east of the island, a city Ormuz; this in the 13th century was the headquarters of the Persian trade with India. But about the end of the century its ruler transferred his people to the site of the present town to escape the Mongols. The new city maintained its commercial supremacy even after it passed into the hands of the Portuguese, on its capture by Albuquerque in 1507. It was taken from the Portuguese in 1622 by an English fleet (Baffin, the Arctic navigator, being killed in the action), and given to Shah Abbas of Persia, who transferred the trade to his port of Bandar Abbas, 12 miles north-west on the mainland. The Portuguese fort still stands, but the town of Ormuz is a ruin. The island yields salt and sulphur.

Ormuzd (*Ahurô-Mazdâd*), the name of the supreme deity of the ancient Persians, and of their

descendants the Guebres and Parsees. It was at first emphatically employed in this sense by Zoroastrian. See **ZOROASTER**.

Orne, a department of France formed out of the old provinces of Normandy, Alençon, and Perche, is separated from the English Channel on the W. by La Manche and on the N. by Calvados. Area, 2353 sq. m.; pop. (1861) 423,350; (1921) 274,814. A range of wooded hills, nowhere rising above 1370 feet, extends across the south of the department from east to west, separating the streams that flow north to the English Channel from those that go south to the Seine and Loire. Although the soil is fertile, agriculture is not in an advanced state. Apple and pear trees abound, and great quantities of cider are made, as well as brandy. Cattle and horses of the purest Norman breed are reared. There are cotton and hemp spinning and cotton and linen weaving, dyeing, bleaching, and manufactures of gloves, iron, glass, &c. Fishing and bee-keeping are carried on. The department is divided into four arrondissements, Alençon, Argentan, Domfront, and Mortagne; capital, Alençon.

Ornithology. See **BIRDS**.

Ornithorhynchus, or **DUCKMOLE** (also called Duck-billed Platypus, the 'water-mole' of colonials), one of the lowest mammals, found in the rivers of Australia and Tasmania. Along with the Porcupine Ant-eater (*Echidna*, q.v.) and a neighbour genus, the duckmole is included in the sub-class Prototheria or Ornithodelphia, co-extensive with the order Monotremata. These three genera are of great interest as 'living fossils,' retaining the ancient characters of primitive mammals.

The duckmole, represented by a single species (*Ornithorhynchus paradoxus* or *anatinus*), is a flat animal, between a foot and 18 inches in length,

Fig. 1.—*Ornithorhynchus paradoxus*.

not including the broad beaver-like tail, which measures 4-5 inches. The thick, soft fur is dark-brown above, rusty yellow below. The very short legs have webbed digits in adaptation to the swimming habits, and are also equipped with strong claws, utilised in burrowing. The 'duck-bill' is due to the anterior expansion of the premaxillæ and mandibles, is covered with a horny sheath, bears the nostrils far forward, and is provided with curious tactile structures. Behind the 'bill' is a loose, naked, sensitive collar. The eyes are very small, and the ear pinnæ are inconspicuous. True teeth are present only in the earliest stages; their place is taken in the adults by eight horny plates, sharp-edged in front, broadened out behind. The tongue is not extensile. In the young of both sexes a curious perforated spur, associated with a gland, occurs near the heel, but this only persists in the males. The duckmole is imperfectly warm-blooded. The body temperature is peculiarly low. The voice resembles the

growl of a small puppy. No fossil forms are known.

This lowly mammal is essentially aquatic, living in rivers and 'ponds,' swimming and diving admirably. It is lively and active, diving when alarmed, and able to remain several minutes under water.

Fig. 2.
Ornthorhynchus asleep.

It constructs on the bank elaborate burrows (sometimes 20 to 50 feet in length) with two entrances—one above, the other under water. Like many other defenceless animals, it is most active in the twilight. It grubs in the mud for worms, water-insects, molluscs, &c., which it

can temporarily stow away in cheek-pouches. When frightened or asleep it often rolls itself up, in hedgehog fashion, into a living ball. It appears to live amicably with the water-rat, but is molested by carnivorous marsupials, and is often wantonly, though fortunately not easily, shot. The eggs—for the discredited oviparous habit has been confirmed—are laid in a rough nest within the burrow. The young appear to use their bills in breaking the tough shell. The animals have a fishy, oily smell. The flesh is eaten by the omnivorous natives, who are said especially to esteem the young forms.

Many of the enigmas about the duckmole's structure and affinities are still unsolved, but there is no doubt that along with its neighbours it links mammals back to reptilian or even amphibian types. It need hardly be stated that it has no close connection with birds. Some of the most important structural characters may be briefly summarised: The bones of the skull fuse and are polished as in birds; the halves of the lower jaw do not unite in front, and have no ascending process; the bones of the ear are in a primitive state. There are important technical peculiarities in the vertebræ, ribs, hip-girdle, &c. Epipubic bones, for instance, occur as in marsupials. The coracoids are remarkable in reaching the sternum, and the breastbone is like that of the lizard and some other reptiles. The brain is smooth, and old fashioned in having a small corpus callosum and large anterior commissure. There is a common cloaca, receiving the rectum and the urino-genital canal. The ureters do not open into the neck of the bladder, but farther down into the short urino-genital canal. The left ovary is larger than the right, and the testes are abdominal. The oviducts have no 'fimbriated' upper ends, are separate throughout their course, open into the urino-genital passage, and thence into the cloaca. The vasa deferentia open separately in the same way, and have only a temporary connection with the penis, which lies attached to the wall of the cloaca. The milk-glands have numerous openings on a flat patch of skin, and the young lick the milk. The eggs, like those of reptiles, undergo partial segmentation.

From the above it will be seen that the duckmole not only represents the lowest extant stage of mammalian evolution, but preserves, more markedly than the higher forms, traces of the far-off pedigree of the class.

See ECHIDNA, MAMMALS, MARSUPIALS; also Gould's *Mammals of Australia* (3 vols. 1845-63); W. K. Parker's *Mammalian Descent*; Flower's *Osteology of the Mammalia*; Spencer, *Nature*, xxi. (1884-85); Semon's *Zoolog. Forschungsreise in Australien*, vol. ii. (1897); Beddard, *Cambridge Natural History*, vol. *Mammalia*.

Orobanchaceæ, or OROBANCHEÆ, a family of parasitical herbs, generally with simple stems

clothed with brown, purplish, yellow, or blue, but never green scales, instead of ordinary leaves; terminating in a spike of flowers each in the axil of a scale or bract similar in colour and character to those of the stem. The species known considerably exceed one hundred in number, and are spread over the greater part of the globe, chiefly in temperate climates, but more abundant in the Old World than in the New. Eight species are natives of Britain, seven of which belong to the genus *Orobanche* (Broomrapes), and one species to *Lathræa* (Toothwort). In Britain they are all rather rare or purely local plants. High medicinal virtues ascribed to some of the species, especially to *Epifagus americanus* (see CANCER-ROOT), are now discredited. With *Cistanche lutea* the Egyptians dye the ropes made of the palm *Hyphæne thebaica* black.

Orobis, an old genus, now reckoned a section of *Lathyrus* (q.v.).

Orontes, the ancient name of a river in Syria, now called *Nahr-el-Asi*. It rises in the highest part of Cœle-Syria, near Baalbek, flows northward between the mountains of Libanus and Anti-Libanus, as far as the city of Antioch, and then westward to the Mediterranean Sea, through a total course of 147 miles. Its lower course is remarkably beautiful; its rocky banks are 300 feet high, and the windings of the river show them off to the greatest advantage. Myrtles, laurels, figs, wild vines, arbutus, dwarf-oaks, and sycamores grow up the cliffs in picturesque irregularity. The country through which the river flows is in many parts richly cultivated.

Orosius, PAULUS, a Spanish presbyter and historian, was born at Tarragona, and flourished in the 5th century. He visited Augustine in 415, and presented to him his work written against the heresies of Priscillian and Origen. He went thence to Palestine to study under Jerome at Bethlehem. His chief work, the *Historiarum adversus Paganos Libri vii.*, begins with the creation and goes down to 417 A.D. It is apologetic in design, intended as a complement to the great work of Augustine written to prove from historical evidence that the prevailing evils of the time were not due to Christianity. It is based on the chronicle of Eusebius-Jerome, and on Livy, Eutropius, Justin, Tacitus, and Suetonius; but the work is a trivial, inaccurate, uncritical miscellany of facts, although the style is elegant if watery, in Bacon's phrase. It was a favourite text-book of universal history during the middle ages, and had the honour of being translated into English by King Alfred (ed. Bosworth, 1851; Sweet, 1883 *et seq.*).

The editio princeps appeared at Vienna in 1471; the best edition is that by C. Zangemeister in *Corpus Script. Eccles. Latin.* (Vienna, 1882). The edition of Havercamp (1738) was reprinted in vol. ix. of Galland's *Bib. Pat.* (1773) and vol. xxxi. of Migne's *Patrol.* (1846); the history alone by Dr Brohm (Thorn, 1877). An English translation (1773) was reprinted in Bohn's 'Antiquarian Library' (1853).

Orotava, LA, a town on the north coast of Teneriffe, is situated below the Peak, in one of the pleasantest districts in the world; pop. 12,000.

Orpen, SIR WILLIAM, R.A., born on 27th November 1878 at Stillorgan, Co. Dublin, stands in the forefront of the portrait-painters of his day. While at the Dublin School of Art he attracted attention by his wonderful draughtsmanship, and already in his early twenties ranked as a master in the manipulation of his pigment. 'The Mirror,' an example of this period of his art, shows none of the hesitancy of the student, and although reminiscent of Whistler, it displays that power of painting interiors delightfully which became such a prominent

feature of his later work. Fine spacing, significant silhouette, and rich, gay colouring are prominent qualities in his painting. 'The Fracture' (1901) and 'The Valuers' (1902) are the best known of his earlier works, although in them a rather sombre key prevails. 'Charles Wertheimer' (1908) was the first of his paintings to be exhibited at the Royal Academy, of which he became an associate in 1910 and a full member in 1919. 'The Jockey,' 'Venus and Myself' (1910), 'A. W. Rich' (1910), 'On the Irish Shore' (1910), show a steady development in his style. In 1917 he went to France as an official artist, and painted a series of magnificent and very living portraits, 'Marshal Foch,' 'Lord Haig,' 'Lord Plummer,' &c., and many sketches of British soldiers and the conditions under which they lived. At the Peace Conference he added such figures as Lord Beatty and President Wilson, as well as a picture of the actual signing of peace. 1921 saw the appearance of a striking work, 'The Chef of the Hotel Chatham,' where Orpen's quite amazing dexterity in handling paint is displayed in a picture which for human appeal and brilliant painting deserves to rank with Moroni's 'The Tailor.' 'To the Unknown British Soldier in France' appeared in 1923, and is something more than a brilliant example of interior painting. 'Man versus Beast' was his exhibit for 1925. Besides these, Orpen has painted a large number of portraits, and in each it can be seen that his art has broadened and matured. His publications include *The Outline of Art* (1923) and *An Onlooker in France* (1924).

Orpheus, a Greek hero, a son of Apollo and the Muse Calliope, or of Cægrus and Clio or Polyhymnia. His native country is Thracia, where many different localities were pointed out as his birthplace. Apollo bestows upon him the lyre, which Hermes invented, and by its aid Orpheus moves men and beasts, the birds in the air, the fishes in the deep, the trees, and the rocks. He accompanies the Argonauts in their expedition, and the power of his music wards off all mishaps and disasters, rocking monsters to sleep and stopping cliffs in their downward rush. His wife, Eurydice, is bitten by a serpent and dies. Orpheus follows her into the infernal regions; and so powerful are his 'golden tones' that even stern Pluto and Proserpine are moved to pity, while Tantalus forgets his thirst, Ixion's wheel ceases to revolve, and the Danaids stop in their wearisome task. He is allowed to take her back into the 'light of heaven,' but he must not look around while they ascend. Love or doubt, however, draws his eyes towards her, and she is lost to him for ever. His death is sudden and violent. According to some accounts, it is the thunderbolt of Zeus that cuts him off, because he reveals the divine mysteries; according to others, it is Dionysus, who, angry at his refusing to worship him, causes the Mænads to tear him to pieces, which pieces are collected and buried by the Muses in tearful piety at Leibethra, at the foot of Olympus, where a nightingale sings over his grave. Others, again, make the Thracian women divide his limbs between them, either from excessive madness of unrequited love or from anger at his drawing their husbands away from them. The faint glimmer of historical truth hidden beneath these myths becomes clearer in those records which speak of Orpheus as a divine bard or priest in the service of Zagreus, the Thracian Dionysus, and founder of the Mysteries (q.v.); as the first musician, the first inaugurator of the rites of expiation and of the Mantic art, the inventor of letters and the heroic metre; of everything, in fact, that was supposed to have contributed to civilisation and initiation into a more humane worship of the deity among the primitive

inhabitants of Thracia and all Greece. A kind of monastic order sprang up in later times, calling itself after him, which combined with a sort of enthusiastic creed about the migration of souls and other mystic doctrines a semi-ascetic life. Abstinence from meat (not from wine), frequent purifications and other expiatory rites, incantations, the wearing of white garments and similar things were among their fundamental rules and ceremonies. But after a brief duration the brotherhood, having first, during the last days of the Roman empire, passed through the stage of conscious and very profitable jugglery, sank into oblivion, together with their 'orpheotelistic' formulas and sacrifices.

Orpheus has also given the name to a special literature called the Orphic, and was called the first poet of the heroic age, anterior to both Homer and Hesiod. The fragments current under his name were first collected at the time of the Pisistratidæ, chiefly by Onomacritus, and these fragments grew under the hands of the Orphic brotherhood, aided by the Pythagoreans, to a vast literature of sacred mythological songs sung at the public games, chanted by the priests at their service, worked out for dramatic and pantomimic purposes by the dramatists, commented upon, philosophised upon, and 'improved' by grammarians, philosophers, and theologians. Although authorities like Herodotus and Aristotle had already combated the supposed antiquity of the so-called Orphic myths and songs of their day, yet the entire enormous Orphic literature which grew out of them retained its 'ancient' authority from the 3d and 4th centuries down even to quite recent times, when it was irrefutably proved to be in its main bulk, as far as it has survived, the production of these very 3d and 4th centuries, raised upon a few scanty, primitive snatches. The most remarkable part of the Orphic literature is its Theogony, which is based mainly on that of Hesiod.

Besides the fragments of the Theogony which have survived, imbedded chiefly in the writings of the Neoplatonists, may be mentioned the *Argonautica*, a poem of the Byzantine period, consisting of 1384 hexameters; further, a collection of 87 or 88 liturgical hymns; and a work on the virtues of stones, called *Lithica*. Of other poems belonging to the Orphic Cycle, only names have survived in most instances. The hymns may be of the 1st or 2d century B.C. They have repeatedly been translated.

See the editions of the *Orphica* by Hermann (1805) and Abel (1885); Lobeck's *Aglaophamus* (1829); Gerhard, *Orpheus und die Orphiker* (1861); Dieterich, *De Hymnis Orphicis*; Kern, 'Die Herkunft des orphischen Hymnenbuchs' in the Carl Robert *Genethliakon* (1910).

Orpiment. See ARSENIC.

Orpine, a kind of Sedum (q.v.).

Orpington, a village of Kent, 12 miles by rail SE. of London, where Ruskin's books began to be published in 1873 (see E. T. Cook, *Studies in Ruskin*, 1890). Pop. 7000.

Orrery, a machine constructed for the purpose of exhibiting the motions of the planets round the sun, and of the satellites round their primaries, which was in high repute during the 18th and beginning of the 19th century, though now regarded as a mere toy. Made by Rowley in 1715 at the expense of Charles Boyle (q.v.), Earl of Orrery, it was a combination of the old Planetarium of the 16th century with other machines which showed the motions of the earth, moon, and planetary satellites. Though the construction of a machine which would exhibit accurately the motions, distances, and magnitudes of the planets is impossible, yet an orrery is in some degree useful as giving a general notion of the way in which the planetary

motions are performed. In making the machine a number of iron tubes equal in number to the planets, and of different dimensions, are placed one within the other; their lengths being arranged so that the innermost tube projects at both ends beyond the one next to it, that one similarly projects beyond the third, and so on. At one end of each tube a rod is fixed at right angles, and a ball or lamp attached to its end; the lengths of the rods being proportional (or at least supposed to be so) to the radii of the planetary orbits. The other ends of the tubes form the axes of toothed wheels, which are made to turn at angular velocities proportional to those of the planets.

Orris-root (probably a corruption of *Iris* Root), the root-stock (*rhizome*) of certain species of *Iris* (q.v.), natives of the south of Europe, belonging to the division of the genus having bearded flowers, sword-shaped leaves, and scapes taller than the leaves—viz. *I. florentina*, a species with white flowers; *I. pallida*, which has pale flowers; and *I. germanica*, which has deep purple flowers. The flowers of all these species are fragrant. *I. germanica* extends farther north than the other species, and its root is sometimes said to be more acrid. Orris-root was formerly used in many medicinal preparations as a stimulant, but is now almost entirely disused. It is sometimes chewed to sweeten an offensive breath. Its chief use is in perfumery. It has a pleasant smell of violets, which it acquires in drying. Hair and tooth powders, and oils, are often scented with it. A tincture of it also is used as a scent, and is often sold as *Essence of Violets*.

Orsay. See D'ORSAY.

Orsini, FELICE, conspirator, was born in 1819 at Meldola in Italy, in the States of the Church, and studied at Bologna. He belonged to a branch of a noble family, long famous as supporters of the Gueff party, which produced famous scholars, soldiers, and churchmen (including two popes, Nicholas III. and Benedict XIII.). Felice, the son of a conspirator, was early initiated into secret societies, and in 1844 was sentenced at Rome to the galleys for life. The amnesty of Pius IX. (1846) restored him to liberty, but he was soon again imprisoned for participation in political plots. When the revolution of 1848 broke out Orsini was elected a deputy to the Roman Constituent Assembly, and, invested with extraordinary powers, was sent to Ancona and Ascoli to suppress brigandage. He signalised himself by the violence with which he executed his commission. He also took part in the defence of Rome and Venice; agitated in Genoa and the duchy of Modena; and in 1853 was shipped by the Sardinian government to England, where he formed close relations with Mazzini. Furnished with money by the leaders of the revolutionary party, he appeared at Parma in 1854, and afterwards at Milan, Trieste, Vienna, everywhere agitating in the interest of insurrection; until at last he was arrested at Hermannstadt, and confined in the fortress of Mantua. In 1856 he succeeded in making his escape, and found refuge in England, where he supported himself by public lecturing, and wrote *Austrian Dungeons in Italy* (1856). Towards the end of 1857 he repaired to Paris, with the intention of assassinating Napoleon III., whom he reckoned the great obstacle to the progress of revolution in Italy. His associates were Pieri, Rudio, and Gomez, all more or less of the Mazzinian group. They took up their station in a house close by the Opéra, and on the evening of the 14th January 1858, just as the carriage containing the emperor and empress was drawing up, they threw three bombs under it. An explosion took place, and 10 persons were killed, 156 wounded, but Napoleon and the empress remained unhurt. The

360

assassins were arrested, tried, and sentenced; Orsini, Pieri, and Rudio, to capital punishment, Gomez to penal servitude for life. Rudio's life was spared at the intercession of the empress, but Pieri and Orsini were guillotined on 13th March. See *Memoirs and Adventures of Orsini, written by himself* (Eng. trans. Edin. 1857); his *Letters* (2 vols. Milan, 1861); and a work by Montazio (1862).

Orșova, the name of two Rumanian towns (Hungarian till the Great War) on the Danube (q.v.) over against the Iron Gates. OLD ORȘOVA is 478 miles by rail SE. of Vienna. Pop. 5000.—NEW ORȘOVA, on an island in the Danube, is a fortified town. The Austrians were masters of it between 1716 and 1738; the Turks held it both before 1716 and after 1738. Pop. 3000.

Ortegal, CAPE, the north-west extremity of Spain (q.v.), in Galicia.

Ortelius, the Latin form of the name of ABRAHAM ORTELL, or ORTEL, who, born of German parents in 1527 at Antwerp, where he died in 1598, published the earliest atlas under the title *Theatrum Orbis Terrarum* (1570); a critical work on ancient geography, *Synonymia Geographica* (1578), re-issued, greatly improved, as *Thesaurus Geographicus* (1596); and other geographical works. He was also a frequent traveller to England, Ireland (1577), and Italy, and the countries between.

Orthez, a town in the French department of Basses-Pyrénées, on the right bank of the Gave de Pau, 41 miles by rail E. of Bayonne. The 'Tour de Moncade' (1240), the stately castle of the counts of Foix (q.v.), which Froissart visited in 1388, was reduced to a ruin by Richelieu. Near Orthez Wellington gained a decisive victory over Soult, 27th February 1814. Pop. 6000.

Orthoceras, a large genus of common fossil Cephalopods. The shells are quite straight, but a gradual series of forms lead on to the Nautilus type. Some species were gigantic—as much as six feet in length and a foot or more in diameter.

Orthoclase. See FELSPAR.

Orthoclase-porphry, a crystalline igneous rock, of variable colour, but generally reddish. It is fine-grained and compact in texture. The ground-mass is feldspathic, and micro- or crypto-crystalline; now and again it shows a little glassy or devitrified matter. Scattered through this ground-mass are porphyritic crystals of orthoclase, and usually some hornblende and biotite in small granules, crystals, and scales. The rock occurs in minor intrusions, dykes and sills, and is intermediate in texture between syenite and trachyte. See also IGNEOUS ROCKS.

Orthoclase-rocks. See PETROGRAPHY.

Orthodoxy (Gr. *orthos*, 'right,' and *doxa*, 'an opinion'), a name given by theologians to religious opinions in agreement with Scripture and historical tradition, or rather with the interpretation of these entertained by the particular church to which they themselves happen to belong. While it is true that the great cardinal and essential points of Christian dogma have been preserved by all sections of the Church of Christ, the gravest divergences have also arisen, alike in doctrine and practice, each fortified by an assumed infallible interpretation of the letter of Scripture or the line of historical descent in the usage of the church.—The antithesis of *orthodoxy* is *heterodoxy* (*heteros*, 'other'—i.e. 'wrong'). See also GREEK CHURCH.

Orthoepy (Gr. *orthos*, 'right'; *epos*, 'a word'), a branch of grammar that treats of the correct pronunciation of the words of a language.

Orthography. See SPELLING.

Orthoptera (Gr., 'straight-winged'), an order of Insects (q.v.).

Ortolan (*Emberiza hortulana*), a species of Bunting (q.v.) of the Finch family Fringillidae. The adult male is about six inches long; has the head, neck, and upper breast slate-gray suffused with yellow; bill reddish brown; chin, throat, and feathers round the eye yellow, with a narrow band of greenish gray descending from a little in

Ortolan (*Emberiza hortulana*).

front of the angle of the mouth; back, wing-coverts and secondaries fulvous brown with dark stripes; rump reddish brown. The plumage of the female is paler in colour. The ortolan in its summer migrations ranges as far north as the Arctic Circle in Scandinavia. In the south of Europe, where it is found in great numbers, and in the north of Africa, where it sometimes breeds, it is but a summer visitor. In winter it migrates as far south as to Abyssinia and North-western India, but its true winter-quarters have not yet been accurately ascertained. Though enormously abundant in certain localities on the Continent, it is rare in Britain, and many of the specimens captured have no doubt escaped from captivity, considering the large quantities imported alive from Holland and Belgium. It frequents bushy places, and builds its nest of dry grass always on the ground and generally in the open fields, though sometimes among herbage or under low bushes. It lays from four to six eggs, which vary in colour from very pale-bluish white to salmon colour, spotted with rich purple brown, with underlying spots of pale violet, not streaked as is usual with other buntings. The note of the male is rather metallic, and his song at times is incessant and very monotonous. The food consists of beetles and other insects and seeds. Large numbers of ortolans are netted during their migrations, and confined in dark or dimly-lighted rooms, where they are fattened upon oats and millet until ready for the table. Their flesh is considered a great delicacy.

Orton, ARTHUR. See TICHBORNE.

Ortona, a town of Italy, on the Adriatic, 104 miles by rail SSE. of Ancona. It has a cathedral and an improved harbour. Pop. 17,000.

Ortygia. See DELOS, SYRACUSE.

Ortyx. See VIRGINIAN QUAIL.

Oruro, capital of the department of Oruro, in Bolivia, stands on a saline plain 11,960 feet above the sea, near the salt lake of Aullagas, and possesses mines of silver, gold, copper, and tin. Founded in 1590, it had 70,000 inhabitants in 1650, but now, though connected by rail with Antofagasta, has only 32,400. The department, bordering on Peru, has an area of 20,657 sq. m. and a pop. of 141,000. The soil is saline, but the mineral wealth is great.

Orvieto, a city in the Italian province of Perugia, 78 miles NNW. of Rome, crowns an isolated tufa rock, which rises 765 feet above the river Paglia, and 1327 above sea-level. The cruciform cathedral (1290-1580), one of the most beauti-

ful and richly decorated specimens of Italian Gothic, is built of black and white marble, and measures 295 feet by 109. The façade (damaged by earthquake, 1915) is unsurpassed in richness of material, and in the beauty of its mosaics, sculptures, and elaborate ornamentation. The interior also is magnificently decorated with sculptures and with paintings by Luca Signorelli, Fra Angelico, &c. The bishop's palace and St Patrick's Well (1527-40), with its 250 steps, are also noteworthy. Pop. 20,000. Orvieto, called in the 7th century A.D. *Urbs Vetus*—whence its present name—is supposed to occupy the site of the Etruscan Volsinii (see ETRURIA). In the middle ages it gave shelter to thirty-two popes.

Orwell. See IPSWICH.

Oryx, a genus of antelopes, chiefly African, also Arabian and Syrian, with long slightly curved horns in both sexes. The *Leucoryx*, whose apparently 'unicorn' figure is frequent on ancient monuments, is *Oryx leucoryx*; the Beisa and the Beatrix antelope are two other species. The name is also applied to species of the nearly allied genus *Hippotragus*, and more widely still. See ANTELOPE.

Oryza. See RICE.

Osage Orange (*Maclura aurantiaca*), a North American tree of the Moraceæ, attains a height of 20 to 60 feet. It is of the same genus with *Fustic* (q.v.). The bright yellow wood is fine-grained and very elastic, and takes a high polish; it is much used for fence-posts, sleepers, paving-blocks, &c. The tree is largely employed in America, especially in the west, as a hedge-plant; it has also been tried in Britain for that purpose. Its fruit is about the size of a large orange, has a tuberculated surface of a golden colour, and is filled with radiating, somewhat woody fibres, and with a yellow milky juice, the odour of which is generally disliked, so that the fruit, although not unwholesome, is seldom eaten.

Osages, a tribe of American Indians, of the Siouan linguistic stock. Formerly very troublesome, they settled in Kansas in 1825, till in 1872 they removed to Oklahoma, where there are Quaker teachers. As a tribe they are rapidly approaching extinction by absorption. See monograph by F. la Flesche (1914-15).

Osaka, or OZAKA, the second city of Japan, situated at the head of the gulf of the same name, and at the mouth of the Yodo River. The city is intersected with canals. Its fine castle, the stones of whose walls are of astonishing size, was constructed by Hideyoshi's orders in 1583, and the palace, built afterwards in its precincts and destroyed in 1868, was perhaps the most magnificent structure in Japan. Osaka is the great commercial and industrial centre of the empire, and the headquarters of the rice and tea trade. Harbour improvements were begun in 1897 and again in 1906. There is a university of medicine (1880). In the earthquake of 28th October 1891, of which Osaka was the centre, nearly 10,000 lives were lost. There was a great fire in 1909. Pop. 1,253,000.

Osborn, SHERARD, admiral and Arctic navigator, was born at Madras, 25th April 1822, the son of an English officer, and entered the navy in 1837. He took part in the capture of Canton (1841), and of the defences of Woo-sung (1842); commanded vessels in two expeditions sent out in 1849 and 1852-55 respectively to search for Sir John Franklin; was head of the division of the British fleet that served in the Sea of Azov during the Crimean war; and took a leading share in the Chinese war of 1857-59, penetrating up the Yang-tsze-kiang as far as Hankow. After his retirement from active duty

he superintended the construction of a submarine telegraph between Great Britain and Australia, and was made rear-admiral in 1873. He died 6th May 1875. Besides publishing *Stray Leaves from an Arctic Journal* (1852), *Journals of Robert M'Clure* (1856), and *Career, Last Voyage, and Fate of Sir John Franklin* (1860), he proved his interest in Arctic exploration by inducing A. H. Markham to test the navigability of Baffin Bay in winter (1873) by steam-power, and by helping to fit out the expedition which sailed under Nares in 1875.

Osborne. See LEEDS (DUKE OF). For DOROTHY OSBORNE, see TEMPLE (SIR WILLIAM); for OSBORNE HOUSE, see COWES, NAVY; and for OSBORNE or ST HELEN'S BEDS, see OLIGOCENE SYSTEM.

Oscans (Lat. *Osci* or *Opisci*; Gr. *Opikoi*), the name of an Italian people, who at an early period occupied Campania, and were either closely allied to or the same race as the Ausones. Subsequently (about 423 B.C.) Samnites from the hilly districts to the north overran the country, and amalgamated with the inhabitants whom they had subjugated; and the names *Osci* and *Oscan language* were subsequently applied to all the other races and dialects whose origin was nearly or wholly the same. The Oscan language was not substantially different from the Latin, but only a ruder form of the same central Italic tongue. By the victories of the Romans over the Samnites, and the conferring of the *civitas* on all the Italians (88 B.C.), an end was put to the official use of the Oscan tongue; nevertheless, in the time of Varro (1st century B.C.) it was still used by the people. During its most flourishing period it was something more than a country *patois* (see ATELLANÆ). Besides a considerable number of coins with Oscan legends, there are still extant a number of Inscriptions (q.v.).

See Mommsen's *Oskische Studien* (1845), and *Unteritalische Dialekte* (Leip. 1850); Zvetiaeff's *Sylloge Inscr. Oscorum* (Petersb. 1878); grammars by von Planta (1892-97) and Buck (1904); and Conway's *Italic Dialects* (1897); also the article ITALY.

Osceola (*As-se-he-ho-lar*, 'Black Drink'), a Seminole chief, was born in Georgia in 1804, the son of an English trader, named Powell, and of a chief's daughter. With her he removed to Florida as a child, and there attained great influence among the Indians. In 1835 his wife, the daughter of a runaway slave, was seized as a slave. The outraged husband threatened revenge, and for his threats was imprisoned six days in irons by General Thompson: six months afterwards he killed the general and four others outside Fort King. This was the beginning of the second Seminole war. He then placed himself at the head of a band which had surprised and massacred Major Dade and a detachment of soldiers, and taking to the almost impenetrable Everglades with two or three hundred followers, he fought for nearly two years with great energy and skill the superior numbers sent against him. He was taken prisoner at last, in October 1837, by General Jesup, while holding a conference under a flag of truce—an act of inexcusable treachery, though represented as one of retaliation—and confined in Fort Moultrie until his death, 30th January 1838. Mayne Reid, in *Oceola*, has woven the story into a romance.

Oscott, a Roman Catholic college, near Birmingham; formerly a centre of the Roman Catholic movement in England. The name is first met with towards the close of the 17th century as the seat of a Catholic mission, which continued to be served by different priests till in 1793 it was formed into a college for the education of both laymen and ecclesiastics. In 1835 the development of the college led to the erection of the present fine buildings some two miles from the original site, the old

name being retained.—In 1889 the establishment was closed and reopened as a purely ecclesiastical institution for the diocese of Birmingham. In 1897 it became a central seminary for various midland and southern dioceses of England, but in 1909 again returned to its position of a diocesan establishment, though students from other dioceses are still on occasion admitted. It is now styled St Mary's College.

O'Shaughnessy, ARTHUR, minor poet, was born in London, 14th March 1844. He was employed in the natural history division of the British Museum, married a daughter of Dr Westland Marston, whom he lost in 1879, and followed to the grave on 31st January 1881. During his brief life he published *Epic of Women* (1870), *The Lays of France* (1872), and *Music and Moonlight* (1874); and soon after his death appeared *Songs of a Worker* (1881). As a poet he is somewhat diffuse, over-gorgeous in colour, and not sufficiently discerning in his admiration for modern French models; yet he reveals imagination, passion, tenderness, melody, and a mastery of lyrical forms. See an edition of his poems by Percy (1923).

Oshkosh, capital of Winnebago county, Wisconsin, on both sides of the Fox River, at its entrance to Lake Winnebago, 80 miles by rail NNW. of Milwaukee. The lake (30 miles by 12), with the Fox and Wisconsin rivers, which are connected by a canal, forms a water-route between Lakes Michigan and Superior. The city extends along the lake for 4 miles, and contains a number of handsome buildings. It carries on a great trade in lumber, and contains numerous sawmills, extensive door and sash factories, and large manufacturing of furniture, matches, carriages, and soap, besides pork-packing establishments. It is the seat of a state normal school, and close by is a state lunatic asylum. Oshkosh was incorporated in 1853, and burned down in 1859; it was again partially destroyed by fire in 1874 and 1875; and in 1885 a cyclone overwhelmed part of the suburbs. Pop. (1880) 15,748; (1890) 22,836; (1920) 33,162.

Osiander, ANDREAS, German reformer, was born on 19th December 1498 at Gunzenhausen, near Nürnberg. His name is a Græcised form of the original German Heiligmann or Hosemann. Educated at Ingolstadt, he declared himself an adherent of Luther, and became a preacher at Nürnberg (1522), persuaded that city to declare itself Lutheran, took part in the conference at Marburg (1529), and was present at the diet of Augsburg (1530), and at the signing of the Schmalkald articles (1537). In 1548 he was deprived of his office as preacher because he refused to agree to the Augsburg Interim; but was immediately afterwards invited by Albert, Duke of Prussia, to become professor of Theology in the newly-established university of Königsberg. He was hardly settled there when he became entangled in a theological strife that was greatly embittered by his vehement and arrogant temper. In a treatise, *De Lege et Evangelio*, Osiander asserted that the righteousness by which sinners are justified is not to be conceived as a mere justificatory or imputative act on the part of God, but as something inward and subjective, springing in a mystical way from the union of Christ with man. The most notable of his opponents was Martin Chemnitz (q.v.). Osiander's death in the midst of this fierce polemical war, on 17th October 1552, did not check it; the battle was continued by his followers, called Osiandrists, and led by his son-in-law Funk, who was executed for high-treason in 1566, and the entire party was banished from Prussia in 1567. See Lives by Wilken (1844), Möller (1870), and Hase (1879). Osiander's son Lukas (1534-1604)

and his son Lukas (1571–1638) won reputations as theologians of note.

Osier, the popular name of those species of Willow (q.v.) which are used chiefly for making Baskets (q.v.) and other wickerwork. They are of low bushy growth, few of them ever becoming trees, their branches long and slender; and they are the more valuable in proportion to the length, slenderness, suppleness, and toughness of their branches.

The Common Osier (*Salix viminalis*), a common native of wet alluvial grounds in Britain and many parts of Europe, is one of those which sometimes become trees, although when cultivated for basket-making it is not permitted to do so. It is often planted to prevent the banks of rivers from being washed away. Its branches are used for making hoops and coarse baskets. There are several varieties in cultivation, not easily distinguished except by a very practised eye, but much more useful than the original or wild kind, which is apt to break, and therefore of little value. More suitable for the finer kinds of basket-making are *Salix purpurea*, sometimes called the Fine Basket Osier, and *S. rubra*, known near London as the Green-leaved Osier or Ornard; *S. triandra*, a triandrous species, known to English osier-cultivators and basket-makers as the Spaniard Rod; whilst *S. alba*, var. *vitellina*, sometimes becoming a tree, is the Golden Osier or Golden Willow, remarkable for the bright-yellow colour of its branches, as well as for their pliancy and toughness. There are other species, not natives of Britain, which also are valuable.

Osiers are very extensively cultivated in Holland, Belgium, and France, on alluvial soils, especially near the mouths of rivers; and from these countries great quantities of 'rods' are imported into Britain. They are cultivated also to a considerable extent in some parts of England, particularly on the banks of the Thames and the Severn, and in the level districts of Cambridgeshire, Huntingdonshire, &c. Islets in the Thames and other rivers, entirely planted with osiers, are called *Osier holts*. Osiers grow particularly well on grounds flooded by the tide. Much depends on the closeness of planting of osier grounds; as when space is too abundant the shoots of many of the kinds do not grow up so long, slender, and unbranched as is desirable. The French cultivators, when they wish osiers for the finest kinds of basket-work, cut branches into little bits with a bud or eye in each, and plant these pretty close together, so as to obtain weak but fine shoots; but generally cuttings of 15 or 16 inches in length are used, and of tolerably thick branches, and these are placed in rows from 18 inches to 2 feet apart, and at distances of 15 to 18 inches in the row. Osier plantations in light soils continue productive for fifteen or twenty years, and much longer in rich alluvial soils. Osiers succeed best in rich soils, but not in clays. No cultivation is required after planting;

but the shoots are cut once a year, at any time between the fall of the leaf and the rising of the sap in spring. After cutting they are sorted, and those intended for brown baskets are carefully dried and stacked, care being taken that they do not *heat*, to which they are liable, like hay, and by which they would be rotted and rendered worthless. The stacks must be protected carefully from rain. The osiers intended for white baskets cannot at once be peeled, but, after being sorted, they are placed upright in wide shallow trenches, in which there is water to the depth of about four inches, or in rivulets, being kept secure in their upright position by posts and rails; and thus they remain till they begin to bud and blossom in spring, which they do as if they remained on the parent plant, sending forth small roots at the same time into the water. They are then, in ordinary seasons, easily peeled by drawing them through an instrument called a *break*, but in cold springs it may be necessary to lay them for a while under a quantity of litter. After being peeled, they are stacked for sale.

Osijek, the Croatian name of Essek (q.v.).

Osiris, greatest of Egyptian gods, is the son of Seb (the Earth—the father) and Nut (Heaven—the mother). He wedded Isis his sister while they were yet in the womb; was slain by Set, was avenged by his son Horus, and judges the dead in the nether world. The myth is generally interpreted by taking Osiris for the Sun, Set for darkness. Osiris had by Nephthys another son Anubis (i.e. Dusk), who is said to have swallowed his father. Osiris has also been identified with the god Ra, with the Moon, with the Nile, and with the annual sun-period or summer. See EGYPT, ISIS, SERAPIS, and works there quoted; also J. G. Frazer, *Adonis, Attis, Osiris* (1914, forming part iv. of *The Golden Bough*, 3d ed.); Wallis Budge, *Osiris and the Egyptian Resurrection* (1911).

Oskaloosa, capital of Mahaska county, Iowa, 104 miles by rail WNW. of Burlington. It possesses mines of bituminous coal, and manufactures flour, woollens, boilers, electric appliances, &c. Here are Penn College (Quaker) and two others. Pop. 9500.

Oslo, an old Norwegian town, founded, according to legend, by Harold III. (q.v.) of Norway, who made it his capital. In 1589 James VI. of Scotland braved the North Sea to meet his storm-bound bride Anne of Denmark in Oslo, and was married there with great splendour. Oslo was destroyed by fire in 1624, and Christian IV. founded near-by the new capital Christiania, making Oslo a suburb. The name of the suburb, however, was extended to the whole city on 1st January 1925. See CHRISTIANIA.

Osman. See OTHMAN.

Osmium (sym. Os; atom. wt. 190.9; atom. number 76) is a metal which occurs in association with platinum in the form of an osmium-iridium alloy. It may be obtained in the metallic condition by several processes which yield it either as a black amorphous powder or in hard bluish-white crystals. It is the least fusible of all the metals, the oxyhydrogen jet volatilising, but not fusing it. It is the heaviest substance known, its specific gravity being 22.477. Four oxides of osmium are known. Three of these—viz. the protoxide, OsO , the sesquioxide, Os_2O_3 , and the binioxide, OsO_2 , are black or grayish-black powders. The peroxide, OsO_4 , commonly called osmic acid, is the most important oxide. It is produced when the metal is heated strongly in air or oxygen, and forms colourless, glistening, acicular crystals, freely soluble in water, and very volatile. At about 100°C . this

Common Osier (*Salix viminalis*): a, male catkin; b, female catkin.

compound gives off an extremely irritating and irrespirable vapour; and hence the name of the metal (from the Greek word *osmē*, 'odour'). It produces a permanent black stain upon the skin, and at the same time causes an eruption which is difficult to heal. It violently attacks all the mucous membranes, and its vapour may cause partial or total blindness by depositing a film of metallic osmium on the eyes. A solution of the peroxide is employed in histological work for staining fat and nerve substance. Osmium also forms two chlorides; and osmates, corresponding to an unknown osmic acid, have been prepared. This metal was discovered by Tennant in 1803.

Osmose, the interdiffusion of two liquids through a septum, usually of bladder or of parchment paper. If a bottle, filled with one liquid, be closed by parchment paper, and be completely immersed in a vessel containing another liquid, increase or decrease of the contents of the bottle will occur according as the liquid contained in the bottle passes out through the septum less quickly or more quickly than the other liquid passes inwards. When the contents are increased the phenomenon has been called *endosmose*; when they decrease it has been termed *exosmose*. The distinction is obviously not a scientific one; for a reversal of the positions of the liquids will cause a reversal of the osmotic process, so that the process which was formerly denominated *exosmose* must now be called *endosmose*, and *vice versa*. The phenomenon is one of extreme importance, for it is constantly taking place in living bodies—both animal and vegetable.

Nollet was the first to record the occurrence of osmose. He placed a vessel, filled with alcohol and closed with a piece of bladder, inside a larger vessel which was filled with water. The rapid entry of the water almost burst the bladder; and the opposite effect took place when the water was placed inside the inner vessel and the alcohol was placed outside it. Nollet did not pursue his observations any further. Dutrochet first made careful investigations into the subject, which has since received numerous practical applications—notably in the method of dialysis, which is due to Graham. The phenomenon consists merely in the interdiffusion of two liquids complicated by the mutual molecular actions which take place between the liquids and the material of the membrane. The rate of interdiffusion depends greatly upon the nature of the membrane; sometimes the direction of the osmose is affected when the membrane is altered.

A process which is analogous to osmose occurs in the interdiffusion of two liquids through an intervening liquid layer. The difference between the rates of diffusion of colloids and crystalloids is even more marked when the substances are separated by parchment paper or animal membrane than when they diffuse directly into each other.

Osmund, St, a nephew of William the Conqueror, whom he accompanied to England as one of the royal chaplains. He became chancellor in 1072, and bishop of Salisbury in 1078, and was engaged in the preparation of Domesday Book. He built the cathedral of Old Sarum, and drew up in his 'Use of Sarum' an order of church service which in his time was universally adopted. He died in 1099, and was canonised in 1457.

Osmunda. See ROYAL FERN.

Osnabrück, a town in the Prussian province of Hanover, in the fertile valley of the Hase, 75 miles by rail SSW. of Bremen and 70 WSW. of Hanover. Its great Catholic cathedral, in the Transition style of the first half of the 13th century, is rich in relics and monuments; and the town-hall

(1486–1512) contains portraits of all the plenipotentiaries who here on 24th October 1648 signed the peace of Westphalia. By that treaty the bishopric of Osnabrück, founded by Charlemagne about 810, was to be occupied alternately by a Catholic prelate and a Protestant secular prince of the House of Brunswick-Lüneburg. After having last been held by Frederick, Duke of York, the district of Osnabrück came in 1802 to Hanover, and the chapter was dissolved, until the re-establishment of the bishopric in 1857. Osnabrück has important iron and steel works, and manufactures of railway plant, agricultural machinery, gas-meters, paper, tobacco, &c. Dating from 772, it suffered much in the Thirty Years' War, but recovered, thanks to its linen industry, during the 18th century. The name *Osnaburgs* given to coarse linens in England is derived hence. Pop. (1852) 13,718; (1890) 39,929; (1900) 51,573; (1919) 85,017, one-third Catholics.

Osprey (*Pandion haliaëtus*), or FISH-HAWK, a not infrequent autumnal visitor to British shores, estuaries, and lochs, where it feeds exclusively on fish. It has been known to breed in England, and several eyries still remain in Scotland. But its

Osprey (*Pandion haliaëtus*).

distribution is almost cosmopolitan, for it occurs on all the continents, especially where fish are common and men rare. The male bird is 22 inches in length, the female 24. 'The adult male has the head and nape white, streaked with brown; upper plumage umber, with a purplish tinge; under parts white, with a band of brown spots across the breast; cere, legs, and toes greenish blue.' The female has more brown on the breast. A large nest of sticks and turf, with a small moss-lined cavity for the eggs, is built on a tree or rock. The eggs (two or three) are laid in April or May, and have a 'ground colour of white or buff, with chestnut or claret blotches, and blurs of purplish gray.' In North America the osprey is gregarious. It never preys on other birds, and is not dreaded by them. It is, indeed, of a pacific and timorous disposition, and readily abandons its prey to the White-headed Eagle. In the days of falconry it was sometimes trained and used for catching fish. See Saunders, *British Birds*.

Osrhoene, ancient name of a district (now Turkish) in north-west Mesopotamia, containing Edessa (q.v.).

Ossa, the ancient name of a mountain on the east side of Thessaly, near Pelion (q.v.), and separated from Olympus by the vale of Tempe. The ancients placed the seat of the Centaurs and

Giants in the neighbourhood of Pelion and Ossa. See TITANS.

Ossetes. See CAUCASUS.—SOUTH OSSETIA is an autonomous territory in Georgia.

Ossian, the great heroic poet of the Gael. In form the name is a diminutive—*Oisean*, *Oisín*, the little *os* or deer. In Gaelic story Ossian was the son of Fionn MacCumhail, a celebrated hero who flourished in the 3d century A.D. Fionn gathered about him a band of warriors like himself, who were collectively termed the *Feinn*. The adventures and exploits of these heroes, and especially of the principal figures in the group—of Fionn himself, magnanimous and wise; of his grandson Oscar, chivalrous and daring; of his nephew Diarmad, handsome and brave; of his rival Goll, the one-eyed; and Conan, the villain of the band—their jealousies, dissensions, and final overthrow constitute the literature of the *Feinn*. The story goes that Ossian was carried away by his fairy hind-mother to *Eilean na h-Oige*, 'the isle of the ever young,' from whence he returned betimes; and now old, blind, and alone, 'Ossian after the *Feinn*,' he told the story of the heroes to St Patrick.

The legends of the *Feinn* are but a fragment of the heroic literature of the Gael, and in the oldest MSS. the deeds of Fionn and his companions occupy but little space. There were two earlier cycles. The first of these extended from unknown antiquity until the settlement of the Gael in Ireland. The legends of this period preserve traditions of the old divinities of the race, notably the *Tuatha de Danann*, under the guise of earlier colonists whom the Gael conquered and displaced. Several tales of this cycle are preserved, among which the Fate of the Children of Tuirenn and the Fate of the Children of Lir are the best known. The second, and by far the richest, epoch in Gaelic romance is that of Cuchullin, Connall Cearnach, Fergus, and the Sons of Uisneach. The date is about the commencement of the Christian era, when Conchobar MacNessa ruled Ulster and Queen Meave ruled Connaught. The great literary product of this period is the *Tain* or Cattle Spoil of Cuailgne, the Iliad of the Gael. Another noted Saga recounts the death of the Sons of Uisneach and suicide of the Lady Deirdre, the Darthula of James Macpherson. Eventually the legends of the *Feinn* partly absorbed and totally eclipsed the earlier traditions; so that Ossianic literature is now but another name for the heroic literature of the Gael.

These traditions have come down from the misty past in tale and ballad. They were early reduced to writing, and as time goes on we observe great development in incident and detail. In ballads preserved in the Book of Leinster (circa 1150 A.D.) Ossian is represented as old and blind, surviving father and son. A 15th-century MS. recounts the boyish exploits of Fionn. As we come down, the volume of tradition gets fuller, while cycles tend to become confused. The leader of the *Feinn* is at one time a god, at others a hero, a king, a giant, but usually a great warrior, as wise as brave. In the book of the Dun Cow his mother is Muirn 'of the Fair Neck;' in later traditions we hear of Fionn as the son of a sister of Cuchullin; at another time a Scandinavian princess is his mother. But the literary form in which the legends are preserved remains practically unchanged. A Gaelic tale is of a distinct type—narrative prose with verse interspersed. Gaelic poetry, older and later, is ever rhymed lyric verse.

To the majority of people Ossian is known through the publications of James Macpherson (q.v.). In 1760–62–63 this remarkable man published *Fingal*, an epic poem, in six books; *Temora*, another epic, in eight books; with a num-

ber of shorter pieces, epic and dramatic—all purporting to be translations of poems composed by Ossian, the son of Fingal. 'The translation,' Dr Blair is made to say in the preface to the *Fragments* printed in 1760, 'is extremely literal.' These publications, in the opinion of the most competent judges, possessed great literary merit. They brought wealth and fame to the author, and before the end of the century a translation of them appeared in nearly every European language. Encouraged by the success that attended Macpherson's venture, other publications of a somewhat similar kind followed. In 1780 Dr Smith of Campbelltown issued a volume of *Sean Dana*, or ancient poems, 'composed by Ossian, Orran, Ullin,' &c.; and in 1787 Baron Edmund de Harcourt, an Irishman in the service of the Elector Palatine, printed at Düsseldorf seventeen so-called Ossianic poems in English. The genuineness of Macpherson's *Ossian* was early called in question by Dr Johnson and others. An angry controversy followed. It was maintained that Macpherson had jumbled together persons and periods to an unwarrantable extent; that his originals, so far as he had any, were not Scottish, but Irish. If this were all that could be said one would feel justified in regarding, with Professor Windisch of Leipzig, Macpherson's *Ossian* as a legitimate development of the old traditions. For the legends of the *Feinn* are the common property of the Gael, whether in Ireland, Scotland, or Man. They are located in Scottish topography time out of mind, and within the last four hundred years quite as rich a harvest of ballad and tale has been recovered in Scotland as in Ireland. It is no doubt absurd to represent Fionn, whom Macpherson after Barbour calls Fingal, as a mighty Caledonian monarch, at one time successfully fighting the Roman legions in the 3d century, at another assisting Cuchullin, who lived in the beginning of the 1st century, to expel from Ireland the Norsemen who made their appearance for the first time in the end of the 8th. But Macpherson had warrant in genuine tradition for mixing up names and epochs. In the 'Battle of Ventry' Fionn defeats the kings of the world. According to a Gaelic tale, his father Cumhal sets up as king of Alba, and the kings of Ireland and Scandinavia combine to effect his overthrow; while the son is ever fighting Norsemen. Zimmer has propounded the theory that the whole of these *Finnsagen* are in their origin traceable to Teutonic sources, the very names by which the hero and his band are known being borrowed from the Norse. *Find*, *finn*, *Fionn* this distinguished Celtic scholar regards as a translation of *hwitr*, 'white;' while *fiann*, *feinn* are merely *fjanda*, 'foe,' later 'fiend.' Again, in genuine Gaelic ballad Fionn and Cuchullin are not directly brought together, but we find *Garbh* or the Rough, son of Starno, now fighting the latter hero, and again opposed to *Caoilte*, a distinguished companion of the former. According to some spirited verses composed in Perthshire before James Macpherson was born, the tailor of the *Feinn* passes, in the exercise of his calling, from the house of Goll to Dundalgan, the abode of Cuchullin, and back again to the palace of Fionn, without the least consciousness of anachronism.

But in Macpherson's *Ossian* there is a wide departure from genuine Gaelic literature and tradition. In his magnifying of the past, in his sympathy with nature, and in his powerful descriptions of the scenery of his own mountain-land James Macpherson is true to the genius of his people. But there he parts company with it. Gaelic literature supplies material for epics and dramas; but the epic and dramatic, as literary forms, were unknown to the people. The dim and shadowy characters of Macpherson are in sharp

contrast to the clear-cut features of the Gaelic heroes. Rarely does this author make a definite statement of fact; but when he does, as when, for example, he arms the old Gaels with bows and arrows, he blunders hopelessly. Macpherson is the most vague and abstract of writers; Gaelic poets are wearisome in detail, and revel in the concrete. In the opening of Book iii. of *Cathloda*, the author inquires regarding the origin and issue of things; but he is indebted for his answer rather to Bishop Berkeley than to the son of Fionn.

Macpherson was not a Gaelic scholar, and the fact is considered conclusive proof of his inability to compose the Gaelic text of *Ossian*. The only Gaelic printed in the author's lifetime was *Temora*, Book vii. *Ossian* was published in all the languages of Europe before he appeared in his own. And when at length the great edition of 1807 did appear, there were Gaelic texts for only one-half of the poems, and for about three-fourths of the matter published by Macpherson in English forty-five years previously. For the others, no 'original, ancient or modern, has ever yet been found. And it must be allowed that this truncated *Ossian* does not show to advantage in his native garb. The Gaelic-speaking people have never known him. There is not a single line of these Gaelic texts which can be proved to have been committed to writing before Macpherson's day. The diction is essentially modern. The loan-words are numerous, several of them borrowed from English. The idioms and constructions are colourless, and show traces of classical training rather than of the turns of phrase characteristic of native authors. The so-called blank verse in which the poems are written is unknown to Gaelic poetry. The archaic orthography of the seventh book of *Temora* was adduced by Dr Clerk of Kilmallie as proof of the antiquity of the writing. But in his frequent use of the *tenuis* (c, p, t), instead of the *mediae* (g, d, b), Macpherson merely followed Alexander Macdonald, who published his own poems twelve years previously. By the same gifted man he was led into the blunder of making *grian*, 'sun,' a masculine noun, contrary to invariable Gaelic usage, which has the sun as well as the moon of the feminine gender.

The truth seems to be that these so-called translations were essentially the compositions of James Macpherson, and that the Gaelic texts were prepared with or without aid from his friends, but how and when we do not now know. The only man who could explain things died and made no sign. One regrettable consequence of this famous episode in the history of Gaelic literature still remains. To many persons the discrediting of James Macpherson means the blotting out of existence of an extensive and interesting literature—the heroic literature of the Gael.

See the *Poems of Ossian* (1762-63); Brooke's *Reliques of Gaelic Poetry* (1789); *Ossian* (1807); *Transactions of the Ossianic Society of Dublin* (6 vols. 1854-61); *Popular Tales of the West Highlands* (1860-62); *Dean of Lismore's Book* (1862); Clerk's *Ossian* (1870); *Leabhar na Fíinne* (1872); *Folk and Hero Tales from Argyllshire* (1890); Windisch, *Irische Texte* (1880); *Ztschr. für deutsches Alt.*, vol. liii.; *Academy*, February 1891; William Sharp's Introduction to the centenary edition of *Ossian* (1896); and books noted at MACPHERSON (JAMES).

Ossification is the formation of bone. Most human bones are first represented by cartilage, which, by a complicated series of changes, becomes transformed into bone. The bones of the vault of the cranium and the face, part of the clavicle, and the 'sesamoid' bones occurring in tendons, on the other hand, are developed from fibrous tissue, without passing through a cartilaginous stage, and are distinguished as *membrane-bones*. In the

larger bones of the limbs at least three *centres of ossification* are found, one in the shaft, and one at each extremity. Growth of the bone takes place mainly at the lines between these elements, which long remain cartilaginous. Bony union becomes complete in each situation at a tolerably definite age (in some not till about twenty-five; see BONE). *True Ossification* sometimes occurs as a morbid process; but in many cases the term is incorrectly used (especially in the case of blood-vessels—see under ARTERIES) to designate a hard calcareous deposit, better called *calcification*, or *calcareous degeneration*, in which the characteristic microscopic appearances of true bone are absent. In one sense the osseous tissue that is formed in regeneration of destroyed or fractured bones (see FRACTURES) may be regarded as due to a morbid, although a restorative action. Hypertrophy of bone is by no means rare, being sometimes local, forming a protuberance on the external surface, in which case it is termed an *exostosis*; and sometimes extending over the whole bone or over several bones, giving rise to the condition known as *hyperostosis*. Again, true osseous tissue occasionally occurs in parts in which, in the normal condition, no bone existed, as in the dura mater, in the so-called permanent cartilages (as those of the larynx, ribs, &c.), in the tendons of certain muscles, and in some forms of tumours.

Ossoli. See FULLER (SARAH MARGARET).

Ossory, a diocese of the Roman Catholic Church of Ireland, embraces the county of Kilkenny and parts of King's and Queen's Counties. The bishop has his cathedral at Kilkenny. There is also an Episcopal diocese of Ossory.

Ostade, ADRIAN, painter and engraver, was born at Haarlem in December 1610, and in that city he died, 27th April 1685. His teacher was Franz Hals. Country dancing-grounds, farm-yards, stables, the interiors of rustic hovels and houses, and beer-shops are the places which he loves to paint; and his persons are for the most part coarse peasants, ugly, sordid, dirty, ragged. Vigour and close observation, with skilful management of lights, are perhaps his most noticeable characteristics; and humour and poetic appreciation are not unfrequently present. About 1639 he fell under the influence of Rembrandt's style. He was a prolific painter, and his works are to be found in the museums and collections of the Netherlands, Germany, Austria, Russia, France, and England. See works by Bode (1881) and Rosenberg (1900).—ISAAC OSTADE, brother of Adrian, also a painter, was born at Haarlem in 1621, and died at Amsterdam in 1649. Until 1644 he worked in the style of his brother, but then struck out a path for himself, and excelled in roadside scenes, winter landscapes, village street life, and similar subjects.

Ostend, a fashionable watering-place in the Belgian province of West Flanders, on the German Ocean, 77 miles by rail WNW. of Brussels. Its *Digue*, or sea-wall, 3 miles long, 40 feet high, and 35 yards broad, forms a favourite promenade, as also do the two *Estacades*, or wooden piers, projecting on both sides of the harbour's entrance. Harbour extensions were carried out in 1900-5, and other works have been found necessary. As a station for Dover and London steamers, and the terminus of various lines of railway, Ostend is a lively and active place of transport traffic (butter, rabbits, oysters, &c.), and the resort in the season (July to September) of 16,000 to 50,000 visitors from all parts of the Continent. It is, moreover, an important fishing-station, and has a good school of navigation, a monster Kursaal (1878), an hôtel-de-ville (1711), a fish-market, and a lighthouse

(1771; 175 feet). The place is now notorious for gambling facilities. Pop. 48,000. Dating from 1072, Ostend is memorable for the protracted siege by the Spaniards which it underwent from 7th July 1601 to 20th September 1604. It surrendered to the Allies in 1706, and to the French in 1745. It was held by the Germans from October 1914 to October 1918 as an outlet for submarines from Bruges. The fortifications have been demolished since 1865.—The 'Ostend Manifesto,' in American history, was a despatch forwarded to the United States government in 1854 by its ministers at the courts of Great Britain, France, and Spain, who had met here, by the government's request, to discuss the Cuban question. The despatch declared that if Spain would not sell Cuba, self-preservation required the United States to take the island by force, and prevent it from being Africanised like Hayti. Nothing, however, came of the 'manifesto.'

Ostensory. See **MONSTRANCE**.

Osteolepis (Gr., 'bone-scale'), a genus of fossil ganoid fish peculiar to the Old Red Sandstone. It is characterised by smooth rhomboidal scales, by numerous sharply-pointed teeth, and by having the first dorsal fin in front of the pelvic pair. The body is long and slender.

Osteology. See **BONE, SKELETON, &c.**

Osterode, (1) a town of Hanover, at the western base of the Harz Mountains, on the Söse, an affluent of the Leine, 30 miles by rail NW. of Nordhausen. Its church of St Giles (724; rebuilt 1578) contains the graves of the dukes of Grubenhagen, and there are also a fine town-hall, baths, large grain-stores, and cotton, woollen, and linen factories. Pop. 10,000.—(2) **OSTERODE**, in East Prussia, on the Drewenz, 77 miles NE. of Thorn, has a castle of the Teutonic knights (1270) and iron manufactures. The Germans defeated the Russians there, 31st August 1914. Pop. 15,000.

Osthoff, HERMANN (1847-1909), philologist, born in Westphalia, studied at Bonn, Tübingen, and Berlin, and became in 1877 professor of Sanskrit and Comparative Grammar at Heidelberg. He was one of the leaders of the 'new grammarians.'

Ostia, an ancient city of Latium, built at the mouth of the Tiber on its left bank, 14 miles SW. of Rome. Its origin is connected with the salt marshes (see **SALARIA VIA**), and it was said by the Romans to have been founded by Ancus Martius, but excavations have brought to light no remains earlier than the 4th century B.C. To this period belongs the nucleus out of which the city developed—a small rectangular fort, with walls of hewn stone, which probably inspired Virgil's description of the *castrum* established by Aeneas at the mouth of the Tiber; but it is not till the second Punic war that it is mentioned as the harbour of Rome. The wall of the 1st century B.C., which has been traced along its whole course, encloses a far larger area, which does not seem ever to have been greatly increased. The harbour was, however, exceedingly bad; its entrance, exposed to the south-west wind, was continually silted up, so that vessels were compelled to discharge their cargoes in the open roadstead. The Emperor Claudius, about 46 A.D., completed a large new harbour on the right bank, $2\frac{1}{2}$ miles to the north, and connected it with the Tiber by a canal. It was named *Portus Augusti*. In 103 A.D. Trajan was obliged to construct a hexagonal basin, with enormous warehouses and docks, further inland, connecting it with Claudius' canal. This to-day forms the right (navigable) arm of the Tiber; and the island between the two arms is still called *Isola Sacra*, as in Procopius' time. Notwithstanding this, the importance of Ostia continued to be great, and the

2d and 3d centuries after Christ were indeed its most prosperous period. Excavations now in progress have brought to light remains which vie with those of Pompeii for interest and for perfect preservation, and are far more solidly built, in concrete faced with brickwork and *opus reticulatum*. The main road from Rome merges into the *decumanus*, the main street of the town. This has been cleared for its full length of over half a mile down to the ancient coastline, which is some two miles behind the modern. A considerable part of it was flanked by porticoes. Along this street lie the public baths (behind which are the barracks of the *vigiles*, the police and fire-brigade) and the theatre, behind which lies a large area with a temple in the centre; this area is surrounded by colonnades, containing the offices of the various trading and shipping guilds, connected especially with Sardinia, North Africa, &c. The most conspicuous ruin is the so-called Temple of Vulcan (really the Capitolium), opposite which is the Forum with the temple of Rome and Augustus. The Basilica, Curia, and other public buildings have recently been brought to light. The area towards the river has also been cleared; it is occupied by large stores and by private houses—the latter remarkable for their complete divergence from the Pompeian type, and the surprising modernity of their planning—sometimes in blocks of flats three or four stories high, with or without a central courtyard.

In the 4th century portions of Ostia began to be abandoned; it lost some of its importance owing to the severance of it from Portus, to which trade was confined during the Gothic wars. In 313 A.D. we first hear of a bishop of Ostia, and Portus had one at about the same period. Both bishoprics still continue, and the former is held by the dean of the Sacred College of Cardinals. The ravages of pirates led to Ostia's gradual abandonment. It was fortified by Gregory IV. in 830. In the Middle Ages its remains became a quarry for the cathedral of Orvieto and other buildings. Later, owing to the silting up of the right arm of the Tiber (only reopened by Paul V.), it partly regained its importance; and in 1483-86 Pope Julius II., while yet a cardinal, erected a castle at the bend. The flood of 1557, however, changed the course of the river, and the place became malarious. An agricultural colony from Ravenna began operations in 1875; the marshes have been drained, and conditions are rapidly improving. Excavations were unsystematic until 1854, and were taken up again by the Italian government in 1880-89, and resumed in 1907 on a larger scale, on which they are still being successfully continued; while on the shore a rapidly growing seaside-resort (now reached by electric railway from Rome) has been built. See **MITHRA**.

See Ashby in *Journal of Roman Studies*, ii. (1912), 153 sqq. (with references to previous literature), and in *Year's Work in Roman Studies*, *passim* (where the official Italian reports, in the *Notizie degli Scavi* and *Monumenti dei Lincei*, are summarised); Carcopino, *Virgile et les Origines d'Ostie* (1919); Calza, *Guida di Ostia* (1925; English translation in preparation).

Ostiaks, or **OSTYAKS**, a Ural-Altaic people living along the lower course of the river Ob in western Siberia, where they struggle against chronic poverty, drunkenness, frequently famine, to get a living by fishing and hunting fur-bearing animals. They dwell in wretched and very dirty huts, eat flesh raw, use bows and arrows, and weapons of bone and stone. They are still in great part heathens, and are decreasing in numbers. Their language belongs to the Finnish division.

Ostmen, or **EASTMEN**. See **NORTHMEN**.

Ostraca. See **WRITING**.

Ostracion. See COFFER-FISH.

Ostracism, a right exercised by the people of Athens of banishing for a time any person whose services, rank, or wealth appeared to be dangerous to the liberty of his fellow-citizens, or inconsistent with their political equality. It was not a punishment for any particular crime, but rather a precautionary measure to remove such leaders as were obviously exercising a dangerous ascendancy in the state. Ostracism was introduced by Cleisthenes about the beginning of the 6th century B.C., after the expulsion of the Pisistratidæ. The people were annually asked by the Prytanes if they wished to exercise this right, and if they did a public assembly (*ecclesia*) was held, and each citizen had opportunity of depositing, in a place appointed for the purpose, a potsherd (*ostrakon*, also 'oyster-shell') or small earthen tablet, on which was written the name of the person for whose banishment he voted. Six thousand votes were necessary for the banishment of any person; but the greatest men of Athens—Miltiades, Themistocles, Aristides, Cimon, and Alcibiades—were subjected to this treatment. The banishment was at first for ten years, but the period was afterwards restricted to five. Property and civil rights or honours remained unaffected by it. Alcibiades succeeded in obtaining the final abolition of ostracism, of which, however, Plutarch and Aristotle speak as a necessary political expedient, and its utility has been very ably defended in modern times by Grote (*History of Greece*, vol. iv.).

Ostracoda. See CYPRIS, CRUSTACEA.

Ostrava, or OSTRU, two neighbouring towns of Czechoslovakia on opposite sides of the Ostrawitz, which till 1918-19 separated Moravia from Austrian Silesia. There are coal-mines and iron industries. The people are mostly Czechs. Pop. Mährisch-Ostrau or Ostrava Moravská, 42,000; Polnisch-Ostrau, 23,000.

Ostrich (*Struthio*), a genus of birds which was once included with the cassowaries, emu, rhea, and apteryx in a distinct order, the Ratitæ, but which is probably better regarded as forming a family apart. There are probably four living species: the Common or Northern Ostrich, *S. camelus*; the South African, *S. australis*; a third, *S. molybdophanes* from Somaliland and Central Africa; and *S. massaicus* from East Africa. The ostrich is the largest existing bird, reaching a height of from six to eight feet. As in the other 'struthious' birds (=Ratitæ), the wings are somewhat rudimentary and quite useless as organs of flight; but the bird spreads them out when running, and they appear to act as sails. The breast-bone or sternum has no keel—that is, no median ridge to which the great pectoral muscles in other birds are so largely attached; in the ostrich these pectoral muscles are but slightly developed, which fact is of course in relation to its small wing. The absence of the sternal keel was the chief reason which led to the association of all the struthious birds into one order, and the name of this order—Ratitæ—emphasised the character, signifying raft-like, as opposed to Carinatae or keeled. The ostrich is now confined to Africa, Arabia, and Syria, but the discovery of its fossil remains in India and elsewhere indicates that the genus formerly had a much wider range.

The ostrich shuns the presence of man, but is often to be seen in near proximity to herds of zebras, giraffes, antelopes, and other quadrupeds. It is gregarious, although the flocks of ostriches are not generally very large. It is polygamous, one male usually appropriating to himself, when he can, from two to seven females, which seem to make their nest in common, scooping a mere hole in the sand for this purpose. Each female is supposed to

lay about ten eggs. The eggs are all placed on end in the nest, which often contains a large number, whilst around it eggs are generally to be found scattered on the sand. It is said that these—

Ostrich (*Struthio camelus*).

perhaps mislaid—eggs are sometimes broken up by the parents as food for the newly hatched chicks. Selater and others have shown that the cock does most of the incubation, that he is occasionally relieved by the hens during the daytime, and that in some places the eggs are covered with sand and left to be hatched by the heat of the sun. The chicks are hatched in six or seven weeks. That the ostrich hides its head in the sand and thinks itself unseen is pure myth.

The ostrich feeds exclusively on vegetable substances, its food consisting in great part of grasses and their seeds; so that its visits are much dreaded by the cultivators of the soil in the vicinity of its haunts, a flock of ostriches soon playing terrible havoc with a field of corn. In South Africa the introduction of lucerne (from California) has produced feathers 20 to 30 per cent. higher in value. The ostrich swallows large stones, as small birds swallow grains of sand, to aid the gizzard in the trituration of the food; and in confinement it has often been known to swallow very indiscriminately whatever came in the way—pieces of iron, bricks, glass, old shoes, copper coins, &c. Its instincts do not suffice to prevent it from swallowing very unsuitable things; copper coins were fatal in one instance, and a piece of a parasol in another.

The speed of the ostrich, when it first sets out, is supposed to be not less than sixty miles an hour; but it does not seem to be capable of keeping up this speed for a long time. Twenty-five miles an hour may be considered a fair estimate of the speed at which it can travel. It is successfully hunted by men on horseback, who take advantage of its habit of running in a curve, instead of a straight line, so that the hunter knows how to proceed in order to meet it and get within shot. It is often killed in South Africa by men who envelop themselves in ostrich-skins, and, cleverly imitating the manners of the ostrich, approach it near enough for their purpose, without exciting its alarm, and sometimes kill one after another with their poisoned arrows. The strength of the ostrich is such that it can easily carry two men on its back. Its voice is deep and hollow, not easily distinguished, ex-

cept by a practised ear, from the roar of the lion; but it more frequently makes a kind of cackling, and, when enraged and striking violently at an adversary, hisses very loudly. The flesh of the ostrich is not unpalatable when it is young, but rank and tough when old. It is generally believed to have been prohibited as unclean to the Jews (Lev. xi. 16), although the name is translated *oual* in the English Bible. There are frequent references to it in the Old Testament.

The eggs of the ostrich, which are white or yellowish white in colour, are much esteemed as an article of food by the rude natives of Africa, and are acceptable even to European travellers and colonists. Each egg weighs about three pounds, and is thus equal to about two dozen ordinary hen's eggs. The egg is usually dressed by being set upright on a fire, and stirred about with a forked stick, inserted through a hole in the upper end. The thick and strong shell is applied to many uses, but particularly is much employed by the South African tribes for water-vessels. The reader will probably recollect the interesting plate in Livingstone's *Travels* of women filling ostrich-shells with water. In taking ostrich-eggs from the nest the South African is careful not to touch any with the hand, but uses a long stick to draw them out, that the birds may not detect the smell of the intruder, in which case they would forsake the nest; whilst otherwise they will return, and lay more eggs. The long plumes of the ostrich have been highly valued for ornamental purposes from very early times, and continue to be a considerable article of commerce (see below; also FEATHERS). The ostrich is often to be seen in Britain in confinement, and readily becomes quite tame and familiar, although still apt to be violent towards strangers. Great numbers were exhibited in the public spectacles by some of the Roman emperors; and the brains of many ostriches were sometimes presented in a single dish, as at the table of Helio-gabalus. See the articles CASSOWARY, EMU, RHEA; also *ÆPYORNIS*, *DINORNIS*.

OSTRICH-FARMING.—The domestication of the ostrich in South Africa, for the sake of its plumage, dates from about 1865, at which date there were 80 tame ostriches in the Cape Colony. So rapidly did the industry grow that by 1875 the number of birds was 32,000, by 1891 nearly 155,000, by 1904 over 360,000; and the Union census of 1911 recorded close upon 750,000. Speculation and a slump in prices ruined many ostrich-farmers in 1886 and the following years. Whereas in 1882 the 253,954 lb. of feathers exported were valued at £1,094,000, in 1893 the 259,933 lb. shipped oversea were declared at only £461,500. In the next two decades, however, the export figures mounted rapidly till the record year 1913, when over 1,000,000 lb. left South Africa, valued at well-nigh £3,000,000. Then the war (1914-19), combined with overproduction, the whims of fashion, and other causes, brought about another disastrous crisis in this luxury industry. The centre of the industry is the Oudtshoorn district of the Cape, in the Southern Karroo, but vast areas in all provinces of South Africa have been found suitable for ostrich-farming. Indeed, it has been proved that the ostrich will thrive and produce good plumage in almost any part of the world; farming has been carried on in regions as far apart as North Africa (Egypt, &c.) and California, Europe (e.g. Nice), Florida, East Africa, Australia, and the Argentine. South Africa, however, enjoys virtually a monopoly, and in order to retain this as far as possible has prohibited by law the export of live ostriches and eggs. The beautiful white plumes so highly prized by ladies all over the world grow in the ends of the wings of the male birds. A good bird in his prime will yield from

twenty to forty of these, besides a few black feathers also from the wings. The tail-feathers are not nearly so valuable or so beautiful. The plumes of the hen from her wing-tips are generally spotted and flecked with gray, and are called 'feminines.' From 120 to 130 good feathers go to a pound: they are always thus sold by weight. An ostrich yields on an average from 18 to 21 ounces per annum. The 'plucking-box' is a solid wooden box, in which the ostrich has only room to stand. The feathers are cut before the quills are quite ripe; the stumps remain for a month or two, and are then easily pulled out. Formerly the feathers used to be pulled out by the roots. The first crop of good feathers is clipped at seven or eight months; this is repeated at intervals till the birds take to breeding, after which (unless incubators are used) it is not desirable to deprive them of their feathers, as they require them to cover the eggs on the nest. The bird's plumage has reached perfection when three years old, and at four years the birds have reached maturity. The legs are easily broken. Adult birds are hardy, but chicks are rather delicate, being subject to many parasitic diseases. In the early days ostriches were allowed to roam at large in vast fenced camps of bushveld, hundreds—even thousands—of acres in extent, ten acres or more being allowed per bird. Soon, however, the Hon. Arthur Douglass introduced artificial incubation, and this naturally led on to selective breeding and new methods of rearing, feeding, and clipping, closer supervision being rendered possible by the subdivision of camps and the provision (with the aid of irrigation) of lucerne and other pasturage for hand-feeding purposes. For poorer-grade feathers the old system is still used to some extent. Scientific methods have unquestionably improved the average quality, but it is doubtful if the best feathers of stud-book ostriches are finer than those yielded by the original wild birds. Wild chicks are often added to flocks, especially in the Transvaal and British East Africa. In 'boom' times feathers have sold at as much as £100 per lb., and prize birds, even chicks, have fetched hundreds of pounds.

See books by Mosenthal and Harting (1876), Douglass (1881), Mrs Martin (1890); papers by Prof. Duerden.

Ostrog, a town in Volhynia, just within the 1921 frontier of Poland, 176 miles W. of Kieff; pop. 16,000, mostly Jews.

Ostrogoths. See **GOTHS**.

Ostrovsky, ALEXANDER NIKOLAIEVICH (1823-86), a Russian dramatist, of sombre biting humour, merciless realism, and special knowledge of the merchant class, was born at Moscow, and directed a theatre there. Tschaikowsky used some of his plays as libretti.

Ostuni, a city of South Italy, 22 miles NW. of Brindisi by rail; pop. 25,000.

Ostwald, WILHELM, a great German chemist born at Riga, 2d September 1853, studied at Dorpat, was professor of Chemistry at Leipzig 1887-1906, and director of the physico-chemical institute there. He was awarded a Nobel prize in 1909. Besides books on chemistry, he wrote on monism. See *Life by Walden* (1904).

Osuna, a town of Spain, 66 miles by rail ESE. of Seville; pop. 16,000.

Oswald, ST, king of Northumbria, was the son of the conquering Ethelfrith of Bernicia and of Acha, sister of the brave Edwin of Deira. He fought his way to the throne by the defeat, at Heavenfield near Hexham (635), of Cædwalla the Welsh king who had aided Penda to crush Edwin at Hatfield two years before. Under the reign of Edwin he had found shelter in Scotland, and been converted to Christianity at Hii or Iona; and now, when he

was hailed king by the whole of Northumberland, he established Christianity with the help of St Aidan, who settled on Holy Island. Oswald was acknowledged as over-lord by all the kingdoms save those subject to Penda. He fell fighting against the enemy at Maserfield (Oswestry) in 642.

Oswego, a port of entry and capital of Oswego county, New York, is situated at the mouth of Oswego River (here crossed by three bridges), on Lake Ontario, at the extremity of the Oswego Canal (to Syracuse, 35 miles by rail). It is a handsome city, with wide streets, a United States government building, court-house, city-hall, state armoury, state normal school, &c. It is the principal port on the lake, and carries on a brisk trade in grain, lumber, coal, &c. The river falls 34 feet, and gives abundant water-power. There are foundries, machine shops, oil, match, cotton, woollen and other manufactures. Pop. 24,000.

Oswego Tea, a name given to several species of Monarda, particularly *M. fistulosa* and *M. didyma*, natives of North America, because of the occasional use of an infusion of the dried leaves as a beverage. They belong to the Labiatae, somewhat resemble mints in appearance, and have an agreeable odour. The two species named are not uncommonly cultivated in gardens for ornament.

Oswestry, a thriving market-town and municipal borough (1397) of Shropshire, 18 miles NW. of Shrewsbury. It has an old parish church, restored in 1872; a fragment of the Norman castle of Walter Fitzalan, progenitor of the royal Stewarts; and a 15th-century grammar-school, rebuilt in 1810 and enlarged in 1863-78. Railway workshops were established in 1865. Oswestry derives its name from St Oswald (q.v.), who was slain there. In 1644 it was taken by the parliamentarians. Pop. 10,000.

Oswini, Oswin, kings of Northumbria (q.v.).

Osymandyas, the name of a great king of Egypt, mentioned by Diodorus and Strabo, who reigned, according to these authors, as the 27th successor of Sesostris. He is said to have distinguished himself by his victories, to have invaded Asia with an army of 400,000 men and 20,000 cavalry, and to have conquered the Bactrians, who had been rendered tributary to Egypt by Sesostris. In honour of this exploit he is said by Hecataeus to have erected a monument which was at once a palace and a tomb, and which, under the name of *Osymandeion*, was renowned for its size and splendour in later times. The *Osymandeion* is generally believed to be represented by the extant ruins of the Ramesseum at Medinet Habu (see THEBES), though great difficulty has been felt in reconciling the descriptions of its magnificence in ancient writers with the dimensions of the existing relic. *Osymandyas* was perhaps another name for *Rameses II.*

Otago, the most southerly provincial district of New Zealand, in the South Island. It was one of the original six provinces in the colony, but since 1876 these have been abolished and the county system has been adopted. The name is said to be derived from the Maori *Otakou*, 'red earth.' It was colonised in 1848 by the Otago Association connected with the Free Church of Scotland. It is bounded on the N. by Canterbury and Westland, and on the E. and W. by the sea. It has a coastline of 400 miles, is 160 miles long by 195 broad, and has an area of over 16,000,000 acres, of which 9 millions, chiefly in the centre and in the east, are fit for agriculture. Pop. 290,000. Gold was discovered in 1861, and now the goldfields comprise an area of 2½ millions of acres. Dunedin (q.v.) is the capital. See NEW ZEALAND.

Otaheite. See TAHITI.

Otalgia (Gr. *ous*, *ōtos*, 'ear,' and *algos*, 'pain') is neuralgia of the ear. See EAR.

Otaru, a seaport of Japan, 22 miles W. of Sapporo, exports timber, sulphur, &c.; pop. 100,000.

Otary (*Otarion*), a genus of the Seal family (Phocidae). See SEA-LION.

Otchakoff, a seaport of Ukraine, stands on the north shore of the estuary of the Dnieper, 38 miles ENE. of Odessa. It occupies the site of the ancient *Alector*, and has beside it the ruins of the once important Greek colony of Olbia. In 1492 the khan of the Crimea built here a strong fortress, which was taken by the Russians under Münnich in 1737, recovered in 1738, and again captured after a long siege by Potemkin in 1788, and annexed by Russia. After it had been bombarded by the Allied fleet in 1855 the Russians demolished the fortifications. Pop. 15,000.

Othman, or **Osman I.**, surnamed *Al-ghazi* ('the conqueror'), the founder of the Ottoman (Turkish) power, was born in Bithynia in 1259, and, on the overthrow of the sultanate of Iconium in 1299 by the Mongols, seized upon a portion of Bithynia. Then he forced the passes of Olympus, took possession of the territory of Nicæa, except the town of that name, and gradually subdued a great part of Asia Minor, and so became the founder of the Turkish empire, from his name called Ottoman or Osmanli. See TURKEY.

Othman, third khalif. See KHALIF.

Otho, MARCUS SALVIUS, Roman emperor for the first three months of 69 A.D., was descended from an ancient Etruscan family, and was born in 32 A.D. He was a favourite companion of Nero, who sent him as governor to Lusitania for his refusal to divorce his beautiful wife, Poppæa Sabina. Here he remained ten years, and ruled with wisdom and moderation. He joined Galba in his revolt against Nero (68), but, disappointed in his hope of being proclaimed Galba's successor, marched at the head of a small band of soldiers to the forum, where he was proclaimed emperor, and Galba was slain. Otho was recognised as emperor over all the Roman possessions, with the exception of Germany, where a large army was stationed under Vitellius, which at once began to march on Italy under the command of the lieutenants Valens and Cæcina. Otho showed vigour in his preparations, but his forces were completely defeated after an obstinately fought battle near Bedriacum. Next day, though things were still far from desperate, Otho set his house in order, and then stabbed himself, 16th April 69.

Otho I., or OTTO THE GREAT, son of the Emperor Henry I. of Germany, was born in 912, and was, on the death of his father in 936, formally crowned king of the Germans. His reign was one succession of eventful and generally triumphant wars, in the course of which he brought many turbulent tribes under subjection, acquired and maintained almost supreme power in Italy, where he imposed laws with equal success on the kings of Lombardy and the popes at Rome, consolidated the disjointed power of the German emperors, and established Christianity at many different points in the Scandinavian and Slavonic lands, which lay beyond the circuit of his own jurisdiction. He died in 973.

Otis, JAMES, American statesman, was born at West Barnstable, Massachusetts, 5th February 1725, graduated at Harvard in 1743, practised law, and became a leader of the Boston bar. He was advocate-general in 1760, when the revenue officers demanded his assistance in obtaining from the superior court general search-warrants allowing them to enter any man's house in quest of smuggled

goods. Otis, however, refused, resigned his position, and appeared for the people; and his speech, which took five hours in delivery, produced a great impression—John Adams afterwards declared that 'the child Independence was then and there born.' When the writs were granted, by the direction of the home authorities, in 1761, Otis was elected to the Massachusetts assembly; and he afterwards was prominent in firm resistance to the revenue acts. In 1769 he was savagely beaten by some revenue officers and others, and as a result of a sword-cut on the head he lost his reason. On 23d May 1783 he was killed by lightning. The publication on which his fame chiefly rests is *The Rights of the Colonies Asserted and Proved* (1764), a powerful and fearless defence of their right to control their own public expenditure. See the *Life* by W. Tudor (Boston, 1823).

Otitis, inflammation of the tympanic cavity of the ear. See EAR.

Otley, an urban district in the West Riding of Yorkshire, on the banks of the Wharfe, and at the north base of Otley Chevin (925 feet), 10 miles NW. of Leeds. Its church, restored in 1868-69, is mainly Perpendicular, but has fragments of Saxon and Norman work; and there are also a court-house (1875), a mechanics' institute (1869), and a grammar-school (1603; new buildings 1925). The making of printing-machines (see PRINTING) is the principal industry, with worsted and leather manufactures. Pop. 10,000 (before extension of boundaries).

Otocorys. See LARK.

Otocyon. See DOG.

Otoliths. See EAR, FISHES.

Otorrhœa, a purulent or muco-purulent discharge from the external ear. See EAR.

Otranto (the ancient *Hydruntum*), a town in the extreme south-east of Italy, 29 miles by rail SE. of Lecce, and on the Strait of Otranto, 45 miles from the coast of Albania on the opposite side. During the later period of the Roman empire, and all through the middle ages, it was the chief port of Italy on the Adriatic, whence passengers took ship for Greece—having in this respect supplanted the famous Brundisium of earlier times; but its port is now in decay. In 1480 it was taken by the Turks. At the present day its castle, which gives the title of Horace Walpole's well-known story, is in the same condition as its port. The town is the seat of an archbishop, and has a cathedral, restored after the siege by the Turks, with fine mosaics and an ancient crypt. Pop. 3000. In the province of Lecce (formerly called Terra di Otranto) many Albanians have long been settled. For the Duke of Otranto, see FOUCHÉ.

Ottava Rima, an Italian stanza of eight lines rhymed *abababcc*. Each line has eleven syllables; in its English form ten.

Ottawa, one of the largest rivers of British North America, rises nearly 300 miles due north of Ottawa city, flows west to Lake Temiscamingue, some 300 miles, and thence 400 miles south-east, and falls into the St Lawrence by two mouths, which form the island of Montreal. Its drainage basin has an area variously estimated at from 60,000 to 80,000 sq. m. During its course it sometimes contracts to 40 or 50 yards; elsewhere it widens into numerous lakes of considerable size. It is fed by many important tributaries, the chief of which are the Petawawa, Bonnechère, Madawaska, and Rideau on the right, and the Coulonge, Gatineau, and Rivières du Lièvre and du Nord on the left side. These, with the Ottawa itself, form the means of transit for perhaps the largest lumber

trade in the world. The passage of timber over falls and rapids has been greatly facilitated by the construction of dams and slides. See next article.

Ottawa, the capital of the Dominion of Canada, is situated upon the south bank of the Ottawa River, 120 miles from its influx into the St Lawrence at Montreal. The river Ottawa drains a vast stretch of country as far north-west as Lake Nipissing and beyond; all the lumber-products of this district, as well as all the local trade, are carried down to Ottawa, to the point at which the river forms the splendid Chaudière Falls (200 yards wide and 40 feet high). These falls, above which a suspension bridge spans the river, supply the motive-power for the numerous lumber-mills, flour-mills, factories, &c. To the east of the city the river Rideau forms a second fall, which, although inferior to the Chaudière, supplies further motive-power. The Rideau Canal, which was made in 1827-36, passes through the centre of the city, and affords connection with the Rideau Lakes, and so with the great lakes beyond. Opposite the city, to the north-east, the Gatineau River joins the Ottawa and affords further lumbering facilities. A few miles to the east, the Du Lièvre River opens up a rich phosphate country, which is being much worked. The industries of Ottawa are varied, and number among them some of the largest in the world, the lumber industry and its by-products, including pulp, paper, paper-bags, fibre-ware, and matches, being among the foremost. Other important manufactures include iron wares, furniture, pianos, cement, carbide, plaster, bricks, tiles, leather goods, electric cars, carriages, wagons, &c.

The Italian Gothic parliamentary buildings, 1860-66, were burned down in February 1916, and new buildings were erected in 1916-20 on the same site, a noble bluff on the bank of the Ottawa. The handsome library building escaped. The residence of the governor-general—an old-fashioned, picturesque building, called Rideau Hall—is about a mile off. The city hall, post-office, banks, and other public buildings are of stone, and, like many of the churches, are architecturally imposing. Ottawa is the place of residence of the Anglican bishop of Ontario and of the Roman Catholic bishop of Ottawa. The university of Ottawa is conducted by the Oblate Fathers. There are, besides, other important educational institutions. There are several public and private hospitals. Besides the rivers and canal already mentioned, Ottawa is the centre for the great railways of the Dominion and the New York Central from Cornwall on the United States border. Ottawa is governed by a mayor, board of control, and city council. The city was begun in the last years of the 18th century by a settler named Wright, of Boston, Mass., who built himself a residence near the Chaudière, and called the village he founded on the north side of the Ottawa Hull (q.v.). The southern bank lots on which Ottawa now stands were sold to one Sparks, who took them reluctantly in payment for labour. In 1823 Colonel By was sent by the British government to survey the Rideau Canal, the construction of which (1827) stimulated the settlement, which was called Bytown. In 1854 its name was changed to Ottawa, and the town was created a city. In 1861 the population was 15,000; in 1881, 27,412; in 1901, 59,920; in 1911, 87,063; in 1921, 107,843. In 1858 Ottawa was chosen as administrative capital of Canada. The first parliament met there in 1865.

Ottawa is the official seat of the governor-general, also of the Federal government. It has a national Victoria museum, geological museum, national art gallery, royal observatory, a parliamentary library, city public library, royal mint;

Canada experimental farm (467 acres), thirty miles of the most beautiful drive-way in North America, 2000 acres of park lands. Many beautiful summer resorts are in the district. Ottawa is the centre of one of the greatest water-power districts in the world.

Ottawa, (1) in Illinois, at the confluence of the Fox and Illinois rivers, 70 miles WSW. of Chicago, has a mineral spring rich in bromine and iodine, glass-furnaces, and manufactures of flour, tiles, &c. (pop. 11,000); (2) in Franklin county, Kansas, on the Osage River, 50 miles SW. of Kansas City, has a Baptist college, railway-shops, and manufactures of flour, furniture, iron, and soap (pop. 9000).

Otter (*Lutra lutra* or *L. vulgaris*), a carnivore of the order Mustelidae, which includes stoat and badger. The genus *Lutra* is represented by about ten species, widely distributed, and the Common Otter ranges over the whole of Europe and a large

Fig. 1.—Otter (*Lutra vulgaris*).

part of Asia. It still holds its own in Great Britain, notably in the Lake District and in the rocky parts of Somerset, Devon, and Monmouthshire. In some regions, as on the west coast of Ireland, it frequents the shore, and may swim well out to sea. It must not be confused with its very rare relative, the Sea-otter (*Enhydra lutris* or *Lutax*), which is confined to the shores of North Pacific, and has been seen swimming fifteen miles from land.

The Common Otter has a lithe, low-set body, about two feet in length, with sixteen more inches to the powerful tail, which is slightly flattened from above downwards. It often weighs a pound for each foot of body-length, but magnificent specimens of about forty pounds have been recorded. The general colouring is rufous brown, lighter below; and the dense under-fur is covered with long coarse hairs, which are 'plucked' when the skin is prepared for the market. Among the otter's adaptations to its secondarily acquired semi-aquatic habits may be mentioned the webbed feet, which still retain strong claws, the rudder-like tail, the reduction of the appressed ear-trumpets, the closeable nostrils, and the highly developed musculature, which is well suited for diving and for tortuous swimming after fishes. The hind-legs are of most importance in swimming.

The otter is characteristically a fish-eater, but its persistence is partly due to its long bill of fare. When one kind of food is not available, it can turn to another. It depends in the main on eels, trout, salmon, pike, and flat-fish, but it condescends to the mussels on the seashore (biting through their shells), the limpets on the rocks, and the frogs in the marsh; it rises to wild-duck and rabbit. Its severest trial in its inland haunts is when the lakes are frozen, but even then it shows its characteristic resourcefulness in swimming underneath the

ice, returning successfully to the hole where it entered.

Another characteristic of the otter is its nomadism. As Izaak Walton said, the 'fish-beast will walk upon land sometimes five or six or ten miles in a night.' Mr Tregarthen calls it 'the homeless hunter,' 'the Bedouin of the wild,' and says that 'it has been known to travel fifteen miles in a night, and not infrequently the holt where it lies up during the day are ten or twelve miles apart.' It passes from tarn to stream, from river to shore; it swims far out to sea and reaches isolated rocks; it wanders along the cliffs and explores the caves; it crosses the heather-covered hills, and even the mountain passes, sheltering for the day among the bracken or in the heart of a cairn; it neither stores nor hibernates, but is always on the move—a gipsy among carnivores. It is plain that this restlessness of habit must be of considerable survival-value. Of course the otters are stationary during the breeding-season.

The otter lives more or less alone, except at the pairing-time, and a favourite site for the 'holt' is underneath the excavated bank of the river, or among the root-fastnesses of a big tree. There are hints of monogamy, and there are sometimes fierce fights between two rival dog-otters. Early in the year, sometimes in January, sometimes about March, the female brings forth three to five cubs in the soft-lined nest. They are blind for towards two months. When they open their eyes, the mother takes them out into the sunshine, and begins to instruct them very definitely in the ways of life. Thus she teaches them to swim and dive, and it is of interest to note that the cubs do not at first take very kindly either to the water or to a diet of fish. They are very playful creatures, and both parents sometimes find it impossible to resist the appeal of situations that suggest a frolic. It is indeed a remarkable fact in regard to the otter that playfulness never quite leaves it. There is

Fig. 2.—Sea-otter (*Enhydra lutris*).

considerable longevity, even for over a dozen years; but although there may be signs of senescence in eyes and hairs, there is never any trace of senility.

Fossilised remains of the otter occur in later Tertiary deposits in England, so the animal is one of the oldest vertebrate inhabitants of the British Isles. The question rises: How it holds its own in a country that, apart from sport (!), is anything but friendly. The otter is abundantly strong; it has keen senses of sight, hearing, touch, and smell; it has almost no natural enemies; it is one of the most elusive of mammals, in great part nocturnal in its habits, shy of repeating itself, shifty in its hunting, and very thoroughly amphibious. We have referred to the catholicity of its appetite and to its roving habits, but enough has not been said of its resourcefulness. It is equally at home on land and in water; it can enter the water without

a splash and swim near the surface with scarce a ripple; it can dive in a spiral full fathoms five, and lie under the bank on a stream for hours with its nostrils in a space between water and earth. It knows its own footsteps in the thicket and will not retrace them; it never goes back to a kill, for that way danger lies; it will carry a water-trap on its shoulders and wrench it off among the alder-roots; it will dive at the flash of the gun and elude the bullet; it is an outlaw of unsurpassed alertness and resource. But it seems certain that the survival of the otter depends in great part on the intense parental, especially maternal, care, and on what has been proved by Mr Tregarthen and others, that the mother gives the cubs a detailed education in movements, in food-catching, in food-eating, in lying low, and in the long alphabet of danger-sounds, especially those proceeding from man and dog. It is of biological importance to realise that the prolonged youth and the detailed parental instruction must count for much in the otter's survival in a country like Britain.

Otter-hunting in Britain is practised in the early morning and with special hounds, bold, hardy, and rough-coated, nearly two feet high at the shoulder. The huntsmen's use of a barbed spear has almost come to an end. The seamy side of the sport is exposed in Joseph Collinson's *Hunted Otter*, but it is not necessarily very cruel; and it must be remembered that the ægis of sport has saved the otter from being exterminated in Britain for the sake of its fur. The best book on this interesting animal is J. C. Tregarthen's *Life Story of the Otter* (London, 1915).

Otterburn, a small village in Redesdale, Northumberland, about 16 miles south of the Border, and 32 miles from Newcastle, on the benty uplands a little to the west of which was fought, during the moonlit night of 19th August 1388, what Froissart calls 'the hardest and most obstinate battle that was ever fought.' Of a Scottish army of 50,000 men which had mustered on the Border, the greater part invaded England by Carlisle, while 2000 foot and 300 lances under the Earls of Douglas, Dunbar, and Moray, remained to carry fire and sword through Northumberland and Durham. On the march back, laden with spoil, they lay three days before Newcastle, and in one of the frequent passages of arms that occurred Douglas carried away Hotspur's pennon, and declared that he would plant it on his castle of Dalkeith. 'By God, Earl of Douglas,' said Hotspur, 'you shall not even bear it out of Northumberland.' The Scots marched up Redesdale, and, after failing in an attempt on Otterburn Tower, by the desire of Douglas entrenched themselves on a hill slope near, the exact site of which is somewhat uncertain, in order to give Percy an opportunity of coming to claim his pennon. The chivalrous Hotspur hastened after them with 600 horse and over 8000 foot, and came up while the Scots were at supper, whereupon a desperate hand-to-hand fight at once began. Douglas was greatly overmatched in numbers, and, seeing his men forced back, grasped his ponderous mace in both hands and hewed a way before him until he was borne down mortally wounded by three spear-thrusts. To some of his kinsmen anxiously asking how he did, Hume of Godscroft tells us the dying hero made answer, 'I do well, dying as my predecessors have done before; not in a bed of languishing sickness, but in the field. These things I require of you as my last petitions: first that ye keep my death close both from our own folk and from the enemy; then that ye suffer not my standard to be lost, or cast down; and last, that ye avenge my death, and bury me at Melrose with my father. If I could hope for these things, I should die with

the greater contentment; for long since I heard a prophecy that a dead man should win a field, and I hope in God it shall be I.' Towards morning the Scots gained a complete victory, losing 300 men, while the English lost 1880, and among the prisoners both Hotspur and his brother Ralph. The Scottish ballad of 'Otterburn' is almost as historical as Froissart's glowing narrative; the English 'Ballad of Chevy Chase' is a glorious effort of the imagination, which still stirs a modern reader, as it did Sir Philip Sidney, more than the blast of a trumpet. See Robert White's monograph, *History of the Battle of Otterburn* (1857).

Ottery St Mary, a town of Devonshire, on the river Otter, 11 miles (15 by rail) E. of Exeter. Twice the scene of a great conflagration, in 1767 and 1866, it retains its magnificent collegiate church, a reduced copy of the cathedral of Exeter (q.v.), with the only other transeptal towers in England. Begun about 1260 by Bishop Bronescombe, it is Early English, Decorated, and Perpendicular in style, and was restored by Butterfield in 1849-50. The old King's Grammar-school was demolished in 1884. Alexander Barclay was a priest here; Coleridge (q.v.) was a native; and 'Clavering' in *Pendennis* is Ottery St Mary, the Devonshire residence of Thackeray's stepfather. Silk shoe-laces, handkerchiefs, and Honiton lace are manufactured. Pop. 3500.

Otto of Bavaria (1815-67) was chosen king of Greece in 1832, and deposed in 1862. See GREECE. For the Emperor Otto I., see OTHO; for Otto of Saxony, see ITALY (*History*).

Otto, or **Attar**, of **Roses** is the volatile oil or otto of the petals of some species of rose, obtained by aqueous distillation, and highly prized as a perfume. It is a nearly colourless or light-yellow crystalline solid at temperatures below 80° F., liquefying a little above that temperature. It is imported from the East, where in the Balkan Peninsula, Syria, Persia, and India roses are cultivated to a considerable extent for its sake. It is probable that the oriental otto is the produce of more than one species of Rose (q.v.); it is uncertain what species is cultivated in some of the localities most celebrated for it, but *Rosa damascena* is known to be so employed in the north of India, and a kind of otto is sometimes obtained by the makers of rose-water from *Rosa centifolia* in Europe. Ghazipur, near Benares, is celebrated for its rose-gardens, which surround the town, and are in reality fields occupied by rows of low rose-bushes, extending over 160 acres. Kashmir is noted for its extensive manufacture of otto, as are also the neighbourhoods of Shiraz and Damascus. Kazanlik is the centre of the rose-growing district in the Balkans, which is 40 miles long; *Rosa moschata* affords the chief supply. The gathering is commenced on the third year, and is carried on chiefly in May and June. About 7200 lb. of petals are required to produce 2½ lb. of otto, or about the gathering of 2½ acres. The manufacture is practised much more scientifically and profitably in parts of France and of Germany. Otto is said to have been first procured by what may be called an accidental distillation of rose-petals exposed with water to the heat of the sun, and to have been found floating on the surface of the water; it is still sometimes obtained in India by such a process. During the distillation of rose-petals a small quantity of a solid volatile oil comes over, which crystallises and floats on the water in the receiver; this is sometimes called *English Oil of Roses*. The odour of otto itself is too powerful to be altogether pleasant, and frequently gives headache. Otto of roses is a mixture of two volatile or essential oils; the one solid at ordinary temperatures, and the other liquid. The

solid oil of roses (rose camphor, stearopten of oil of roses) possesses of itself very little odour. The liquid oil of roses (eleopten of oil of roses) is a very fragrant liquid. The otto of roses may be regarded as a solution of one part of the solid oil in two parts of the liquid.

Ottoman Empire. See **TURKEY**.

Ottrelite, a silicate of alumina with protoxides of iron and manganese and water. It occurs in the form of thin hexagonal plates or tables in certain more or less metamorphosed slates, which are hence termed *Ottrelite-slate*.

Ottumwa, capital of Wapello county, Iowa, on both sides of the Des Moines River, 75 miles by rail W. by N. of Burlington, in the heart of the state's bituminous coalfields. The residence portion extends along the high bluffs. A number of railways meet here. Extensive dams concentrate the river's water-power for numerous industries. Ottumwa has large pork and beef packing works and a normal school. Pop. 23,000.

Otway, THOMAS, one of the greatest masters of English tragedy, of whose life, says Dr Johnson, 'little is known, nor is there any part of that little which his biographer can take pleasure in relating.' He was born at Trotton in Sussex, March 3, 1652, son of the rector of Woolbeding in that county, and entered Christ Church, Oxford, as a gentleman-commoner in 1669. He was a brilliant and impulsive youth—'charming his face was, charming was his verse,' says Dryden, but his life throughout was darkened by the shadow of misfortune. He made a wretched failure as an actor in Aphra Behn's *Forc'd Marriage* in 1671, declined the church, and left the university without a degree in 1672, and next year obtained a cornetcy in a troop of horse. A year later he was settled in London, and had a tame and conventional tragedy, *Alcibiades*, accepted at the Duke's Theatre, which was managed first by Davenant, then by Betterton. In it the beautiful Mrs Barry made her first appearance, and with her the hapless poet quickly fell in love. In 1676 Betterton accepted *Don Carlos*, a good tragedy in rhyme, nervous and full of pathos, dedicated to the Duke of York. Its plot, like that of his greatest play, he owed to the Abbé St-Réal. The year after Otway translated Racine's *Titus and Berenice*, as well as Molière's *Cheats of Scapin*. The intrigue between Rochester and Mrs Barry now became more than he could bear, and through the influence of the Earl of Plymouth, a college friend, and one of the king's bastards, he received a cornet's commission again, and went a-soldiering to Flanders. It proved a complete fiasco, and he soon came back to his infatuation, miserable and unpaid, a butt for Rochester in his poor and spiteful *Session of the Poets*. In 1678 he had produced a poor comedy, *Friendship in Fashion*; in 1679 another, *The Soldier's Fortune*, full of touches of autobiographic detail. He was ever improvident and dissipated, and his affairs by this time had become desperate, but the death of his rival in 1680 seems to have nerved him to make a brave effort to shake off his burden of debt. That year yielded two tragedies, and his one important poem, *The Poet's Complaint of his Muse*, a rough, but firmly drawn satirical portrait of himself and his principal enemies, Rochester, Shadwell, and Settle. Of the plays, the first was *The Orphan*, a tragedy in blank verse, marred by many faults in plot besides its radical indelicacy, but stamped throughout with power and sovereign pathos, over whose central figure, Monimia, Sir Walter Scott said he believed more tears had been shed than over any other stage-heroine. The other was *The History and Fall of Caius Marius*, confessedly a kind of cento from Shakespeare's *Romeo and Juliet*, with touches from

Julius Caesar. The year 1682 saw his greatest work, *Venice Preserved, or a Plot Discovered*, a noble masterpiece of tragic passion, admirably constructed, its heroine Belvidera a delightful creation of almost the highest order of dramatic genius. The only blot upon its perfection is the comic passages, which Taine alone among critics finds Shakespearian. Otway's mistress was now at the height of her fame, and in the parts of Monimia and Belvidera had taken the town by storm. Six letters of his to her are extant, written apparently about 1682, which tell us the touching story of his faith and of her cruelty, how she played with his passion for seven years, and at last broke his heart. From this time he sinks out of sight, drowned in dissipation, debt, and misery. He reappears again in 1684 with *The Atheist*, a feeble comedy, and, on the death of Charles II. in February 1685, with *Windsor Castle*, a poem addressed to the new king. But his claims were neglected, and he wore out the ruins of his wasted life in abject misery in a sponging-house or tavern on Tower Hill. Here he died, April 14, 1685, choked, it is said, after a long fast, with a piece of bread, which he had rushed in the eagerness of hunger to buy with a guinea given him by a passing stranger from whom he had begged a shilling.

In 1719 a badly edited tragedy, *Heroick Friendship*, was published as his, and Sir Edmund Gosse thinks that, imperfect as the execution is, the plot and ideas are characteristic of Otway. Otway owed much to Corneille, and was long popular in France, despite the severe and unjust judgment of Voltaire. His life recalls the tragic history of Marlowe, just as his greatest play reminds a reader of *Othello*. Strong without bombast, its exquisite love-scenes between Jaffier and Belvidera tender without weakness, 'it is simply,' says Sir Edmund Gosse, 'the greatest tragic drama between Shakespeare and Shelley. Out of the dead waste of the Restoration, with all its bustling talent and vain show, this one solitary work of supreme genius arose unexpected and unimitated.'

See Thornton's editions of the *Works* (3 vols. 1813); Roden Noel's of the 'best plays' ('Mernaid Series,' 1888); McClumpha's of the two great tragedies (1909); Johnson's *Lives*; Ward's *History of English Dramatic Literature* (vol. ii. 1875); Gosse's excellent essay in *Seventeenth Century Studies* (1883).

Ouabain is a crystalline glucoside separated from the wood and roots of *Carissa Schimperi*, a plant growing on the east coast of Africa. It is intensely poisonous, a twelfth of a grain being sufficient to kill a rabbit. It acts upon the heart in the same way that digitalis does, and has been employed in medicine as a substitute for digitalis, and also to lessen the violence of the paroxysms in whooping-cough. The Somalis make an extract of the wood and roots for an arrow-poison.

Oubliette (Fr., 'place of forgetfulness'), a dungeon in which persons condemned to perpetual imprisonment were confined—especially a perfectly dark underground dungeon—into which the prisoners were let down from above by ropes.

Oudenarde (*Audenarde*), a town of Belgium, on the Scheldt, 37 miles W. of Brussels. It has a fine flamboyant Gothic town-hall (1535) and two interesting churches. Margaret of Parma was born here. Pop. 7000. In 1706 Oudenarde was taken by Marlborough; and an attempt made by the French to retake it brought on the famous battle of Oudenarde, the third of Marlborough's four great victories, which was gained, on the 11th July 1708, with the aid of Prince Eugene, over a French army under the Duke of Burgundy and Marshal Villars.

Oudh, or AWADH, a great plain sloping southward to the Ganges and watered by the Gumti, Gogra, and Rapti rivers, was made a British commissionership in 1858, and from 1877 was administered by the lieutenant-governor of the North-west Provinces; but since 1901 the latter term is disused, the two areas being jointly known as the United Provinces of Agra and Oudh. In 1921 the United Provinces were placed under a governor, with an executive council and ministers. Area, 24,000 sq. m. Pop. (1881) 11,387,741; (1911) 12,558,004; (1921) 12,166,642. The bulk of the inhabitants are Hindus, though the dominant native race for centuries has been Mohammedan. The Brahmans are the most numerous class, about one-eighth of the whole population. The principal towns are Lucknow (the capital), Faizabad, Bahraich, Shahabad, Rai Bareilly, Ajodhya. Oudh is believed to have been one of the oldest seats of Aryan civilisation in India. After being the centre of a long native Hindu dynasty it was subjugated by the ruler of Kanauj, and in 1194 was made subject to the Mussulman empire of Delhi. In 1732-43 it became virtually an independent state, and the dynasty of the Nawabs lasted until the annexation of the province by the British in 1856. During the Mutiny of 1857 Oudh was one of the centres of rebellion and the scene of highly dramatic events.—The city of Oudh or AJODHYA has been treated of under the second title.

Oudinot, CHARLES NICOLAS, Duke of Reggio and Marshal of France, was born at Bar-le-Duc, Meuse, 25th April 1767. At the age of seventeen he entered the army, and in the revolutionary wars distinguished himself in various actions with the Prussians and Austrians. In 1805 he obtained the Grand Cross of the Legion of Honour, and about the same time received the command of ten battalions of the reserve, afterwards famous as the 'grenadiers Oudinot.' At the head of this corps he did good service in the Austrian campaign. He was present at Austerlitz and Jena, gained the battle of Ostrolenka (16th February 1807), and greatly contributed to the success of the French at Friedland. He sustained his now brilliant reputation in the second Austrian campaign of 1809, and was created Marshal of France and Duke of Reggio. In 1810 he was charged with the occupation of Holland, was engaged in the disastrous Russian campaign, and subsequently took part in the various battles of 1813 between the French and the Russians and Austrians. He was one of the last to abandon Napoleon, but he did so for ever, and spent the period known as the 'Hundred Days' on his own estates. At the second restoration he became a minister of state, commander-in-chief of the royal guard and of the national guard, and was created a peer of France, Grand Cross of St Louis, &c. In 1823 he commanded the first division of the army of Spain, and was for some time governor of Madrid. After the revolution of July 1830 Oudinot retired to his estates; but Louis-Philippe in 1842 appointed him governor of the Invalides. He died at Paris, 13th September 1847. See his *Life* by Nollet (Paris, 1850).—His son, CHARLES NICOLAS-VICTOR OUDINOT, Duke of Reggio (1791-1863), was a general in the French army. He first distinguished himself in Algeria, and was general of the French expedition against Rome in 1849.

Ouida, the pseudonym of LOUISE RAMÉ, or DE LA RAMÉE, who was born 1st January 1839, her father being French, her mother English. By 1861 she was in London writing industriously for the magazines; after 1874 her home was at Florence or Lucca, and there she produced most of her fifty novels, not to speak of dramatic sketches and

stories for children. She died (in poverty) on the 26th January 1908. Her stories have verve and go; she often attains to the picturesque, is at times powerful as well as tender, and created one or two attractive characters. But, though she could envelop in glamour her handsome rakes and women with a past, her characters are conventional, her ideals unwholesome, and her style without distinction. See *Memoir* by Miss Elizabeth Lee (1914).

Oulachan. See CANDLE-FISH.

Ouless, WALTER WILLIAM, portrait painter, was born 21st September 1848, at St Helier, Jersey. He began to study art in London in 1864; four years later first exhibited at the Academy; and became an A.R.A. 1877, an R.A. in 1881. Of his portraits perhaps that of Darwin is most generally known on account of the very fine etching from it by Rajon. Mr Ouless never paints a commonplace portrait; his work is sober and manly. His portraits of Justice Manisty and Cardinal Newman are fine examples of his different methods.

Oulu, Finnish name of Uleåborg (q.v.).

Ounce (Lat. *uncia*), the twelfth part of the *as* or *libra* (pound), or indeed the twelfth part of any magnitude, whether of length, surface, or capacity. Hence *inch*, the twelfth part of a foot. In Troy weight the ounce is divided into 480 grains, and 12 ounces make a pound; the ounce in Avoirdupois weight contains 437½ grains Troy, and 16 of them go to the pound.

Ounce (*Felis uncia*), a feline carnivore like the leopard, but with lighter, longer fur, and with a skull unusually broad for one of the Felidae. It frequents the mountains of central Asia. It may also be noted that a somewhat similar title, *Felis onca*, belongs to the jaguar.

Oundle, a small but ancient and pleasant town of Northamptonshire, 13 miles SW. of Peterborough by rail, has an old church, partly Early English and partly Decorated in style, restored in 1864. Here St Wilfrid died. Laxton's Grammar-school dates from 1550. Lace is made here. Pop. 3000.

Ourari. See CURARI.

Ouro Preto ('Black Gold'), former capital of Minas Geraes, Brazil, stands among barren mountains, 3780 feet above sea-level, and 200 miles N. by W. of Rio de Janeiro. It contains several handsome official buildings, but consists mainly of narrow and irregular streets. The gold-mining is now reduced to comparatively unprofitable washings. Pop. 10,000.

Ouse, a river of Yorkshire, formed by the union of the Swale and the Ure in the immediate vicinity of the village of Boroughbridge, and flowing south-eastward past York, Selby, and Goole. About 8 miles below the last town it joins the Trent, and forms the estuary of the Humber (q.v.). The length of its course from Boroughbridge is 60 miles, for the last 45 of which (from York) it is navigable for large vessels. Its principal affluents are the Wharfe and the Aire from the west, and the Derwent from the north-east. The basin of the Ouse, or the Vale of York, commences about the northern boundary of the county near the river Tees, from whose basin it is separated by a low ridge of hills, and extends southward, including almost the whole of Yorkshire (q.v.).—The GREAT OUSE, rising close to Brackley, in the south of Northamptonshire, flows north-eastward through the counties of Buckingham, Bedford, Huntingdon, Cambridge, and Norfolk, till it falls into the Wash, 2½ miles below Lynn. It is 160 miles in entire length, and is navigable for about 50 miles. It receives the Ivel, Cam, Lark, and Little Ouse.

Useley, SIR FREDERICK ARTHUR GORE, musician, was born on 12th August 1825, and at nineteen succeeded his father, Sir Gore Useley (1770-1844), the celebrated Orientalist and first baronet. He graduated at Christ Church, Oxford, and took orders, his first curacy being at St Paul's, Knightsbridge. In 1855 he followed Henry Bishop as professor of Music at Oxford, and in 1856 became vicar of St Michael's, Tenbury. He had an immense knowledge of music, extending from St Ambrose to Wagner. His mastery of the literature of music is seen in his edition of Neumann's *History of Music*, and his treatises on harmony have taken their place as standard works. He was an accomplished linguist, and collected a magnificent library. His oratorios *St Polycarp* and *Hagar* are too solid and severe to be popular, but will always command respect. Haver-gal's *Memorials of F. A. G. Useley*, published after his death in 1889, is a collection of contemporary opinions pronouncing him a perfect gentleman, a skilled musician, and a churchman who devoted the whole of his fortune to building and endowing St Michael's College, Tenbury, for the training of chorists. See Life by Joyce (1896).

Outcrop, in Geology, the name given to the edges of strata as they appear or crop out at the surface. The same term is applied to the line along which a mineral vein or lode comes to the surface—although other terms, such as 'outgoing,' 'back,' are also employed by miners.

Outlawry, in English law, means putting one out of the protection of the law, for contempt in wilfully avoiding execution of legal process. Formerly, in the common law courts, if the defender would not enter an appearance certain proceedings were taken to outlaw him, so as to allow the action to go on without his appearance. These proceedings, however, were abolished in 1879, and, in the majority of cases, it is immaterial as regards the action whether the defendant appear or not, provided he was properly served with the original writ of summons. After judgment a defendant against whom a *capias* was granted might be outlawed if the sheriff failed to find him. These forms of process are now obsolete. In criminal proceedings it is still possible to outlaw a person who cannot be found and arrested. But a criminal who flies the country may now, as a general rule, be made amenable to justice by applying to a foreign government for his Extradition (q.v.). Outlawry therefore is practically obsolete. See Stephen's *Criminal Procedure*. The effect of outlawry was that a man forfeited his rights, and was precluded from suing or defending in any English court; but the outlawry might be reversed by means of a plea or of proceedings in Error (q.v.).

Outram, SIR JAMES, the 'Bayard of India,' was born 29th January 1803, at Butterley Hall, Derbyshire, the residence of his father, Benjamin Outram (1764-1805), a well-known engineer. His mother in 1810 removed with her five children to Aberdeen, where and at Udney James was educated. After one session at Marischal College, in 1819 he received an Indian cadetship, and became lieutenant and adjutant in the Bombay native infantry. Between 1825 and 1835 (in which latter year he married his cousin, Margaret Anderson) he successfully organised a corps of the wild Bhils; from 1835 to 1838 he was political agent to the Mahi Kantha district in Gujrat. In 1839 he attended Sir John Keane as aide-de-camp into Afghanistan (q.v.); and his eight days' ride of 355 miles, disguised as an Afghan merchant, from Kelat, through the perilous Bolan Pass, to the sea, will long be famous in eastern annals. Appointed in 1840 political agent in Sind, he distinguished himself by his heroic defence of

the British Residency at Hyderabad against 8000 Beluchis (15th February 1843), as also by his manly opposition to what he deemed Sir Charles Napier's aggressive policy towards the Ameer. He was afterwards resident at Satara and Baroda, and in 1854, on the eve of the annexation of Oudh, was selected by Lord Dalhousie for the highest political office in India—the Residency of Lucknow. In 1857, after a third brief furlough to Europe, he commanded the Persian expedition—a short, brilliant campaign, whose objects triumphantly attained, he returned to India a G.C.B. (he had been knighted sixteen months before). When he landed in July the Mutiny was raging; and Lord Canning tendered him the command of the forces advancing to the relief of Lucknow. He chivalrously waived that glory in favour of his old lieutenant, Havelock (q.v.), who already had fought eight victorious battles with the rebels; and accompanied him only as chief-commissioner of Oudh, whilst tendering his military services as a volunteer. Lucknow (q.v.) was relieved, and Outram took the command, but only to be in turn himself besieged. He held the Alum-bagh against almost overwhelming odds, until Sir Colin Campbell advanced to his relief. He then made a skilful movement up the left bank of the Gumti, which led to a final and complete victory. For his services he was in 1858 promoted to the rank of lieutenant-general, thanked by parliament, and created a baronet. He took his seat as a member of the Supreme Council at Calcutta, but in 1860 had to return to England, already stricken by the hand of death. He spent the winter of 1861-62 in Egypt, and, after a short stay in the south of France, died at Paris, 11th March 1863.

Ouzel, or OUSEL (O.E. *ōsle*; cf. Germ. *amsel*), an old name of the blackbird (as in *Midsummer Night's Dream*). But it is also applied to other birds. Thus, one British thrush (*Turdus torquatus*) is called the Ring Ouzel, and the Dipper (q.v.) is very generally known as the Water Ouzel.

Ovamos, or OVAMBO; also called Otjiherero, an industrious and peaceable Bantu people of the west coast of Africa, inhabiting the country south of the Cunene. Ovampoland extends from Damara-land northward to the Portuguese frontier. Some 50 miles from the coast the country rises into a lofty tableland, which is moderately fertile, and then declines to the south and east into the deserts of the Kalahari and the region of Lake Ngami.

Ovariectomy. The treatment of ovarian disease by the removal of the offending organ is one of the triumphs of 19th-century surgery. Formerly relief in cystomata was only obtained temporarily by tapping—i.e. withdrawing some of the fluid by means of a trocar and canula. But the tumour almost always filled again, and, though tapping might be repeated time after time, the patient ultimately succumbed. Now the abdominal wall is laid open, the tumour emptied as much as possible of its contents, the collapsed sac drawn through the incision, its neck secured by ligature or otherwise, the mass cut away, the stump returned to the abdomen, and the wound carefully closed by stitches.

Towards the middle of the 19th century the operation was performed by a few surgeons, under

the protest of the great majority of the medical profession; now it takes its place as a routine operation, demanded in any suitable case, and performed with results as regards the saving of life and restoration to health, together with an immunity from risk, which can be claimed by no other major operation. The operation for extirpation of ovarian cystoma was first performed by Ephraim M'Dowell of Kentucky in 1809, but was established in England as a regular operation by Charles Clay of Manchester, who operated on his first case in 1842. Clay operated on nearly 400 cases with 69 per cent. of recoveries. Since then the operation has been performed many thousands of times, and the mortality has been reduced to a figure which renders the operation, while always one of the gravest, yet, in competent hands, one of the safest in surgery. To this result the labours in Britain of Spencer Wells, Thomas Keith, and Lawson Tait have mainly contributed. With the best operators the mortality at this moment is probably less than 5 per cent., and some have had series of over 100 cases without a death. This result has been ascribed to various causes, such as the mode of treating the pedicle, or stump, the use of antiseptics, &c., but is probably most due to the experience acquired in dealing with the various complications and difficulties arising in the operation.

Within more recent years the removal of the ovaries and Fallopian tubes for other than cystic disease has come to be recognised as a regular operation, and is now frequently performed. When the ovary is removed for conditions other than acystic tumour the operation is usually known as 'oophorectomy.' Such conditions are severe inflammation of the ovary, pregnancy occurring outside the uterus, and the development of a solid tumour in the ovary.

Ovary. The ovaries in the female are analogous to the testes in the male, and are two oblong flattened bodies (about an inch and a half in length, three-quarters of an inch in width, and nearly half an inch thick in the human subject), situated on either side of the uterus, to which they are connected by ligaments and by the Fallopian tube. The ovary is composed of two well-defined portions, a superficial or 'cortical' portion, and a deep or 'medullary' portion. The whole is enclosed in a tough fibrous coating, which is, however, closely blended with the cortical portion, and cannot be stripped off. It is termed the *tunica albuginea*. The medullary portion is highly vascular, and of a reddish colour. The cortical portion in the adult ovary contains an enormous number of vesicles, varying greatly in size. These are the *Graafian follicles*, and contain the ova or germs—the female element of reproduction. Their number is estimated at 30,000. From ten to twenty large and more or less mature vesicles are found near the surface, to which they gradually approach as they become developed. The structure of these ovisacs and their contained ova is somewhat complex, and cannot be described here. More or less coincident with menstruation is the process of *ovulation*, by which is meant the rupture of the wall of Graafian follicle, and the escape of the contained ovum. On its escape from the ovary the ovum enters the end of the Fallopian tube, by which it is conveyed into the uterus.

The ovary is the subject of several diseased conditions. (1) It is the seat of acute and chronic

inflammation. This may arise from injuries during labour, operations in the pelvis, but very frequently is the result of gonorrhoeal infection, spreading from the vagina. Such inflammations cause great organic changes in the structure, often leading to sterility, and they are usually associated with severe pain, frequently so intense as to unfit the subject for all active duty. (2) The ovary is the seat of new growths, which may be of several varieties. Some represent enlargements of one or more Graafian follicles, and attain an enormous size, sometimes weighing 100 lb. or more. They contain fluid which is usually of a viscid, ropy nature, and brownish colour, but sometimes presents other characters. They are known as *ovarian cysts*. Other tumours are of a more or less solid nature, and contain portions of hair, teeth, bone, &c., and are known as *dermoid tumours*. Moreover, the ovaries may become the seat of cancerous disease as well as of various forms of simple tumour. See OVARIOTOMY.

Ovary, in Botany, the part of the Pistil (q.v.) containing the Ovule (q.v.). See FLOWER, FRUIT, SEED.

Ovation. See TRIUMPH.

Oven.—The old type of baker's oven, still very largely used, is a low arched chamber either of brick with a tile or stone sole, or built entirely of stone. A common size of sole is 11 feet 6 inches by 9 feet 6 inches (some are smaller), with sides 18

Bailey-Baker Oven—Longitudinal Section :

A, furnace bars; B, main flue; C, air chamber; D, door of oven; E, E, doors of furnace.

inches high, from which the crown or arch springs. The door is in front, and the dough is put in with a long wooden spade called a 'peel.' In one class of these ovens the fireplace or furnace is placed in the front corner, with an opening admitting the products of combustion directly into the oven, while there is an exit flue on the other side. This furnace is fired from the bakehouse; coke or coal is used for fuel, and any smoke is mostly cleared away during the heating up of the oven. Sometimes the plan of having a fixed fire within the oven itself is adopted, and another way is to have a movable iron furnace, called a chaffer, which can be shifted from place to place, so as to heat the oven evenly. For this inside firing wood is the best fuel. Picrite, quarried near Bathgate and elsewhere, makes a better and more durable sole than tiles or bricks.

Many newer forms of ovens have been introduced; the Bailey-Baker, though not the newest, may serve as an illustration, and is shown in longi-

tudinal section in the annexed figure. The furnace is placed below the oven sole, and the heated gases pass, by flues, entirely round the oven without actually entering it, if it is to be worked solely by external heat. But by openings, regulated by valves or dampers, they can be led into the oven, and so heat it internally. The construction of the oven is such that, even when it is worked in the latter way, fragments of fuel rarely get inside, so that comparatively little cleaning is necessary, and baking can go on continuously with the exception of the time required to fill and discharge the oven.

Some ovens are heated with hermetically-sealed iron pipes containing water, which is converted by heat into superheated steam (see STEAM). The pipes are placed inside the oven, but a portion, or portions of them, project through its back wall into a furnace. Perkins was the originator of this method of heating. The delay due to the use of a peel is avoided by having a draw-plate, or movable sole, fixed on wheels, so that it can be drawn out in front of the oven and loaded or unloaded very quickly. With such ovens there is little time required for raising the heat between the batches. Another way of heating ovens is by gas-burners. Ovens for army use in barracks or the field are generally arranged so as to be serviceable for cooking meat, roasting potatoes, coffee, &c., as well as baking bread. In those for the field portability is a main essential. For biscuit ovens, see BISCUITS. Coke-ovens are described under COKE.

Oven-bird, a genus (*Furnarius*) and subfamily (Furnariinae) of Passerine birds, family Dendrocolaptidae. The name is given because some of the species build nests resembling an oven or beehive. The genus, which consists of nine species, is exclusively South American, ranging from Guiana and Ecuador to La Plata. The habits of these birds have been described chiefly by Mr Edward Bartlett, and by Darwin in his *Voyage of the Beagle*. The name oven-bird is also applied, for a similar reason, to the willow-wren (*Phylloscopus trochilus*).

Overbeck, JOHANN FRIEDRICH, painter, was born at Lübeck, 4th July 1789, and commenced his art studies at Vienna in 1806 as a pupil of the pseudo-classical school of David; but, having adopted notions on art essentially different from those inculcated in the academy, he was expelled along with some like-minded friends, and in 1809 set out for Rome. His principle was to abjure the classical Renaissance and its sensuousness, and to 'abide by the Bible.' In Rome he was joined by Cornelius, Schadow, Schnorr, and Veit; and these five laid the foundation of a school that influenced the taste for art in Europe, though they were scoffed at as 'Pre-Raphaelites,' 'Nazaries,' 'Church-Romantic painters,' and had long to struggle with poverty. A picture of the Madonna, which Overbeck painted in 1811, brought him into marked notice. He was next employed by the Prussian consul, Bartholdy, to execute for his house at Rome frescoes illustrating the history of Joseph, the 'Selling of Joseph' and the 'Seven Lean Years' being the subjects assigned to Overbeck. After completing these he painted in fresco, in the villa of the Marchese Massimo, five large compositions from Tasso's *Jerusalem Delivered*. In 1813 he abjured Lutheranism, and embraced the Roman Catholic religion. Overbeck's chief work is a fresco at Assisi, 'The Vision of St Francis.' His oil-pictures are inferior to his frescoes, being dry and weak in colour. Among his famous pictures are 'Christ's Entry into Jerusalem,' at Lübeck; 'Christ's Agony in the Garden,' at Hamburg; 'Lo Spozalizio,' at Berlin; 'The Triumph of Religion

in the Arts,' at Frankfort; the 'Incredulity of St Thomas,' in London. He executed a great many drawings and cartoons remarkable for devotional feeling, most of which, like his frescoes and paintings, have been engraved. One of his last undertakings was a series of designs from the Evangelists, delicately engraved in the line manner. Amongst the characteristics of the school are devout feeling, hardness of outline, scholastic composition, and the avoidance of merely sensuous beauty both in colour and form. Overbeck died at Rome on 12th November 1869. See Life by J. B. Atkinson (1882), in 'Great Artists' series.

Overbury, SIR THOMAS, was born in 1581 at Compton-Scorpion, in Ilmington parish, Warwickshire, his father being squire of Bourton-on-the-Hill in Gloucestershire. After three years at Queen's College, Oxford (1595-98), he studied awhile at the Middle Temple, and travelled then on the Continent, returning an accomplished gentleman. In 1601 at Edinburgh he met Robert Carr, then page to the Earl of Dunbar, and the minion afterwards of James I., who knighted him in 1607, and in 1611 made him Viscount Rochester. The two became inseparable friends, and Overbury himself was, through Carr's influence, knighted in 1608, the year before his second visit to France and the Netherlands. Meanwhile, in 1606, the lovely but profligate Frances Howard (1592-1632) had married the third Earl of Essex (q.v.), and during his two years' absence had intrigued with more than one lover—Carr the most favoured. Overbury had played pander to their guilty intercourse; but Carr now telling him that he purposed to get Lady Essex divorced from her husband, and then to marry her, he strongly deprecated the idea, declaring she might do for a mistress but not for a wife. Carr informed Lady Essex what Overbury had said of her; she became furious for revenge, and offered Sir Davy Wood (between whom and Sir Thomas there was a standing feud) £1000 to assassinate him—an offer prudently declined, except under royal assurance of pardon. So on 21st April 1613 Overbury, on a most trivial and illegal pretext—his contemptuous refusal to go on an embassy—was thrown into the Tower, where on 15th September he was poisoned. Three months later Carr (just created Earl of Somerset) and his paramour were married with great pomp, and the whole affair was soon to appearance forgotten. But in the autumn of 1615, after Villiers had largely supplanted Somerset, an enquiry was instituted, and four of the humbler instruments were promptly hanged—among these Mistress Anne Turner in her starched yellow ruff. In May 1616 the countess pleaded guilty, and the earl was found guilty; but by an amazing stretch of the royal prerogative they were pardoned. In 1622 they were even released from the Tower; and Somerset survived till 1645.

Overbury's works, all published posthumously, include *The Wife* (1614), a didactic poem; *Characters* (1614; partly by others), whose conceits are not lacking in epigrammatic point; and *Crumms fall'n from King James's Table* (1715; doubtful). They were collected with Life by Rimbault (1856). See also Andrew Amos, *The Great Over of Poisoning* (1846); Whibley's *Essays in Biography* (1913); Judge Parry, *The Overbury Mystery* (1925); and works cited at JAMES L. BACON, and COKE.

Over Darwen. See DARWEN.

Overland Route to the East is now understood to be that from England across France to Marseilles, or (by the Mont Cenis tunnel) to Brindisi, thence through the Levant, the Suez Canal, Red Sea, and Indian Ocean. This makes the journey to India only about half as long as the voyage round by the Cape of Good Hope. In 1838

a monthly service was started to carry the mails across Egypt; but to Lieutenant Waghorn (1800-50) belongs the credit of first showing how the voyage from India could be still further shortened. On 31st October 1845 he arrived in London with the Bombay mail of the 1st October (*via* Austria, Bavaria, Prussia, and Belgium). The railway from Suez to Alexandria by Cairo was opened in 1858; but the Suez Canal in 1869 rendered the Overland Route available for passengers generally. Marseilles has superseded Brindisi for passenger traffic. See also EUPHRATES.

Overlap, in Geology. When the upper beds of a conformable series of strata extend beyond the bottom beds of the same series, the former are said to overlap the latter. Hence strata showing this structure constitute an *overlap*.

Overman, or SUPERMAN (Ger. *übermensch*), a higher type to be evolved from man. See NIETZSCHE.

Overseers. See PARISH, POOR-LAWS.

Overstone, SAMUEL JONES LOYD, BARON, an economist and financier, was born in London, 25th September 1796, being the only son of Mr Lewis Loyd, descended from a respectable Welsh family, and a leading partner in an eminent banking-house. From Eton he passed to Trinity College, Cambridge. On leaving Cambridge Loyd entered his father's banking-house, afterwards merged in the London and Westminster Bank. He entered parliament in 1819 as Whig member for Hythe, which he continued to represent till 1826, and in 1850 was raised to the peerage by the title of Baron Overstone and Fotheringhay. The first of Lord Overstone's famous tracts on the management of the Bank of England and the state of the currency was published in 1837, and was followed by others between that period and 1857. The proposal for making a complete separation between the banking and issue departments of the Bank of England, introduced by Peel into the Act of 1844, was first brought forward in these tracts. Lord Overstone was currently believed to have been worth £6,000,000 or £8,000,000, but after his death, without male issue living, on 17th November 1883, his personal estate was sworn under £2,118,803. He zealously opposed the principle of limited liability, and the introduction of the decimal system.

Overture (Fr. *ouverture*) was originally an instrumental prelude to an opera, oratorio, &c. It first received definite form from the composer Lully (q.v.), whose pattern was followed by most succeeding writers, including Handel, up to the time of Gluck and Mozart. The somewhat different Italian form, styled *Sinfonia*, was developed by Scarlatti. Modern overtures almost defy classification. Two leading styles may be indicated—the *medley* form, in which various melodies from the succeeding opera are interwoven, and the finest examples of which are by Weber and Wagner; and the independent concert overture, usually in the form of a first movement of a sonata, without repeat, of which Mendelssohn's are the type. Mozart's *Magic Flute* overture is a triumph of constructive skill, combining the forms of sonata and fugue. Beethoven's *Leonora No. 3* is considered the greatest of all; while foreshadowing the events and music of the opera, it has an individual form of its own, as has also his *Egmont* overture. Operas—e.g. Wagner's—now often begin with a short *Introduction* or *Prelude*, leading without break into the first scene.

Overijssel, a province of the Netherlands, lying on the east side of the Zuider Zee, and separated from Guelderland on the south by the river Yssel. Area, 1291 sq. m.; population, 450,000.

Rich meadows cover almost one-third; moors are extensive; the province is well intersected by canals. The chief cities are Zwolle, Deventer, and Kampen.

Ovid (PUBLIUS OVIDIUS NASO), born March 20, 43 B.C., at Sulmo, the present Solmona, in the Abruzzi, was the younger of two sons, both of whom were brought early to Rome by their father, a well-to-do *eques*, who placed them under the most famous rhetoricians of the day, to be trained for the bar. His brother Lucius died in his twentieth year, and Publius, in spite of extraordinary forensic aptitude, gave up his whole time and energies to poetry. He filled, indeed, a few legal posts, but soon abandoned them, and, like other young Romans of his class, repaired to Athens, whence he crossed to Asia Minor, and on the return journey lingered a while in Sicily. While still a youth he married, but almost immediately separated from his wife, only to take another, with whom he lived scarcely more happily. By her he had a daughter, Perilla, herself a poetess. He married yet again, and this, his third wife, Fabia, gained and returned his best affections, and, unlike her two predecessors, survived him. His life at his country-seat, among congenial friends and in correspondence with the most distinguished of his contemporaries, was an enviable one. Messala Corvinus, a highly cultured poet, exercised on his rapidly developing powers a salutary influence, reinforced by that of the younger Macer, author of the *Ante-Homerica* and *Post-Homerica*, of Propertius, the epic poet Ponticus, and others. He had no acquaintance personally with Tibullus or Virgil, both of whom died 19 B.C.

His first literary success was his tragedy *Medea*, of which Quintilian had a high opinion. Then came his *Epistolæ* or *Heroides*, imaginary love-letters from ladies of the heroic foretime to their lords: but in his next publication he touched the sphere he has made peculiarly his own—his *Amores*, so called from their subject-matter. Here he had Gallus, Tibullus, and Propertius for exemplars, and in wit and wayward fancy, less often in soul and passion, he excelled them all. His *Medicamina Faciei* (a practical poem on artificial aids to personal beauty) seems to have been preliminary to his true master-work, the *Ars Amandi*, or *Ars Amatoria*, in three books, which appeared about 1 B.C., followed by a subsidiary book entitled *Remedia Amoris*—the former teaching how to win and preserve the love of woman, the latter how to relieve the rebuffs and disappointments encountered in the attempt. These publications close the first period of the poet's activity: the second opens with the *Metamorphoses*, in fifteen books, and with the *Fasti*, designed to be in twelve, of which six only were completed. The *Metamorphoses*, according to Bernhardt, surpasses all that antiquity has to show in brilliant and felicitous metrical narration. The *Fasti*, a contemporary work, forms in elegiac distichs a poetic commentary on the calendar, wherein the origin of Roman feast-days, divinities, and religious observances is set forth. Midway in its composition he was banished (8 A.D.); but shortly before he died he worked at a revised version of it in order to dedicate it, thus recast, to Germanicus—the original having been inscribed to Augustus. But he did not carry out this project. As it stands the *Fasti* seeks to ennoble the policy of Augustus, and, by revivifying their forgotten religious ceremonies, to re-awaken in the Roman people the sentiment out of which these ceremonies sprung.

Posterity has failed to fathom the true ground of Ovid's banishment—the poet himself refraining studiously from all but the vaguest allusions to it. He admits that he deserved to be so punished, but he also declares that he was more the witness than

the author of the offence. Whether he was concerned in some intrigue of the licentious Julia, or in one of the many scandals connected with Agrippa Postumus, will never be cleared up. Nothing could move Augustus to a reprieve of the sentence; so in the late autumn, 9 A.D., he left Rome, as 'relegatus, non exul,' for Tomi, on the Euxine (close to the present Constantza). There, at the outskirts of Roman civilisation, severed from wife, daughter, relatives, and friends, with only the nomadic Scythians for neighbours, he languished out the last years of his life. Tiberius remained as deaf to his appeals for mercy as Augustus, and there he died in 17 A.D. This period constitutes the third of his poetic activity—in which his genius, bereft of its gaiety, responds to his invocation only in the minor notes of melancholy. Already on his last journey from Rome he began the elegies which he published in five books, by name the *Tristia*. Similar in tone and theme are the four books of the *Epistolæ ex Ponto*, differing only in this from the *Tristia* that they are addressed to a particular friend in Rome—a step he did not venture on in the composition of the latter. His *Ibis*, written in imitation of Callimachus, in which he invokes destruction on an enemy unknown, and his *Hali-eutica*, a poem, extant only in fragments, on the fish of the Euxine, complete the list of his remains.

In mastery of metrical form and in creative fecundity Ovid outsoars all the poets of the Augustan cycle. From his youth up he was so favourably circumstanced that he passed quickly through the successive stages of his development till he reached the highest perfection of which he was capable. The struggle between the new poetry and the old had issued in the subjection of the latter, and he entered immediately on the inheritance prepared for him by others. This he carried to its culmination, in finish as in form. He stands at the limit of the Augustan without by a hair's breadth encroaching on the Silver age. The poetic circle in which he lived, the *beau monde* of Rome in which he moved, the favour of the court in which he basked, all contributed to mould his genius and stamp its products with the hall-mark of 'society.' In that world he has always been a favourite, contriving as he did to combine learning with lightness of touch, force with finish, variety with order. He knew the *vie intime* of the contemporary world, in its real as in its conventional forms, and he could sweep the collective chords of human passion, from love to hate, with the assured boldness of a master. He is the most voluminous of Latin poets, and in this characteristic may be found the cause of his chief defects—his self-repetition, his too frequent echoings of former felicities, the monotony of his cadences, particularly in the elegiac distich. In this metre, where the thought rarely overflows the two-line limit, he has developed a sententiousness in which Quintilian traces his forensic education.

There are old translations of the *Metamorphoses* by Golding (1565), Sandys (1632), and Garth (q.v.); and an admirable one by King (1871). Complete editions are by Merkel (1853), Riese (1872-74), and Magnus (1914).

Oviedo, the capital of the Spanish province of Oviedo, 14 miles SSW. of Gijón on the Bay of Biscay. Standing in a plain between the rivers Nalón and Nora, and sheltered to the north by a hill 470 feet high, it has four main streets, branching off from a central square, and possesses a cathedral, a university (1604), a theatre, a botanic garden, a fine aqueduct, &c. The cruciform cathedral, dating from 781, but mainly rebuilt between 1388 and 1528, is a noble specimen of richly ornamented Gothic, with a tower of 284 feet high, the

remains of fourteen early kings and queens of Asturias, many much-prized relics, and a fine old library. In or near the city there are several ancient Romanesque churches. Linens, woollens, hats, and firearms are manufactured; whilst in the neighbourhood are many ironworks, and at Prutia (12 miles W.) a government foundry. Population, 70,000. Oviedo (ancient *Asturum Lucus* or *Ovetum*) now gives its name to the old province of Asturias; it was known during the middle ages as *Civitas Episcoporum*, because many of the Spanish prelates, dispossessed of their sees by the Moors, took refuge there. It was twice plundered by the French of its ecclesiastical and other treasures, in 1809 and 1810.—The province is a rugged mountainous country, seamed with deep valleys and chasms, between the Cantabrian range and the Bay of Biscay. Like the Galicians, the people are hardy mountaineers and fishermen. Area, 4200 sq. m.; pop. 744,000.

Oviedo y Valdes, GONZALO FERNANDEZ DE, born at Madrid in 1478, was sent by Ferdinand to St Domingo, in the West Indies, in 1514, as inspector-general of the gold-mines, and subsequently was appointed historiographer of the Indies. After his return to Spain he published a history thereof (1526). Of a second edition (21 vols. 1535) an English translation was made by Eden in 1555; a complete edition of the entire work appeared at Madrid in 4 vols. 1851-55. Oviedo died at Valladolid in 1557. He likewise wrote *Las Quincuagenas*, a valuable gossiping account of the principal personages of Spain in his time.

Oviparous is an objectionable term applied to the great majority of female animals, whose eggs are first laid and then hatched. *Ovoviviparous* is a corresponding term applied to animals in which the eggs are hatched within the body of the mother, and where there is no nutritive connection between parent and offspring. Some reptiles, amphibians, fishes, &c. which do not lay their eggs illustrate this mode of parturition. In regard to the terms oviparous and ovoviviparous it should be noted (1) that all animals are in one sense viviparous, for whatever is born is normally alive; (2) that 'viviparous' animals *par excellence*—viz. the placental mammals—differ from 'ovoviviparous' animals, such as the brown lizard (*Zootoca vivipara*), the blindworm, the black salamander (*Salamandra atra*), one of the blennies (*Zoarces viviparus*), and many invertebrates which bring forth already hatched young, not so much in the manner of birth as in the relation between mother and offspring before birth; (3) that oviparous and viviparous parturition often occur in the same class—witness the oviparous Monotremes among mammals; (4) that oviparous and ovoviviparous parturition often occur in nearly related forms among reptiles, fishes, amphibians, and invertebrates—that they even occur in the same animal: e.g. the grass-snake (*Tropidonotus natrix*), which usually lays eggs, but may in artificial conditions bear already hatched young; or some aphides in which the parthenogenetic generations are usually born as young insects, while the fertilised eggs are laid as such. In short, the distinctions are for the most part differences of degree.

Ovoca. See AVOCA.

Ovule, a little egg; in Botany the rudimentary seed. It needs to be fertilised by the pollen tube before it can develop and grow into the seed. The ovule has a complicated structure which can only be properly understood by comparing it with the corresponding parts of the lower plants known as the Vascular Cryptogams. In the common Ferns (q.v.), when a spore is sown a small green plant, the prothallium, grows from it; this bears male and

female organs called antheridia and archegonia. A male sperm from an antheridium fertilises the egg-cell of an archegonium, and a plant which we call the fern grows from it. In other plants called heterosporous ferns, because the differentiation has been carried further back in the life-history, and the spores, and prothallia, are of two kinds, the archegonium-bearing prothallium grows inside its spore-case, bursting it, but not leaving it. In Conifers the prothallium is still more reduced, is surrounded by a mass of tissue called the nucellus, and also by an 'integument.' In ordinary flowering plants the history of the ovule is as follows: On a special leaf called a carpel a mass of tissue grows called the nucellus; this becomes covered in by two integuments which grow up from its base, but leave an opening at the top called the micropyle. A cell near the top of the nucellus represents the mother-cell of the female spore of the vascular cryptogams. It divides into two and then into four; one of these becomes the female spore; it is called the embryo-sac because the embryo will be formed within it. The male spores of the vascular cryptogams are represented by the pollen grains contained in special leaves called stamens; a pollen grain being placed on a part of the ovary sends out a tube which enters the micropyle. The nucleus of the embryo-sac now divides into two, one daughter-nucleus travels to each end of the sac; it there divides into two, then into four, daughter-nuclei. One of these from each end travels back to the centre of the sac; they fuse and form the secondary nucleus of the sac. The three remaining nuclei at the end near the micropyle are supposed to represent three archegonia; the three at the other end are supposed to represent the rest of the prothallus. Only one of the three archegonia—the inner one, called the oosphere—will develop into the embryo if fertilised; the other two merely aid in that process. Fertilisation is effected by the pollen tube entering by the micropyle and touching one of the outer archegonia, which then breaks up and becomes attached to the oosphere; this is now called oospore, and grows into the embryo, while the secondary nucleus of the embryo-sac by repeated division gives rise to a tissue which fills up the embryo-sac, called endosperm, rich in food materials upon which the embryo feeds. The embryo-sac at the same time grows, displacing the tissue of the nucellus. This is a generalised description. There are variations in the different orders of flowering plants. See CHALAZA.

Ovum, or EGG-CELL, the female germ-cell or gamete, whose union with the sperm-cell (male gamete) forms the zygote, the first stage of the young plant's or animal's existence. See EMBRYOLOGY, HEREDITY, REPRODUCTION, SEX, and also such articles as FERNS, MOSSES, as well as OVULE.

Owain ap Gruffydd, prince of Gwynedd or North Wales, fiercely resisted Henry II., but ultimately submitted, and died in 1169.—For another (Owain Glyndwr), see GLENDOWER.

Owen, JOHN, epigrammatist, was born at Llanarmon, in Carnarvonshire, in 1560, and had his education at Winchester and New College, Oxford, where he became a Fellow in 1584. He was afterwards a schoolmaster at Warwick, died in 1622, and was buried in St Paul's Cathedral. He had a great reputation in his day as a writer of Latin verse, and as the 'British Martial' his fame as an epigrammatist was widely spread also on the Continent. His robust Protestantism sharpened into stinging wit placed his book on the *Roman Index* in 1654. Three books of the *Epigrammata* appeared in 1606; additions were made in later editions.

The best edition is that by Renouard (Paris, 2 vols. 1795). An English translation was published as early as 1619. See EPIGRAMS.

Owen, JOHN, a great Puritan divine, was born at the vicarage of Stadhampton, Oxfordshire, in 1616. At twelve he was admitted at Queen's College, Oxford, where he worked with amazing diligence, for years taking no more than four hours' sleep a night. In 1632 he took his B.A. degree, and M.A. in 1635, and two years after was driven from Oxford by dislike to Laud's new statutes. The next three or four years of his life were spent in a state of anxious and melancholy introspection, as chaplain first to Sir Robert Dormer of Ascot, next to Lord Lovelace of Hurley; but the outbreak of the war left him without a patron, and about the same time his zealous Puritanism cost him the estate a wealthy Welsh uncle meant to bequeath him. He now removed to London, where a casual sermon, preached by a stranger in Calamy's church, brought to his heart that peace he had long laboured after in vain. In 1642 he published *The Display of Arminianism*, a work for which the 'Committee for Purging the Church of Scandalous Ministers' rewarded him with the living of Fordham in Essex. Here he married a lady named Rooke, who bore him eleven children. In 1646 he removed to Coggeshall, and here made public his growing aversion to Presbyterianism, and preference for a moderate form of Independent church government. The Presbyterian ministers fell upon him at once for his apostasy, but all their acrimony, dogmatism, and intolerance failed to perturb his sober temper. At Coggeshall he wrote his *Salus Electorum*, *Sanguis Jesu*, the result of seven years' study, and of which he himself said that 'he did not believe he should live to see a solid answer given to it.' On April 29, 1646, he preached before parliament, and to his discourse, when printed under the title of *A Vision of Free Mercy*, he added an Appendix in which he pleads for liberty of conscience in matters of religion. He was again chosen to preach before the House of Commons the day after the execution of King Charles I. (January 31, 1649), but discreetly avoided a vindication of the act by making no reference to it whatever. About this time Cromwell made his acquaintance, and thought so highly both of his preaching and character that he carried him to Ireland as his chaplain. Here he remained about half a year, regulating the affairs of Trinity College. Next year (1650) he went with Cromwell to Scotland, and resided in Edinburgh for several months. In 1651 the House of Commons appointed him dean of Christ Church, Oxford, and in 1652 he was admitted vice-chancellor of the university. The manner in which he discharged his duties reflects the highest credit on his moderation and impartiality. Most of the vacant livings in his patronage were bestowed on Presbyterians; and Episcopalians were allowed to celebrate divine worship in their own way, nor could the vice-chancellor ever be induced to offer them the slightest molestation. While at Oxford the 'Atlas of Independence,' as Wood styles him, wrote his *Diatriba de Divina Justitia*, his *Doctrine of the Saints' Perseverance*, his *Vindicia Evangelicæ*—against Biddle and the Socinians—and his *Mortification of Sin in Believers*. He was one of the well-known Triers appointed to purge the church of scandalous ministers, and in this capacity signalised himself by his friendly offices on behalf of men of learning and merit like Dr Edward Pocock, Laud's professor of Arabic. Owen opposed the giving the crown to the Protector, and it appears that a coldness arose between the two. In 1657 he was succeeded as vice-chancellor of the university by Dr Conant, and the year after Cromwell's death he was ejected

from his deanery. He retired to Stadhampton, in Oxfordshire, where he had purchased an estate, and here he formed a congregation, to which he ministered until his removal to London shortly after the Restoration. The writings belonging to this period of retirement are *Communion with God; On the Divine Original, Authority, Self-evidencing Light and Power of the Scriptures; Theologoumena, or De Natura, Ortu, Progressu, et Studio Veræ Theologiæ*; and an uncritical and irreflexive diatribe against Walton's *Polyglott*. In 1662 he published, at Clarendon's request, *Animadversions to Fial Lux*, a treatise written by a Franciscan friar in the interests of Roman Catholicism. It was followed by works on *Indwelling Sin*, on the 130th Psalm, and on the Epistle to the Hebrews, the last of which began to appear in 1668, and is usually reckoned Owen's greatest work. In 1669 he published *Truth and Innocence Vindicated*, a reply to Samuel (afterwards Bishop) Parker's *Discourse on Ecclesiastical Policy*, and in 1673 became pastor of a large congregation in Leadenhall Street. His last publications of importance were a *Discourse Concerning the Holy Spirit* (1674); *Doctrine of Justification by Faith* (1677), a treatise still much admired by many; and *Christologia, or Glorious Mystery of the Person of Christ*.

Already in 1663 he had declined a call to Boston in New England, as he did an invitation in 1670 to become president of Harvard. In his later years he was held in the highest esteem by many of the most influential personages in the land, and he had repeatedly long conversations with both Charles II. and the Duke of York on the subject of Nonconformity. In his controversies with Sherlock and Stillingfleet he came off triumphant, and to the end of life he preached and wrote incessantly, notwithstanding the torments of the stone and asthma. He died at Ealing, 24th August 1683, and was buried in Bunhill Fields, being followed to the grave we are told by as many as sixty noblemen. Owen was learned, considerate, and generous.

For his life, see the Rev. W. Orme's *Memoirs* (1820), and the *Life*, by the Rev. A. Thomson, prefixed to the most complete edition of Owen's more than eighty works, that edited by Dr Goold (24 vols. Edin. 1850-55).

OWEN, JOHN, born at Pembroke in 1833, was educated at Lampeter, and in 1870 was appointed rector of East Anstey in Devonshire, where he died, 6th February 1896. A profound student, he wrote much for the *Edinburgh Review* and the *Academy*, but is best known for *Evenings with the Skeptics* (1881), *Skeptics of the Italian Renaissance* (1892), and *Skeptics of the French Renaissance* (1893). He edited Glanville's *Sceptis Scientifica* (1885), and published a volume of *Verse Musings*.

OWEN, SIR RICHARD, one of the most eminent of zoologists, was born at Lancaster, July 20, 1804. From the grammar-school of that town he passed (1824) to Edinburgh University and extra-mural School of Medicine, and thence (1826) to St Bartholomew's Hospital in London, where he completed his course. He had barely started medical practice when he was called (1830) to help in cataloguing the Hunterian collections in the museum of the Royal College of Surgeons, to the curatorship of which he afterwards succeeded. In 1835 he married the only daughter of Clift, his colleague in the museum. Till 1856 he continued to produce a marvellous series of descriptive catalogues, while for more than twenty years (1834-55) he lectured as professor of Comparative Anatomy, for two years at Bartholomew's, and afterwards as Sir Charles Bell's successor at the College of Surgeons. Some of the results of his research and teaching are embodied in several well-known volumes on comparative anatomy and physiology. Meanwhile he had helped to give new life to the Zoological

Society of London, of which he was for a time the unpaid prosector, while he had also worked willingly in various public interests—e.g. as a commissioner of health (1843-46), and for the Great Exhibition of 1851. In 1856 he became superintendent of the natural history department of the British Museum, where he continued his investigations on living and fossil animals, energetic moreover in such practical matters as the fit housing of this magnificent collection. He also continued to teach periodically at the Royal Institution and elsewhere, until his resignation of official duties in 1883. But even thereafter the veteran of fourscore years and more persisted at work.

As a student Owen had also visited Paris and seen Cuvier, of whose school he became a prominent disciple, yet in his theoretical conclusions he rather supported Geoffroy St-Hilaire, against whose principle of the unity of organic structure he had heard Cuvier argue in 1831 before the French Academy. Marvellous industry and width of knowledge, anatomical insight and enthusiasm for palæontology, were as characteristic of Owen as of Cuvier, and their names will be linked while zoology lasts. Owen's anatomical and palæontological researches number towards four hundred, and concern almost every class of animals from sponge to man; he helped to elucidate the structure of many rare and interesting types, such as the Venus-flower-basket (*Euplectella*), the Brachiopod *Lingula*, the King-crab (*Limulus*), the Pearly Nautilus and the Argonaut, the Mud-fish Protopterus, many extinct reptiles and birds, the recently-lost Moa and the persistent Apteryx, the Aye-Aye and the Gorilla; he greatly advanced morphological enquiry by his clear distinction between *analogy* and *homology*, as well as by his concrete studies on the nature of limbs, on the composition of the skull, and on other problems of vertebrate morphology; while his essay on *Parthenogenesis* was a pioneer work of much historical importance in connection with theories of sex and reproduction. As a Pre-Darwinian, much influenced by the conception of 'archetypes,' Owen maintained a cautious, though by no means hostile, attitude to the more detailed evolutionist theories; his convictions, in short, are those of a Platonic anatomist. He died 18th December 1892. See the *Life* by his grandson (1894).

OWEN, ROBERT, social reformer, was born a saddler and ironmonger's son, at Newtown, in Montgomeryshire, 14th May 1771. He had a poor education, and was put at ten into a draper's shop at Stamford, but a few years later shifted to Manchester, and by nineteen had risen to be the enterprising manager of a cotton-mill with five hundred hands. In 1799 he married the daughter of David Dale (q.v.), the philanthropic owner of the celebrated cotton-mills at New Lanark, on the Clyde, and, having induced his firm to purchase the concern, settled there next year as manager and part-owner. Here he laboured with constant zeal to teach his workpeople the advantages of thrift, cleanliness, and good order, and organised with a wisdom far before his time a system of infant education. In 1813 the business was reorganised, so as to give Owen a freer hand for his philanthropic schemes, under a firm content with a profit of 5 per cent., of which Jeremy Bentham and the Quaker William Allen were members. By this time Owen had thought out a religious creed for himself, and he now began his social propagandism in *A New View of Society, or Essays on the Principle of the Formation of the Human Character* (1813). His works at New Lanark quickly became famous, and attracted visitors from all parts of the world, while his advice on social questions was sought, if not always followed, by statesmen. Owen's thoughts on the

pressing social questions of the day finally drove him to socialism rather than co-operation as a solution, but he lost much of his influence on the wider community by utterances on religion that were at least honest, if not discreet. His socialistic theories were put to the test of practice in experimental communities at Orbiston near Bothwell, and later at New Harmony in Indiana, at Ralahine in County Clare, and at Tytherly in Hampshire, but all were completely unsuccessful. In 1828 his connection with New Lanark finally ceased; and, his means having been exhausted in the American experiment, the remainder of his days were spent in restless secularist and socialistic propagandism. In his old age his mind fell into the comfortless vagaries of spiritualism. He died at his native town, 17th November 1858.—His son, ROBERT DALE OWEN, was born in Glasgow, 9th November 1801, and went to America in 1825 to help his father in founding his short-lived colony at New Harmony, Indiana. He finally settled in America in 1827, edited the *Free Inquirer* in New York, acted as a member of the Indiana legislature, and entered congress as a democrat in 1843. Later he helped to remodel the constitution of Indiana; acted first as *chargé d'affaires*, next as minister at Naples (1853-58); debated divorce with Horace Greeley; supported the cause of emancipation by vigorous and able pamphlets; and made his name widely known as one of the chief advocates of spiritualism in the United States. He died on Lake George, New York, 17th June 1877. Of his books need only be mentioned the spiritualistic *Footprints on the Boundary of another World* (1859), and *Debatable Land between this World and the Next* (1872); and *Threading my Way*, an autobiography (1874).—Two other sons, David Dale Owen (1807-60) and Richard Owen (1810-90), achieved contemporary eminence as geologists.

Owen Stanley Range, a mountain range of the south-east corner of Papua, reaches 13,000 feet in Owen Stanley (or Victoria) Peak.

Owl (*Striges*), a sub-order of birds, constituting with two other sub-orders—the Pandionces (ospreys) and Falcones (hawks, falcons, and eagles)—the order Accipitres or Raptores (birds of prey). The owls vary in size from 5 inches to 2 feet in length, the females being as a rule larger than the males. The head is very large; the skull is broad, the cranial bones highly pneumatic, and the facial region flattened; the beak is short, hooked, strong, and sharp, but never notched. The eyes are very large, directed forwards, only slightly movable; the upper eyelid is very large, and both eyelids

are ciliated with barbed plumelets, and have a broad, thin, bare margin; the third eyelid, or nictitating membrane, is conspicuous; the iris is unusually broad, and is capable of being greatly expanded and contracted. A disc of feathers surrounds the eye, either completely or partly. The ear is peculiar and variable; it has an external meatus, unusual in birds, generally of large size, and sometimes provided with a special flap of skin or operculum. The head often bears a pair of tufts known as feathered horns. The plumage is generally spotted or barred with different shades of brown and yellow. In nearly all owls two phases of colour, a lighter and a darker, can be distinguished. The wings are always broad and long and loose; the tail usually short and even, or slightly rounded. The legs are not long, and are almost completely feathered. The toes are often covered with feathers, and are always terminated by strong talons; the first and fourth toes can be opposed to the second and third. The mouth is very wide; the gullet is large; there is no crop; the stomach is large, roundish, and somewhat compressed; the intestine is short, and has two wide caeca connected with it. The indigestible portions of food are regurgitated in the form of pellets as in other Accipitres.

Owls range over the whole globe, from the extreme polar regions to the remotest oceanic islands. No birds are more cosmopolitan in their distribution. In habit they are generally nocturnal; their flight is noiseless and buoyant; their eyesight is very acute, as is also their sense of hearing. They are either solitary or live in pairs, and although so often regarded with superstitious aversion and animosity, they are nearly always harmless and very useful birds. Their food consists of small mammals, birds, insects—especially nocturnal lepidoptera; and some species prey on fish, either habitually or occasionally. They pounce upon their prey noiselessly, and, striking their talons into it, kill it and carry it off. Small animals may be carried in their bill, and are swallowed whole; larger animals, torn in pieces, are eaten in morsels. The disgorged pellets of indigestible materials—bones, fur, and feathers—produce a characteristic fetid odour near the owl's abode. The examination by Dr Altam of remains found (communicated to the German Ornithologists' Society) gives a good idea of the food and utility of the three commonest species of British owls.

The nesting habits of owls vary considerably. The nest is rudely made of twigs and grass, in holes of trees, crevices of rocks, dark corners of buildings, or on the ground; sometimes there is no nest at all, or only the forsaken one of some other bird. The eggs are usually white, either pure or yellow or blue tinted, and almost spherical, commonly four to six in number, but some species lay eight or ten, others not more than two. The young remain long in the nest, and are helped by their parents for some days after going abroad. Some owls are diurnal in habit, and these have more compact plumage, smaller ears, and incomplete discs; but the habits of owls in general are too little known to allow of many general statements being made regarding the adaptation of structures to particular habits. Though the small and unspecialised ear is said to characterise diurnal species, it is found in the eagle-owl, whose habits are nocturnal. Unfeathered legs are sometimes associated with fishing

habits; but some feather-legged species catch fish, while other species with unfeathered legs do not. And again, feathered horns, which have sometimes been considered characters sufficiently important to serve as a basis for classification, have no known function, occur in widely-different species, vary much in size and form, and are not peculiar to either males or females. During the day nocturnal owls repose in some secluded spot, generally in a tree, but often on rocks and bushy cliffs, while some prefer the ground. If found abroad they are persecuted by other and smaller birds, being bewildered and rendered helpless by the unaccustomed glare of the daylight. When surprised, owls hiss like a cat and make a clicking noise with their bills; some have a harsh shrieking cry, others a not unmusical *hoot*.

The classification of the owls has always been a fruitful matter of discussion, owing to the difficulty of estimating properly the classification value of the various anatomical characters. According to the most generally received method (Sharpe's, in the *Catalogue of Birds in the British Museum*, vol. ii.), the sub-order Striges is subdivided into two families—(1) Strigidae, containing only the two genera *Strix* and *Phodilus*, which embrace six species; (2) Bubonidae, containing all the other owls—17 genera and about 190 species. (Newton subdivides the owls, which he reckons as a family of Accipitres, into two sub-families—(1) Aluconinae, corresponding to the Strigidae of Sharpe; and (2) Striginae, corresponding to the Bubonidae.) In the Strigidae the sternum has no manubrium, and its margin is entire behind; the clavicles meet to form a furcula or merrythought, which is firmly united with the keel of the sternum; the tarsus is without a bony arch over the extensor tendon of the toes; and the claw of the mid-toe has its inner margin serrate. In the Bubonidae, on the other hand, the sternum has a distinct manubrium, and has its margin notched behind; the clavicles are small and do not form a furcula, nor are they united with the sternum; the tarsus has a bony arch or ring over the groove which contains the common extensor of the toes; and the inner margin of the middle claw is not serrate.

The only British representative of the family Strigidae is the Barn-owl, White Owl, Screech-owl, or Church-owl (*Strix flammea* of Linnæus). This, although the commonest British owl, is really a tropical bird, not ranging more than 40° north or south of the equator, except in western Europe, where it breeds as far north as Denmark and the south of Sweden. In Scotland it is found in the Inner Hebrides, Caithness, and the Shetland Isles. The adult male is about 13 inches long; the bill is white; the claws purplish gray; the face discs, which are oval in form and complete, are white. The general colour, which is light reddish yellow, mottled with gray on the upper parts, and white with small dusky spots on the under parts, distinguishes it from all other

Fig. 1.—Barn-owl (*Strix flammea*).

but differs little in colour, except that the upper parts are darker. This owl is pre-eminently nocturnal in habit. It frequents villages, homesteads, and ruins, where it carries on its depredations among rats, mice, and other animals—as many as twenty rats have been found in the nest of one, all freshly killed. It has also been known to catch fish. Its cry is a discordant scream, and it also produces a snoring and hissing noise. If a nest is made it is merely a loosely-arranged collection of twigs and straws. The eggs number two to five, and are large and smooth and white. Several broods of young may be produced annually. *Phodilus*, the other genus of the Strigidae, consists of only one species (*P. badius*), which ranges from the eastern Himalaya to Burma and Pegu, and is also found in Ceylon, Java, and Borneo. This genus possesses characters common to both families, and is really an intermediate form belonging properly to neither. A species from Madagascar, described by Alphonse Milne-Edwards under the name of *Heliodilus soumagnii*, has been placed in this sub-family.

Among the Bubonidae the Tawny Owl, Wood-owl, Ivy-owl, Brown Owl (*Strix stridula* or *aluco*, or *Syrnium aluco*) is a very common British species. It is found chiefly in wooded parts of England, and in the midland and southern districts of Scotland, but also as far north as Caithness and the Inner Hebrides. Its cry *hoo-hoo*, or *tu-whit, tu-whoo* at night makes it easily recognised. Although a species deserving to be preserved, it is rapidly declining in numbers. It ranges from the southern parts of Scandinavia through temperate Europe, in some parts of which, however, it is very local, to Asia Minor, Palestine, and Barbary. The Snowy Day-owl, the *Harfang* of the Swedes (*Strix* or *Surnia nyctea* or *Nyctea scandiaca*), is a circumpolar bird, breeding chiefly within the Arctic Circle, and common in parts of Greenland and Iceland. Its home is on the fields of Lapland, the tundras of Russia and Siberia, and the prairies of Arctic America, where it feeds on lemmings and other small rodents, sometimes on ptarmigan

Fig. 2.—Heads of *a*, Short-eared Owl; *b*, Long-eared Owl; and *c*, Snowy Owl.

and willow-grouse, and even on the Arctic hare and on fish. In Shetland, where it has been known to breed, forced from its home by exceptional cold, and in other parts of the British Islands it is found generally in solitary, stony, and elevated places, preying chiefly on sandpipers. It is a diurnal bird of large size and vigorous rapid flight, with strong limbs, toes completely feathered, and large talons. Its white plumage, generally marked with dusky-brown spots, distinguishes it from every other owl. The Long-eared and Short-eared Owls of Europe, Asia, and America (*Asio otus* and *A. accipitrinus*), which are also common British species, have the ear peculiarly developed, the opening on one side looking upwards, and on the other downwards. The Long-eared owl, which frequents wooded localities, is about the size of the Barn-owl, and generally carries its horns erect; while the Short-eared, known also as the Woodcock-owl, from the coincidence of its time of appearance, prefers moors and open country, and carries

its horns depressed. The specialisation of ear-structure is carried to its greatest known limit in Tengmalm's owl (*Nyctala tengmalmi*), a rare visitor to Britain from the northern regions; in it the bones of the head are developed differently on each side.

Fig. 3.
Foot of Snowy Owl.

The Eagle-owl (q.v., *Bubo maximus*), the Little Owl (*Athene noctua*), the Hawk-owl (*Surnia funerea*), and the very small Scops-owl (*Scops giu*) are also visitors to Britain, and the Little Owl, introduced by enthusiasts, has become common.

Of foreign species belonging to this family one of the most noteworthy is the Burrowing Owl (*Speotylo* or *Athene cunicularia*) of America. On the prairies of North America it shares the burrows of the prairie-dog and other mammals, while on the pampas of South America it lives in the holes of the viscacha, armadillos, and large lizards, or makes a hole for itself, which is often invaded by rattlesnakes. Another interesting species is Pel's Fish-owl (q.v., *Scotopelia peli*).

Owosso, or OWASSO, a city of Michigan, on the Shiawassee River, 78 miles by rail NW. of Detroit. The river supplies abundant water-power, and there are flour and planing mills, beet-sugar, furniture, sash and blind factories, foundries and railway-shops. Pop. 12,600.

Ox. See CATTLE and BOVIDÆ.

Oxalic Acid, $H_2C_2O_4 + 2H_2O$, occurs in colourless, transparent, oblique, rhombic prisms, which have an intensely sour taste, and are soluble in nine parts of cold water, and much more freely in boiling water. When heated to 212° (100° C.) the crystals lose their two equivalents (or 28.5 per cent.) of water, and the residue, consisting of the anhydrous acid, $H_2C_2O_4$, becomes opaque. When the crystallised acid is rapidly heated to about 300° (149° C.), or when it is warmed with strong sulphuric acid, it is decomposed into carbonic acid and carbonic oxide gases, and into water. Oxidising agents, such as binoxide of manganese, peroxide of lead, nitric acid, &c., convert oxalic into carbonic acid, and on this property is based a good method of determining the commercial value of the black oxide of manganese. One of the most powerful of the organic acids, it expels carbonic acid and many other acids from their salts. The acid itself, which, like its soluble salts, is poisonous, is very widely diffused throughout the vegetable kingdom, sometimes in the free state, but more frequently as a salt of lime, as in rhubarb and many lichens. In the animal kingdom it never occurs except in minute quantity, and in combination with lime. It is produced by the action of either caustic potash or nitric acid upon most organic compounds of natural occurrence. Its most common mode of preparation is by the oxidation of cellulose in form of sawdust, by means of caustic potash. The most important salts are the oxalate of ammonia, $(NH_4)_2C_2O_4 + H_2O$, used as a test for lime, and the binoxalate of potash or salt of sorrel, $KHC_2O_4 + H_2O$, also known as essential salt of lemons, and which is popularly used for removing ink-stains or for cleaning brass.

The best test for this acid is the production of a white precipitate (of oxalate of lime), on the addition of any soluble salt of calcium. The precipitate is insoluble in water, in solution of potash, and in acetic acid, but dissolves in the mineral acids. A solution of nitrate of silver also gives

a white precipitate of oxalate of silver, which explodes when heated.

In consequence of its employment in cotton-printing, bleaching straw, &c., oxalic acid is more accessible to the general public than many other poisons; and on this account instances of suicide from the swallowing of this acid are by no means uncommon. Cases of accidental poisoning, moreover, sometimes occur from its being sold by mistake for Epsom salts. Large doses destroy life very rapidly. With the view of converting the free acid in the stomach into an insoluble and inert salt, chalk, whiting, or lime-water, with full draughts of milk, should be administered with the least possible delay. Salt of sorrel is almost as poisonous as the pure acid.

Oxalidaceæ, or OXALIDÆ, a family of dicotyledons, allied to Geraniaceæ; including herbaceous plants, shrubs, and trees; with generally compound alternate leaves; calyx of five equal persistent sepals; corolla of five equal unguiculate petals, spirally twisted in bud; ten stamens; the ovary five-celled, with five styles; the fruit a capsule of five cells opening by five valves, or more rarely a berry with five one- or many-seeded cells. Temperate North America and the Cape of Good Hope may be said to be the headquarters of the order. The herbaceous parts of almost all the species are distinguished by a strong acidity, which is owing to the presence of oxalate of potash; some, however, are bitter and slightly stimulating. The fruit of some is pleasantly acid and cooling—as Carambola—and reputed to be antiscorbutic and antiseptic. The tubers of several of the typical genus (*Oxalis*) are eatable, and contain a considerable quantity of starchy matter. The leaves of all the species are more or less sensitive. The Wood-sorrel (*O. acetosella*) is a native of Britain, and one of the most elegant of the wild flowers, carpeting woods and shady places with its bright trifoliate leaves and white or rose-tinted flowers. Its leaves, resembling as they do those of the clover, have led to the surmise that it may be the true Shamrock (q.v.). The plant, which is antiscorbutic and refrigerant, is widely distributed throughout Europe, Russian and central Asia, and northern America. It is much used in salads on the Continent; and in Lapland, where it is very abundant, it is the favourite herb of the inhabitants. The expressed juice of the plant abounds in binoxalate of potash. Twenty pounds of fresh leaves yield about six pounds of juice, from which is obtained about two ounces of the pure salt.—*Salt of Sorrel* and *Essential Salt of Lemons* (see OXALIC ACID). The preparation is carried on mainly in Switzerland and Germany; not, however, exclusively from this species of *Oxalis*, but from several other species of the same genus and of the true sorrels (*Rumex*), which contain the same salt. The numerous species of *Oxalis* strongly resemble each other in their general appearance and properties. Several of them, such as *O. crenata* and *O. tuberosa*, natives of Peru and Bolivia, and *O. Deppei*, a Mexican species, are cultivated in those countries for the sake of their tuberous roots, which are eatable. These species have all been recommended for culture in Britain as substitutes for the potato, but their produce is too meagre to deserve attention; besides, the plants are constitutionally adapted only to the most favourable parts of England. The yellow-flowered *Oxalis cernua*, from the Cape, introduced in Italy about 1800, has now spread over nearly all the Mediterranean countries, being in many places one of the most conspicuous flowers. *Averrhoa Bilimbi*, or Cucumber-tree, indigenous to the East Indies, and now cultivated in some parts of South America, produces a green fleshy fruit of the shape and size of a small cucumber, which is

esteemed for its grateful acid juice when ripe. The unripe fruit is also pickled.

Oxaluria, the occurrence of crystals of oxalate of lime in the Urine (q.v.).

Oxenstjerna, AXEL, COUNT, Swedish statesman, was born at Fånö, north of Stockholm, 16th June 1583. He was originally educated for the church, and studied theology as well as jurisprudence at Rostock, Jena, and Wittenberg, and, although he entered (1602) the public service of his country, he continued all his life to take a deep interest in religious questions, and laboured zealously for the extension of the Protestant doctrines. Charles IX. despatched him in 1606 as ambassador to the court of Mecklenburg, and made him senator in 1609. Having displayed great prudence and wisdom in the settlement of disputes between the Livonian nobles and the town of Reval, he was appointed by Charles—now infirm from age—guardian of the royal family and head of the regency. On the accession of Gustavus Adolphus (q.v.) in 1611 Oxenstjerna was created chancellor; and in 1613 acted as minister-plenipotentiary in the negotiations for peace between Sweden and Denmark, and in 1617 in those which terminated hostilities between Sweden and Russia. In 1621, on the departure of the king for the Polish war, Oxenstjerna was charged with the administration of affairs at home, but five years later was summoned to act as governor-general of the conquered districts in Prussia. In 1629 he concluded peace with the Poles on highly favourable conditions. Although he strongly opposed the desire of Gustavus to take part in the Thirty Years' War, yet, when he found that the Protestant sympathies of the king were irrepressible, he supported his master most faithfully and ably; Gustavus in return charged him with the difficult business of managing the diplomatic relations of Sweden in central Germany. After the king's death it was Oxenstjerna who not only kept the Swedish armies together, but sustained the Protestant cause and prevented it going to pieces on the jealousies of the German Protestant princes, displaying masterly diplomatic ability, great courage, resource, and moderation. Having in four arduous years reorganised the Protestants and reanimated their courage by gaining French and Dutch assistance, he went back to Sweden (1636). He had already drawn up a constitution, which the estates accepted and ratified in 1634. After his return he resumed the duties of chancellor, adding to them those of guardian to the young queen Christina, who, however, did not accept the advice of her father's wise friend and counsellor as it beseemed her. Oxenstjerna continued to direct the policy of the Protestants in Germany till the peace of Westphalia in 1648 put an end to the war. He humiliated the Danes and forced them to sign the treaty of Brömsebro (1645), and opposed the abdication of Christina and the succession of Charles X. This king, nevertheless, retained him in office until he died, 28th August 1654. See Lundblad's *Svensk Plutarch* (2 vols. Stock. 1824); Fryxell's *History of Gustavus Adolphus* (1852); Geijer's *History of the Swedes* (London, 1845); Bulstrode Whitelocke's *Journal* (1772); also Oxenstjerna's *Writings and Correspondence* (1888 *et seq.*).—His eldest son JOHAN (1611–57) carried through several diplomatic missions, his greatest service being to act as Sweden's plenipotentiary at Osnabrück (1648). It was in a letter to this son, who felt himself unequal to the office, that the chancellor used the famous phrase, 'Nescis, mi fili, quam parva sapientia regitur mundus.' This aphorism is current, however, in an extraordinary number of versions (*Notes and Queries*, 7th July 1888).—

The younger brother ERIK (1624–56) was governor of Esthonia (1640), and succeeded his father as chancellor of the kingdom.

Ox-eye. See CHRYSANTHEMUM.

Oxford, the capital of the county, the home of the university, and the seat of the bishopric of the same name, stands about the confluence of the rivers Cherwell and Thames, 52 miles (63 by rail) WNW. from London. The city, under the Act of 1889, is governed by a council, comprising a mayor, fifteen aldermen, and forty-five councillors, of whom three aldermen and nine councillors are elected by the university. Up to 1885 the city returned two members to parliament; since that date only one. The university returns two members. Until about 1830 the area and population of the city remained almost stationary, extending only a little beyond the limit of the old city wall as reconstructed in the reign of Henry III., and very little beyond the area represented in Loggan's bird's-eye view (1675). But since then the city boundaries have been considerably extended. Pop. (1801) 11,000; (1851) 27,843; (1901) 49,335; (1911) 53,049; (1921) 57,052.

The topography of Oxford is simple in the extreme. The river Thames (locally called the 'Isis'), which has flowed from north to south, takes here a sharp bend to the east, and about a mile from the angle receives the Cherwell, flowing from the north, parallel with its former course. All the old part of the town stands in the rectangle thus formed by the rivers. The centre of the town is at a place called 'Carfax' (derived from *quadri-furcus*, 'four-forked'), from which four main streets run to the four points of the compass. Taking in rotation these four lines of streets, we shall be able to pass quickly in review all the chief buildings and places of interest. *North* runs Cornmarket Street ('the Corn'), passing the Oxford Union Society's rooms (the club, library, and debating-hall of the undergraduates, founded in 1823). At the end of Cornmarket Street is St Michael's Church, the tower of which (c. 1070) is a characteristic specimen of Saxon masonry. Here formerly was the north gate of the city, the chambers over which (taken down in 1771) were used as a prison, and called Bocardo. From the end of Cornmarket Street, George Street runs west, containing theatre (1886), corn exchange (1895), High School for boys (1881); Broad Street runs east, containing Balliol, Trinity, and Exeter Colleges, the Old Ashmolean Museum, the Sheldonian (the University 'Theatre'), the Clarendon Building (used for the Clarendon Press till 1830, now as university committee-rooms), and the Indian Institute. Broad Street was the place where the Oxford martyrs were burned (Ridley, Latimer, and Cranmer). The Martyrs' Memorial, a cross in their honour, was built in 1841, at the end of Magdalen Street, the continuation of Cornmarket Street. Beaumont Street leads west from this point, past the Taylor Institution (for modern literatures, built 1845), Ashmolean Museum of Art and Archaeology (containing the Ruskin Drawing-school, the Arundel Marbles, presented to the university in 1667, and other relics of classical antiquity, a valuable collection of paintings and engravings, and 190 original drawings by Michelangelo and Raphael), to Worcester College. Thence northwards, by Walton Street, access is got to the University or Clarendon Press, to St Barnabas Church (1868), to Port Meadow (an extensive flat ground beside the river, being the common of the freemen of the city), and the 'Upper River' or part of the Thames north of Oxford, and so to Godstow, a ruined nunnery, famous as the burial-place of Fair Rosamond. Returning to the Martyrs' Memorial, and looking north, we see St

Giles' Street, containing St John's College and the Pusey House (a library and clergyhouse, in support of Anglican principles, established 1884 in memory of Dr Pusey, and containing his library). In the

College and the Canterbury gate of Christ Church into Merton Street, where are Corpus Christi and Merton Colleges. From St Mary's Church, Catherine or Cat Street leads north, having on

Brasenose College, Oxford—The Quadrangle (showing also Spire of St Mary's and Dome of Radcliffe Library).

Woodstock Road continuation of St Giles' Street are the church of St Aloysius (Roman Catholic) (1875), the Radcliffe Infirmary (1770), and the Radcliffe Observatory (1795). In the Banbury Road continuation of St Giles' Street are Somerville College (1879), the High School for girls (1884), and Wycliffe Hall (a Church of England theological college, in the interests of the Evangelical party, 1877). *West*.—Returning to Carfax we find Queen Street to the west, continued by New Road, leading past the Castle (including the court-house and gaol) to the railway stations, and so along the Seven Bridges Road (across cuts from the Thames) to Cumnor. *South* from Carfax runs St Aldate's Street, past the town-hall and public library (rebuilt 1893–97), and post-office (1881), St Aldate's Church (rebuilt since 1863), Pembroke College, the front of Christ Church, the entrance to Christ Church Meadow and Broad Walk, to Folly Bridge across the Thames. This bridge was rebuilt in 1815. Over the old bridge was a watch-tower (taken down in 1779) known as 'Friar Bacon's Study.' From near Folly Bridge, for about a quarter-mile along the north bank of the river, are moored the Barges (q.v.) of the university and college boat-clubs.

East from Carfax runs High Street in a graceful curve. In the High Street itself, or just off it, stand these buildings, in this order from Carfax: the city market (1773), the Mitre Hotel (extant, as Dagville's Inn, before 1470), the church of All Saints (built in 1706 from designs by Dean Aldrich), the new front of Brasenose, the University Church (St Mary the Virgin), where are preached the university sermons (including the 'Bampton Lectures,' q.v.), All Souls, University, and Queen's Colleges, the Examination Schools (1882), with the Non-collegiate Students' buildings, Magdalen College School (founded 1480), Magdalen College, and the Botanic Gardens (laid out in 1632). The street ends with Magdalen Bridge over the Cherwell. At the Church of All Saints, Turl Street runs north from the High, leading to Lincoln, Jesus, and Exeter Colleges, and so into Broad Street at Trinity College. From opposite St Mary's Church, Oriel Street leads south past Oriel

College and the Canterbury gate of Christ Church into Merton Street, where are Corpus Christi and Merton Colleges. From St Mary's Church, Catherine or Cat Street leads north, having on

the east the Codrington Library (built 1716–60 by All Souls College to receive the library of Christopher Codrington, and maintained by the college as a law library), and on the west the Radcliffe Library (built in 1737 as a library for medicine and natural science; since 1861 a reading-room in connection with the Bodleian); and farther on the Old Schools (including the Bodleian Library and the Divinity School) on the west, and Hertford College on the east. Past Hertford College a street leads to New College. Cat Street, after crossing Broad Street, is continued by Park Street, which leads northwards past Wadham College and the garden front of Trinity College to the University Museum, Keble College, and Lady Margaret and St Hugh's Halls. Here are the University Parks, laid out and kept up by the university, containing the university observatory, erected in 1874. Here also is the ground of the University Cricket Club, one of the finest, in itself and

in its surroundings, in England. A walk leading from the Parks, east and south, is known as 'Mesopotamia,' being between two cuts of the Cherwell. ALL SOULS COLLEGE was founded in 1437 by Archbishop Chichele as a chantry for the souls of those who had fallen in the wars with France. It remains still a college entirely of fellows; several of the fellowships have been attached to university professorships. The front quadrangle is practically as the founder left it; the fine chapel (consecrated 1442) contains a beautiful reredos, partially destroyed in 1577 and in 1664, but restored in 1876. The hall (built in 1720) contains the Codrington Library and some good portraits of former fellows, among them those of Sir William Blackstone, Reginald Heber, Sir Christopher Wren, Thomas Tanner, John Linares, Jeremy Taylor, and Robert Herrick.

OLD ASHMOLEAN MUSEUM, the earliest public museum in England, built in 1682 to receive the antiquities, &c. of Sir Elias Ashmole (q.v.). The original collections have since 1860 been dispersed; the books and MSS. going to the Bodleian, the natural history specimens to the Museum, the anthropological (including curiosities brought home by Captain Cook) to the Pitt-Rivers collection, various antiquities to the New Ashmolean. BALLIOL COLLEGE, founded about 1268 by Devorguilla Balliol, mother of John Balliol, king of Scotland. The buildings are chiefly modern, the hall (1877) being a favourable example of Oxford building of its time. This hall contains portraits of John Wyclif, formerly master of the college; of Archbishop Tait; of Robert Browning, honorary fellow; and of Benjamin Jowett, master. By means of the Snell and Warner exhibitions, Balliol has had since the 17th century a close connection with Scotland, including among its members Adam Smith, John Gibson Lockhart, Sir William Hamilton, and Andrew Lang. Colet, Parsons the Jesuit, John Evelyn, Robert Southey, Dean Stanley, Matthew Arnold, A. C. Swinburne, and Cardinal Manning were members of the college.

BODLEIAN LIBRARY (q.v.), founded in 1602 by Sir Thomas Bodley, in a room (built about 1460) over the Divinity School for the old library of the university, augmented by Humphrey, Duke of Gloucester. Duke Humphrey's Library had been plundered by King Edward VI.'s commissioners. The library has grown to be one of the great libraries of the world (see LIBRARY), and now occupies the whole of the Old Schools (built 1618) of the university. The library contains a fine portrait of the founder. The picture-gallery attached is one of the finest extant examples of an 'ambulacrum,' or

room for walking in, found in old great houses. On its walls hang portraits of many benefactors and famous members of the university; also many historical portraits.

BRASENOSE COLLEGE, founded in 1509 by William Smyth, Bishop of Lincoln, and Sir Richard Sutton. The gateway tower (1520) is the most striking feature of the old building. The old 'brassen nose' knocker of Brasenose Hall, on the site of which the college was built, was (it is claimed) acquired in 1890, and is now found in the hall. John Foxe, Robert Burton, Dean Milman, Bishop Heber, Barham, and F. W. Robertson were students.

CHRIST CHURCH is both the cathedral of the diocese of Oxford and a college of the university. The cathedral was instituted in 1546 by King Henry VIII. in the church of the old priory of St Frideswide (q.v.). This church contains many remains of Norman architecture (1120-80), and (it is claimed) some fragments of the older Saxon church. The college was founded by Cardinal Wolsey in 1525 as 'Cardinal College,' the priory of St Frideswide being suppressed by him; was remodelled by the king as 'King Henry VIII.'s College,' in 1532; and finally settled, as 'Christ Church,' in 1546. The hall and the kitchen (1529) are Wolsey's work, and surpass any building of the kind in Oxford, or even in England. The great quadrangle ('Tom' Quad.) begun by Wolsey was not completed till 1668. Peckwater Quadrangle was rebuilt in 1705-61. The entrance tower (finished in 1682 by Sir Christopher Wren) now contains 'Great Tom,' one of the largest bells in England, being the great bell of Osney Abbey recast (see BELL; also *Letters of Sir Christopher Wren to Bishop Fell*, ed. W. D. Caroe, 1923). The 'Broad Walk' of elms leading from the Meadow Gate to the Cherwell, planted by Dean Fell (q.v.) in 1670, was long one of the finest avenues in England. The library contains a valuable collection of paintings, especially by great Italian masters, with a few of the Dutch masters. The hall contains many portraits of eminent statesmen and divines by great painters, from Holbein to Millais. Sir Philip Sidney, Camden, George Peele, John Locke, Sir George Cornewall Lewis, Dr Liddon, Gladstone, John Ruskin, and Lord Salisbury are a few of the famous names of Christ Church men.

CORPUS CHRISTI COLLEGE, founded in 1516 by Richard Fox, Bishop of Winchester, in the interests of Renaissance learning. Cardinal Pole was a student here, Richard Hooker a fellow, John Keble a scholar.

DIVINITY SCHOOL, built 1445-80, a splendid example of Perpendicular architecture. The university was too poor to finish it, portions of the work showing that the carving of the interior was designed to be much more elaborate than it is. The rich colours of the roof and the stained windows were destroyed in Edward VI.'s reign. Wren restored the whole building.

EXETER COLLEGE, founded in 1314 by Walter de Stapledon, Bishop of Exeter. The buildings are nearly all modern. The chapel (1858) is a fine example of Sir Gilbert Scott's work, and contains good specimens of modern painted glass and tapestry. Members have been Grocyin, Glanville; Bishops Bull, Prideaux, and Secker; Lyell, Maurice, and Frondie.

HERTFORD COLLEGE, founded in 1874 by T. C. Baring, M.P., in the interests of the Church of England. This college was erected out of Magdalen Hall (founded 1487), which had been removed to this site in 1822 from its former site near Magdalen College. The site had previously been occupied by Hart Hall, founded about 1284, which had been created Hertford College by act of parliament in 1740, but dissolved in 1818 for lack of funds. The 'learned' John Selden was a member of Hart Hall; so also was Charles James Fox. William Tyndall, Hobbes, and Clarendon were members of Magdalen Hall.

JESUS COLLEGE, founded in 1571 by Queen Elizabeth at the instance of Dr Hugh Price, and its revenues greatly augmented by Sir Leoline Jenkins, principal of the college (1661). Until 1855 the college had an exclusively Welsh connection. It has good portraits of Queen Elizabeth, the nominal foundress, of Charles I., and of Charles II. The library has many valuable Welsh MSS. James Howell was a member.

KEBLE COLLEGE, founded in 1870 by subscription, in memory of John Keble and in the interests of the Anglican Church. The ornate chapel is the chief object of interest. The hall contains a portrait of Keble. In the library is Holman Hunt's picture, 'The Light of the World.' The college has no fellows and is governed from without by a council.

LINCOLN COLLEGE, founded in 1429 by Richard Fleming, Bishop of Lincoln, and refounded in 1478 by Thomas Rotherham, Archbishop of York, to check the progress of Lollardism. The chapel (1631) is a good specimen of Stuart work, containing fine cedar panelling and painted glass. Among its fellows have been Robert Sanderson, George Hickes, John Kettlewell (the non-juror), John Wesley, John Radcliffe.

MAGDALEN COLLEGE, founded in 1458 by William Patten of Waynflete, Bishop of Winchester. This college, in its original quadrangle, cloisters, hall, and chapel, built 1474-81 in the founder's lifetime, possesses the finest buildings of any college in the world. The tower, built 1492-1505, on whose top the choir sing a Latin hymn on May Day, is ascribed, questionably perhaps, to the initiative of Cardinal Wolsey when bursar here. The buildings in the Grove or Park, built 1736, were at one time regarded in Oxford as the perfection of architecture. A quadrangle to the west (called St Swithin's Buildings) was added in 1885. The musical services in chapel have for centuries been famous. Among the members of this college have been Colet, Latimer, John Hampden, Joseph Addison, Edmund Gibbon. The college has a fine walk round an island formed by two branches of the Cherwell, the northern side of which is called 'Addison's Walk.' The heroic age of the college was the period 1685-88, when its resistance to the arbitrary measures of James II. gave it a foremost place in the history of England.

MAGDALEN HALL, see above, Hertford College.

MANCHESTER NEW COLLEGE, a college (not of the university) for the study of theology independent of creed, was removed from Manchester to London in 1853, and thence to Oxford in 1889. Buildings for it were erected in 1891 in Holywell.

MANSFIELD COLLEGE, the chief theological college of English Nonconformity (not of the university), was transferred to Oxford in 1886. It has large buildings at the back of Wadham College.

MERTON COLLEGE, founded in 1264 at Malden in Surrey, and transferred to Oxford in 1274 by Walter de Merton, Bishop of Rochester, was the first institution in Oxford organised as a college; and is therefore the type which has been imitated by all existing foundations in Oxford or Cambridge. The old quadrangle ('Mob Quadrangle,' 1278) and the library (1376) of this college are the most ancient college buildings in Oxford. The 13th-century chapel is a fine building, with some good early brasses. Members of Merton College have been remarkable benefactors to the university; Sir Thomas Bodley, who founded the university library, and Sir Henry Savile, who founded professorships in geometry and astronomy, were both fellows. Duns Scotus is said to have been fellow here; William Harvey was warden; and other members were Bishops Hooper, Jewel, and Patten; Anthony Wood, the great Oxford antiquary (buried in the ante-chapel, 1695); and Steele.

MUSEUM, the 'New Museum,' was opened in 1860, for the reception of the university medical and natural science collections, and the medical and scientific library of the Radcliffe trustees. Large additions have since been made, particularly in the departments of chemistry, electricity, anatomy, and physiology. A wing was added in 1887 to receive the remarkable anthropological collection of General Pitt-Rivers. The School of Rural Economy and Forestry stands near the museum.

NEW COLLEGE, founded in 1379 by William of Wykeham, Bishop of Winchester. Walter de Merton's college had so far been the only well-established society in Oxford, and was 'the college' *par excellence*. Wykeham's college therefore became known as 'the new college;' a name which it has retained to the exclusion of the name the founder gave it, 'St Mary of Winchester College.' Wykeham also founded Winchester College to be a school to supply his Oxford college. The hall, chapel, cloisters, bell-tower, and other buildings were on a scale hitherto unknown in Oxford, and, except at Magdalen and Christ Church, have had no rivals. The gardens are very beautiful, and are bounded by the only perfect segment of the city wall. The best-known names of members of this college are Archbishop Warham; William Waynflete, founder of Magdalen College; Henry Chichele, founder of All Souls; Bishop Ken; Sydney Smith; Augustus Hare; and Lord Milner.

NEW INN HALL, founded about 1369, was closed in 1887. During the Civil War, when Charles I. held

Oxford, in 1642, the royal mint was set up here, and the old plate of the colleges was coined for the king's use.

ORIEL COLLEGE, founded in 1326, nominally by King Edward II, but really by Adam de Brome, his almoner, in a house on the High Street, removed in 1329 to 'la Oriole,' a house on the present site, whence it has its modern name. For a long time it was known as 'King's College' (Collegium Regale). The buildings are modern, the hall and chapel dating from 1637. Sir Walter Raleigh was probably commoner for a short time. In the first half of the 19th century Oriel College possessed most fellows—Kemble, Pusey, Thomas Arnold, Archbishop Whately, Cardinal Newman, Arthur Hugh Clough. Cecil Rhodes was a great benefactor.

PEMBROKE COLLEGE, erected in 1624 by Thomas Tesdale and Richard Wightwick, out of Broadgates Hall, a most ancient place of academical study, in which Bishop Bonner, Beaumont the dramatist, and Sir Thomas Browne had been students. The name was given in compliment to the Earl of Pembroke, then chancellor of the university, and in hope of a godfather's gift from him, which his death soon after prevented. Members of this college (and hall) have filled the three Anglican primatial sees of Canterbury (Moore, 1783), York (Yong, 1561), Armagh (Newcome, 1795). Dr Johnson was a student here.

QUEEN'S COLLEGE, founded in 1340 by Robert de Eglesfeld, chaplain to Philippa, queen of Edward III. He arranged that the queen-consort of England for the time being should be patroness of the college; hence its name, and several donations by queens of England when the college was in difficulties. The college was rebuilt in 1707-14. Henry V. is said to have been a student here for a short time; and other members were Cardinal Beaufort, Wycherley, Addison, and Collins. The college retains the old ceremony of bringing in the 'Boar's Head,' with the traditional song, on Christmas Day.

ST ALBAN HALL, founded about 1230, was united to Merton College by a statute of 1881.

ST EDMUND HALL, founded about 1260, the only survivor of the multitude of halls of mediæval Oxford. Queen's College appoints the principal, but otherwise St Edmund Hall remains a distinct institution. Thomas Hearne, the antiquary, was long resident here.

ST JOHN'S COLLEGE, founded in 1555 by Sir Thomas White, a London alderman. The chapel, hall, entrance tower, and part of the street front of the outer quadrangle are substantially those of St Bernard's College, a house of the Cistercian monks, built here 1437-1530. The garden front of the inner quadrangle was built by Archbishop Laud (q.v.) in 1631. Members of this college have deserved well of the university, Archbishop Laud and Dr Richard Rawlinson having been principal benefactors to the Bodleian. Edmund Campion, Shirley the dramatist, Edmund Calamy, and Dean Mansell are other St John's names.

ST MARY HALL, founded in 1333 by Oriel College, retained a close connection with Oriel, and was in 1896 incorporated with it.

SHELDONIAN THEATRE, completed in 1669 by Sir Christopher Wren at the order of Archbishop Sheldon for the holding of the great university degree ceremonies, hitherto held in St Mary's Church. The 'act' (the degree-ceremony in which all M.A. degrees and doctors' degrees granted during the year were supposed to be completed by 'inception') is now superseded by the Encenia, in which prize compositions are recited (among them the 'Newdigate,' q.v.), honorary degrees are conferred, and a Latin oration delivered. The University Press was originally situated in the Sheldonian Theatre.

TRINITY COLLEGE, founded in 1554 by Sir Thomas Pope. The library is part of Durham College which stood here (see DURHAM); the hall dates from 1620; the chapel, with its fine carved cedar, from 1694; the garden quadrangle was built 1665-1728; and large new buildings were added in 1887. The 'Lime Walk,' planted in 1713, is the feature of the garden. Kettel Hall, on Broad Street, near the college, built in 1615 by Ralph Kettel (president of Trinity), is a characteristic example of Oxford architecture of the period. Chillingworth, Selden, Denham, Aubrey, Thomas Warton, Landor, Newman, Freeman, and Stubbs were members.

UNIVERSITY COLLEGE had its origin in an endowment left in 1249 by William of Durham for the maintenance of some graduates of the university. This was at first administered by the university itself, and the institution called the university's Great Hall, 'Magna Aula Universitatis,' in distinction probably from some smaller

'halls' which the university owned. Afterwards the administration of the trust was committed to the beneficiaries themselves; and, under the influence of the example of Walter de Merton's foundation, the society became a college. In the 14th century there grew up a legend that the building occupied the site of a college founded by King Alfred, destroyed in the Danish invasion: King Alfred was even said to have founded University College in 872 A.D. University College was a great power in Oxford in 1686-88, when its master, Obadiah Walker, was the chief agent in the Roman Catholic effort to reconquer Oxford. The lawyers Lord Eldon and Lord Stowell, Sir William Jones, and the poet Shelley were members of this college.

WADHAM COLLEGE, founded by Dorothy, widow of Sir Nicholas Wadham, in 1613, on the site of the old Austin Friary. The beautiful gardens of this college perhaps owe something to the labours of the friars. The college buildings are an exquisite specimen of Jacobean work; the street front in particular is one of the prettiest bits in Oxford. Admiral Blake and Sir Christopher Wren were students here. The Royal Society took its origin in meetings in the rooms of Dr John Wilkins, warden of Wadham.

WORCESTER COLLEGE, founded by Sir Thomas Cookes of Worcestershire in 1714, in Gloucester Hall. Gloucester Hall had in 1560 succeeded Gloucester College, a college for Benedictine monks, founded in 1283, dissolved at the Reformation. Each monastery had its own building; and a row of these, forming one side of Worcester College quadrangle, each with the coat of arms of its monastery carved in stone over the door, is one of the most interesting bits of old Oxford. During the earlier part of Elizabeth's reign Gloucester Hall was filled with Roman Catholic students, their tutors being graduates who had been ejected from their fellowships in various colleges for refusing the oath of allegiance. Lovelace, Sir Kenelm Digby, and De Quincey were members of this college.

There are four recognised colleges and halls for women students:

LADY MARGARET HALL, founded in 1878, and called after Lady Margaret Beaufort, mother of Henry VII. Several enlargements have been made, notably the Wordsworth Building (1896) and the Toynbee Building (1915).

ST HILDA'S HALL, founded in 1893 by Miss Dorothea Beale, LL.D., and since then considerably enlarged, especially by the addition in 1921 of St Hilda's South.

ST HUGH'S COLLEGE, founded in 1886, but accommodated in new buildings in 1915. The membership is about 150.

SOMERVILLE COLLEGE (1879), originally Somerville Hall, has been very greatly extended, especially in 1886 and 1913.

The university of Oxford is a corporation under the title of 'the chancellor, masters, and scholars of the university of Oxford.' It consists of a body of graduates (masters of arts and graduates in law, medicine, divinity, &c.) who are the governing members of the corporation, and of a body of undergraduates (and bachelors of arts) who are *in statu pupillari*, that is, subject to the government of the officers of the university and without voice in university business. The statutes by which the university is governed are partly the code promulgated in the chancellorship of Archbishop Laud, partly the body of enactments issued by a parliamentary commission in 1877. The business of the university is formally transacted in three houses: (1) the Ancient House of Congregation, consisting of masters of arts of less than two years' standing, heads of colleges, deans of degrees of colleges, professors, examiners, &c., in which the ceremonial business of conferring ordinary degrees is conducted; (2) the House of Congregation, constituted by act of parliament in 1853, consisting of university officers, professors, and resident graduates, in which proposed statutes are submitted for discussion and vote; (3) the House of Convocation, consisting of all graduates who have kept their names on the books, which is in theory the supreme governing body of the university. Practically, however, the business of the university is in the hands of the Hebdomadal Council and of small committees, called delegacies

(or curators). Council began as a committed of heads of houses, invented under Stuart absolutism to control the free spirit of the university. It now consists of the chancellor, vice-chancellor, and ex-vice-chancellor and proctors, and eighteen persons elected by convocation, three being heads of houses, six professors, and nine members of convocation. Council retains the initiative in all legislation, the control of most of the negotiations in which the university takes part, the nomination of persons to receive honorary degrees, and the like. Committees govern the institutions of the university, such as the Bodleian Library, the University Chest, the University Press, and the Museum. The chief officers of the university are (1) the chancellor, the official head of the university, generally a peer of the realm, elected for life by convocation; (2) the vice-chancellor, nominated by the chancellor from the heads of houses in rotation, and holding office (as a rule) for four years; (3) the two proctors, holding office for a year, elected by the graduates of the colleges according to a cycle, each college getting its turn to elect a proctor every eleventh year. The proctors are specially charged with the discipline of the university as regards its junior members. Each college of the university is a distinct corporation, self-governed according to its own statutes under sanction of the parliamentary commissions of 1852 and 1877.

The earliest historical notice of Oxford shows also its importance in early times. In 912 A.D. the Saxon Chronicle records that, on the death of Ethelred, Edward (the son of Alfred) took possession 'of London and Oxford and all the lands obedient to those cities.' The remarkable Castle mound, now included in the precincts of the county gaol, was heaped up at this period, being part of the great system of fortifications which were then raised against the Danes. During the troubled years which follow Oxford is frequently mentioned, its position just between Mercia and Wessex rendering it important as a citadel against invasion, and as a place of parley between Danes and Saxons. It may be inferred that at the Norman Conquest Oxford offered a stubborn resistance to the invader (1) from the great number of 'waste' houses mentioned in the Domesday survey; (2) from the vastness of the work erected by the conqueror's governor, Robert D'Oyley, to overawe the city and district. Two portions of this work remain, the tower (now of St Michael's Church) which commanded the approach to the assailable North Gate of the city, and the great keep of the Castle (now in the precincts of the gaol). In the contest for the crown between the Empress Maud and Stephen (1142) Oxford was again a place of capital importance, Maud taking refuge in Oxford when driven from London, and escaping over the frozen Thames when the castle was about to surrender to Stephen after ten weeks' siege. Here in 1258 the 'mad parliament' enforced on Henry III. the scheme of reform known as the Provisions of Oxford (see MONTFORT). From this date Oxford as a town ceases to be of national importance, except for a few years in the heat of the great Civil War, when Charles I. made it the centre of his operations, the station of his court, and the meeting-place of the 'parliament' which he had brought together in opposition to that 'Long' one at Westminster.

But at the very time when Oxford, as a city, was losing its political and strategical importance there was growing up within it a distinct, and destined often to be a hostile, corporation which was to make it for centuries the intellectual capital of England. This corporation was the university which we find by the end of the 12th century and

the beginning of the 13th establishing itself in Oxford. But, at the same time, it must have been only the official recognition of a guild of teachers with their pupils which was already in existence in the city; and a guild of this kind must, in its turn, have been the development of accidental, and perhaps temporary, assemblages of teachers and students. The beginning of the university of Oxford is therefore to be carried as far back as the earlier third of the 12th century; Thibaut d'Estampes (Theobaldus Stampensis) about 1120, and Robert Pullein in 1133, being recorded to have taught in Oxford. The university, thus begun under Henry I. (who in 1130 built as a royal residence Beaumont Palace in the north suburb of Oxford, in which palace Richard Cœur de Lion was born in 1157), rapidly grew in numbers and in prestige; and by the beginning of the 13th century we find popes and kings interested in its fortunes, its scholars numbered perhaps by thousands and not by hundreds, and the feuds between it and the town occasionally events of almost national importance. Teachers and scholars in this early university were of the secular clergy; they lived and taught in houses ('halls') and lecture-rooms ('schools') hired from the townsmen; and discipline was practically non-existent.

The fame of the university attracted to Oxford the four great orders of mendicant friars immediately after their arrival in England, the Dominican (Black) Friars coming in 1221, the Franciscan (Grey) Friars in 1224, the Carmelite (White) Friars in 1253, and the Austin Friars in 1268. The friars, unlike the older orders of monks, who had stood aloof from secular learning, threw themselves with enthusiasm into the studies of the university; and the 'schools' in their convents and their lecturers soon eclipsed the fame of the secular schools and teachers. That Oxford can boast the greatest names in mediæval learning and legend, Bishop Grosseteste, Roger Bacon, Friar Bungay, and Duns Scotus, is due to these conventual schools. So threatening did the supremacy of the friars become that the university in the early 14th century had a hard fight to retain control of its own education.

In emulation of the friars, the older monastic orders began to found conventual schools at Oxford for students of their own body. The Benedictines had four colleges in Oxford: Gloucester College (*v. supra*); Durham College (*v. supra*); Canterbury College, founded in 1363, now taken into the site of Christ Church; and St Mary's College, founded in 1435, now a dwelling-house belonging to Brasenose. For the Cistercians St Bernard's College was founded in 1437 (*v. supra*).

The introduction into the university of the conventual system, with the severity of its discipline, the interpenetrating stimulus of its common life, and the efficiency of its personal tuition, suggested a change in the university of secular students which was to effect in time an entire revolution in its form. In 1264 Walter de Merton conceived the plan of bringing together into a common home a number of secular students, engaged in academic studies but subject to something like conventual discipline. In 1274 he moved his college (which he had established at Malden in Surrey) to Oxford. Two other institutions, which had been founded in Oxford at a slightly earlier date, soon, under the influence of the new idea, took the shape of Balliol and University Colleges. By 1525 ten other colleges had been instituted, among them such great designs as New College, Magdalen College, and Wolsey's Cardinal College (afterwards reconstituted by Henry VIII. as Christ Church, with a fraction of its former endowment).

The Reformation of religion, and the dissolution of the monasteries which it carried with it,

destroyed half the glory of Oxford. Two abbeys, five friaries, and five monastic colleges ceased to exist; and the western and south-western quarters, which had contained the finest buildings of the city, became heaps of stones out of which the citizens of Oxford quarried building material. During the Romanist reaction under Queen Mary something was done to repair the loss thus inflicted: Trinity College in 1554 and St John's in 1555 were built on the respective sites of Durham College and St Bernard's College. Jesus College, founded in Elizabeth's reign, was the first of Protestant colleges. The more settled times of the early Stuarts patronised the gown more liberally; Wadham College coming in 1613, Pembroke in 1624. Then came the Civil War, and not till 1714 did a new foundation arise in Oxford, in Sir Thomas Cookes' Worcester College; and, except for the abortive attempt (1740-1818) to erect Hart Hall into a college, that example found no imitator till the foundation of Keble College in 1870 and of Hertford College in 1874, followed by the transference to Oxford of Mansfield College and of Manchester New College, bearing witness to the new life which had begun to throb alike in the Anglican Church and in Nonconformity.

In Elizabeth's reign, and still more under the Stuarts, we have to mark a very strong desire on the part of the supreme power to compel all students in the university to reside within the walls of the colleges and the halls (then five in number). The strong opposition of minorities, in matters both of polity and faith, rendered English sovereigns and their ministers suspicious and intolerant of students and teachers who were not directly under their control; and to secure this control they required that all students should reside in the colleges, where they were under the charge of governors appointed by court influence and responsible to the court. From this time, therefore, we have to date the disappearance of the old university and the development of that peculiarly English form, a university of colleges.

In some outstanding features the university of Oxford stands in marked contrast to universities out of England. (1) The College System. Before a person becomes a member of the university he must first of all become a member of one of the twenty-one colleges, of St Edmund Hall, or of the Society of Non-Collegiate Students; and the moment he ceases to be a member of one of these societies his actual membership of the university is also terminated. This means that the Oxford undergraduate is not left as a unit in a great body of two or three thousand, but is made a member of a much smaller body of a few hundred members. (2) The Fellowship System. Formerly every first-class man (and many in the second class) could count with certainty on his fellowship—that is, on a secure endowment (for a shorter or longer period) which would enable him to pursue his studies or to prepare himself for professional life. Some few of these fellowships are still open to competition; but the regulations of the Commission of 1877, which suppressed many fellowships to found professorships, coinciding with the loss of more than a third of the annual revenues of the colleges from the fall in agricultural rents, have seriously reduced their number and, so far, deprived Oxford of her best feature. The scholarship system—i.e. endowments held during the time of an undergraduate's course—is not so distinctive of Oxford; though such endowments are more numerous and valuable in Oxford than in any other university. (3) The System of Tuition. The work which in other universities is discharged by the professors is in Oxford done mainly by the college lecturers. Formerly a college

lecturer lectured only to the men of his own college, a system unfair to the students of an inefficient college; now the better college lectures are practically open to the whole university. At the same time, the old Oxford tradition of a college tutor devoting himself to the interests of the men of his own college still continues. Apart from attendance at lectures, a large portion of Oxford tuition consists in taking compositions, translations, papers, and essays either individually or in very small classes to one's tutor or lecturer. This individual instruction involves, it is true, an expenditure of time and talent which seems out of all proportion to the results it achieves, yet the happiest memories of Oxford men are probably those half-hours or hours in their tutor's room when their individual faults were exposed by the large scholarship and their individual eccentricities corrected by the unsparing but good-natured chaff of a kindly mentor. When the university has resident in it a man of special reputation in a given branch of study, the common university fund has frequently appointed him to lecture for three or more years in his own subject, with the title of 'Reader.' (4) The Discipline. The discipline of Oxford is much stricter than that of any university outside England. Within college the government of the college deans, without college the vigilance of the proctors and their deputies, repress disorder and immorality. The passage of years has softened many restraints, but even yet there is a strict code of discipline both with respect to the university as a whole and to each particular college. The wearing of cap and gown, though not now so general as formerly, is still insisted on for certain functions—e.g. university ceremonies.

Under present arrangements the B.A. degree is reached by three examinations: (1) Responsions, a preliminary examination in the elements of a certain number of specified subjects. In 1920 Greek, hitherto compulsory, was made optional for this examination. (2) The 'First Public Examination,' usually known as Moderations ('Mods'). Here it is necessary to decide whether a candidate shall (a) take an Honours examination in the middle of his course, (b) take a Pass examination at that point, or (c) take an examination which implies taking an Honours examination at the end of the course. (3) The final examinations, officially termed the 'Second Public Examination,' but colloquially 'Greats,' where the distinction between pass and honours is very marked. The degree of M.A. is obtained by keeping the name on the books for three (or four) years from the date of B.A., by paying quarterly dues, and by paying graduation fees. The university of Oxford grants also the degrees of doctor in philosophy, and of bachelor and doctor in divinity, law, medicine, literature, science, music. The doctors' degrees are awarded, as in other universities, on the production of approved theses. Although attendance at lectures and examinations has been open to women students since 1884, only since 1920 have women been admitted to matriculation and degrees (except degrees in divinity).

Since 1868 there has been in Oxford a body of students not members of any college or hall, styled formerly 'unattached students,' but latterly The Society of Non-Collegiate Students. These students reside in licensed lodgings; have a building provided by the university in which they attend lectures and meet their tutors; are under the disciplinary control of a censor, as the students of a college are under the control of their dean; and are supervised by a board of delegates, in the same way as the students of a college are by the head and fellows of their college. A somewhat similar

institution for women is The Society of Oxford Home-Students (1879). Under a statute of 1882 it is possible for a member of convocation to open a 'private hall,' of which he is the 'licensed master,' for the reception of academical students. These private halls are partly for Roman Catholics under a head of their own faith.

Oxford is fortunate in having been described from the points of view of its different interests in several attractive handbooks: Rev. C. W. Boase's *Oxford City*, in the 'Historic Towns' Series (Longmans, 1887); Dr Brodric's *History of the University of Oxford*, in the 'Epochs of Church History' series (Longmans, 1886); Rev. E. Marshall's *Oxford Diocese*, in the 'Diocesan Histories' series (S.P.C.K. 1882); and a complete series of *Oxford College Histories* (F. E. Robinson, 1898 *seqq.*). Alden's *Oxford Guide* is a useful guide to the architectural features of the city; and in Andrew Lang's *Oxford: Brief Historical and Descriptive Notes* (1885; new ed. 1890) a charming presentment of Oxford is given both by writer and artists. A manual of the studies of the university is furnished by J. Wells in his *Oxford and Oxford Life*, while for general information *Oxford of To-day*, by Crosby and Aydelotte (1923), is interesting reading. A full account of Oxford, civic, ecclesiastical, academic, collegiate, personal, up to the end of 17th century, will be found in the various works of the great Oxford antiquary, Anthony Wood, in the following editions—his *History of the University and of the Colleges and Halls*, by J. Gutch (1786-96); his *Athenae and Fasti*, by Dr Bliss (1813-20); his *City of Oxford*, by A. Clark (1889 *seqq.*). From the time of Wood the formal annals of the university become of little interest and very little importance. The interest of books about Oxford rather lies in the diaries which give the day-to-day impressions of Oxford residents. Anthony Wood for the 17th century and Thomas Hearne for the 18th (best edition of both by the Oxford Historical Society), or in reminiscences of Oxford life in memoirs and autobiographies—e.g. in the autobiographies of Edmund Gibbon, R. L. Edgeworth, &c., and in Stanley's *Life of Arnold*. Part of the ground traversed by Wood has been gone over from the point of view of modern criticism by James Parker for the city (to the year 1100) in his *Early History of Oxford* (Oxf. Hist. Soc. 1888), and by H. C. Maxwell Lyte for the university (to the year 1530) in his *History of the University of Oxford* (1886). See also *Reminiscences of Oxford by Oxford Men*, edited by Miss Quiller-Couch (1891); S. F. Hulton, *Ricce Ozonienses* (1892); Joseph Foster, *Alumni Ozonienses 1500-1886* (1888-91), and his *Oxford Men and their Colleges* (1893); Wells, *Oxford and Oxford Life* (1893), and numerous other publications, *Oxford and its Colleges*, *The Charm of Oxford*, &c.; *The Colleges of Oxford, their History and Traditions*, edited by Andrew Clark (1891); Madan's *Oxford outside the Guide-books* (1923); Mallet's *History of the University of Oxford* (1924). Oxfordshire, an inland county of England, in shape very irregular, and with an extreme length and breadth of 48 miles by 26; is bounded on the N. by Warwickshire and Northants, E. by Bucks, S. by the river Thames, and W. by Gloucestershire. Area, 749 sq. m., or 479,220 acres. Pop. (1801) 109,620; (1891) 185,669; (1921) 189,558. Flat and bleak in the north and west, except near Edgehill (q.v.), on the Warwickshire border, and undulating in the central district, the county in the south presents a succession of richly wooded hills, alternating with picturesque dales, and terminating on the south-east border with a branch of the Chiltern Hills, which, near Nuffield, attain a height of nearly 700 feet above sea-level. Foremost, however, among the natural beauties of Oxfordshire are the numerous rivers by which it is watered, notably the Thames, with its affluents the

Windrush, Evenlode, Cherwell, and Thame. By river and canal Oxfordshire has water communication with nearly every part of England. The soil in general is fertile, and the state of agriculture advanced; wheat, barley, and oats are the principal crops, while sheep, cattle, and pigs are reared. Ironstone is extensively worked in North Oxfordshire. The most important manufactures are those of plush, shag, and girth weaving, agricultural implement-making, and engineering at Banbury (also famous for its cakes), of blankets at Witney, of paper at Shiplake and Henley, and, to a certain extent, of gloves at Woodstock. The county contains the city and county borough of Oxford, the municipal boroughs of Banbury, Chipping Norton, Henley-on-Thames, and Woodstock, the urban districts of Bicester, Thame, Wheatley, and Witney, all in the diocese of Oxford. Two members are returned to the House of Commons for the county, as also one for the city of Oxford and two for the university. Most of the historical events connected with the county took place at Oxford (q.v.), but apart from them may be mentioned the battles of Chalgrove (1643) and Cropredy Bridge (1644). The best known of its worthies are Edward the Confessor, Leland (the antiquary), Dr Heylin, Viscount Falkland, 'Doctor' Fell, Thomas Ellwood, Lord Chief-justice Holt, Rev. James Granger, Warren Hastings, Lord Keeper Guilford, Sir William Beechey, Miss Edgeworth, Charles Reade, Green (the historian), Lord Penzance, Sir W. Vernon Harcourt, and Lord Randolph Churchill. See works by Skelton (1823), Davenport (1869), Meade Falkner (1899), and the 'Victoria History' (1907 *et seq.*).

Oxidation is the term given to the changes which occur when elementary or compound substances enter into new combinations with oxygen. The majority of those chemical actions to which the term Combustion (q.v.) is applied are examples of oxidation. The products of the processes of oxidation are frequently (but not invariably) oxides.

Oxides are compounds of oxygen with other elements, and are amongst the most important of the classes of chemical compounds. Basic oxides and acid oxides are described in the article CHEMISTRY (q.v.). In addition to these two large classes of oxides there are numerous oxides which do not possess either basic or acid properties, or if at all only to a very insignificant degree.

Oxlip. See COWSLIP.

Ox-pecker. See BEEF-EATER.

Oxus, the ancient name of the Amu Daria in Asiatic Russia, known as Jihûn by Arab writers. Rising in the Pamir at 13,000 or 14,000 feet above sea-level, it flows westwards between Afghanistan and Bokhara; from 66° E. it runs NW. across the deserts of Bokhara and Khiva, and empties itself through a delta 90 miles long into the southern extremity of the Sea of Aral. From the junction of the Waksh (or Surkhab) and Panj, between 68° and 69° E., the river is navigable, and is called Amu Daria by the natives. Its length from Lake Victoria in the Pamir to the Aral Sea is 1560 miles; its width varies from 400 yards to over 3 miles; its basin, half in Afghanistan, half in Russian Central Asia, is 116,000 sq. m. in area, apart from rivers like the Zarafshan and Kashka Daria, which are lost in Bokharan deserts before reaching the Amu Daria. Its tributaries (e.g. Surkhan and Kafirnahan on right, Aksarai on left) all enter E. of 67° E. Of all great rivers the Amu Daria derives the greatest percentage of its waters from mountain snow and ice; in the hot, dry plains absorption and evaporation take place; in winter the river freezes. From early times it has been utilised, as in the Khiva oasis, for irrigation purposes,

and it invites extensive development. At Charjui the Transcasian Railway crosses it by a bridge (1888; rebuilt 1901) over a mile long. Some authorities have maintained that the Oxus used to flow into the Caspian by the Uzboi depression in the Post-Pliocene period, and even at intervals during the Christian era. The Russians long considered the possibility of diverting it into the Caspian. See TURKESTAN, ARAL, CASPIAN SEA, PAMIR.

Oxyacetylene. See BLOWPIPE.

Oxychlorides, chemical compounds containing both chlorine and oxygen in combination with some other element, and intermediate in composition between the oxides on the one hand and the chlorides on the other. Thus, antimonious oxychloride, SbOCl , is intermediate between antimonious oxide, Sb_2O_3 , and antimonious chloride, SbCl_3 .

Oxygen (sym. O; atom. number, 8; atom. wt. 16) is a colourless, inodorous, tasteless gas, long regarded as a 'permanent' gas, but liquefied by Pictet of Geneva for the first time in 1877. Its chemical affinities for other elementary substances are very powerful; with most of them it is found in combination, or may be made to combine, in more than one proportion; with several in as many as four different proportions. Apart from the gases of the argon group, bromine and fluorine are the only elements with which it does not enter into combination. Owing to the intensity with which many of these combinations take place, this gas has the power of supporting Combustion (q.v.) in an eminent degree. It is only slightly soluble in water; 100 cubic inches of that liquid dissolving 4.11 cubic inches of gas at 32°, and only 2.99 inches at 59°. It is slightly heavier than air, its specific gravity being 1.1056.

Oxygen gas is not only respirable, but is essential to the support of animal life; and hence it was termed *vital air* by some of the older chemists. A small animal placed in a bell-glass containing pure oxygen will not be suffocated as soon as if it were placed in the same glass filled with atmospheric air. For further details on this property of oxygen, the reader is referred to the article RESPIRATION.

Oxygen is the most abundant and the most widely distributed of all the elements. In its free state (*mixed* but not *combined* with nitrogen) it constitutes about a fifth of the bulk, and considerably more than a fifth of the weight, of the atmosphere. In combination with hydrogen, it forms eight-ninths of all the water on the globe; and in combination with silicon, calcium, aluminium, &c., it enters largely into all the solid constituents of the earth's crust; silica—in its various forms of sand, common quartz, flint, &c.—chalk, limestone, marble, and all the varieties of clay, containing about half their weight of oxygen. It is, moreover, found in the tissues and fluids of all forms of animal and vegetable life, none of which can support existence independently of this element.

There are various laboratory methods of obtaining oxygen on the small scale, the simplest of which consists in the exposure of certain metallic oxides to a high temperature. It was originally obtained by its discoverer, Dr Priestley, from the red oxide of mercury, which, when heated to about 750°, resolves itself into metallic mercury and oxygen gas. It may be obtained similarly from red oxide and peroxide of lead, the resulting products being protoxide of lead and oxygen.

The ordinary laboratory method commonly employed to obtain an abundant supply of oxygen consists in heating chlorate of potash, KClO_3 , which yields up all its oxygen (amounting to 39.16 per cent.), and leaves a residue of chloride of potassium. One ounce of this salt yields nearly

two gallons of oxygen gas. It is found by experiment that if the chlorate of potash is mixed with about a fourth of its weight of black oxide of copper, or of binocide of manganese, the evolution of the gas is greatly facilitated, although the oxides do not seem to undergo any change during the process.

Various processes have been proposed for obtaining oxygen on the large scale, but only in recent years has the commercial production of the gas been carried out sufficiently cheaply to enable oxygen to be employed extensively for industrial purposes. The method employed by Brin's Oxygen Company consists in passing air under pressure over barium oxide, BaO , heated to a temperature of dull redness. In this way a quantity of barium peroxide, BaO_2 , is formed, and this can be made to again yield up its extra oxygen in the pure state (being reduced again to BaO) by heating to a full red heat, or, as is actually done in practice, by greatly diminishing the gaseous pressure without altering the temperature. It is now obtained in a high degree of purity by the fractional distillation of liquid air. Oxygen can now be obtained in practically any required quantity in wrought-steel cylinders, in which it is compressed up to a pressure of 120 atmospheres.

Oxygen was discovered almost simultaneously, in 1774, by Priestley and by Scheele. Priestley called it 'dephlogisticated air,' Scheele 'empyrean air,' Condorcet 'vital air;' and in 1789 Lavoisier, who proved that the combustion of bodies in the air consisted essentially in their chemical combination with oxygen, and thus overthrew the 'Phlogiston' (q.v.) theory, gave it its present name (from Gk. *oxys*, 'acid,' and *gennao*, 'produce'), believing (wrongly) that it was a necessary constituent of every acid.

Oxyhydrogen. See BLOWPIPE, LIME-LIGHT.

Oxyrhynchus (now *Behnesa*), on the edge of the Libyan Desert, near the Nile and some 400 miles SSW. of Cairo, is the site of an ancient city, where since 1896 valuable papyri have been excavated, including Logia ('sayings'—some otherwise unknown) of Jesus, lost poems of Callimachus, Sappho, and Pindar, much of Isocrates, Menander, and Alcæus, fragments of Ibycus, a heretofore unknown continuation of Thucydides, and a 3d-century Christian hymn, the most ancient piece of church music extant. Most of them have been edited by Grenfell and Hunt.

Oyer and Terminer (Fr. *ouïr*, 'to hear;' *terminer*, 'to determine'). See ASSIZE.

Oyster (*Ostrea*), a genus of bivalves, the members of which are well known to be very passive and very palatable. *Structure*.—The fundamental characteristics, as displayed by the favourite European species, *Ostrea edulis*, are those of other bivalve Molluscs (q.v.), but the 'foot,' with which many less sedentary forms move, is almost completely degenerate, the two valves of the shell are unequal, the hinge which unites them is without teeth, and the powerful closing muscle is almost median in position. The left valve of the shell, that by which the animal fixes itself, is hollowed out, while the other is almost flat, and the whole animal is slightly unsymmetrical. On an opened oyster it is easy to detect the fringed mantle which lines and makes the shell, the ciliated gills or 'beard,' two somewhat similar flaps (labial palps) on each side of the mouth, which, overhung by a hood, lies near one end of the hinge, the brownish digestive gland, the heart and the kidneys close beside the shell-shutting muscle. 'I suppose,' says Professor Huxley, 'that when the sapid and slippery morsel—which is and is gone like a flash of gustatory summer lightning—glides along the palate, few people imagine that they are swallowing a piece of machinery (and going machinery too) greatly more

complicated than a watch'—in fact a living organism of a high order.

General Life.—The oyster feeds on microscopic organisms which are washed into the gaping shell and on to the mouth by the ciliary activity of the

Diagram of Internal Structure.

The dorsal surface is downwards, the anterior or head end to the left. *a*, region where water enters and leaves the animal; the dark lines indicate where one mantle-flap has been cut away to expose the other structures; *b*, gills; *c*, margin of one of the mantle-folds; *d*, anterior part of hinge; *e*, hood over mouth; *f*, position of mouth; *g*, *h*, labial palps; *i*, end of intestine; *l*, the closing muscle of the shell; *m*, position of the heart.

gills and palps; and it may be noted that the greenish tinge, regarded by epicures as one of the highest credentials of an oyster, is probably due to a copious diet of minute green algae. As every one knows, oysters live gregariously in 'beds' or 'banks' at depths of 3 to 20 fathoms, and are strangely fastidious as to locality. They have many enemies besides the dredger, such as the little sponges (*Clione*), which bore in the shells; marine worms, and sea-snails (e.g. *Purpura* and *Murex*), which also effect an entrance; besides starfishes, which swallow little ones intact, or, embracing larger specimens, insert their arms when the shells gape. Although these passive animals have no eyes or ears they can detect the shadow of an approaching boat; the mantle-fringe and some other parts are undoubtedly sensitive; and some enthusiasts have even inferred 'intelligence' from the fact that in the 'oyster-schools' and elsewhere the molluscs learn to keep their shells shut when the tide retires or when they are transported by rail!

Life-history.—There are many interesting facts connected with the life-history of the oyster. Thus, *O. edulis* is hermaphrodite, being first an egg-laying female, afterwards a sperm-producing male, while *O. angulata* and the American *O. virginica* have the sexes separate. Maturity is sometimes rapidly attained, but usually not until the third or fourth year of life, and the maximum fertility is between the fourth and seventh year. The reproductive season generally begins in May, and continues till the beginning of autumn, but its limits are extended or lessened by the conditions of temperature. When the oyster becomes 'sick,' 'milky,' or 'out of season,' the mantle-cavity and the interspaces between the gills are packed with developing eggs, which fishermen call 'white,' and at a later stage 'black spat.' Buckland likened this black spat to fine slate-pencil dust, and the emergence of the young from the mother to a puff of smoke from a railway-engine. He computed the number of developing eggs in an oyster at from 276,000 to 829,000; and Professor Möbius, a great German authority on oysters, calculated that 1000 full-grown parents produce 440 million embryos annually.

These embryos are only about $\frac{1}{16}$ th of an inch in length, and about two millions of them might be

packed into a cubic inch, but the numbers which rise from an oyster-bank are so immense that the water seems to be clouded. They are very unlike the adults in habit, for they swim actively for some days by means of a protrusible ciliated cushion or *velum*. The valves of the shell are transparent and symmetrical; the gills, palps, and some other adult structures have yet to be developed. In the American oyster, the eggs are set adrift at an early stage, fertilisation and the whole of development taking place outside the shelter of the parent. In either case the mortality is enormous; multitudes are washed away to unsuitable localities, and multitudes are devoured by hungry animals; in fact Möbius computes that out of 440 million embryos only 421 individuals reach maturity.

Those that survive become weighted by their growing shells, draw in their ciliated velum for the last time, and sink to the bottom as a 'fall of spat.' They settle on stones, shells, or other 'culch,' and often nowadays on chalked tiles or on floating collectors which are placed for the purpose of receiving them. Moored by their left shells, they grow rapidly, from $\frac{1}{8}$ th of an inch when first attached, till at the end of six to eight months they are like threepenny pieces, and are known as 'brood.' The diameter of an oyster at two years is about two inches, another inch is added in the third year, after which the growth is much less rapid.

Different Kinds.—Oysters are represented by several widely distributed species—e.g. the European *O. edulis* and *O. angulata*, the American *O. virginica* with several varieties, two others from the western coasts (*O. conchophila* and *O. lurida*)—all of them edible, while the Cape of Good Hope, Australia, Japan, &c. are not without their share. They vary considerably in size; those from 3 to 6 inches are common, but Sir J. E. Tennent found one in Ceylon measuring a little over 11 inches in length. American oysters are often very large. The banks of oysters sometimes form important marine and shore deposits—witness the banks of long, narrow 'raccoon' oysters off the coast of Georgia and other parts of North America, which are said to form natural breakwaters. The race is an ancient one, for oysters appear in the Carboniferous strata, and two related forms—*Gryphæa* and *Exogyra*—with thick heavy shells, are common fossils. The name is sometimes extended to other bivalves, such as the false oyster *Anomia* (one valve of which is perforated by a tag of attaching byssus), the pearl-oyster *Meleagrina* (see PEARL), and the thorny oyster *Spondylus*.

Edibility.—The accumulations of oyster-shells in the 'kitchen-middens' of Neolithic ages show that the appreciation of oysters is no modern taste. To Roman palates the oyster was precious, and the praises of its appetising flavour (*grata ingluvies*) were often sounded. Those of Rutupie (Richborough, in Kent) were early known to the epicures and highly esteemed. When eaten alive or half-alive in the usual fashion, they are not only pleasant, but nutritious and readily digested, nor can any evil effects (such as parasites) be traced to moderate indulgence in these dainties. 'The points of an oyster are,' Frank Buckland says, 'first the shape, which to be perfect should resemble very much the petal of a rose-leaf. Next, the thickness of the shell; a first-class thoroughbred native should have a shell of the tenuity of thin china or a Japanese tea-cup. It should also have an almost metallic ring, and a peculiar opalescent lustre on the inner side; the hollow for the animal of the oyster should be as much like an egg-cup as possible. Lastly, the flesh itself should be white and firm, and nut-like in taste. It is by taking the average proportion of meat to shell that oysters should be

critically judged. The oysters at the head of the list are of course "natives" (oysters artificially reared); the proportion of a well-fed native is one-fourth meat.

Oysters and Disease.—Many cases of enteric illness and death have been referred to the eating of oysters, and bacteriological investigations of the power of the oyster to absorb, retain, and transmit the typhoid bacillus and the cholera vibrio have been made. It appears that oysters contaminated by sewage, &c., can and do transmit disease; and that in many localities the conditions of culture and storage do expose oysters to the serious risk of such contamination.

Supply.—The British supply is derived from three sources—from the national oyster-banks, which are gradually getting the attention which they deserve; from the continental banks and farms, especially those of France and Holland; and from the United States. Of national oyster-banks the chief are at Whitstable, Colchester, and Brightlingsea, but oyster-fishing is also conducted at Inverary and Ballantrae in Scotland, and at Wicklow, Queens-town, Ballyheige, Galway, and Moville in Ireland. In Britain oysters are considered as in season from September to April. By an act of 1877, applying to England and Scotland, a general close time for the capture and sale of 'deep-sea oysters' is fixed from 15th June to 4th August, and for all other kinds of oysters—except oysters taken in the waters of a foreign state—from 14th May to 4th August. In Ireland the general close time fixed by law is from 1st May to 1st September, but in several instances this period has been legally varied. In France the principal oyster fisheries are at Arcachon (q.v.) and Cancale (q.v.). From France and elsewhere large quantities of young oysters are imported to be fattened on British culture-grounds. In the United States the great oyster-beds are at Long Island Sound and Chesapeake Bay. The bivalve is found, however, from the Gulf of St Lawrence to and along the north shore of the Gulf of Mexico, and, though smaller, at points on the west coast, as Puget Sound and Juan de Fuca Strait. The chief market lies in the east, but oysters are sent also in car-loads from Baltimore, New York, and other centres to places in the west—to Milwaukee, Chicago, St Louis, and even San Francisco. In some parts the Clam (q.v.) rivals the oyster in popularity. For the oyster fisherman the practical problem is to keep up a supply sufficient to meet the large demand. For various reasons this seems to be difficult. As oysters live in 3 to 20 fathoms of water, they can hardly be gathered with much selection; they are sometimes lifted by 'rakes' and tongs, but usually by the dredge; this is a destructive process, probably killing more than it secures. There seems some evidence to show that sheer over-dredging has almost ruined some of the banks, but this probably has been exaggerated. Changes in the sea-bottom and in the food-supply have doubtless had more to do with the disappearance of oysters from localities where they once abounded. Those who permit all kinds of debris and foulness to be emptied into the sea can hardly expect a flourishing oyster-bank in the neighbourhood. To preserve the beds, to observe 'close time,' to re-stock when the supply wanes, and similar practical precautions are certainly effective; but regulations which are satisfactory on paper are often very unsatisfactorily realised.

Oyster-culture.—Artificial oyster-culture is now successfully practised on various plans throughout the world, British and American methods substantially agreeing, while French, Dutch, and Japanese systems are somewhat more elaborate. Oyster-culture is no novelty, having been prac-

tised by the Romans. Thus, Pliny says that 'the first person who formed artificial oyster-beds was Sergius Orata (in the time of Augustus), who established them at Baiæ . . . not for the gratification of gluttony, but for the sake of gain, as he contrived to make a large income by the exercise of his ingenuity.' In the days of the later emperors there were well-established *ostrearia*, and Lake Fusaro, the Acheron of Virgil, a muddy salt-water pond, nowhere more than six feet in depth, has been for many centuries utilised for this purpose. Of oyster-culture there are many different kinds; it may be confined to 'fattening' oysters in some conveniently constructed pond; or 'fallen spat,' collected on tiles or artificial 'culch,' may be brought to the sheltered culture-grounds, where the young can grow in safety; or again, oysters may be bred in confinement. It has even been found possible in America to fertilise the eggs artificially with sperm from male oysters, and though this is not so feasible in the case of the European species, whose eggs are retained within the parent until they have to some extent developed, they can nevertheless be bred in confinement. Another possibility is to collect the free larvæ, which are sometimes very abundant, and transfer them to culture-grounds where the risks of mortality would be lessened. The success which has already attended various forms of oyster-culture certainly warrants further extension and experiment, especially as many authorities believe that there is more hope in this than in any legislative measures to preserve the natural banks.

Oyster-catcher (*Hematopus*), a genus of birds of the family Charadriidæ, closely allied to the Plovers, and distinguished chiefly by the long, strong, straight, wedge-shaped bill, legs of moderate length, feet with only three toes, all directed forwards and united at their base by a small membrane. The genus, which is cosmopolitan in its distribution, embraces nine species. The only European species, *H. ostralegus*, known also as

Oyster-catcher (*Hematopus ostralegus*).

the Sea-pie and Mussel-picker, is found on many parts of the English coast, and is common in Scotland along the whole east coast, on the Scottish islands even as far as St Kilda, and also on the Irish coasts. Although a coast bird, it often wanders inland, and may be found breeding near inland lochs and on the banks of large rivers. It occurs in Greenland, is common in Iceland, and in many parts of Europe, Asia, and Africa. Its southern migrations extend to Burma, Ceylon, Persia, Mozambique, and Senegambia. The adult bird is about 16 inches long, has black and white plumage, orange-yellow bill, crimson irides, and flesh-coloured legs and toes. It is very regular in its feeding habits, passing with great punctuality to and from its feeding-grounds, where it regales

itself with mussels, whelks, limpets, annelids, crustaceans, and small fish. Its eggs, usually three or four in number, are laid on shingle, more rarely among sandhills or even in fields inland, and sometimes on the top of a fairly lofty stack. The oyster-catcher swims well, and takes to the water of its own accord. Its flesh, though dark in colour, is palatable. *H. capensis* is a black species ranging from the Cape to the Canaries. Three or four species are confined to America.

Oyster Plant. See SALSIFY.

Ozæna (Gr. *ozē*, 'a stench') is generally used of all diseased conditions of the nose accompanied by great fetor of the breath. This may arise from the ulcerations occurring in tubercular or syphilitic disease, or in lupus; from malignant disease; from necrosed bone; or from the presence of a foreign body. But it also occurs where none of these causes is present; and to this form of disease the term is limited by medical writers. In these cases there is a peculiar form of inflammation of the mucous membrane of the nose, called *dry catarrh*, in which the morbid secretion accumulates in the form of crusts in the nasal cavity. This may occasion comparatively little inconvenience, till it leads, as it often does, to the occurrence of an offensive and characteristic odour, the precise cause of which has not been ascertained. It is a very chronic and troublesome disease; but much relief is obtained by the frequent use of alkaline and antiseptic washes or sprays. An arrangement devised by Gottstein renders the secretion moist, and so keeps the fetor in abeyance—the introduction of a plug of cotton-wool, which is worn in each nostril for a few hours daily.

Ozaka. See OSAKA.

Ozanam, ANTOINE FRÉDÉRIC, was born at Milan, 23d April 1813, studied at Lyons and Paris, and was appointed in 1841 to fill the chair of Foreign Literature at the Sorbonne. He died at Marseilles, 8th September 1853. Ozanam possessed learning and industry, but fate did not favour him in his dream of rivalling the work of Gibbon, save in such fragments as *Dante et la Philosophie Catholique au XIII^e Siècle* (1839), *Histoire de la Civilisation au V^e Siècle* (1845; Eng. trans. 1868), and *Études Germaniques* (1847–49). A collected edition of his writings fills 11 vols. (1862–65). See books by Karker (Paderborn, 1867), O'Meara (Edin. 1876), Hardy (Mainz, 1878), Chauveau (1887), Huit (1888), and Baurard (1912).

Ozokerite. See BITUMEN.

Ozone (Gr. *ozō*, 'I smell'). It was remarked long ago that a peculiar odour was produced by the working of an electrical machine. Van Marum found that, when electric sparks were passed through a tube containing oxygen, the gas became powerfully impregnated with this odour—which he therefore called the 'smell of electricity.' Subsequent writers attributed the phenomenon to the formation of nitric acid, due to a trace of nitrogen mixed with the oxygen; especially as the gas was found to act energetically upon mercury. Thus supposed to be explained, these curious results were soon forgotten. But in 1840 Schönbein (q.v.) with remarkable acuteness made a closer investigation of the question, and arrived at many most curious results, all of which have not even yet been satisfactorily accounted for. The problem remains, in fact, one of the most perplexing, as well as interesting, questions imperfectly resolved in chemistry. The earlier results of Schönbein were these: (1) When water is decomposed by the voltaic current, the electrodes being of gold or platinum, the oxygen (which appears at the positive

pole) possesses in a high degree the smell and the oxidising power developed by Van Marum by means of friction-electricity. (2) When the positive electrode is formed of an oxidisable metal these results are not observed, but the electrode is rapidly oxidised. (3) The oxygen collected at a platinum electrode retains these properties for an indefinite period if kept in a closed vessel; but loses them by heating, by the contact of an oxidisable substance, and even by contact with such bodies as charcoal and oxide of manganese. To the substance, whatever it may be, which possesses such powerful chemical affinities, Schönbein gave the name ozone, from its smell. In 1845 he showed that the same substance can be produced by the action of phosphorus on moist air, and hinted that it might be a higher oxide of hydrogen.

De la Rive and Marignac shortly afterwards, repeating the experiments of Van Marum, showed that electric sparks produce ozone even in *pure* and *dry* oxygen, and came to the conclusion that ozone is oxygen in an *allotropic* state, as diamond is a form of coke or charcoal. Baumert, in 1853, endeavoured to show that there are two kinds of ozone—one formed from pure oxygen by electric sparks, which he allowed to be allotropic oxygen; the other formed in the voltaic decomposition of water, which he endeavoured to prove to be a *terozide* of hydrogen. Andrews, in 1856, refuted this view, by showing that no such oxide of hydrogen (at least in a gaseous form) is produced in the electrolysis of water; and that ozone, from whatever source obtained, is the same body, and is not a compound, but an allotropic form of oxygen.

In 1860 Andrews and Tait published the results of a series of *volumetric* experiments on this subject, which led to some remarkable conclusions—among which are the following: When the electric discharge is passed through pure oxygen it *contracts*, hence ozone must be denser than oxygen. A much greater amount of contraction, and a correspondingly greater quantity of ozone, are produced by a silent discharge of electricity between fine points than by a brilliant series of sparks. The contraction due to the formation of the ozone is entirely removed by the destruction of the ozone by heat; and this process can be repeated indefinitely on the same portion of oxygen.

Soret subsequently determined the density of ozone as compared with that of oxygen, first by absorbing the ozone from the oxygen with which it was mixed by means of oil of turpentine or oil of cinnamon, and observing the contraction produced; and later by determining the relative rates of diffusion of chlorine and ozone. He ascertained that its density is one and a half times that of oxygen. Andrews showed later that ozone is rapidly destroyed when shaken up with dry fragments of glass, &c. He also proved that the effect which is (almost invariably, and sometimes in fine weather powerfully) produced by the air on what are called ozone-test papers—papers steeped in iodide of potassium which are rendered brown by the liberation of iodine—is really due to ozone. Ozone has been liquefied by the application of pressure, at a temperature of about -23° C. It is then a blue liquid, liable to decomposition into oxygen, with explosive violence, on sudden diminution of pressure.

Its value as an oxidising agent, in regenerating impure air and sterilising water, is explained by its being concentrated oxygen, O_3 , with three atoms of oxygen instead of the usual two. Mechanisms have been devised for breaking up by electric current three 2-atom oxygen molecules into two 3-atom ozone molecules; and have been in use in ozonising the air in banks, theatres, restaurants, and underground railways.

P

the sixteenth letter of our alphabet, descends from the seventeenth letter of the ancient Semitic alphabet, the original sound of which, the voiceless labial stopped consonant, was retained unchanged in the Greek and Roman alphabets.

In late Hebrew and Aramaic the letter was sounded as a bilabial *f* when following a vowel; in Arabic and some Syriac dialects it has the value of *f* in all positions. The Semitic name (in Hebrew and Syriac *pē*, and adopted by the Greeks as *pei*, which became *pi* in late Greek) is supposed to be identical with the Hebrew *peh* (inflected *pī*), meaning 'mouth.' No resemblance to the shape of the mouth can be seen in the earliest known form , which was variously modified in the later Semitic alphabets, becoming in late Hebrew , at the end of a word . One of the early Semitic forms was , which was adopted by the Greeks, and when the direction of the writing was reversed was turned into . This form was afterwards altered into , and ultimately into , represented by Π, π in printed Greek.

The Romans modified the early Greek form by bringing the hook round to meet the stem. The resulting form **P** is identical with the late Greek form of the letter R. In minuscule handwriting the body of the letter was, like that of other stemmed letters, written on the line, so that the stem descended below the line. This mode of formation is retained in our printed *p*. In the script

form *p* the loop is left uncompleted, in order

to facilitate junction with a following letter. The Romans used the combination *Ph* in Greek proper names and in Greek words adopted into Latin, to render the letter Φ, which expressed the sound of an aspirated *p* (= *p+h*). In late Greek this sound developed into *f*, and in late Latin the pronunciation of *ph* was altered in conformity therewith. Hence in French, English, German, and some other languages, the digraph *ph*, which is used almost solely in words of Greek derivation, is pronounced as *f*. In modern Italian and Spanish *f* is used instead of *ph*.

In the modern European languages there are a considerable number of words of Greek etymology beginning with *pn*, *ps*, *pt*. As these combinations of consonants are foreign to English habits of articulation, it has in English until recently been the universal custom to omit the *p* in pronunciation. As, however, many modern scientific terms become unrecognisable when pronounced in this way, a tendency has lately arisen to restore the *p* sound except in words of popular currency. In other European languages initial *pn*, *ps*, *pt* are pronounced as spelt. A silent *p*, inserted for etymological

reasons, occurs in the English *receipt* and in the French *baptême* and other words.

The Roman name of the letter *pē* (formed after *bē*, *cē*, *dē*, *gē*) is preserved in the modern languages except Italian (*pi*).

Paardeberg, a mountain on the Modder River, Orange Free State, 30 miles SE. of Kimberley, where Cronje (q.v.) surrendered, 27th February 1900.

Paarl, capital of a district in the Cape Province, 40 miles by road NE. of Cape Town; pop. 12,000.

Pabjanice, a town of Poland, 10 miles SSW. of Łódź; textiles and agricultural implement making are the principal industries; pop. 32,000.

Pabna, a town of Bengal, on an arm of the Ganges, 115 miles N. of Calcutta; pop. 19,000.

Paca (*Calogenys*, i.e. 'hollow-cheek'), a remarkable genus of rodents, allied to the Agoutis (*Dasyprocta*), represented by two Brazilian species, an alpine form (*C. paca*) and the common forest form. The latter, also called the 'Spotted Cavy,' has its cheek-bones uniquely developed, the zygomatic arch being enlarged to form a great cavity on each side. Each communicates by a narrow aperture with the mouth, is lined by mucous membrane, and does not contain food as an ordinary cheek-pouch naturally does. The *paca* is two feet in length, stout and somewhat pig-like in build, with

Paca (Calogenys paca).

a large blunt head, cloven lip, small ears, stump-like tail, thick legs, five-toed feet, and rounded back. The colour is brownish-yellow above, whitish below, with whitish-yellow spots or longitudinal bands along the sides. Though somewhat clumsy in form and gait, the *paca* runs actively, and can swim well. It lives alone or in pairs in the moist forests, especially by sides of rivers, and tends to be nocturnal in its habits. It makes burrows, said to have three openings. The female bears only one or two young at a birth. As a vegetable eater, the *paca* sometimes does damage to sugar-cane plantations and gardens. Its fat, pork-like flesh is much esteemed.

Pace. See YARD.

Pachamac, a village of Peru, 18 miles SE. of Lima, with the ruins of a temple from which Pizarro took immense treasure.

Pachmann, Vladimir de, Russian pianist, born at Odessa, 1848. He studied music under his father and at Vienna, and has gained a unique reputation as an interpreter of Chopin.

Pachmarhi, a sanatorium and convalescent dépôt for European troops in India, is situated, 2500 feet above the plains, in the Central Provinces, 110 miles SW. of Jabalpur; pop. 4500.

Pachomius, an Egyptian monk, the founder of Christian cenobitic life. He was born about 292, and about 340 founded the first monastic institution at Tabenna, an island in the Nile. He also established the first convent for nuns, under the presidency of his sister. At his death, according to Palladius, not fewer than 7000 monks and nuns were under his inspection. The writings ascribed to Pachomius are not only worthless in themselves, but of dubious authenticity. See MONACHISM.

Pachuca, capital of the state of Hidalgo, in Mexico, 55 miles NNE. of Mexico city; the vicinity is rich in silver, and Pachuca is one of the oldest mining towns of the country; pop. 39,000.

Pachydermata (Gr., 'thick-skins'), a term, no longer much used, applied by Cuvier to hoofed mammals (Ungulates) which are not ruminants—e.g. elephants, hyrax, hog, hippopotamus, tapir, rhinoceros, horse, &c.—and which have thick skins. See MAMMALS.

Pacific Ocean.—*Position and Extent.*—The Pacific Ocean is the largest of the great divisions of the ocean, occupying as it does about one-half of the water-surface of the globe and more than one-third of the whole area of the world. It is almost landlocked towards the north, communicating with the Arctic Ocean by the narrow and shallow Behring Strait, only about 40 miles in width, whereas towards the south it opens widely into the great deep Southern and Antarctic Oceans. Looking upon its southern boundary as the Antarctic Circle, its length from north to south is about 9000 miles, while its greatest breadth at the equator is over 10,000 miles. Its area is approximately 68,000,000 sq. m.

History.—The Pacific was first seen by Europeans in 1513, when a Spaniard, Balboa, with a few followers, viewed its waters from the summit of a mountain in Panamá; Columbus was aware of its existence, but did not live to see it. The first European to sail upon it was Magellan, who in 1520 entered it after threading his way through the strait bearing his name, and he gave it the designation 'Pacific,' by which it is known to the present day. From about this time trade was established between Europe and the Pacific coasts through the Strait of Magellan and round Cape Horn. Sir Francis Drake was the first Englishman to sail upon it, entering it in 1577, and afterwards sailing across it as far as the Moluccas. The explorers of the 17th century discovered Australia, New Zealand, and other islands, and during the 18th century the work of exploration was carried on by numerous voyagers, whose names are famous in the annals of geographical discovery. Many of them attempted to find passages between the Atlantic and Pacific through the Arctic Ocean; but the problem remained unsolved until M'Lure in 1850 discovered the North-west Passage, and Nordenskiöld in 1874 the North-east Passage. In the 19th and 20th centuries many surveying expeditions investigated the Pacific (see CHALLENGER EXPEDITION). The Pacific telegraph cable, connecting Canada with Australasia, was completed in 1902; and there is an American cable system to the Philippines, with branches to Shanghai and Bonin Islands (Japan).

River-systems.—Compared with the enormous expanse of the Pacific the area of land draining into

it is comparatively insignificant—7,600,000 sq. m., being less than a third of that draining into the Atlantic. By far the greater proportion of the land of North and South America drains into the Atlantic, the Andes and Rocky Mountains, which form the watershed, running north and south in more or less close proximity to the Pacific coast. The largest American river draining into the Pacific is the Yukon in the extreme north, which is over 2000 miles in length, and flows into Behring Sea. Proceeding south, we find the Fraser (600 miles long), the Columbia or Oregon (750), the Sacramento (420), and the Colorado (1100). The South American rivers draining into the Pacific are little more than mountain-streams. The Asiatic rivers flowing into the Pacific include some of the largest and most important rivers of the world. There is the Amur, 3060 miles in length, flowing into the Sea of Okhotsk, the Hoang-ho, over 3000 miles long, and the Yang-tse-kiang, 3200 miles in length, falling into the Yellow Sea; into the China Sea flow the Chu-kiang, the Mekhong, and the Menam. Australian rivers draining into the Pacific include the Burdekin in Queensland (440 miles) and the Fitzroy-Dawson (490 miles). The total annual rainfall on the catchment basin of the Pacific is estimated at 5000 cubic miles; the annual river discharge at over a fifth of that amount.

Coasts and Seas.—Generally speaking, the American and Australian coasts bordering the Pacific are mountainous and free from indentations, while the Asiatic coasts are low and fertile, with many gulfs and bays, and fringed with island groups enclosing numerous seas. The Alaskan shores of North America are low and swampy, while the coast farther south is rocky and rugged, with numerous inlets and off-lying islands. The most considerable indentation of the whole American Pacific coast is the Gulf of California, the Gulfs of Panamá and Guayaquil being the only others of importance. The southern extremity of South America presents a complete contrast to the rest of the coast-line, being broken up into numerous bays with scattered islands, the winding Strait of Magellan separating Tierra del Fuego from the mainland. The contour of the Asiatic coast-line is much more diversified than that of America, being especially characterised by the off-lying seas more or less completely enclosed and cut off from communication with the open ocean. Behring Sea is separated from the Pacific basin by the peninsula of Alaska and the Aleutian Islands, communicating with the Arctic Ocean through Behring Strait. The Sea of Okhotsk is divided from Behring Sea by the peninsula of Kamchatka, and from the basin of the Pacific by the Kurile Islands. The Sea of Japan is cut off from the ocean by the Japanese islands, from the Sea of Okhotsk by the island of Sakhalin, and from the Yellow Sea by the peninsula of Korea. The Yellow Sea (q.v.) is cut off from the Pacific by the East China Sea lying between Kyushu and Formosa. The South China Sea is separated from the Pacific by Formosa, the Philippine Islands, the island of Palawan, and Borneo, and from the Indian Ocean by the Malay Peninsula; it includes the two extensive Gulfs of Tongking and Siam. The islands of the Malay Archipelago cut up this part of the Pacific into several more or less distinct seas, known as the Sulu, Celebes, Java, Banda, and Arafura Seas, the last named lying between the north coast of Australia and New Guinea, and including the Gulf of Carpentaria. The Coral Sea is enclosed by the north-east coast of Australia, New Guinea, New Britain, the Solomon Islands, the New Hebrides, and New Caledonia, and communicates with the Arafura Sea by Torres Strait. The Pacific coast of Australia is mountainous and free from any considerable

inlets, the most important harbours being Port Jackson and Moreton Bay, though others of equal value are yet undeveloped; its northern portion is fringed by the Barrier Reef. Bass Strait separates the island of Tasmania from Australia. The main islands of New Zealand are separated by Cook Strait, and the principal bays are the Gulf of Hauraki, Bay of Plenty, Hawke Bay, Pegasus Bay, and Tasman Bay.

Islands.—The Pacific Ocean is remarkable for the innumerable small islands and island groups which stud its surface, but the area occupied by the truly oceanic islands is very small; they are principally congregated towards the central and western portions of its basin, the eastern portion, for some considerable distance off the American coasts, being comparatively free from islands. The principal continental islands may be briefly enumerated: commencing at the southern point of South America, and proceeding northwards along the American coast, then southwards along the Asiatic coast, we have various islands off the coast of Chile; Vancouver, Queen Charlotte, Prince of Wales, and other islands off the coast of British North America; Kodiak Island, off the Alaskan coast; the Aleutian chain of islands, stretching from the Alaskan peninsula towards the Asiatic coast and enclosing Behring Sea; the Kurile Islands, stretching from the peninsula of Kamchatka to the Japanese Islands; Sakhalin; the islands of Japan; Formosa and Hainan, off the Chinese coast; the Philippine Islands; Borneo, Celebes, Sumatra, Java, and other islands of the Malay Archipelago; New Guinea; New Caledonia; Australia and Tasmania; and New Zealand. The oceanic islands of the Pacific are all either of volcanic or coral origin, the volcanic islands lying within the zone of coral-reef builders being fringed with coral-reefs, while there are large numbers of islands entirely of coral formation—coral atolls. The principal groups are the Hawaiian Islands, in the centre of the North Pacific basin, 18° to 22° N. lat., consisting of eight larger and four smaller islands, containing many active and extinct volcanoes, including the well-known Kilauea in Hawaii, said to be the largest active crater in the world; the Bonin Islands, south-east of Japan; the Ladrone or Mariana Islands, between 13° and 20° N. lat., containing several active volcanoes; the Caroline Islands, south of the Ladrone, mostly of coral formation; the Marshall Islands, east of the Carolines, entirely of coral formation; the Gilbert Islands, on the equator, of coral formation and densely populated; in the South Pacific there are the Solomon Islands, the New Hebrides, the Fiji Islands, the Friendly or Tonga Islands, the Samoa or Navigator Islands, the Society Islands, all fringed by coral-reefs, and the Tuamotu or Low Archipelago, an extensive group of coral islands lying between 10° and 25° S. lat., besides the volcanic Galápagos group on the equator about 600 miles off the coast of Ecuador, and others of less extent and importance.

Depth.—The Pacific was formerly looked upon as rather a shallow ocean, but it is now known that some of the greatest depths in the world occur in it, and that on the whole it is deeper than the Atlantic, its mean depth being about 2500 fathoms. The eastern basin is comparatively uniform in depth, between 2000 and 3000 fathoms, while the western basin is much more diversified, numerous groups of islands, shallow water, and immense depths occurring irregularly. Eight soundings over 5000 fathoms have been recorded, all in the Pacific Ocean: three in the South Pacific, in the Aldrich Deep, to the north-east of New Zealand; four in the Challenger Deep, to the south of Guam, in the Ladrone group of islands; and the deepest

known sounding, which was taken in the Swire Deep, off Mindanao, in the Philippine group, in 5348 fathoms (32,089 feet, or over six English miles), by the German survey ship *Planet*. The *Challenger's* deepest sounding, 4575 fathoms (nearly $\frac{1}{2}$ miles), was in the sea between the Caroline and Ladrone Islands. The seas bordering on the western basin of the Pacific vary considerably in depth, the greatest depths in each being as follows: In the Behring Sea over 2200 fathoms, in the Sea of Okhotsk over 1800 fathoms, in the Sea of Japan 1900 fathoms, in the Yellow Sea 1300 fathoms, in the China Sea 2500 fathoms, in the Sulu Sea 2300 fathoms, in the Celebes Sea 2700 fathoms, in the Java Sea 500 fathoms, in the Banda Sea 3500 fathoms (the Weber Deep), and in the Arafura Sea 1700 fathoms. The bulk of water filling the Pacific is estimated at nearly 170,000,000 cubic miles.

Winds and Currents.—The surface-currents of the Pacific Ocean depend to a great extent upon the direction of the prevailing winds, the principal of which are the two trade-winds, blowing more or less constantly, the one from the north-east, the other from the south-east. Between these two regions is what is called the equatorial belt of calms, which is found all the year round north of the equator in the eastern Pacific, but in the western Pacific it is south of the equator during the summer of the southern hemisphere, and during the southern winter it is replaced by a regular southerly breeze; north and south of the trade-winds, also, there are two other belts of calms. In addition to the trade-winds, there are the monsoons, which blow with great regularity, but the direction of which changes according to the season. Monsoons are especially prevalent in the west Pacific, their general direction being south-east, north-east, or north-west, and they cause surface-currents, the direction of which likewise changes with the season. The differences between the temperature and atmospheric pressure over the land and over the water cause monsoonal winds. In mid-ocean the winds are found to have a greater velocity than in the vicinity of the land.

The Pacific is practically cut off, as far as the circulation of the deep water is concerned, from communication with the Arctic Ocean in the north, but towards the south it has uninterrupted communication with the Antarctic. A cold surface-current flows constantly northwards from the Antarctic, dividing into two at Cape Horn, one entering the Atlantic, the other flowing along the coasts of Chile and Peru, thence turning to the westwards; but the cold water frequently met with along the eastern coasts of America is evidently brought from oceanic depths by the action of off-shore winds. The great equatorial current flows to the westward, divided by a counter-current running in an opposite direction into two branches, the northern one on approaching the Asiatic coast being deflected northwards and finally north-eastwards as the Japan current, which is comparable to the Gulf Stream in the Atlantic; the southern branch is diverted to the southward, flowing along the shores of Australia and New Zealand, thence curving eastwards, and ultimately merging into the Antarctic surface-current. There are many minor currents, and branches of the more important ones, diverted by the numerous groups of islands. The broad currents, circling in the one direction in the North Pacific and in the opposite direction in the South Pacific, enclose in their centres two miniature Sargasso Seas somewhat similar to that of the North Atlantic, though not so well marked.

Temperature of the Water.—The temperature of the surface-waters of the Pacific varies with the

season, but in the tropical regions the variation is very small. Between the latitudes of 45° N. and 45° S. the temperature of the surface is always above 50° F., while north and south of these latitudes it is nearly always below 50° F. The highest temperature occurs among the islands of the Malay Archipelago and off the Mexican coast, where the mean temperature rises to 85° F., and in the sea between Japan and New Guinea the temperature in August reaches 84° F. In the South Pacific the temperature of the surface-water is apparently higher than that of the air, while in the North Pacific the reverse is the case in some places. The temperature of the water below the surface as a general rule decreases as the depth increases, the lowest temperature occurring at the bottom in great depths, where the bottom temperature appears to be nearly constant all the year round, usually about 35° F. This refers only to the open ocean, for in the enclosed seas of the western basin of the Pacific the minimum temperature is usually found some distance above the bottom, depending upon the depth of water over the barrier cutting off the sea from the general oceanic circulation. (See SEA.) The temperature of the intermediate water in the open ocean decreases rapidly at first from the surface downwards, and then slowly down to the bottom, irrespective of the surface temperature, which may vary, from below 60° to over 80° F.

Salinity.—The salinity of the surface-waters of the ocean changes with the season; increase of evaporation raises, while precipitation in the form of rain lowers, the salinity. In the South Pacific there is a region of high salinity in the neighbourhood of the Society Islands, the maximum salinity exceeding 36 per thousand; in the North Pacific the salinity is never so high, being usually less than 36 per thousand.

For the deposits see the article SEA; see also CORAL, POLYNESIA.

Pacifico, DON. See PALMERSTON.

Packard, ALPHEUS SPRING (1839–1905), son of the historian of Bowdoin College, was born at Brunswick, Maine, graduated at Bowdoin in 1861, was assistant to Agassiz at Cambridge, and in 1878 became professor of Zoology and Geology at Brown University. A Neo-Lamarckian (see LAMARCK), he is best known as a distinguished entomologist and for his classification of insects (1863). His writings include *Text-book of Entomology* (1898), *Lamarck* (1901), and various monographs on arthropod zoology.

Packfong, or PETONG, a Chinese alloy or white metal, consisting of arsenic and copper.

Pactolus, anciently the name of a small brook of Lydia, in Asia Minor, which rises on the northern slope of Mount Tmolus (modern *Buz Dagh*), flows north past Sardis (*Sart*), and empties itself into the Hermus (*Kodus*). It is never more than 10 feet broad and 1 foot deep. The sands or mud of Pactolus were long famous in antiquity for the particles of gold-dust which they contained. The collection of these particles, according to legend, was the source of Cressus' vast wealth. The brook is now called *Sarabat*.

Pacuvius, the earliest of Roman tragic poets, the sister's son of Ennius, was born at Brundisium about 220 B.C., lived mostly in Rome, and died at Tarentum, ninety years of age (130 B.C.). His dramas, of which only fragments are extant, were formed after Greek models.

Padang, capital of a residency on the west coast of Sumatra, at the mouth of the Padang River; pop. 38,000.

Paddington, a metropolitan and parliament-

ary borough (two members) of London, mainly residential in character; pop. 144,000.

Paderborn, a town of Westphalia, situated 50 miles SW. of Hanover. The fine Romanesque cathedral (Roman Catholic), completed in 1163, is built over the sources of the Pader (a tributary of the Lippe), and contains the silver coffin of St Liborius. Other noticeable edifices are St Bartholomew's Chapel (1017) and the town-house (1615; restored 1870–76). There are miscellaneous manufactures in the town and mineral springs close by. The old Hanse town was sacked by the Duke of Brunswick in 1622, and it suffered much else during the Thirty Years' War. From 1614 to 1819 it was the seat of a Roman Catholic university. Much of the town was burnt down in 1875. Pop. 32,000.

Paderewski, IGNACE JAN, Polish pianist, was born in Kurylowka, Podolia, 18th November 1860, and began to play as a child of three. He studied at Warsaw, becoming professor in the Conservatoire there in 1878. In 1884 he taught in the Strasburg Conservatoire, but thereafter became a virtuoso, appearing at Vienna in 1887, and with extraordinary success at Paris, in London, and in America in 1889–91. He became director of Warsaw Conservatoire in 1909. A Polish Nationalist, Mr Paderewski came forward as a leader in 1918. In 1919 he relinquished a disputed presidency for the premiership of the republic, but this later in the same year he resigned. He has composed for the piano, for the voice, and for piano and orchestra.

Padiham, a cotton town of Lancashire, 3 miles W. of Burnley; there are also coal-mines and quarries; pop. 12,500.

Padilla, JUAN DE, one of the most popular heroes in Spanish history, was a scion of a Toledan family, and was appointed by the Emperor Charles V. military commandant of Saragossa. While he was so employed a formidable rebellion, caused by the excessive taxes which the emperor imposed on the Spaniards, to defray the cost of his various wars in Italy, Germany, and the Low Countries, broke out among the towns of Castile, and the rebels, who were known as *comuneros*, called upon Padilla to put himself at their head. He was successful in a number of anti-royalist enterprises, but on 23d April 1521 was completely beaten at Villalar. This conflict decided the fate of the rebellion and of Padilla himself, who was taken prisoner, and next day beheaded. His wife, Doña Maria de Pacheco, rallied the remnants of the rebel army, and for a long time held Toledo against the royalist besieging army; after its fall she retired to Portugal, where she died in 1531. Numerous poems and dramas celebrate their deeds.

Padishah, in Turkish PADISHAH (Persian *padi*, 'protector' or 'throne'; *shah*, 'prince'), one of the titles of the Sultan of the Ottoman empire, and of the Shah of Persia.

Padua (Ital. *Padova*), a city of North Italy, 23 miles by rail W. by S. of Venice and 18 SE. of Vicenza, is still surrounded with walls. The principal streets are lined with arcades; most of the others, especially in the older parts, are narrow, dark, and ill-paved; but there are several handsome squares and fine gates. Of buildings the municipal palace (1172–1219) is a huge structure resting on arches, with balconies running round the upper story. The roof (1420) of its great hall (267½ feet long, by 89 wide, and 78 high) is one of the largest in Europe unsupported by pillars. The churches include the cathedral (1552–1754); St Antony (1230–1307), said to have been designed by Niccola Pisano, a building in the

Pointed style, with Byzantine blendings, and a richly decorated interior by Donatello, Sansovino, and others—the bones of St Antony rest in a side-chapel; outside is Donatello's fine equestrian statue of Gattamelata, the Venetian captain; St Justina (16th century), a fine Renaissance church, with an altarpiece by Veronese, and other pictures; church of the Eremitani (13th century), with frescoes by Mantegna; the chapel of the Annunciation (1303), adorned with frescoes by Giotto; and the chapel of St George (1377), with frescoes by Avanzi and Altichieri. The 'saint's school' has frescoes by Titian and his pupils. Padua's famous university was founded by the Emperor Frederick II. in 1221, though the fine Renaissance buildings date from 1493–1552. To it are attached one of the oldest botanical gardens in Europe, and a library (1629). The city museum (1881) contains antiquarian, art, and numismatic collections, a library, and archives. There is not much industry or much commerce, though leather, cloth, and gut-strings are prepared. Pop. of commune, 105,100. Padua's most famous natives were Livy and Mantegna. One of the oldest cities in Italy, *Patavia* came under the Roman supremacy in 215 B.C. In the 5th century it was severely handled by the Huns, and was banded to and fro between the Goths and the Eastern empire. From the Lombards it passed to the Franks (774); during the Guelph and Ghibelline quarrel it alternately submitted to the emperors and sided with the Lombard cities. From 1318 till conquered by Venice in 1405, it was ruled by the house of Carrara. Venice kept it till 1797, when it was given to Austria, who held it (except from 1805–14) until it was incorporated in Italy in 1866. The province has an area of 800 sq. m.; pop. 550,600.

Paducah, capital of McCracken county, Kentucky, on the Ohio River, 48 miles above its mouth, and just below the entrance of the Tennessee, 226 miles by rail WSW. of Louisville. It has a large trade by river and rail, notably in tobacco, and contains foundries, railway-shops, woollen, flour, and saw-mills, &c. Pop. 25,000.

Pæan (of doubtful etymology), the name given by the ancient Greeks to a kind of lyric poetry originally connected with the worship of Apollo.

Pædo-baptism. See BAPTISM.

Pæony. See PEONY.

Pæstum, anciently a Greek city of Lucania, in Southern Italy, on the present Gulf of Salerno. Founded as Posidonia by the Sybarites between 650 and 600 B.C., it was subdued by the Lucanians, and from them passed to the Romans, who established a colony there about 273 B.C. The Latin poets sing the praises of its roses, which bloomed twice a year—long extinct except in the guide-books. Pæstum was burned by the Saracens in the 9th century, and ravaged by Robert Guiscard in the 11th, and never recovered from these disasters. Portions of the ancient walls and three well-preserved Doric temples remain. See Labrousse, *Les Temples de Pæstum* (1877).

Pagan. See BURMA.

Paganini, NICOLO, Italian violinist and composer, was born a porter's son at Genoa on 18th February 1784. His genius showed itself early, and, practising sometimes a single passage for ten hours running, he acquired, if somewhat addicted to mere feats of musical legerdemain, a mastery over his instrument that has never been equalled; the vulgar, indeed, ascribed it to diabolic agency. He gave his first concert as early as 1793; began his professional tours in Italy in 1805; in 1827 received from the pope the order of the Golden

Spur; in 1828–29 made a great sensation in Austria and Germany; and in 1831 created an equal *furor* in Paris and London. He had gambled much in youth, but returned very rich to Italy. He died at Nice on 27th May 1840, drawing a last long note on his favourite G string.

See Grove's *Dictionary of Music*; there are Lives in English by Stratton (1907) in French by Fétis (1851) and Prod'homme (1907), in Italian by Bruni (1873) and Bonaventura (1911), in German by Niggli (1882) and Kapp (1913).

Page (derivation variously assigned to Gr. *pais*, 'a boy,' and Lat. *pagus*, 'a village'), a youth of noble or good birth employed in the service of a royal or noble personage. The practice of employing youths of noble birth in personal attendance on the sovereign existed in early times among the Persians and Romans, and was a special feature of feudal chivalry. The degree of page was preparatory to the further degrees of esquire and knight. The practice of educating the higher nobility as pages at court began to decline after the 15th century.

Page, WALTER HINES, United States editor and diplomat, was born at Cary, North Carolina, 15th August 1855. Graduating from Randolph-Macon College, Virginia, in 1876 he became, after association with various newspapers, editor of the *Forum* (1890–95), the *Atlantic Monthly* (1896–99), and the *World's Work* (1899–1913). He was appointed United States ambassador in London in 1913, but retired owing to failing health in August 1918, and died on 21st December of the same year at Pinehurst, South Carolina. A champion of Anglo-American solidarity, Page's labours during the Great War were important, especially in the delicate years preceding United States intervention. He wrote *The Rebuilding of Old Commonwealths* (1902), and a novel *The Southerner* (1909). See B. J. Hendrick, *Life and Letters of Walter H. Page* (3 vols. 1922–25).

Paget, SIR GEORGE EDWARD (1809–92), was born at Yarmouth, and educated at the Charter-house and at Cambridge. He took his B.A. in 1831, became Fellow of Caius in 1832, M.D. in 1838. In 1872 he became regius professor of Physic in Cambridge. He played a leading part in the advancement of medical education.

Paget, SIR JAMES (1814–1899) brother of Sir George, was born at Yarmouth. He became president of the Royal College of Surgeons in 1875. He discovered *Trichina spiralis* (q.v.), and wrote two standard works, *Lectures on Surgical Pathology* (1853), and *Clinical Lectures* (1875). See the *Memoir and Letters* (1901) by his son.

Pagoda (a Portuguese corruption of the Persian *but-kadah*, 'idol-temple') is originally an Indian temple of the approximately pyramidal shape especially characteristic of the Dravidian style (see INDIA). Thus, the great pagoda at Tanjore has a perpendicular part two stories in height, 82 feet square, and above that thirteen stories, forming an elongated pyramid about 100 feet high. The basement section is simple in outlines, but adorned by niches and pilasters; the pyramidal portion is somewhat elaborately sculptured; and the whole is crowned by a dome (said to consist of a single stone), which brings the total height to 190 feet. The temple stands in one of two great courtyards, and in the same court stand several small shrines, one of which is so beautifully carved as to rival in interest the great temple. The date of the latter is not certainly known, but is with much probability referred to the beginning of the 14th century. The so-called 'Thousand Pagodas' of Brambanan (q.v.) in Java are obviously

modelled on Hindu originals, either Jain or Buddhist. The Burmese pagodas are described

Pagoda at Tanjore.

and illustrated at BURMA. The term is also loosely applied to the Chinese *taa*, or tapering

Chinese Pagoda of Thirteen Stories.

pagodas have seven, nine, or thirteen stories; minor ones three or five.

Pago-Pago (also PANGO-PANGO), a United States port and coaling-station on the SE. coast of Tutuila in Samoa (q.v.).

Pahang, or PAKANG, a Malay and Moslem state on the east coast of the Malay Peninsula, since 1889 under British protection, and one of the Federated Malay States. Area, 14,300 square miles; pop. 146,000. See MALAY STATES.

Pahlanpur. See PALANPUR.

Pahlewi, or ENZELI, the port of Reshd (q.v.) on the Caspian.

Paignton, a seaside resort of Devonshire, on Tor Bay, 2½ miles SW. of Torquay; here is a 14th-century Bible Tower, last occupied by Miles Coverdale; pop. 14,400.

Paine, THOMAS, deistical and radical writer, was born at Thetford in Norfolk on 29th January 1737, the son of an ex-Quaker staymaker. He himself had by turns been staymaker and marine, schoolmaster, exciseman, and tobacconist, had married twice, losing his first wife, and soon separating from the second, when in 1774, with introductions from Franklin, he sailed for Philadelphia. On 1st January 1776 appeared his pamphlet *Common Sense*, which argued simply but strongly for complete independence, and which in Washington's words 'worked a powerful change in the minds of many men.' His *Crisis*, a twelvemonth later, gave the battle-cry, 'These are the times that try men's souls,' for the Americans' first victory at Trenton, where Paine himself was serving as a private; and congress rewarded him with the post of Secretary to the Committee of Foreign Affairs. He lost that post in 1779 for divulging state secrets, but was appointed clerk of the Pennsylvania legislature, and in 1785 received from congress \$3000 and the confiscated farm of New Rochelle. In 1787 he returned, by Paris, to England, where in 1791-92 he published *The Rights of Man*, the most famous of all the replies to Burke's *Reflections upon the French Revolution*. The work, of which 1,500,000 copies were sold in England alone, involved many in heavy penalties. Paine escaped to Paris, having been elected by the department of Pas-de-Calais its deputy to the National Convention. Here he voted with the Girondists, and at Louis XVI.'s trial he 'alone,' says Madame de Staël, 'proposed what would have done France honour—the offer to the king of an asylum in America.' He thereby offended the Robespierre faction, and in 1794 was thrown into prison, just before his arrest having written part i. of *The Age of Reason*, against Atheism and against Christianity, and in favour of Deism. Part ii. appeared in 1795, and a portion of part iii. in 1807. The book alienated Washington and most of his old friends; and it was not till after an imprisonment of eleven months that he was released and restored to his seat in the Convention. He became disgusted with French politics, and occupied himself chiefly with the study of finance, till in 1802 he returned to America. He died at New York, 8th June 1809. The stories about his intemperance were greatly exaggerated. In 1819 his bones were removed by Cobbett (q.v.) from New Rochelle to England; their whereabouts since 1847 is unknown. There is a memorial (1905) at New Rochelle, and a museum established in Paine's house there by the Thomas Paine National Historical Association, New York (founded 1906). 'Paine's ignorance,' says Sir Leslie Stephen, 'was vast and his language brutal; but he had the gift of a true demagogue—the power of wielding a fine vigorous English.'

The standard edition is Conway's (4 vols. 1894-96); there are biographies by 'Francis Oldys' (i.e. George Chalmers, 1791), Cheetham (1809), Rickman (1814), Sherwin (1819), Vale (1841), Blanchard (1860), Conway (2 vols. 1892), and Gould (1925). See also Sir Leslie Stephen's *English Thought in the Eighteenth Century* (1880); Alger's *Englishmen in the French Revolution* (1889); and pamphlets of the Thomas Paine National Historical Association.

Pains and Penalties. See ATTAINDER.

Painted Lady. See BUTTERFLY.

Painter, WILLIAM, author of the *Palace of Pleasure*, was born of Kentish stock in London about 1540, and studied at Cambridge. In 1560 he was master of Sevenoaks school, but early next year became Clerk of the Ordnance in the Tower, with a stipend of eightpence a day. He kept this post all his days, married, seems to have had a somewhat easy standard of honesty, grew rich, and bought lands. He made his will in 1594, and died

probably soon after. In 1566 he published the first volume of *The Palace of Pleasure* 'beautified, adorned, and well furnished, with Pleasant Histories and Excellent Nouells selected out of divers good and commendable authors;' the second volume, 'containing manifold store of goodly Histories, Tragical matters, and other Moral argument, very requisite for delight and profit,' followed in 1567. Of the first volume the principal source was the *Heptameron*; of the second, Bandello, through the medium of the French translations of Boastuau and Belleforest; but, in the definitive edition of the whole work (1575), to both parts stories were added from Boccaccio, Ser Giovanni, and Straparola. These last two at least he must have taken directly from the Italian. Painter's work became exceedingly popular, and indeed was the main source whence many dramatists drew their plots. Even in almost all Shakespeare's comedies we see the prevalence of the convention in early English comedy in favour of Italian plots, names, and places. Ascham in the *Scholemaster* denounces the 'bawdie stories . . . enchantments of Circes, brought out of Italie, to marre mens maners in England,' and there can be little doubt that here he points directly at Painter, though he does not name his book. Painter's English is easy and unaffected, but lacks the dignity the reader expects of an Elizabethan. His book is the largest work in prose between the *Morte d'Arthur* and North's *Plutarch*, but its real importance is that it introduced into our literature many of the best novels of Boccaccio, Bandello, and Margaret of Navarre.

Joseph Haslewood edited an admirable edition in 1813 (2 vols.); a later is that by Joseph Jacobs (3 vols. 1890).

Painter's Colic, or LEAD-POISONING. See LEAD.

Painting. This sketch of the history of painting may conveniently be divided into two main sections, the first dealing with the technical, and the second with the intellectual, history of the art.

(1) *The Technical History of Painting.*—The importance of technical conditions in the fine arts is due to their influence upon the action of the mind. For example, fresco-painting, if genuine, requires both speed and decision, oil-painting permits deliberation and correction almost without limit. Water-colour occupies, as to hurry, a position between the two. A technical facility allures the mind in certain directions, a technical difficulty impedes it, and a technical impossibility, like an insurmountable obstacle, diverts its energy into another channel. Each art has its own educational influence on the artist who practises it. Albert Dürer was an engraver with the burin, and he carried the strictness and precision of the burin into his painting; Rembrandt was an etcher, and he painted with an etcher's freedom; Turner was a water-colour painter, and his practice in oil bears evidence of his other skill. Fresco was painted either from drawings or from pure imagination. The deliberation possible in oil has led to painting from the life, with its consequences of increased reality, better knowledge, and more perfect truth. The improvement in water-colour has done for landscape what oil has done for the figure. As water-colour dries quickly it is convenient for sketching from nature, so that modern landscape-painters have been induced to study more in colour than their predecessors, a practice which has brought about a revolution in landscape-painting by taking it from the studio and the gallery into the open air.

Painting was not, in its origin, an independent art. It was employed in subservience to sculpture, to architecture, and to primitive engraving quite unconnected with printing. Rude idols were coloured in imitation of life, or rude outlines in-

cised in stone or wood were filled up with spaces of colour sharply separated and clearly distinguished. The outlines might also be themselves painted and then filled up with colour. Painting was separated from sculpture and engraving long before it was separated from hard and definite linear drawing.

Palæolithic painters, as at Altamira in north-west Spain, have left remarkably spirited paintings of animals in red, brown, and black. They painted on the walls of caves with iron ores, carbonaceous matter, pyrolusite, and kaolin. These were mixed with fat. The ancient Egyptians, painting in a kind of distemper or water-colour with dissolved gum, used white, a light yellow, a duller yellow, light red, dark red, light blue, green, brown, and black. Pure chalk supplied a white; the Egyptians were acquainted with a vegetable yellow; they were familiar with the ochres; cinnabar was to be had in Ethiopia; their blue was powdered blue glass, itself stained with copper, and when mixed with yellow it supplied a green; black was easily obtained from animal charcoal and other materials. It is a misunderstanding of Egyptian art to criticise it as a representation of nature; that was rendered impossible by ignorance of perspective and other technical deficiencies. It was intended to be at the same time a record and a decoration, and it effectually answered both purposes.

The remains of Assyrian painting are much less abundant than those of Egyptian, though it appears from the evidence of travellers that the Assyrians must have painted extensively upon internal wall-surfaces covered with plaster, and also upon tiles built together so as to make more or less extensive compositions. The little that we know of Assyrian and Babylonian painting leads to the conclusion that it was technically not more advanced than that of Egypt, and resembled it in being a record and a decoration rather than an imitation of nature. Outlines were still strongly marked and adhered to, and spaces were coloured flatly, almost as we colour them in heraldic painting. The painting of those early times is, in principle, much the same as that now employed upon playing-cards.

The supreme position of Greece in the art of sculpture has strongly predisposed many critics in favour of her painters, and it has long been believed that if we could see their works we should admire them as we now admire Greek statues of the age of Pericles. There are, however, very good reasons for believing that Greek pictures, even by the most famous men, would appear to us still primitive from the pictorial point of view, though it is certain that the drawing of the figures would be elegant and observant. We have no evidence whatever in the classical paintings which have come down to us that the ancients ever mastered the craft of painting in the modern sense—i.e. as an art which interprets truths of effect and which studies not only the *forms* but the *appearances* of nature. The great Greek painters must have been fine linear draughtsmen, and they would colour their drawings carefully; but all Greek art that is known to us has a clear and positive quality incompatible with the richness, the mystery, and the subtle visual truth of painting in its most advanced stages. With regard to the colouring of the Greeks, Sir Joshua Reynolds praised them for having used only four colours, and said that four are sufficient to make every combination required. Sir Joshua probably was thinking of flesh-colour only, which has since been painted by Etty with very few colours. Maclise said of Etty that 'with three colours and white—anything approaching to a yellow, a red, and a blue—he could produce a sweetly-coloured picture.' The Greeks in like manner might

colour 'sweetly' with few pigments, but it is not possible to imitate the full colouring of the natural world without a complete palette. Apelles himself could not paint a primrose with yellow ochre, nor a geranium with red ochre, nor is there any means of mixing black and white so as to imitate the azure of a southern sky. It is therefore of the greatest interest to ascertain whether the Greeks had a complete palette or not. Here the difficulty is to know at what date each pigment came into use. The vague expression generally employed is that certain colours were 'known to the ancients.' Of yellows Pliny says that Polygnotus and Micon used yellow ochre only. Vermilion is said to have been 'first prepared by Kallias the Athenian five hundred years before the Christian era,' and minium (red lead) was first used by Nicias, a painter of Athens in the time of Alexander. It is highly probable that the Greeks would be acquainted with Egyptian colours, and the Egyptians knew the madder-root. The Tyrian purple and Egyptian blue were too famous for the Greeks to remain ignorant of them. Yellow and red orpiment were also known to the ancient world. Blue-black made from burnt wine lees was used by Polygnotus and Micon, and ivory black is said to have been employed by Apelles. As for vehicles, there is a well-known passage in Pliny which Sir Joshua Reynolds interpreted as a description of glazing, that is, repainting with transparent colours; but it seems more probable that such accounts as have come down to us mean really no more than varnishing. The use of the word 'atramentum' by Pliny seems to imply that the varnish darkened the picture, which it would do if it were not colourless. It is generally believed now that the works of the Greek painters were executed in distemper and varnished afterwards, except their encaustic pictures, tediously executed with melted colours. Distemper or tempera (the Italian word for the same thing) is a kind of painting in which opaque colours, ground in water, are mixed with any kind of thin glue or white or yolk of egg with vinegar. We believe that the Greeks possessed oils and varnishes, but there is no evidence that they ever practised what we call oil-painting. However, a tempera picture protected by a coat of oil-varnish is distinguishable from an oil-painting only by experts. As to their palette, the probability is that the extremely restricted list of pigments which has been attributed to them was a matter of choice rather than of necessity for conventionally under-coloured work, or they may have begun their paintings with very few colours, as Titian did afterwards, and finished them with a fuller palette.

For a study of Roman painting our materials are much more abundant. We have no important works by famous artists, but there is an ample supply of such ordinary painting as was applied to the decoration of houses and tombs; and from this we may infer at least the technical condition of higher art. The variety of pigments was evidently sufficient to give a full scale of colouring by mixture or superposition, and, as oils and varnishes were known, it might have been possible for oil-painting to arise under the Cæsars. Everything was ready for it as everything was ready for printing, yet the final step was not taken. The art of tempera or size-painting remained technically much what it had been before, except that there may have been greater freedom in execution and in choice of subject. Classical taste in painting continued with a tradition of old methods for a considerable time after the introduction of Christianity, and even when the nude figure was no longer a subject of study tempera painting was still practised, though more stiffly than in classic times. The

distance from the painters of Pompeii to mediæval work is marked by more than a technical decline.

In reading histories of painting we may be on our guard against the careless and inaccurate employment of the word 'fresco.' It really means painting on fresh plaster—i.e. on plaster that is still wet; but the word is inaccurately used for paintings on dry plaster also. The practice of painting on walls covered with plaster is as old as ancient Assyria, and it has been believed that the ancient Greeks understood true fresco, principally on the strength of an expression of Plutarch, *eph' hūgreois zōgraphēin*, 'to paint on a wet ground.' Vitruvius, too, speaks of a wet ground, and, although he does not directly say that it was painted upon *when wet*, he says that, so prepared, it was fit for pictures, and that colours on it are permanent. This permanence of the colours is the characteristic of true fresco. Unfortunately, Plutarch compares painting on the wet with encaustic as evanescence to permanence.

Whatever may be the real antiquity of true fresco, it is certainly much older than oil-painting. The technical process (see *FRESCO*) was well understood and practised in Italy in the middle ages, when mural painting in churches was already in great request, and when art itself was still in a primitive condition.

Cimabue, Taddeo Gaddi, and Giotto, with many less known men, painted in fresco as well as in tempera, so that all the technical part of the craft was a matter of ancient tradition when Raphael and Michelangelo took it up on their own account, and brought to it far greater powers of mind. To appreciate the progress made before these great men it is necessary only to refer to the stiff and mindless Byzantine art from which that of Cimabue was already a partial emancipation.

After the invention of oil-painting the inconveniences of fresco were more strongly felt, and many artists turned away from it to the new process. True fresco cannot be retouched; it has to be painted darker than the artist's intention, as it lightens in drying, and it must be painted from sketches or cartoons. On the other hand, it is luminous and has no gloss, and so is suitable for mural decoration. Raphael seems to have liked fresco and oil equally well. Michelangelo greatly preferred fresco, as better suited to his powers. Leonardo da Vinci painted his great mural work, 'The Last Supper,' in oil, though fresco must have naturally suggested itself.

Many modern attempts to revive fresco have been made in Europe. They have rarely been successful, and have especially failed in the Houses of Parliament, where many works have decayed prematurely. Modern failures have led to the adoption of a process on dry plaster, fixed afterwards with water-glass in spray, as in Maclise's large works in the Royal Gallery; but this is not absolutely durable. The best substitute for true fresco appears to be Gambier Parry's 'spirit fresco,' employed by Lord Leighton for his large compositions at South Kensington. These are painted with a spirit medium on dry mortar. In France a substitute for fresco has been found in painting on canvas with a dead surface, the canvas being afterwards fastened to the wall with white lead. True fresco may now be considered almost a dead art.

The next step of importance in the history of art is the discovery, or earliest known practice, of what we call 'oil-painting,' which includes the use of varnishes during the progress of the work. This has been generally assigned to Jan van Eyck, who was born about 1390; but it is now believed that his elder brother Hubrecht may have an equal if not a better claim. Both certainly worked in the new method, and Jan continued it after his

brother's death. Since then the practice of oil-painting and of varnish-painting has been carried without interruption down to our own time, and, though it has undergone much technical development, it remains essentially distinguished from tempera by the mixture of oil or varnish with the colours themselves and by the consequences in execution to which this mixture has led. The brothers Van Eyck themselves were far from anticipating the future freedom and power of oil-painting. Their work was beautifully executed in a smooth and simple way, and, with the exception of small cracks, it has lasted wonderfully; but their careful rendering of detail belongs to the infancy of art. An Italian student of painting, Antonello da Messina, stayed in Flanders for some time and worked under Jan van Eyck. He afterwards returned to Italy by way of Venice, and from him the knowledge of the new method spread to Florence, and thence to the other cities of Italy. His death, in Venice, apparently occurred in the last years of the 15th century.

It may be convenient to remember that the year 1500 saw the practice of oil-painting firmly established in the north and south of Europe. It did not immediately win the absolute pre-eminence that it has subsequently attained. Michelangelo expressed a contempt for it, which was probably due to the fact that its full powers were not yet developed by his neighbours. The fame of Raphael as an artist is due to other qualities than the technical merit of his oil-painting, which remained comparatively primitive. The earliest practice of oil-painting was dependent upon the luminous quality of the ground showing through the colours; and, although the early oil-painters manifested a workman-like skill in dealing with their materials, they displayed no power of handling. The manual precision of Albrecht Dürer has never been surpassed, yet his work as a painter is primitive. Roman painters of the time of Michelangelo might use oil as a convenience, but they could have expressed themselves as completely in fresco or tempera. When we come to the Venetian school the case is very different. There was a harmony between the technical methods of oil and the genius of the Venetians which led to the highest technical excellence. Van Eyck and his followers, both in Flanders and Italy, painted upon a transparent monochrome. Titian used a substantial dead-colouring in which he could make whatever alterations he chose, and afterwards worked upon that by successive glazings till he obtained the utmost richness of quality. The notion that Titian had some secret that died with him may be dismissed as purely fanciful. His method of painting is well known, and his superiority to his imitators may be accounted for by his natural genius and by favourable circumstances. His master, Bellini, drew carefully and coloured well, but his work is still primitive, because it is still coloured drawing. In Titian's painting the different kinds of technical knowledge are so completely fused together that he is not the draughtsman who colours, but the painter. The same is true of Giorgione, almost equally gifted, but less favoured than Titian in the circumstances of his life.

Rubens was a great master of the *technique* of painting in another way. He painted much in transparent or semi-transparent colours over a first painting in transparent brown monochrome; but, instead of leaving the lights thin that the white ground might show through as in the practice of the early Flemish painters, Rubens loaded his lights with thick opaque colour. His way of painting was technically very systematic, which permitted an extreme rapidity. There is evidence that he followed the early practice of mixing

varnish with his colours, at least when transparent and for linear sketching with the brush. The technical execution of Velázquez is a model of excellence in the use of both transparent and opaque colours and in variety of handling. It is not so methodical as that of Rubens, being always subordinated to the artistic intention of the painter.

The most perfect works on a small scale have hitherto been those of the Dutch painters, Teniers, Terburg, Metsu (or Metzu), Maas, Peter de Hooch, and many others of the same school. Their method of painting was almost universally to begin with a transparent brown monochrome on which they painted the shadows thinly, giving more substance and opacity to the lights. Being limited in their aims, and painting chiefly what they could see around them and study at their own convenience, they attained a high degree of technical excellence. Their drawing is almost invariably careful and true, and their colouring harmonious, whilst the quality of their textures is often inimitable.

The practice of modern artists is always founded upon that of one or other of the masters we have mentioned. There are not very many ways of painting, or if they seem to be many they are reducible to a few very simple principles. The early method of giving luminous quality to the lights by letting the white ground show through them is seldom followed in these days, but it has been resorted to occasionally. The practice of Rubens, by which the shadows are painted thinly and the lights more thickly, is much commoner in the modern schools. Reynolds, who painted first a strong dead-colour with few colours and glazed upon it afterwards, worked on the principle of Titian. Landseer's practice was essentially that of the Flemish school, and Meissonier's (in his best works) that of the Dutch. Turner approached much more nearly to the Venetian practice than to that of Rubens, as he dead-coloured broadly and afterwards painted in detail on the dead-colour, using glazes and scumbles (opaque colour used thinly); but Turner's practice was complex, as he often had recourse to water-colour in his oil-pictures, and finally loaded his lights. Ingres, the leader of the classical French school, was a close follower of Raphael. It is difficult to point to any real technical originality in modern art, unless it be the use of thick pigments in the French school (called in French, *pleine pâte*) introduced by Decamps, and often exaggerated by his imitators. The novelty here was, however, rather in the brush-work than in the use of thick pigments themselves. Many French artists have also blurred their outlines in revolt against the clear definition of the classical school, but the originality was rather in the manner of doing it than in the mere softening of the outlines, as Titian, Correggio, Reynolds, and others had already carefully avoided the early hardness of definition.

Although the technical methods of oil-painting are few and have now been known for centuries, the varieties of *quality* which result from individual genius are almost as numerous as artists themselves. They cannot be explained without examples; but it may be said generally that, as different violinists elicit different qualities of tone from the same instrument, so the idiosyncrasy of painters produces new results with old colours and old processes. It is in this way, and not by the invention of novel methods, that the art continually renovates itself.

Oil-painting now holds the first place on account of its convenience, as it permits of infinite deliberation and alteration, and also on account of its great power and truth in imitating the textures and tones of nature. But the true successor of fresco in modern times is water-colour. It resembles fresco

very closely by its rapidity and by the absence of gloss, though it cannot replace fresco in mural decoration. Water-colour, as a process, is much more ancient than oil, having been extensively employed in various ways during ancient and mediæval times; but the method of using it that gives the process its present intellectual value is essentially modern and English, dating from the early years of the 19th century. The practice of the 18th century led up to it by the use of broad washes in sepia or in neutral tint, afterwards more or less coloured, an adaptation of the Dutch and Flemish practice in oil-painting, except that the finished result stopped very far short of full colour. The water-colour of the present day has discarded the monochrome wash, beginning with pale washes in colour, and working from light to dark. In its perfection modern water-colour is distinguished by extreme freshness and brilliancy. It is important not only as an independent art, but by its great influence on modern oil-painting. The majority of oil-painters have themselves employed water-colour as an auxiliary for studies, especially in landscape, and much of the light and air in modern oil-painting may be attributed to its influence. Water-colour, in the 19th century, proved a compensation for failure in the attempted revival of fresco. Though apparently of inferior importance, because practised on a small scale, it has taught what fresco taught and more, as it has educated us in landscape. Improvements in the materials of water-colour have led some of its practitioners to attempt rivalry with the force of oil, which is unnecessary, as oil must ever remain the more powerful medium of the two, and water-colour has its own superiorities in freshness and delicacy. There does not seem to be any probability that either of the two arts will ever be replaced by a new discovery as tempera was superseded by oil, nor is it likely that the technical methods will be improved. There is room for improvement in a stricter abstinence from the use of evanescent or destructive colours; but unfortunately very few artists trouble themselves to secure the permanence of their works.

Water-colour was despised in France until the fall of the second empire; but the example of English artists has led the French to the study of it, and now many of them pursue it with success. Their methods of work are usually very simple and direct, and their influence is almost exclusively in favour of freshness and decision.

(2) *The Intellectual History of Painting.*—Under the Egyptian dynasties painters were recorders of events and decorators; in Assyria they illuminated a sort of pictorial history of royal deeds. In both these cases there could be very little room for the exercise of individual intellect in the artist, who was seldom more than a manual workman, laying on colour according to methods prescribed for him by authority. Even in Greece we have evidence that the manual skill of artists was despised as handicraft by the class of gentlemen and scholars; however, Greek painters of eminence attained individual distinction, and such a complete degree of personal emancipation that they were free to exercise whatever intellectual power they possessed. There is not much expression in Greek sculpture, but there is some, and what there is proves quite sufficiently that the subtle and acute intellect of Greece could express itself in art as effectually as in literature. What remains to us of Greek and Roman caricature is good evidence of faculties that might have exercised themselves, by an alliance with a higher form of art, in what we now call genre-painting. Still, we have no direct proof that the fine arts in Greece ever really were intellectually so great as her poetry, her philosophy, and her drama. In the decline of classical art we find little

more than the current production of an inferior class of men for the adornment of habitations or tombs. The beginnings of Christian art, stiff in design and laboriously ornamental, give hardly any evidence of intellect; the artists who produced that art were in a condition of mental servitude, like that of those modern descendants of the early Byzantine school—the makers of holy icons in Russia. As the fine arts became gradually emancipated from the thralldom of sacerdotal authority intellectual power began to show itself, and, at length, when the human mind was stimulated in so many directions by the great outburst of the Renaissance, the art of painting had its full share in the general activity, and assumed a place by the side of literature which it has ever since maintained. Nevertheless, the necessity for high manual accomplishment and technical mastery must always, in painting, give an advantage to the workman over the thinker; and so we find, as in many Dutch pictures, that clever representations of the most commonplace subjects preserve their value though almost destitute of mind. There can be no more striking contrast than that between a Dutchman toiling for six weeks on the representation of a besom and Michelangelo painting a prophet in half a day; yet the Dutchman is immortal too. The intellectual progress of art has been marked by the extension of its sympathies. Under Christianity the art of painting began again from the beginning, without either technical or intellectual preparation. Its first awakening of sympathy is with the human side of Christianity, the love of mother and child, the sufferings of the crucified Christ, the sorrow and bereavement of the disciples. As religious art advances, its mental progress is shown by the increasing importance given to the human side of its subjects and the diminution of ornament in dress, till at length the dresses become simple draperies, almost without jewels or embroidery, and the charm of the work lies in the beauty or nobility of the faces and the dignity of the attitudes. With the Italian Renaissance the art of painting made a great intellectual advance by its sympathy with what was then the new activity of scholarship. Raphael was, if not himself a scholar, the intimate friend of scholars, working constantly under their influence; besides which he was an architect and an archæologist. The selection of 'The School of Athens' as the subject of one of the most important mural pictures in the Vatican is most significant. In Leonardo da Vinci the artistic is united to the scientific intellect; in Rubens it is united to the broadest culture of the scholar and the man of the world. Rembrandt may not have been a learned man, but few authors or artists have shown more sympathy with different classes, or have discerned so well the dignity that may belong to the learned or the unlearned, to the rich or the poor. The pictures and etchings of biblical subjects by Rembrandt bring them nearer to us by their homely truth than the ideal conceptions of Raphael. Surely we cannot refuse the title 'intellectual' to an art which contains a philosophy at once so comprehensive and so ripe. The faculties of Teniers and Ostade are narrower and lower, yet even in their works there is a sympathy with the humbler classes which has lasted down to the art of our own day, which was lively in the art of Wilkie, and is graver and more profound in the work of Israels.

All portrait-painting of any importance has endeavoured not only to copy the features, but to express as much as possible of the mind; and the knowledge we derive from historians and biographers is felt to be incomplete until we have referred to the canvases of some observant contemporary

artist, some Holbein, Van Dyck, Velázquez, Reynolds, or Raeburn. Even in these days of photographic invention the portrait-painter keeps his place, great portraits are painted still, and future students of history will not be satisfied with the photograph alone, but will go for the intellectual element to the canvases of a Millais or a Bonnat. Closely connected with portraiture is the art which observes and records the passing phases of social life, an art which reached perfection in the 18th century in the strongly characterised and too truthful pictures of Hogarth. The representation of contemporary life, in drawing-rooms and elsewhere, has been actively pursued down to our own day in all the leading schools of Europe, and is now practised more than ever, especially in France, where the artists are tempted by the elegance of modern interiors and the grace of feminine costumes.

In the 19th century there was also much retrospective painting, particularly of the 18th century, and this led to a very close and minute study of that century by Leslie in England, Meissonier and Gérôme in France, and many other artists of ability. The retrospective tendency of our own time has been strongly manifested in other ways. The modern interest in the past has been shown by much 'historical' painting on insufficient data representing personages whose portraits we do not possess, in buildings that have left no trace, and engaged in actions known to us only by the meagre narrative of some chronicler. Art of this kind possesses no real historical interest, though it may display considerable artistic ability. Of late years it has been in a great measure superseded by archaeological painting, skilfully practised by Sir L. Alma Tadema and his followers, whose object has been to revive the past in its details as it really was by representing everyday life without much pretence to the portraiture of individuals or the recording of particular events. This kind of painting has brought the art nearer than ever to the spirit of scholarship. No doubt the special interest of it is outside of artistic interest, but there is no reason why archaeological pictures should not be as beautifully drawn, as well composed, and as richly coloured as any others.

A sketch of the history of painting would not be complete without some notice of the way in which landscape became a speciality. Rude and childish landscape backgrounds are found even in Assyrian art, they are not uncommon in Greek and Roman antiquity, and they attained a considerable degree of freedom and observation in the backgrounds of the paintings at Pompeii. After the death of classic art, painting began again from its first rudiments in the ornamental art of the middle ages, and the study of landscape soon revived in the backgrounds of religious pictures. Mediæval landscape lasted down to Raphael, who was himself essentially a mediæval landscape-painter, especially in his early works. The general characteristics of that kind of landscape are clear atmosphere, pure skies, either cloudless or with a few white clouds, pale blue distances with hills, green foregrounds, and almost invariably one or more well-kept buildings. Trees in the foreground are usually slender, with thin twigs and few leaves visible almost separately against the sky; in the distance they may be more massive. Water is usually calm in ponds or winding rivers, or serene in distant sea. Rocks occur in mediæval landscape, but are seldom accurately represented, the mediæval ignorance of rocks having even persisted in Leonardo da Vinci notwithstanding his scientific genius. In the backgrounds of Albert Dürer all kinds of objects are observed and set down as in a catalogue; he perceived the grandeur of mountains,

the abundance of forest trees, the picturesque beauty of mediæval towns, and he took an interest in all the details of the foreground; but he never fused his details into one connected whole; he never saw nature with the eye of a landscape-painter; he had no sense of atmosphere or effect. The beginning of the modern landscape spirit is to be sought for in Venice. Titian made many studies of landscape, and, although in his pen-drawings there is no recognition of local colour and very little effect, there is a remarkable sense of grandeur and a fine grasp of noble scenery, not in detail merely, but as a whole. In his painted landscape backgrounds Titian goes still further and attempts transient effects, showing himself a true precursor of the modern landscape-painters. Tintoretto occasionally exercised his magnificent powers in the same direction. The most influential of professed landscape-painters was Claude. He had not the power of the Venetians, but he had a tenderness and charm, and a sense of grace and beauty, that won the hearts of contemporaries and have since maintained the celebrity of his name, though it is easy for criticism to point out deficiencies of knowledge. Unlike Dürer, Claude saw nature, not in details, but synthetically in complete pictures full of atmosphere and light. Salvator Rosa and Gaspard Dughet (or Poussin) maintained a grandeur of conception and style in landscape which, in spite of a certain remoteness from pure nature, tell effectually in picture-galleries even at the present day.

The same may be said of Gainsborough, whilst Wilson perpetuated in England a feeling for landscape akin to the amenity of Claude. Cozens and Girtin had the old breadth and serenity of conception, with a more modern view of nature, and Turner did not manifest much personal independence until he had first studied and imitated the old masters, particularly Claude. Indeed, he is much more closely connected with the past than with the future of landscape-painting. He had the deepest respect for the older masters, whom he both studied and imitated, yet he founded no school and has had little influence on the art of England and none on that of continental Europe. Constable, on the other hand, who during his lifetime was a less celebrated artist, has had a very far-reaching influence. The freshness and originality of his view of nature, less poetical and imaginative than Turner's, but nearer to rustic reality, determined the future direction of that French rustic school which in its turn has influenced all the schools of Europe. Whilst England has had her poet landscape-painter in Turner, France has had hers in Corot, a painter of at least equal celebrity, though of much narrower range. Like Turner, Corot founded his art on the study of Claude, but won public favour late in life by a delicacy of sentiment which was his own. His subjects were simple and his effects chosen so as to avoid strong colouring, but he composed beautifully and was a master of quiet grays, pale yellows, and browns.

Since the middle of the 19th century landscape-painting, both in oil and water-colour, has been actively pursued all over Europe, every class of scenery finding its own interpreters. Marine painters in all countries appear to concentrate their attention more than their predecessors upon the sea itself, and English, French, and American artists alike have produced remarkable studies of waves.

It may be of interest to give a brief outline of the sects which have divided artists. The chief of these have been the Classics, the Romantics, the Realists, the Pre-Raphaelites, the Impressionists, and the Post-Impressionists. The classical aim was the pursuit of the ideal, which was believed to be *one* and to have been attained by Raphael; this school was represented by the

French painter Ingres. The Romantics desired freedom from the classical restraint, and liberty to illustrate all literature and all history that interested them in their own way; their great man was Eugène Delacroix. The doctrine of the Realists is the right to represent persons and things as they are without beautifying them by idealisation. This doctrine was at one time represented by the French painter Courbet; but, in fact, there was a great deal of downright realism long before his time, as we find it in Velázquez, Rembrandt, Teniers, Ostade, Hogarth, and many others, who have redeemed the ugliness of a subject by the intelligence of their treatment and the force of their execution. Even in the case of Courbet himself we now easily see that, although he affected to take nature exactly as it is, he displayed the wilfulness and the style of an artist. English Pre-Raphaelitism was not alone in its return to the painstaking imitation of detail which marked the practice of Raphael's predecessors. Like the continental movements in the same direction, it was a return to patient analysis, and had a disciplinary value; but the accumulation of artistic experience was too much for it. After Titian, Velázquez, and Reynolds, it is not possible to bind down the art of painting permanently to the minute practice of the early masters. Intellectually the movement was of more importance, as it favoured the choice of noble subjects. Impressionism asserts the importance of visual truth as opposed to mere truth of fact, and affirms that painting ought not to represent what *is*, but what *appears*. Impressionism is also opposed to the abstract rendering of this or that quality; it requires a synthesis of all visible qualities as they strike the eye together. The Impressionists claim several great artists, especially Turner and Constable, as their predecessors. They are equally opposed to the detail of the minute painters and to the hard, clear, linear definition of the classical schools. If sound theoretically, in practice their art has often proved unsatisfactory.

At the end of the 19th century Impressionism was everywhere triumphant; but reaction came with the 20th. To this reaction in its various manifestations the general name 'Post-Impressionism' (also 'Neo-Impressionism,' and 'Expressionism') has been given. As opposed to the Romantics and Realists, the movement, which is an outcome of as well as a reaction from Impressionism, claims to be a return to the tradition in painting represented by Raphael, Poussin, David, and Ingres. At the heart of Post-Impressionism lies a breaking away from a subordination to external and visible things; these, it is held, are to serve only as a means towards expressing the artist's emotions. Post-Impressionism as a movement is essentially French in origin. Apart from the Dutch painter Vincent van Gogh (1853-90), its chief precursors have been Paul Cézanne (1849-1906), Georges Seurat (1859-1891), Henri Rousseau (1844-1910), Gustave Moreau (1826-1898), and Paul Gauguin (1848-1903). Combining in different degree the several ideas of these painters, various groups of Post-Impressionists have arisen. Thus Symbolists stress the doctrine that a work of art must aim at the expression of an idea, and claim that, in so far as form must be used in that expression, a work of art must necessarily be symbolic in character. Closely akin in method to the Symbolists are the Fauves. Cubists represent a reaction not merely against Impressionism and the chaotic art which had grown out of it, but also against Fauvism; Cubist art is essentially abstract in character, and stands for the introduction of order and discipline into painting; in its attempt to represent conceptions it rejects entirely the reproduction of natural appearance, and that is,

indeed, its central point; questions relating to the representation of the third dimension—an element of resemblance to Nature here being introduced—have divided Cubists into various groups. Futurists, deriving their name from a complete disparagement of past achievement, reject Cubism, and claim to surpass Impressionism, though accepting it as their point of departure; their aim is to represent, not the appearance of objects at some particular point in time, but the sensation of movement and growth itself; Futurism, which has had no more than a transient influence, is, unlike Symbolism, Fauvism, and Cubism, not of French but of Italian origin. Vorticism, an English development, in part rejects Futurism, in part accepts it, but joins the modern movement as a whole in claiming that the artist's task is not to copy Nature but to create new realities; these realities are to be expressed in forms which proceed from the artist's 'vortex,' this vortex being a general conception of relations in the universe, through which for each individual ideas pass and take concrete shape.

Painting as an art is now completely free from all former restraints of religious or classical authority; within recent times, too, almost every school has developed in a manner quite independent of national artistic ancestry; a certain freshness in consequence pervades most modern work. Schools of art are now no longer national, and painting has become cosmopolitan to a degree impossible for literature. Paris has become the capital of the art, and the northern European countries send their students there as once they sent them to Rome. The clever and promising American school, though still in the main an offshoot from the French, shows signs of developing distinctly American characteristics. Manual skill has, perhaps, never been so general as now, but the intensity of the commercial struggle amongst the great multitude of artists is certainly not favourable either to learning or to refinement, and it is doubtful whether painting makes any advance in taste and culture corresponding to the increase of its productiveness or the extension of its fields of study.

Chronology.—The extent of the subject renders laconic treatment necessary. Archaic Greek drawing, marked by want of proportion, especially in thickness of limbs, lasts in vase-painting throughout the 6th century B.C. and later. In 5th century better drawing on many vases; in 4th century it is often learned and beautiful, as on Camirus vase (British Museum), contemporary with Protogenes. Attitudes then easy and graceful, faces shown in all positions; 5th and 4th centuries B.C. golden age of antique painting, including Apollodorus, Zeuxis, Parrhasius, Apelles, Polygnotus, and Micon. Romans imported Greek pictures and took up painting by imitation. Roman painter Ludius (Augustan age) anticipated Claude in choice of subjects. Paintings preserved at Herculaneum and Pompeii, and in baths of Titus, belong nearly to Christian era, some earlier, others a few years later. Pompeian painting shows interest in ordinary life and in landscape. Classical art is, in feeling and principle, prolonged for six centuries in the service of Christianity.

The middle ages are divided by Woltmann into (1) Early, from 700 to 950 A.D.; (2) Romanesque, from 950 to 1250 A.D.; (3) Gothic, from 1250 to 1400 A.D. Thus the three periods are 250, 300, and 150 years. Throughout these ages, speaking generally, the human motive of art is religious, and its artistic motive is ornament. In the middle ages figure design began again from a barbarous infancy, it being necessary for the representation of religious personages. From 8th to 13th century childish drawing and gaudy colouring prevailed throughout Europe. In 13th some partial improvement takes

place, and in 14th the advance is remarkable when Claes Sluter carved his life-like statues. The Brothers Van Eyck (q.v.) were born in this century.

The 15th century is the time of transition from the art of the middle ages to an improved craft of drawing and painting preparatory to the Renaissance. Improvement is simultaneous in Flanders and Italy. Van Eyck's work was known in southern Europe, his influence only technical, and soon died out in Flanders itself. Roger van der Weyden (died 1464) worked differently, having stayed in Italy and exercised much influence in Flanders and Germany. His pupil, Hans Memlinc, died in 1495.

The 16th century is remarkable for its extension of the subject-matter of painting. Before 1500 the art is chiefly confined to religious subjects and portraits, afterwards it includes more of what we now call genre—a change associated with the name of Quentin Matsys (1466–1530). The nude was introduced into Flemish art from Italy by Jan Gossart (died 1532). After this date Flemish painters went much to Italy, which produced a hybrid school called the 'Italianised Flemings'—e.g. Michael Coxis (1499–1592), spent many years in Italy. The first Flemish school, now at an end, was influential in Germany; Roger van der Weyden had German pupils. Cologne and Nuremberg were active centres. Martin Schongauer lived in Rhineland in the 15th century. Hans Holbein the elder, of Augsburg, lived in 15th and 16th centuries. His famous son, Hans (1498–1543), represents the perfection of German realism in portrait. Albert Dürer (1471–1528) stands for Germany, coming out of, but not yet delivered from, the middle ages. His contemporary, Lucas Cranach (1472–1553), was like Dürer, laborious and productive. Dürer visited Venice 1506, and was admired for his skill (particularly by Giovanni Bellini), but had little influence. German hardness and minuteness of finish culminated in the comparatively mindless art of Denner (1685–1747).

Italian painting is minutely divided into local schools, and these again chronologically into three or four stages of development. Masters of 14th century divided into Tuscans, Siene, Bolognese, Paduan, and Neapolitan; those of the 15th into Tuscan, Umbrian, Paduan, Veronese, Milanese, Venetian; those of the 16th are headed by the well-known great individualities. The schools affect each other—e.g. it is difficult to disengage Roman and Florentine art, whilst the Umbrian school gave strength to Rome. The following list gives the most famous names.

14th Century—Tuscans.—Giotto (1276–1336), Taddeo Gaddi (1300–66), Orcagna (died before 1376). *Siene.*—Duccio (still living in 1339), Angelico (1387–1455).

15th Century—Tuscans.—Paolo Uccello (c. 1400–79), Masaccio (1452–28), Filippo Lippi (1412–69), Ghirlandajo (1449–98). *Umbrians.*—Pietro della Francesca (living 1494), Giovanni Santi (died 1594), Pietro Perugino (1446–1524). *Bolognese.*—Francia (1450–1517). *Paduans.*—Andrea Mantegna (1431–1506). *Venetians.*—Antonello da Messina (1414–93), Gentile Bellini (1421–1507), Giovanni Bellini (1426–1516).

16th Century—The Great Masters.—Leonardo da Vinci (1452–1519), Michelangelo (1475–1563), Raphael (1483–1520), Correggio (1494–1534), Giorgione (1478–1511), Titian (1477–1576), Tintoret (1512–94), Paul Veronese (1530–88). Other Italians of eminent, but not of supreme, rank in the 16th century are Luini (living 1500–30), Volterra (1509–66), Andrea del Sarto (1488–1530), Sebastiano del Piombo (c. 1485–1547), Palma Vecchio (c. 1480–1528), Moroni (c. 1525–78).

In the north of Europe there was a new development occupying the 17th century. In the year 1600 Rubens was an accomplished artist (died

1640). Snyder (1579–1637) his most powerful contemporary, and Van Dyck (1599–1641) his most eminent scholar. David Teniers, the father (1582–1649), was eclipsed by David Teniers, the son (1610–94); the latter gave genre-painting a firm position. Gonzales Coques (1614–84) was a portrait-painter. Passing to Holland we find Frans Hals, a contemporary of the elder Teniers (1584–1666), and a painter of remarkable certainty and spirit. The greatest of the Dutchmen, Rembrandt, belonged entirely to the 17th century (1607–69). The fame of Rembrandt greatly increased during the 19th century, and so did that of Frans Hals. Rembrandt had distinguished pupils, like Dow and Flinck, and he influenced many artists. Terburg, genre-painter, was Rembrandt's contemporary (1608–81), also Metsu (1615–58). These carried genre-painting to perfection. Landscape also prospered in Rembrandt's time, chief representatives being Ruysdael (c. 1628–82) and Hobbema.

In Spain a primitive school was founded as early as 1450. In the 16th century local schools developed themselves. Eminent foreign artists visited Spain and worked there, as in England. Of the Spaniards themselves, few have become celebrated out of their own country. Ford's list includes only thirty-seven names; the National Gallery only seven, and of these one was a Greek. Only five Spanish artists are represented in the Louvre. The fame of the school is due almost entirely to Velázquez (1599–1660) and Murillo (1616–82). Next to these come Zurbaran (1598–1662) and Ribera (1588–1656); Morales (c. 1509–86) is also known. Goya (1746–1828) is the only great Spanish artist between the old masters and our contemporaries.

The French school before developing a character decidedly of its own was subject to foreign, chiefly Italian influences, especially after the Renaissance. François Clouet (c. 1500–72), one of the earliest French masters, was naturalised, and probably of Flemish origin, like his accurate method of work; Jean Cousin (1500–89) worked under Italian influence; Vouet (1590–1649) studied, lived, and married in Italy; the great Poussin (1594–1665) lived nearly forty years in Rome, and died there; Claude le Lorrain (1600–82) lived fifty-five years in Rome, where he, too, died; Lesueur (1617–55) refused to go to Rome, but was influenced by Raphael; Le Brun (1619–90) studied four years in Rome, like other eminent Frenchmen since his time. The following artists are essentially French: Rigaud (1659–1743), Watteau (1684–1721), Lancret (1690–1743), Chardin (1699–1779), Boucher (1704–70), Greuze (1725–1805), Fragonard (1732–1806), Prud'hon (1758–1823).

In the British school the seven names which follow are at the same time distinctly national, and generally recognised by continental criticism. They occupy in this respect a position similar to that of the few Spanish masters who are generally known: Hogarth (1697–1764), Reynolds (1723–92), Gainsborough (1727–88), Turner (1775–1851), Constable (1776–1837), Wilkie (1785–1841), Landseer (1802–73).

Technical Chronology.—400 B.C., white-lead of this date has been found at Athens; 1398 A.D., Indian ink prepared in China as now; 1350–1400, true fresco used in Italy; 1500, oil-painting generally adopted; 1710, Prussian blue discovered by Diesbach of Berlin; 1787, zinc white suggested by Courtois of Dijon; 1802, Thénard discovers cobalt blue; 1814, discovery of emerald green; 1814, first discovery of existence of artificial ultramarine and prize offered for its manufacture soon afterwards won by Guimet of Lyons; 1814, cappagh brown found on Lord Audley's estate; 1817, cadmium discovered by Stromeyer; 1834, zinc white prepared by Winsor and Newton as Chinese white; 1838, discovery of chromium green by Pannetier and Binet; 1850, water-glass painting introduced. Of the

ten colours chosen for permanence in Professor Church's restricted palette six were discovered during the 19th century.

J. Foster (1904-8); on American art, Caffin (1902), Isham (1906), and Sherman (1920); on the Scottish school, Mackay (1906) and Caw (1908); G. Moore, *Modern Painting* (1893); Muther, *History of Modern Painting* (3 vols.; trans. 1894-96); Meier-Graefe, *Modern Art* (trans. 1908); Denis, *Theories 1890-1910* (1912); Wright, *Modern Painting* (1916); Marriott, *Modern Movement in Painting* (1920); Fry, *Vision and Design* (1920); Gleizes, *Du Cubisme* (1920); Henry, *Der Weg zum Kubismus* (1920); Gordon, *Modern French Painters* (1922); Bell, *Since Cézanne* (1922). See also articles on the greater painters—DÜRER, LEONARDO DA VINCI, MICHELANGELO, RAPHAEL, TITIAN, TURNER, and the rest; that on RUSKIN; also those on ART, FRESCO, IMPRESSIONISM, PIGMENTS, PRE-RAPHAELITISM, RENAISSANCE, ROMANTICISM, WATER-COLOURS, &c.

Paisiello, GIOVANNI (1741-1816), a Neapolitan composer. Besides more than ninety operas (including a *Barbiere di Siviglia*) Paisiello composed over a hundred masses, requiems, and cantatas.

Paisley, a manufacturing town of Renfrewshire, stands on the White Cart, 3 miles above its influx to the Clyde, 7 WSW. of Glasgow and 16 ESE. of Greenock. Although commonly identified with the *Vanduaora* or *Vindogara* of Ptolemy, which Skene places rather at Loudoun Hill in Ayrshire, it first is heard of certainly about 1157 as *Passeleth*, a possession of Walter Fitzalan, the first Scottish ancestor of the royal Stewarts (q.v.). He founded here six years later a Clugniac priory, which was dedicated to SS. James, Mirin, and Milburga, and which in 1219 was raised to the rank of an abbey. It was burned by the English in 1307; suffered much at the Reformation in 1561, and still more by subsequent vandalism; and now is represented chiefly by the aisled Decorated nave (15th century: the Abbey parish church, restored since 1862), and by the chapel of St Mirin, called the 'Sounding Aisle' (1499), with the altar-tomb of Marjory Bruce. In the ruined choir of the abbey is a memorial of the Stewarts placed there by Queen Victoria (1888). Near the abbey are statues of Wilson the ornithologist and Tannahill, who, like Professor Wilson ('Christopher North'), were natives of Paisley. There are also fine statues of George A. Clark, founder of the town-hall, and (since 1891) of Sir Peter and Thomas Coats. Motherwell and Alexander Smith were residents; and the latter describes the town well in *Alfred Hagart's Household*. Elderslie, 2 miles W., is the traditional birthplace of Wallace.

The public edifices include the municipal (formerly county) buildings (1818); new sheriff court-house (1885); the fine Clark town-hall,

Italian in style (1879-82); the new county buildings (1891), containing one of the finest council halls in Scotland; the Coats free library and museum (1871) with a picture-gallery and an observatory; the grammar-school (1576; rebuilt 1864); the Neilson educational institution (1852); and the Technical College and School of Art. The Coats Memorial Baptist Church (1894) is, it is claimed, the finest ecclesiastical edifice built in Scotland since the Reformation.

The linen, lawn, and silk-gauze industries, important during the 18th century, are now extinct; as, too, are the 'Paisley shawls,' so celebrated between 1805 and the middle of the 19th century, their sale sometimes exceeding £1,000,000 per annum. The manufacture of linen sewing-thread, introduced in 1722 by the witch-denouncer Christian Shaw of Bargarran, has been nearly superseded since 1812 by that of cotton thread, which has assumed gigantic proportions. There are also works for dyeing, bleaching, the manufacture of tartans, woollen shawls, carpets, chemicals, starch, corn-flour, soap, paper, and preserves, for engineering, the building of motor-cars and ships, &c. The Cart, which has been navigable since 1786, was finally deepened to 18 feet in 1888-90. Paisley was made a free burgh of barony in 1488. Since 1833 it has returned one member to parliament. Pop. (1801) 24,324; (1841) 48,125; (1881) 55,627; (1921) 84,837.

Palacio Valdés, ARMANDO, a distinguished Spanish man of letters, born at Entralgo, Asturias, in 1853, won notice first as a critic, then turned to novel-writing in 1881. Notable works are *Marta y María* (1883), *El Idilio de un enfermo* (1884), *José* (1885), *Riverita* (1886), *Los Majos de Cádiz* (1896), *La Algeria del Capitán Ribot* (1899), *Tristán* (1906).

Palacky, FRANTIŠEK, a Bohemian historian, was born 14th June 1798 at Hodoslavitz, in Moravia, and studied at Presburg and Vienna. In 1829 he was appointed historiographer of Bohemia, and was charged to write a *History of the Bohemian People to 1526* (5 vols. 1836-67), which appeared in both German and Czech; it is one of the greatest literary works in Czech, and nationalist through and through. Palacky took part in the political agitation of 1848, and was the leader of the Slav or national party as opposed to the German at the Diet of the Kremsier. Besides his great *History* he published works dealing with the Hussite period, and with Schafarik edited *The Oldest Memorials of the Bohemian Language* (1840). He died 26th June 1876 at Prague.

Palaeobotany. See PALÆONTOLOGY.

Palæography is, according to its derivation from Greek, the science which deals with ancient handwriting. The term 'ancient' is of course relative, but in actual practice it covers the thousands of years that have passed since writing first appears in history down to the invention of printing (about 1450 A.D.). Nor, strictly speaking, is the study confined to any language or group of languages. But in these days of highly specialised study one scholar can command only a region or two of the vast area, and this article therefore deals only with Greek and Latin, and especially with the latter, as it shares its various scripts with most of the modern languages of Europe. Palæography teaches us not only to decipher ancient manuscripts, but to judge of their date, genuineness, and place of origin. While Epigraphy (see the article INSCRIPTIONS) is concerned with letters engraved on some hard substance, such as stone or metal, the materials for palæographic study comprise ancient books, either rolls, *volumina*, written on leather or papyrus, or *codices*, written in book form on sheets of papyrus, vellum, or paper.

Wax-tablets, charters, bulls, decrees, acts, business papers, and similar documents have also to be considered by the student of palæography.

The oldest extant manuscripts come from Egyptian tombs, and are written on sheets of Papyrus (q.v.), prepared from the pith of a rush. Perhaps the oldest extant papyrus is one containing the accounts of King Assa, about 3500 B.C., and the earliest copy of a literary work is the *Papyrus Prisse*, written not later than 2500 B.C. Coming down to the 18th and 19th dynasties, papyrus rolls, usually containing portions of the Book of the Dead (q.v.), are numerous. The earliest Greek literary work written on papyrus is the *Persæ* of Timotheos, of the 4th century B.C., and the earliest Latin work on the same material is a small poetical fragment (not later than 79 A.D.) found in Herculaneum. But documents written on papyrus, a very fragile material, have mostly perished, and the chief ancient MSS. which have come down to us are written either on parchment, which is still used for legal documents, or on vellum; the skins being prepared so as to be written on both sides, thus superseding the older leather rolls, still used in Jewish synagogues for copies of the Law, and the papyrus rolls, which were commonly inscribed on one side only, and the papyrus *codices*, the leaves of which tended to become easily detached. The necessary limits of this article make it impossible to discuss the hieratic and demotic papyri from Egypt, or any of the Eastern scripts, Chinese, Pali, Indian, Coptic, Syriac, Hebrew, or even the magnificent specimens of Persian and Arabic calligraphy preserved in oriental libraries. The student may, however, be referred to the oriental series of the Palæographical Society, to Silvestre's *Paléographie Universelle*, and Burnell's *Elements of South Indian Palæography*. It must, here suffice to describe briefly the Greek and Latin styles, and the more

important of the mediæval scripts.

Both in Greek and Latin manuscripts we find two contemporaneous but widely-different styles of writing; a book-hand, formal and regular, easily legible, used by professional scribes, and a cursive hand, rapid, careless, loose, and straggling, often very difficult to read, which was employed for private correspondence, contracts, accounts, such documents, in fact, as were not intended for permanent preservation, and, somewhat formalised, for charters, rescripts, and other official documents.

The Greek book-hands may be classed as Capital, Uncial, or Minuscule; the Latin as Capital, Uncial, Half-(Semi-)Uncial, and Minuscule. The capitals, which differ little from the lapidary forms used in inscriptions, are square and angular, such as are still retained for initials, titles, and superscriptions. Manuscripts written wholly in capitals are very rare, the use of more facile materials, such as parchment or papyrus, having led at a very early time to modifications of the lapidary forms, transforming them into uncials, a formal book-hand, large, clear, and legible, used by professional scribes, and derived from the capitals with little change, save that the forms are more rounded, and sometimes inclined rather than upright. Thus, **Ε** both in Greek and Latin is a characteristic uncial form, obtained by rounding the capital form **E**, and saving labour by requiring only two strokes of the pen instead of four. The term Uncial is as old as the time of St Jerome, but the origin of the name has not been explained. In the early Middle Ages Latin uncial writing was known, at least in certain circles, as *scriptura Romana*. The general resemblance in the character of Greek and Latin uncials will be seen by a few words from St John, xxi. 19, as they appear in the *Codex Bezae* at Cambridge, a manuscript assigned to the 5th or 6th century, containing the Gospels and Acts in Greek, with a Latin translation.

CHMENONTI OIWOΘANATWΔOΞACEITONON

Greek.

SIGNIFICANSQUAMORTEHONORIFICABITDM

Latin.

Or, in ordinary minuscules, σημειων [σημαιων] ποιω θανατω δοξασει τον Θεον, 'significans qua morte honorificabit Deum.'

In the 8th and 9th centuries a new book-hand was evolved mainly out of the cursive, but incorporating sundry forms from the degenerate contemporary uncial. This, by reason of the smaller size of the letters, is called minuscule. The old majuscule cursive, developed out of the capitals and uncials, which had by this time become formless and illegible, was gradually superseded by a new cursive, developed out of the minuscule. The minuscule reached its perfection as a book-hand in the 12th century, after which it continually degenerated till the invention of printing. Both for Greek and Latin books the early printers adopted at first the corrupted forms of the contemporary book-hands, but afterwards returned to the older and purer types of the 11th and 12th centuries. Thus there is a general analogy between the successive stages of Greek and Latin writing. Side by side with the old cursive scripts there is a gradual evolution of improved uncial book-hands till about the 6th century, followed by a period of decay, till the 9th century, when the revival of learning produced a regeneration, again followed by progressive deterioration till the invention of printing caused a reversion to the best of all preceding styles, that of

the 11th century. Traces of these revolutions may still be recognised. It will be observed that we now employ four different alphabets: minuscules for our printed books, and capitals for their title-pages, headings, and initials, and cursives for our correspondence, while the initials in our ordinary writing are analogous to uncials. Familiarity prevents us from noting the wide differences in the forms of such letters as A, a, α; B, b, β; G, g, γ; or R, r, ρ. These are survivals, the first from the lapidary capitals of the Augustan age, the second from the French book-hand of the 11th century, and the third from the Tudor cursive, modified and improved by the Italian cursive of the Elizabethan age.

Greek Palæography.—The earliest Greek manuscript shows a style of lettering hardly removed from the capitals found on stone. The remarkable finds in Egypt enable us to trace the steady development of Greek majuscule writing from the 4th century B.C. down to the end of the majuscule period in papyrus writing. From this period we have numerous MSS. of Homer, as well as the Orations of Hyperides, Bacchylides' *Odes*, Aristotle's *Constitution of Athens*, the *Mimes* of Herodas, and many other writings, many previously in print, and some quite new to the modern world. The preservation of these old books is due to the dry-

ness of the climate, and to the practice of burying documents in tombs. We have from Herculaneum an ancient library consisting of 1803 papyrus rolls, which must be older than 79 A.D., when the town was destroyed. These contain Greek works of the Epicurean school of philosophy, especially writings of Philodemus of Gadara, a member of the household of the library's owner, Piso, a contemporary of Cicero. These early Greek uncials being written on papyrus, a fragile material, are slender and delicate, without bold curves, thick downstrokes, or fine hair-lines, which only became possible when the use of vellum introduced a firmer and bolder style. In these uncial papyri the occasional presence of ligatures is no doubt due to the influence of cursive forms, which are exhibited in the *ostraca*, of which great numbers have been found in Egypt. These are usually receipts for taxes, scratched with a point or written with ink on potsherds. Our knowledge of the early Greek cursive begins about the beginning of the 3d century B.C., to which a fairly large number of specimens found in Egypt belongs. Cursive forms were, however, used by the Greeks at a much earlier period; Greek inscriptions in the Cypriote syllabary exhibit forms of a distinctively cursive character as early as the 7th century B.C. Compared with the papyri the uncial vellum codices, of which about 300 are known, exhibit a firmer and more set uncial style, which was rendered possible by the material. The oldest to which a definite date can be assigned is the Dioscorides now at Vienna, which from internal evidence must have been written about 506 A.D. Earlier, but undated, are the three great Biblical codices, the *Codex Vaticanus* at Rome, which is assigned to the 4th century; the *Codex Sinaiticus* at St Petersburg, assigned to the end of the 4th or the beginning of the 5th century; and the *Codex Alexandrinus*, now in the British Museum, which probably belongs to the middle of the 5th. The Washington codex of the Four Gospels is also assigned to the 5th century. The style of the writing in these uncial codices is seen in the subjoined specimen, which is taken from the Septuagint version of Esther, i. 22, as it appears in the *Codex Sinaiticus*.

ΚΑΙ ΑΠΕΣΤΙΛΕΝ ΕΙΣ Ὁ ΒΑΣΙΛΕΥΣ
 ΠΑΣΑΝ ΤΗΝ ΒΑΣΙ
 ΛΕΙΑΝ ΚΑΤΑ ΧΩΡΑΝ
 ΚΑΤΑ ΤΗΝ ΛΕΞΙΝΑΥ
 ΤΩΝ ὩΣΤΕ ΕΙΝΑΙ
 ΦΟΒΟΝ ΑΥΤΟΙΣ ΕΝ
 ΤΑΙΣ ΟΙΚΙΑΙΣ ΑΥΤῶΝ.

This in ordinary Greek type would read :

καὶ ἀπέστειλεν εἰς
 πᾶσαν τὴν βασι
 λεῖαν κατὰ χώραν
 κατὰ τὴν λέξιν αὐ
 τῶν ὥστε εἶναι
 φόβον αὐτοῖς ἐν
 ταῖς οἰκίαις αὐτῶν.]

To the 5th century are assigned the palimpsest *Codex Ephraemi* at Paris, to the 5th or 6th the *Codex Bezae* at Cambridge, and to the 6th the

Codex Claromontanus at Paris. After the 7th century the Greek uncial loses its early style; the letters become oval, narrow, elongated, and cramped, sloping to the right; accents make their appearance, and the pure early uncial degenerates into forms difficult to read.

About the middle of the 4th century we find the first beginnings of the new minuscule, the book-hand of the future, which was destined to replace both the deformed uncial and the earlier cursive, from each of which it borrowed certain elements. The earliest traces of these minuscule forms as yet discovered are seen in a letter on papyrus, belonging to about the year 350 A.D., written by Flavius Macarius, chief officer of finance in Egypt, to Flavius Abinnæus, a *praefectus castrorum*. The transition from the old to the new style is exemplified in a most interesting sheet of papyrus from Ravenna, now at Vienna, which contains the signatures of certain bishops to the Acts of the Council of Constantinople, held in 680. The older bishops sign in slanting uncials and the younger men in early forms of the new minuscule. In the 9th century, with the revival of learning, this new minuscule developed into a calligraphic book-hand, which was used in vellum codices. The oldest dated books in which it appears are the Uspensky Gospels, written in 835, and the Bodleian Euclid of 888 A.D. The chief transformations are due to the use of ligatures, as is plainly seen in the forms of the letters δ, ϑ, and σ. Hence in the fully-formed minuscule of the 11th century we find the letters α, ε, κ, λ, φ, ω, which follow the old uncial forms, while δ, η, μ, ν are taken from the cursive. In the case of several letters the double source of this script is shown by the retention of duplicate forms, β, θ, π, and ς, for instance, being uncials, while Ϸ, Ϲ, Ϻ, and σ are of cursive origin.

From the end of the 12th century to the invention of printing the minuscule continually degenerates, losing its purity and beauty, and breaking up into a rough cursive script. The writing becomes intricate and involved, ligatures and accents being combined into a single character rapidly executed without taking the pen from the paper, thus making the writing very difficult to read. In the earliest

printed books the contracted and ligatured forms of contemporary minuscule MSS. were faithfully imitated. These, however, were gradually discarded, though a few, such as Ϸ for στ, Ϲ for ου, and Ϻ for ος, survived till quite recent times.

Latin Paleography followed much the same course as Greek. There were four set book-hands—capitals, uncials, semiuncials, and minuscules, of which the two last were influenced by the old Roman cursive. The capitals are of two kinds, Square and Rustic. Square capitals differ little

from the lapidary characters used in inscriptions, and may be defined as being bounded by a square or as having their vertical and horizontal strokes at right angles. Of the few examples we possess of this script the best is perhaps the St Gall Virgil, assigned to the 4th or 5th century. Rustic capitals, which were more usual, are characterised by circumflexed finials and by the crossbars being curved and slightly oblique. This style, which can be traced as far back as a Herculaneum papyrus of the 1st century A.D., and the sign over a boot-maker's shop in Pompeii of the same date, was

greatly in fashion from the 3d century to the 7th. Good examples are four famous Virgils: the *Codex Vaticanus* assigned to the 4th century, the *Codex Palatinus* and the *Codex Romanus* to the 5th, all of which are in the Vatican, and the 5th-century (about 494 A.D.) Medicean Virgil at Florence. The Rustic died out about the 10th century, and left no successor.

The uncials arose out of the square capitals, and exhibit rounded forms of certain letters. The earliest uncial codices extant are not earlier than the 4th century A.D., but it is plain that uncial writing was practised at an earlier period, since we find isolated uncial forms in inscriptions from about the end of the 2d century A.D. onwards. The uncial book-hand is distinguished from the contemporary square capitals by the rounded forms *Є M U H* instead of E, M, V, H, and by the tails of P, F, Q, and R falling below the line, while the head of L rises above it. Over 400 MSS. or portions of MSS. in this style survive.

Uncial manuscripts naturally fall into two groups. One group is manifestly the older: in orthography, punctuation, and abbreviation it bears close resemblance to inscriptions of the classical or Roman period. The other group is as manifestly composed of the more recent manuscripts: this may be inferred from the corrupt or barbarous spelling, from the use of abbreviations unfamiliar in the classical period but very common in the Middle Ages, or from the presence of punctuation, which the oldest manuscripts invariably lack. The manuscripts of the first group show letters that are simple and unadorned and words unseparated from each other. Those of the second group show a type of ornate writing, the letters having hair-lines and flourishes, and the words being well separated' (E. A. Lowe, *A Sixth-Century Fragment of the Letters of Pliny the Younger*, Washington, 1922; p. 14). After the 8th century uncial was not used for whole texts, but only for titles and such like.

One of the oldest uncial Latin MSS. is the Vercelli Gospels, said to have been transcribed by the hand of Eusebius himself (died 371), but in any case nearly as early as his time. A good example of the later uncials is the copy of the Gospels now in the library of Corpus Christi College, Cambridge, which is believed to have been brought from Rome by St Augustine (of Canterbury) in 596. Also of the 6th (or 5th) century is the *Codex Bezae* at Cambridge, the style of which is shown in the fac-simile already given. The earlier and later uncial styles are well seen in the famous palimpsest Cicero from the monastery of Bobbio, now in the Vatican. A palimpsest is a manuscript from which the writing was washed off with a sponge, or sometimes scraped or rubbed, in order that the vellum might be used for some other work. The *Codex Ephraemi* above mentioned is a palimpsest, a 5th-century Greek text being overwritten in a 12th-century hand. The Vatican Cicero is a codex consisting of 150 leaves, containing in the first hand the treatise *De Re Publica*, written in double columns in large uncials, probably of the 4th century. Over this is written across the commentary of St Augustine on the Psalms, in a small uncial hand of the 7th century.

In the fainter writing of the original manuscript we may decipher the words EST IGITUR INQUIT AFRICANUS RESP.(ublica). The writing in the second hand reads (line 1) HOMO EST QUIA, (2) ET OMNES XPIANI (*Christiani*) MEMBRA SUNT XPI (*Christi*), (3) MEMBRA XPI (*Christi*) QUID CANTANT. AMANT, (4) DESIDERANDO CANTANT. ALIQUANDO.

We now come to the script which goes by the name of semiuncial or half-uncial. This name, which arose out of a misconception of early palaeographers, does not signify a script half the size of the uncial, some semiuncials being larger than some uncials, but is used to denote an uncial script with new forms of b, d, g, m, r, and s, which were derived from the cursive. The earliest traces of the semiuncial style are found in a 4th-century papyrus containing an epitome of Livy. The script seems to have been used mostly in Italy and France, and almost exclusively for the copying of Christian writings: about 160 MSS. or portions of MSS. in this style are known. Various specimens are assigned to the 5th century. The earliest dated example in this script is, however, a Hilary, written in 509 or 510, now preserved in the Chapter Library of St Peter's at Rome. The script endured till about the end of the 8th century by the side of the uncial style.

The old Roman cursive, which contributed to the creation of the half-uncial style, is of great palaeographical importance, since it became the source of many forms in modern scripts. Its character from about the beginning of the Christian era is now fairly well known from examples that have been discovered, particularly on wax and lead tablets, but also on walls (see GRAFFITI). For example, in a house at Pompeii a number of wax-tablets were found in 1875, which proved to be the business memoranda of L. Caecilius Jucundus, a Pompeian banker and agent, mostly belonging to the years 53-62 A.D., and relating to purchases at auctions, and payments of taxes on behalf of his clients. Similar tablets, which are dated from 131 to 167 A.D., have been discovered in abandoned gold-workings in Dacia. This old Roman cursive, which is very illegible, exhibits the forms out of which arose *f* (the long *s*) and also the modern forms g, b, f, m, n, d, r, h, which replaced the capital forms G, B, F, M, N, D, R, H. This illegible Roman cursive reappears in a more set official hand in rescripts addressed to Egyptian functionaries in the 5th century, in official documents written at Ravenna in the 6th century, as well as in numerous marginal notes in uncial or semiuncial manuscripts. It is also employed in a copy of Avitus, written in the 6th century, and a Josephus of the 7th. These two books are written on papyrus, and the absence of other examples may be explained by the fact that the fragile papyrus books, probably copied made by scholars for their own use, have mostly perished, only vellum codices as a rule having been preserved.

With the establishment of the Teutonic kingdoms on the ruins of the Roman empire a number of national scripts developed, such as the Merovingian in France, the Visigothic in Spain, and the Lombardic in North Italy. These were all based on the Roman cursive, and were used for civil purposes as well as for charters and other diplomatic documents. The Merovingian became the official hand of the Frankish empire. It is cramped and vermiform,

homo est quia
et omnes xpiani membra sunt xpi
membra xpi quid cantant, amant
desiderando cantant. aliquando
africanus resp.

with exaggerated loops for the heads and tails of certain letters. It was used as the diplomatic hand in the chanceries of France and Italy till the 9th century, and in the imperial chancery till 1231, when its use was abolished by Frederick II. It has survived, however, in a modified form in the modern German cursive, in which many of the peculiar forms of the old Roman cursive can be detected. Out of the official Roman cursive arose the script which was employed in papal bulls till the 12th century, when it was replaced by the French minuscule, which was used till the 16th century, when a deformed, contracted, and illegible script called the *littera Sancti Petri* was adopted.

The old cursive derives its chief importance from having been one of the sources from which were developed the semiuncial and the minuscule book-hands. The period from about 600 to 800 witnessed a great variety of minuscule scripts in various parts of Europe, some of which have not yet been thoroughly studied. In them can be found cursive, capital, uncial and half-uncial elements mingled in various proportions. Only some of these types can be here referred to. The Beneventan was employed in southern Italy and Dalmatia from the end of the 8th to the end of the 13th century. Its chief centre was Monte Cassino, and its best period the latter part of the 11th century. Among its distinguishing features are the forms of *a* and *t*, the former being made like two *cs* touching each other, the latter with the cross-stroke curved downwards to the left of the stem, sometimes even as far as the line; the prevalence of ligatures with 'enclitic' *i*; and the use of the long form of *i* to indicate the semi-vocalic *i*, a peculiarity shared to a less extent by Visigothic. The script as a whole is marked by the adaptation of certain cursive elements for calligraphic purposes. The minuscule scripts associated with these islands are combined under the term 'insular.' Few recognisable specimens of the Welsh-Cornish and Breton scripts survive, but Irish and Anglo-Saxon examples abound, many of them written on the Continent. Irish and Italian influences converged in the monasteries of Northumbria. The insular scripts are not easy to distinguish from one another. They share an elaborate system of abbreviations and certain forms of letters. Among the latter the forms of *n*, *r*, and *s* are hard to distinguish. There are two types of insular script, the round and the pointed. The insular scripts travelled with the Irish and Anglo-Saxon missionaries, and we thus find Irish influence at St Riquier (Picardy), Péronne, Liège, Luxeuil, Fulda, Metz, Murbach, Reichenau, Würzburg, St Gall, Bobbio, &c. : Anglo-Saxon influence is found at Echternach, Corbie, Lorsch, Ratisbon, &c. The Visigothic script was employed in Spain and southern France from about the end of the 8th century till the beginning of the 12th century. Its dependence on the late Roman cursive is more marked than that of any other script. In many specimens the writing inclines to the left. Of the peculiar forms of letters, the *q*-formed *g* and the *a* form of *t* may be mentioned. The script is further distinguished by special orthography, such as *quum* (for *cum*), *srahel* for *Israhel*, the excessive use of the aspirate before vowels (e.g. *hannis* for *annis*), and its absence where most other scripts rightly employ it (*traere* for *trahere*, cf. Span. *traer*), and by special abbreviations (*aum* for *autem*, *n̄r* for *noster*, &c.). The older Merovingian script of France has many cursive elements, and is, of all pre-Caroline scripts, the most difficult to decipher. It is impossible to follow here the various scripts associated with Corbie, of which the most interesting is the Corbie *ab* script (used from 780 to 815); the writing of Lorsch; the script of Murbach-Reichenau-St Gall-

Chur; the writing of the Veronese school; the Bobbio scripts which combine Irish and Italian elements. The Irish semiuncial is an important script, as it became the basis of the 'Roman type,' which is used in our modern printed books. The history of this Irish semiuncial is obscure. Its elements must have been obtained, probably in the 5th century, from the semiuncial book-hand of southern Gaul. The forms of some of the letters are plainly those of the Roman uncial; others are calligraphic forms which must have been derived from an ecclesiastical Gallican type of the Roman cursive. Just as the Greek minuscule has duplicate forms of certain letters, some derived from the uncial, others from the cursive, so the double parentage of the Irish semiuncial is demonstrated by the permissive use of *N*, *R*, *S*, which are uncials, and of *n*, *r*, *f*, which are uncialised cursives. Several other forms, such as *g*, *b*, *a*, *m*, *f*, *h*, *l*, are also uncialised cursives, and not, like the Roman uncials, merely rounded capitals (see IRELAND, *Language and Literature*). This Irish semiuncial suddenly blazes forth in the 6th century. The noblest specimen is the magnificent Book of Kells now at Dublin, which was probably written at the close of the 7th century, though often referred to the 9th (see ILLUMINATION). Of somewhat later date are St Chad's Gospels, originally of Llandaff, now at Lichfield, and the Lindisfarne or Durham Book, commonly called St Cuthbert's Gospels, now in the British Museum. The latter was written in Northumbria, where the script had been introduced by Irish missionaries.

This Northumbrian semiuncial formed with Merovingian minuscule the basis of the nearly perfect Caroline minuscule, so called because during the reign of Charlemagne it was introduced by Alcuin of York, the friend and preceptor of the emperor, into the calligraphic school at Tours, over which Alcuin presided from 796 to 804. The bewildering variety of minuscule scripts throughout the area which became Charles's empire, each with its own system of abbreviation, each varying more or less in orthography from the others, and each more or less incomprehensible by those who lived outside the particular area where it was employed, made reform necessary. It was most desirable that the new empire should have a common script, distinguished by clearness and beauty, and by a consistent orthography, corrected according to the standards set forth in the works of Cassiodorus and Bede. Alcuin seems to have incorporated certain elements from the Roman uncial and the Merovingian minuscule; and the new script, recommended by its legibility, distinctness, and minuteness, was rapidly diffused by Alcuin's pupils over Europe, and rapidly superseded all the other monastic book-hands. Starting at the end of the 8th century, it reached its highest perfection at the end of the 11th. In the 13th deformation set in; it stiffens and becomes more cramped, ligatures and contractions are introduced, and out of it grew the Black Letter or Gothic of the 15th century, a form of which still survives in many German printed books. The black letter was used in the earliest printed books, but, with the revival of learning, Italian scholars returned to the beautiful Caroline minuscule of the 11th century, which was imitated in the Roman type now universal in Italy, France, Spain, Britain, and America, and which is rapidly replacing the Gothic letter in northern Europe. See PRINTING.

Beside the pure Caroline minuscules used for books various cursive hands are found, more angular, irregular, and difficult. Such are the deformed hands used in English charters and the records of courts of law. Our modern English script is based on this 'court-hand,' improved, however, in the reign of Elizabeth by the influence

of the contemporary Italian hand. It is, however, much superior in legibility and distinctness to the modern German script, which, as we have seen, is to a great extent a survival from the old Roman cursive.

Contractions.—The difficulty of deciphering mediæval MSS. arises largely from the contractions, abbreviations, and ligatures which were employed to economise labour and parchment. To give a complete list within reasonable limits is impossible, more especially as they varied at different periods and in the various scripts. In the very oldest MSS., apart from those containing technical works and those written in cursive, only two abbreviations are found, *b* with a dot after it for the syllable *bus*, and *q* with a dot after it for the syllable *que*. Almost as early we find *m* or *n* after a vowel at the end of a line indicated by a horizontal stroke above and beyond the vowel. The abbreviations of sacred names constitute a special class by themselves. The Hebrews were the first to indicate the name of God in a special way, either by omission or by different coloured lettering, either with or without a horizontal line over the top of the word. The Greek Bible imitated this custom, and the Latin imitated the Greek. In these Bibles and in other sacred works the names for God, Lord, &c., were abbreviated as a sign of sanctity, and the horizontal line was placed above the abbreviation. In the Church the custom was gradually extended to the words meaning Christ, Jesus, Son, Spirit, Holy, and so on. The whole process can be traced almost from the beginning. The still familiar symbol IHS is really the first three letters, or the first, second, and last letters of the name Jesus in Greek, the Greek letters being still used in the Western Church, even after it had ceased to be Greek-speaking. From the beginning of the minuscule period the volume of abbreviation increases, Ireland making in the earliest days the largest contribution. Six ancient shorthand symbols were preserved by the Irish scribes, indicating respectively *con*, *contra*, *et*, *eius*, *est*, and *autem*. It may also be mentioned that abbreviation by suspension is in origin pagan; abbreviation by contraction is in origin Christian.

More than 5000 contractions of Latin words were used in France between the 7th century and the 16th, while in England more than 1000 are found in official Latin documents of the Tudor period alone. There are, for instance, six recognised contractions for *quoniam*, seven for *esse*, and ten for *et*. In one class of MSS. *qm̄* stands for *quoniam*, in another for *quum*, while *quō* denotes *quomodo* in one script and *quoniam* in another. Instead, therefore, of attempting to catalogue the more usual contractions, which are tabulated in several works referred to below, it will be more useful to explain the general principles by which mediæval scribes were guided. In most cases, if not in all, these contractions arose out of ligatures, and were used at first for some particular syllable, and then as time went on they were generalised, so as to denote a whole class. Some of these ligatures we still use. Thus, *w*, as the name implies, is a ligature for *uu*; *æ* and *œ* need no explanation. The two suprascript dots, as in *ä* or *ö*, which express the German *umlaut*, are merely the ligatures *æ* and *œ*.

In *viz* for *videlicet*, and *oz* for *ounce*, we have survivals of a very frequent abbreviation, which proves to be a ligature. The *z* is merely used by printers for their own convenience instead of the correct sign *3*, which is found, by tracing it back, to be only a rapid and slurred way of writing the semicolon (;) without taking the pen from the paper. This sign at one time denoted only the omission of certain frequently occurring final letters. After-

wards it was generalised to signify the omission of any final syllable, as in *oz* for *ounce*, or in the apothecaries' signs *3* for *uncia*, and *3* for *drachma*. The sign *3* for scruple is merely the ligature *sr*, the long *s* being crossed by a cursive *r*.

The suprascript comma now used to denote the omission of medial syllables or letters, as in *can't* for *cannot*, or *I've* for *I have*, was at first merely a suprascript vowel, indicating the omission of *r* followed by that vowel. This custom first occurs in early Irish minuscule. In English records it forms a ligature with the preceding letter, as in *fūnt* for *fuertunt*, *vbō* for *verbo*, or *ts* for *tres*.

The circumflex (*~*) grew out of a cursive form of the uncial *m*, and originally denoted exclusively the omission of *m*, then of *n*, and afterwards of other letters. Thus we have *omēs*, *omīs*, and *ōes* for *omnes*, *ōia* and *ōmīa* for *omnia*, *hōiū* and *hōiū* for *hominum*, *nō* and *nī* for *non*. The horizontal line (*—*) is one of the earliest signs of omission, as we have seen. Its use was, however, less restricted than that of the circumflex, and we still use it in the contraction *lb* for *librae* (pounds), the double bar in *£* denoting a double omission. Shillings and pence, now expressed by *s.* and *d.*, were formerly denoted by *š* and *đ*, abbreviations for *solidi* and *denarii*. The sign *\$* for dollars is said to be the ligature *dll*, the *S* being merely *š*, a cursive Dutch form of *d* (but see DOLLAR). The circumflex (*~*) which was a cursive *m* was not always written horizontally. We see this in the common sign *2* used for *rum*, as *suoz* for *suorum*, or *švo2* for *servorum*. Here *2* is the ligature of *r* and *u*, which is crossed by *m* in the cursive form (*~*) or (*—*) written vertically. For *et* there are numerous signs, all of which resolve themselves into ligatures. Some of them, such as *3*, *ε*, and *q*, require no explanation. They are found in *ε&i* for *etiam*, and in the various forms *ε&c&era*, or *ε&c&ta*, or *ε&cet.* or *ε&ō*, or finally *ε&c.* which we now use for *et cetera*. In like manner *esse* is written in late times *≈*, the two dots each representing *e*, and the two circumflexes being each a long *s*. This became *≈* and then *=*, whence we obtain *=s* for *esses*, *=t* for *esset*, and *=m9* for *essemus*.

Many similar contractions were also used, most of which go back to the early days of minuscule at least. A few of the more common are *p* for *pro*, *p* for *per* and *por*, and *p̄* for *præ*, *q* for *qui*, *fr* for *frater*, *i* for *vel*, *£* for *ser*. Thus we have *supius* and *supio* for *superius*, *ppe* for *prope*, *p̄* for *proximus*, *gehof* for *generosi*, *ass=* for *assisa*, *fiz* for *fitz*.

BIBLIOGRAPHY.—The study of Palæography requires access to a good library, the collections of fac-similes being mostly bulky and costly. The beginner should study Sir E. Maunde Thompson's *Handbook of Greek and Latin Palæography*, with *Specimina Codicum Græcorum Vaticanorum* collegerunt P. F. de' Cavalieri et I. Lietzmann (1910) and *Specimina Codicum Latinorum Vaticanorum* coll. Ehrle et Liebaert (1912), all inexpensive works, and then go on to the others named. Sir E. Maunde Thompson's *An Introduction to Greek and Latin Palæography* (Oxford, 1912, with comprehensive bibliography); V. Gardthausen, *Griechische Paläographie* (2d ed. 1911-13). A most instructive collection of fac-similes is F. Steffens, *Lateinische Paläographie* (100 plates; 2d ed. 1909). For Greek papyri Sir F. G. Kenyon's *The Palæography of Greek Papyri* (1899) is still the most accessible, though multitudes of fresh documents have accrued since its publication. For cursive, H. B. van Hoesen, *Roman Cursive Writing* (1915). General Collections of Fac-similes covering the whole field: The Palæographical Society, *Facsimiles of MSS. and Inscriptions*, ed. E. A. Bond, E. M. Thompson, and G. F. Warner, 5 vols. and indexes (1873-1901); The New Palæographical Society, *Facsimiles of Ancient Manuscripts, &c.*, ed. E. M. Thompson, G. F. Warner, F. G. Kenyon, and J. P. Gilson (1903-); H. Omont, *Facsimiles des manuscrits grecs datés de la Bibliothèque Nationale du IX^e au XIV^e siècle* (1901)

and *Facsimilés des plus anciens MSS. grecs en onciale et en minuscule, de la B. N. du IV^e au XII^e siècle* (1892), &c.; E. Chatelain, *Paléographie des classiques latins* (1884-1900); A. Chrout, *Denkmäler der Schriftkunst des Mittelalters* (1899-). On the Alphabet: I. Taylor, *The Alphabet* (1899), to be supplemented by later Cretan discoveries (Sir A. J. Evans, *Scripta Minora*, 1909). On abbreviation: T. W. Allen, *Notes on Abbreviations in Greek Manuscripts* (1889); L. Traube, *Nomina Sacra* (1907); W. M. Lindsay, *Notæ Latine* (1915); *Palæographia Latina* (1922-), and numerous articles. The following works on early and on national scripts are of the highest value: W. Wattenbach and C. Zangemeister, *Exempla Codicum Latinorum litteris majusculis scriptorum* (1876, 1879); E. Chatelain, *Uncialis Scriptura codicum Latinorum novis exemplis illustrata* (1901, 1902); E. A. Lowe, *Codices Lugdunenses Antiquissimi* (1924), *Scriptura Beneventana* (about to be published), *The Beneventan Script* (1914), *Studia Palæographica* (1910); F. Carta, C. Cipolla, C. Frati, *Monumenta Palæographica Sacra* (1899); C. Cipolla, *Codici Bobbiesi della Biblioteca Nazionale Universitaria di Torino* (1907); C. U. Clark, *Collectanea Hispanica* (1920); A. Staerk, *Les Manuscrits latins du V^e au XIII^e siècle conservés à la Bibliothèque Impériale de Saint-Petersbourg* (MSS. of French, particularly of Corbio origin, 1910). Many Greek and Latin manuscripts have been reproduced in full, particularly by S. de Vries at Leyden (1897-). The palæographer should always have at hand L. Traube, *Vorlesungen und Abhandlungen*, 3 vols. (1909-19). Lists of existing capital and uncial Latin MSS. will be found in this work, vol. i. pp. 157-261, and of half-uncial in *Miscellanea Ehrle*, vol. iv. (1924), pp. 34-61 (by E. A. Lowe). Among the older works the most important are Walther's *Lexicon Diplomaticum*, Wailly's *Éléments de Paléographie*, Astle's *Origin and Progress of Writing*, Silvestre's *Paléographie Universelle*, Montfaucon's *Palæographia Græca*, Mabillon's *De Re Diplomatica*, and the Benedictine *Nouveau Traité de Diplomatique*.

Palæolithic. See ARCHEOLOGY, ART, FLINT IMPLEMENTS, STONE AGE; also MAN.

Palæologus, the name of an illustrious Byzantine family, which first appears in history about the 11th century, and attained to imperial dignity in the person of Michael VIII. in 1260 (see BYZANTINE EMPIRE). The last of the dynasty, Constantine XI., fell bravely fighting at the siege of Constantinople. His brothers were princes of the Morea and of Achaia respectively; a daughter of one of them married Ivan III. of Russia. A branch of the family ruled Montferrat from 1306 to 1533.

Palæontology (Gr., 'study of ancient life'), the science or study of fossil organic remains—whether of animal or plant life. The study of fossil animals is sometimes termed palæozoology, and that of fossil plants palæobotany or palæophytology. The aim of palæontology is to attain a knowledge of all the various plants and animals which have successively appeared and disappeared in the course of geological ages. But as the geological record is highly imperfect, and myriads of species must have lived and died without leaving any trace behind them, it is obvious that our knowledge, no matter how enlarged it may become, can never possibly be complete. The history is full of gaps, some of which may eventually be bridged over, but, however that may be, it is nevertheless certain that our knowledge must always bear but a small proportion to our ignorance. Nevertheless, the study of palæontology has been fruitful in results. It has greatly influenced zoology and botany—and that not merely by adding to the number of subjects with which those sciences deal, but especially by the light which it has thrown on the evolution and mutual relations of existing forms of life. Fossil organic remains consist chiefly of the harder parts—such as bones, scales, teeth, shells, crusts, spines, &c.—of animals, and the ligneous tissues of plants (see FOSSILS). In attempting to interpret the evidence supplied by such remains, palæontologists were early led to study, for purposes of com-

parison, the structures of existing plants and animals. By applying the results of these comparisons to the restoration of extinct forms of life, Cuvier was enabled to establish the law of the 'correlation of organs;' and thus the palæontologist, who has to deal principally with fragmentary remains, is not in such a helpless case as might have been supposed. 'Stated in its most general form, the law of the correlation of organs is the law that all the parts of an organism stand in some relation to one another, the form and characters of each part being more or less closely dependent on, and connected with, the form and characters of all the rest. In other words, an organism is not a fortuitous collocation of unrelated parts, but is composed of mutually adapted and related organs; the possession of any given organ, therefore, implying the possession of other "correlated" parts' (Nicholson and Lydekker). Hence the palæontologist can often infer from an isolated organ or structure the essential characters of the remainder of the organism. But, while the biological sciences have greatly benefited, it is geology which has been most advanced by palæontological research. Without the help of fossils the geologist would be unable to reconstruct the past. By their aid he is able to identify and correlate the various formations which constitute his systems. It is from them that he infers former climatic and geographical changes—that he is able to distinguish between freshwater and marine, shallow-water and deep-sea conditions, &c. But for the general relations of palæontology to geological research the reader is referred to the article GEOLOGY. Some account of the palæontology of the stratified or fossiliferous rocks will be found in the articles that deal with the various geological systems. Here all that need be done is to summarise the characteristic features of the Palæozoic, Mesozoic, Cainozoic, and Quaternary or Post-Tertiary faunas and floras.

Palæozoic Life.—The most prominent types of Palæozoic times were Graptolites, Rugose corals, Brachiopods, Crinoids, Pteropods, Nautilid Cephalopods, Trilobites, Eurypterids, and Heterocerat Ganoids. Graptolites ranged from the Cambrian into the Upper Silurian, and seem to have become extinct before Old Red Sandstone times. Rugose corals, unknown in the Cambrian, swarmed in Silurian, Devonian, and Carboniferous seas, but were much less numerous in those of the Permian. Crinoids first appear in the Cambrian, and attained their maximum development in the Upper Silurian. They are also well represented in the limestones and shales of the Devonian and Carboniferous. Brachiopods, commencing in the Cambrian, abounded all through Palæozoic times, but culminated in the Upper Silurian period. They were still numerous in Devonian and Carboniferous seas, but less abundant in those of the Permian period. Pteropods were more common in Upper Cambrian and Silurian than during Devonian and Carboniferous times. Nautilid Cephalopods first appear in the Upper Cambrian, and seem to culminate in the Silurian, but they continued to abound in the Devonian and Carboniferous seas, becoming reduced in those of the Permian period. Trilobites appear first in the Cambrian, reach a maximum in the Silurian, wane in the Devonian and Carboniferous, and die out in the Permian. They are therefore essentially and characteristically Palæozoic forms. So likewise are the Eurypterids, which, culminating apparently in the Upper Silurian and Old Red Sandstone, became extinct in late Permian times. True fishes, allied to modern sharks, as well as a curious group of extinct forms, Ostracodermis, date back to Upper Silurian times; in the succeeding Old Red Sandstone period these were accompanied by Dipnoan and Ganoid types.

Such are the more prominent types in Palæozoic strata. Many other forms, however, are met with, amongst which may be noted starfishes (Asteroidea), brittle-stars (Ophiuroidea), sea-urchins (Echinoidea), and the wholly extinct and characteristic Palæozoic types, Cystoidea and Blastoidea. Amongst the crustacea were cirripedes, ostracods, phyllopods, king-crabs, amphipods, isopods, long-tailed decapods, and stomapods. Arachnids were represented by scorpions and other forms; myriapods and insects by a number of ancestral types. All the great classes of molluscan life were present—Cephalopods appearing first in the Upper Cambrian; Gasteropods and Lamellibranchs in the Lower Cambrian; and the earliest forms of Scaphopods in the Lower Silurian. The fishes have been already mentioned. Amphibians, represented by Labyrinthodonts and Salamandroids, appear first in Carboniferous strata.

Amongst plants the prominent Palæozoic types are cryptogams—Lepidodendroids, Sigillarioids, and Calamites being exclusively Palæozoic, but conifers were also present; and for Pteridosperms see FOSSILS.

It may be noted that many of the characteristic life-forms of Palæozoic times were what are *synthetic* or *comprehensive* types, that is to say, types which while belonging fundamentally to some particular division or group of the animal kingdom, yet present in their structure characteristics of one or more contemporaneous, or as yet non-existing types. Among such intermediate or comprehensive forms may be mentioned the Labyrinthodonts, which were urodele amphibians with many piscine and reptilian characteristics. Examples are also furnished by the Ganoids, the Trilobites, the Brachiopods, the insects, &c. Amongst plants the Pteridosperms exhibit similar peculiarities, for they combine characteristics of seed plants and ferns. Again, many Palæozoic forms attained a larger size than the corresponding forms that belong to later times. Thus, some of the pteropods, cephalopods, ostracods, phyllopods, and insects were larger than any corresponding forms of our own day. The amphibians likewise exceeded in size any living representatives of their class.

Innumerable Palæozoic genera died out before Mesozoic times, while not a few lived on, and some have even persisted to the present day. These persistent forms are met with chiefly among the lower types of animal life, as foraminifers, brachiopods, and molluscs. See CAMBRIAN, SILURIAN, OLD RED SANDSTONE, CARBONIFEROUS, and PERMIAN SYSTEMS.

Mesozoic Life.—The life of Mesozoic times is in many respects strongly contrasted with that of the Palæozoic era. In place of Sigillarioids and Lepidodendroids, the prevalent forms of plant-life up to the close of the Cretaceous period were arborescent and herbaceous ferns, conifers, and cycads, while in early Cretaceous times the earliest angiosperms appeared. Corals, which were plentiful in Mesozoic seas, consisted almost exclusively of modern types—the rugose corals having waned almost to extinction. Echinoids and starfishes abounded, but Crinoids, so prevalent in Palæozoic seas, were now much reduced in numbers. Some of the higher grades of the crustacea, which are hardly known in Palæozoic rocks, were plentiful in Mesozoic times, and the same was the case with insects. Brachiopods ceased now to be dominant forms; while amongst molluscs the Cephalopods take the lead, and reach their culmination in swarms of Ammonitidæ and Belemnitidæ. Gasteropods and Lamellibranchs are well represented, and include a number of modern genera, which increased towards the close of the era. Ganoids were still numerous, mostly with symmetrical

tails. Chimæroids, true sharks, and rays were all represented, while Teleosteans or bony fishes made their first appearance. Labyrinthodonts, which in Triassic times attained a great size, soon died out, making way for the advent of a prodigious reptilian fauna, in which all orders, save the Ophidians, were represented. There were swimming reptiles (Ichthyosaurus, q.v., Plesiosaurus, q.v.), flying reptiles (Pterodactylus, q.v.), snake-like reptiles (Dinosaurs, see DINOSAURIA), crocodiles, and chelonians. This reptilian life was specially abundant in Jurassic times. Birds probably were numerous, some of the forms being toothed, while others may have approximated to modern types. Mammals were represented by only the inferior grade of marsupials, and were all of small size. All the remarkable reptiles referred to became extinct before the beginning of the Cainozoic era. So it was with the characteristic Mesozoic molluscan families of Ammonitidæ, Belemnitidæ, and Hippuritidæ. Putting aside the lowly organised Protozoa, it may be said that hardly one Cretaceous species has been met with in Cainozoic or Tertiary strata. See TRIASSIC, JURASSIC, and CRETACEOUS SYSTEMS.

Cainozoic Life.—The plants of early Cainozoic times, although differing specifically and often generically from living forms, yet approach on the whole to existing types. Palms were a common feature of the floras from Eocene into Pliocene times. Indo-Australian types were common in Europe during the early Eocene, but later on forms characteristic of the warmer latitudes of North America began to abound. A commingling of Indo-Australian and American types also marked the Oligocene period, but the American forms gradually increased until in Miocene times they preponderated over all the others. The Pliocene flora of central Europe had a prevalent Mediterranean character. With regard to the lower forms of animal life, all that need be noted here is the general fact that these have a modern aspect, the number of existing genera and species becoming greater as we advance from the lower to the higher stages. The foraminifers attained now their maximum development, and are characteristically represented by the large coin-shaped nummulites. Amongst molluscs the Cephalopods are no longer dominant forms—the most abundant groups being Lamellibranchs and Gasteropods. But the most striking and leading Cainozoic forms were the mammals. In Eocene times the mammals were greatly developed—many of the forms attaining a large size. Among the more notable types of the early European Tertiary are Palæotherium (q.v.), Anoplotherium (q.v.), along with which were carnivores, rodents, insectivores, and bats, and also the earliest representatives of the horse and the monkey tribe. The later Tertiaries are marked by the appearance of Dinotheres, Mastodons, true elephants, rhinoceroses, hippopotamus, deer, antelope, gazelles, various carnivores, such as Machairodus, bears, cats, wolves, &c., and apes. No certain or unequivocal evidence of man is yet forthcoming from Tertiary strata.

While it is true that the general aspect of the plant and animal life of the Cainozoic era approaches to that of the present, yet this is truer for the less highly organised types than it is for those which are higher in the scale of being. Amongst the higher vertebrates of early Tertiary times not a few possessed characters which are now met with only in widely separated forms. Some, for example, were intermediate in character between tapirs and horses; in others (Tillodonts) we meet with a combination of structures now seen in ungulates, rodents, and carnivores; while many of the carnivores had decided marsupial affinities.

Other remarkable composite forms were the *Dinocerata* (q.v.).

Quaternary or Post-Tertiary Life.—The animals and plants of Quaternary age belong for the most part to existing species; a number of the higher vertebrates, however, are extinct. Among these latter, in Europe, were the Mammoth and various other elephants, several rhinoceroses, a dwarf form of hippopotamus, and *Machairodus*. In North America the fauna also included various extinct species, such as *Mastodon*, an elephant, and several gigantic members of the Sloth family (*Megatherium*, *Myiodon*, *Megalonyx*). These last seem to have abounded in South America, where they were associated with great armadillos (*Glyptodon*). The Quaternary period was characterised by marked oscillations of climate, and consequently by secular migrations of flora and fauna. Thus numerous forms which had survived from the Tertiary era eventually became extinct, and a still larger number were banished from the areas which they had occupied in Pliocene times. It is in the deposits of the Pleistocene that we meet with the first unquestioned relics and remains of man. See **PLEISTOCENE SYSTEM, POSTGLACIAL AND RECENT SYSTEM**; works cited at **GEOLOGY**; and the special handbooks of **Palæontology**, as by Woodward (*Vertebrate Palæontology*), Woods (*Invertebrate*), Zittel (trans. by Eastman); *Fossil Botany*, text-books by Scott and Seward.

Palæotherium (Gr., 'ancient wild beast'), a genus of odd-toed hoofed mammalia whose remains occur in the Eocene beds of England and the Continent. Several species have been described, the largest being probably about the size of a rhinoceros. The Upper Eocene gypseous quarries of Montmartre supplied the first scanty materials, which Cuvier, by a series of careful and instructive inductions, built up into an animal resembling the existing tapir. The restoration, however, is not quite correct, for the discovery of a complete skeleton (*P. magnum*) shows that the animal was longer-necked, and of a more slender build than the tapir, and probably was not unlike, in general appearance, the living llama. There can be no doubt, however, that *Palæotherium* resembled the tapir in having the snout terminating in a short proboscis. It had three toes on each foot, each terminated by a hoof. The formula of the teeth is i. $\frac{3}{2}$, c. $\frac{1}{1}$, p.m. ($\frac{3}{2}$ - $\frac{4}{2}$), m. $\frac{3}{2}$, and the structure of the upper true molars, in certain particulars, seems to foreshadow that of some of the Equidæ.

Palæotherium magnum.

It is supposed that animals of this genus dwelt on the margins of lakes and rivers, and that their habits were similar to those of the tapir.

Palæozoic (Gr., 'ancient life'), the name given to the lowest division of the fossiliferous rocks, because they contain the earliest forms of life. They were formerly, and are still generally, known as the Primary rocks. The strata included under these titles are the Cambrian, Silurian, Devonian

and Old Red Sandstone, Carboniferous, and Permian systems.

Palafox y Melzi, JOSÉ DE, Duke of Saragossa, a Spanish soldier, was born in 1780 of a distinguished Aragonese family, and rose to the rank of brigadier-general in the Spanish guards. The brave defence of Saragossa (q.v.), 22d July 1808 to 21st February 1809, which only yielded to the French after a second investment, was nominally his. Palafox y Melzi was carried prisoner to France, and not released until 1813. The year after his return home he was appointed captain-general of Aragon, in 1836 was created Duke of Saragossa, and in 1837 grandee of Spain and captain-general of the guards. He died at Madrid, 15th February 1847.

Palagonite-tuff, usually associated with basalt-lavas, is fine-grained, red, brown, and sometimes greenish or yellowish in colour. Under the microscope it is seen to be composed of minute fragments of volcanic glass, crowded amongst which are granules and crystals of augite, olivine, plagioclase, and magnetite. It occurs in Sicily, the Canary Islands, the Faeroe Islands, Iceland, and Scotland. See **IGNEOUS ROCKS**.

Palanpur, capital of an Indian state in Gujarat, lies 83 miles N. of Ahmedabad by rail. The state has an area of 1766 sq. m. and a pop. of 237,000. The 'Palanpur Agency' comprises, besides Palanpur, seventeen other small native states.

Palanquin, or **PALKI**, an Indian vehicle corresponding somewhat to the Roman litter and the modern European sedan-chair, but, unlike the latter, used for long distances by travellers where railways or good roads do not exist. It is a wooden box, about 8 feet long, 4 feet wide, and 4 feet high, with wooden shutters which can be opened or shut at pleasure, and constructed like Venetian blinds. At each end of the palanquin, on the outside, two rings are fixed, and the *hammals*, or palanquin-bearers, of whom there are four, two at each end, support the palanquin by a pole passing through these rings.

Palapteryx (Gr., 'ancient apteryx'), a genus of fossil birds whose remains are found in the river-silt deposits of New Zealand, associated with the gigantic *Dinornis*, and which, like it, resembled in the form of the sternum, and the structure of the pelvis and legs, the living wingless apteryx. *Palapteryx* seems to have been smaller but of stouter build than *Dinornis*. See **MOA**.

Palapwe. See **SHOSHONG**.

Paladium. See **GUTTA-PERCHA**.

Palate, the roof of the mouth, consists of two portions, the hard palate in front and the soft palate behind. The framework of the *hard palate* is formed by the intermaxillary bones, by the palate processes of the superior maxillary bones, and by the horizontal processes of the palate bones, and is bounded in front and at the sides by the alveolar arches and gums, and posteriorly is continuous with the soft palate. It is covered by a dense structure formed by the periosteum and mucous membrane of the mouth, which are closely adherent. Along the middle line is a linear ridge or raphe, on either side of which the mucous membrane is thick, pale, and corrugated, while behind it is thin, of a darker tint, and smooth. This membrane is covered with scaly epithelium, and is furnished with numerous follicles (the palatal glands). The *soft palate* is a movable fold of mucous membrane enclosing muscular fibres, and suspended from the posterior border of the hard palate so as to form an incomplete septum between the mouth and the pharynx; its sides being blended with the pharynx, while its lower border is free.

When occupying its usual position (that is to say, when the muscular fibres contained in it are relaxed) its anterior surface is concave; and when its muscles are called into action, as in swallowing a morsel of food, it is raised and made tense, and the food is thus prevented from passing into the posterior nares, and is at the same time

The Mouth widely opened so as to show the Palate :

1, 1, the upper, and 2, 2, the lower lip; 3, 3, the hard palate; 4, 4, the soft palate; 5, the uvula; 6, 6, the arches of the soft palate; 7, 7, the tonsils; 8, the tongue.

directed obliquely backwards and downwards into the pharynx.

Hanging from the middle of its lower border is a small conical pendulous process, the *uvula*; and passing outwards from the uvula on each side are two curved folds of mucous membrane containing muscular fibres, and called the *arches* or *pillars* of the soft palate. The anterior pillar is continued downwards to the side of the base of the tongue. The posterior pillar is larger than the anterior, and runs downwards and backwards to the side of the pharynx. The anterior and posterior pillars are closely united above, but are separated below by an angular interval, in which the *tonsil* of either side is lodged. The tonsils (*amygdalæ*) are glandular organs of a rounded form, which vary considerably in size in different individuals. They are composed of an oval mass of lymph tissue which is studded on the free surface by a number of small pit-like depressions—the tonsillar crypts. The space left between the arches of the palate on the two sides is called the *isthmus of the fauces*. It is bounded above by the free margin of the palate, below by the tongue, and on each side by the pillars of the soft palate and tonsils.

As the upper lip may be fissured through imperfect development (in which case it presents the condition known as Hare-lip, q.v.), so also may there be more or less decided fissure of the palate. In the slightest form of this affection the uvula merely is fissured, while in extreme cases the cleft extends through both the soft and hard palate as far for-

ward as the lips, and is then often combined with hare-lip. When the fissure is considerable it materially interferes with the acts of sucking and swallowing, and the infant runs a great risk of being starved; and if the child grows up its articulation is painfully indistinct. The closure of cleft palate by operation must be left in the hands of an experienced surgeon, who should be called to see the child as soon as the defect is noticed. If the separation is too great to admit of closure by operation, a plate or 'artificial palate' may be made to cover the opening.

Acute inflammation of the tonsils, popularly known as Quinsy, is treated of in a separate article. Chronic enlargement of the tonsils is very frequent in scrofulous children, and is not rare in scrofulous persons of more advanced age, and may give rise to very considerable inconvenience and distress. It may occasion difficulty in swallowing, confused and inarticulate speech, deafness in various degrees from closure of the Eustachian tubes (now often termed *throat deafness*), and noisy and laborious respiration, especially during sleep; and it may even cause death by suffocation, induced by the entanglement of viscid mucus between the enlarged glands. If local and constitutional remedies fail to reduce the enlarged tonsils they must be more or less removed by the surgeon, either by the knife or scissors, or by a small *guillotine* specially invented for the purpose.

Enlargement or relaxation of the uvula is not uncommon, and gives rise to a constant tickling cough and to expectoration, by the irritation of the larynx which it occasions. If it will not yield to local treatment it may require to be removed either in whole or in part.

Palatinate (Ger. *Pfalz*), the name for two German states, which were united till the year 1623. They were distinguished as the Upper and Lower Palatinate. The Upper or Bavarian Palatinate, now forming a province of Bavaria, was a duchy, its capital being Amberg. The Lower Palatinate, or the Palatinate on the Rhine, lay on both sides of the Rhine, with an area of 3150 sq. m., and included, besides the Electoral Palatinate proper, the principality of Simmern, the duchy of Zweibrücken, the principalities of Veldenz and Lautern, &c., and was bounded by Mainz, Trier, Lorraine, Alsace, Baden, and Württemberg. Its capital was Heidelberg.

The counts of the Rhenish Palatinate were established in the hereditary possession of the territory of that name, and of the lands attached to it, as early as the 11th century. In 1216 it was granted to the Duke of Bavaria, and with various combinations the Rhenish Palatinate and the Bavarian territories were held by members of the Bavarian house and its branches. Sometimes the electoral dignity was alternately exercised by the Duke of Bavaria and the holder of the Rhenish Palatinate. In 1559 the Rhenish Palatinate and the electoral vote passed to Frederick III., who introduced Calvinism. Frederick V. (q.v.) was the 'Winter King' of the Thirty Years' War, who in 1623 lost his lands to his kinsman the Duke. Bavaria retained the Upper Palatinate and the electoral dignity; but the Rhenish Palatinate was in 1648 given to Frederick's son, and the eighth electorate created for him. In 1706, during the war of the Spanish succession, the elector received again the Upper Palatinate and all the ancient rights, resumed again by Bavaria after the war. During this time the Rhenish Palatinate was repeatedly and cruelly desolated by French armies; and in 1801 France took possession of all on the left bank of the Rhine, giving the rest to Bavaria, Nassau, and Hesse Darmstadt. In 1815 the left bank was restored to Germany, the larger part of the Lower

Palatinate being granted to Bavaria (Rhenish Bavaria), the remainder passing to Prussia, Hesse, and Baden. The Palatinate had to change its religion frequently, being successively Catholic, Calvinist, Lutheran, Calvinist, and Catholic again. For the area and population of the modern provinces, see BAVARIA.

Palatine (from Lat. *palatium*, 'palace'). A *Comes Palatinus*, or Count Palatine, was, under the Frankish kings of France, a high judicial officer (see COUNT), his district being called a *palatinate* or *county palatine*. There were long three counties palatine in England—Lancaster, Chester, and Durham—the two last of which were, no doubt, made separate regalities on account of their respective proximity to the frontiers of Wales and of Scotland. Chester and Durham became palatine under William I., Lancaster not till 1451. Chester had not merely its own courts, judges, constable and steward, but a parliament, and was not represented in the national parliament till 1549. At various dates up to the 16th century Kent, Shropshire, Pembrokeshire, the Isle of Ely, and Hexhamshire, were counties palatine. Cheshire was assimilated by Henry VIII. Durham ceased to be a county palatine under its bishop in 1836; and Lancaster (see LANCASTER, DUCHY OF) yielded its jurisdiction in 1873 to the High Court of Justice. In very early times there were a number of similar privileges in Scotland, the most important of which was that of the Earls Palatine of Strathearn.

Palatine Hill (*Mons Palatinus*), the central hill of the famous seven on which ancient Rome was built, and, according to tradition, the seat of the earliest Roman settlements. See ROME.

Palau. See PELEW ISLANDS.

Palaungs, a people living scattered over the Shan States, and belonging to the Môn-Khmer family. A pacific, unwarlike folk, chiefly occupied in the cultivation of tea, they profess a very orthodox Buddhism; but their real religion is faith in the spirits of nature and of the dead, and their whole life shows an astounding display of rites and superstitious practices, hardly equalled in any other people. Prayers are offered to the spirits of water, of trees, of rice, &c. See Leslie Milne, *The Home of an Eastern Clan* (1923).

Palazzolo Acreide, a town of Sicily, 22 miles W. of Syracuse, on the site of the ancient Acra, which was founded by a colony from Syracuse 664 B.C.; there are many archaeological remains, including a fine Greek theatre; pop. 15,000.

Pale, in Irish history (see the article IRELAND), means that portion of the kingdom over which the English rule and English law was acknowledged. It varied very greatly at various dates, but for a long period meant generally Dublin and the greater part of the adjoining counties. For the Jewish Pale in Russia, see JEWS.

Palem'bang, capital of a residency (formerly an independent kingdom) near the south end of Sumatra, stands on the river Musi, 50 miles from its mouth; the houses of the town are built on great log rafts on either bank. Manufactures, trade in silk goods, carved wood, ornaments in gold and ivory, and krises, as well as shipbuilding, are carried on. In the middle ages Palembang was one of the most important centres of Arabian trade with China. Pop. 74,000; and of the residency, an important oil district, 828,000.

Palencia (the ancient *Pallantia*), a walled city of Spain, in Old Castile, stands in a fruitful plain, 180 miles by rail NNW. of Madrid and 29 NNE. of Valladolid. The Gothic cathedral was built 1321–1504. The first university of Castile was founded here in 1208, but was removed to

Salamanca in 1239. Blankets and coarse woollen cloths are manufactured. The vine is cultivated, and there is a good trade in wool. Pop. 20,000.—The *province* of Palencia has an area of 3256 sq. m. and a pop. of 200,000.

Palenque, a ruined Maya city between the Michol and Chacamas rivers, in the north of the Mexican state of Chiapas, $6\frac{1}{2}$ miles E. of the village of Santo Domingo de Palenque. The ruins extend over 20 to 30 acres, and were buried in a dense tropical forest; trees grew over and about the buildings, and rose even from the tower. The ruins consist of vast artificial terraces, or terraced truncated pyramids, of cut stone, surmounted by edifices of peculiar and solid architecture, also of cut stone, covered with figures in relief, or figures and hieroglyphics in stucco, with remains of brilliant colours. Most of the buildings are of one story, but a few are of two, three, and some may have been of four stories. The principal structure, known as the Palace, is 228 feet long, 180 feet deep, and some 25 feet high, standing on a terraced truncated pyramid of corresponding dimensions; the front contained fourteen doorways, each about 9 feet wide. Other important buildings are the so-called temples of the Cross, of the Foliated Cross, and of the Sun. The meaning and source of the cross symbol have been much disputed—a tree of life and a maize-plant (symbol of the maize-god); a reminiscence of the Buddha's tree imported from south-east Asia; a Christian cross derived through Nestorian China from Italy, &c.

See Stephens's *Incidents of Travel in Central America, &c.*

Palermo, formerly the capital of Sicily, now in point of population the fifth city of Italy, an archbishopric, and a seaport. It stands in the north-west corner of the island, on a bay that faces east, and at the mouth of a fertile valley called the Conca d'Oro ('Golden Shell'), 120 miles by rail W. of Messina, and occupies a picturesque site, being backed by mountains—on the north by Mount Pellegrino, with a (pilgrimage) grotto-chapel (1624) to St Rosalia, whose festival is one of the great annual events of the city. The streets are for the most part handsome, and there are many fine old houses. The oldest public buildings date from the Norman period, and belong to two styles of architecture—Saracen and Byzantine. The most conspicuous of them all is the cathedral of St Rosalia, built (1169–85) by an Englishman, Archbishop Walter; it contains sepulchral monuments to Roger I., the emperors Henry VI. and Frederick II., and in the crypt the tombs of the archbishops. Others to be named are the chapel (1143) in the royal palace, with magnificent mosaics; the Norman hall, in the same pile; and the churches of Martorana (with fine mosaics), St John of the Hermits (1132), and St Cataldo; and the mansions of Ziza, Cuba, La Favara, and Mignano, all outside the city. The royal palace, built by Roger I., is principally of Spanish construction; in it Piazzì established his observatory. The other public buildings—archbishop's palace, town-house, law-courts, university, arsenal, &c.—do not call for particular mention. The university was founded in 1447. There are also a national museum, and the town library (1775) and the national library (1804), both with large collections of volumes and manuscripts. Industry is little developed; machinery, essences, sumach, turnery, iron-founding, books, gloves, and shoes represent almost the only branches. But Palermo is an important seaport, with a large, though not growing, trade. Oranges, lemons, dried fruits, sumach, tartar, grain, oils, manna, sulphur, wine, animal produce, and lemon-juice are the principal exports. Pop. (1921) 400,348. The first we know of

Palermo, the ancient *Panormus*, is that it was a Phœnician city, and the stronghold of Carthage in Sicily. It was conquered successively by Pyrrhus (276 B.C.), the Romans (254 B.C.), the Vandals (440 A.D.), Belisarius (535), the Saracens (835), the Pisans (1063), and the Normans from Apulia (1071). Henceforward it was the capital of the kingdom of Sicily (q.v.), first of the Norman kingdom, then of that of the Angevins and their Spanish successors. It suffered severely from earthquakes in 1693, 1726, and 1823. The city revolted against the Bourbon kings of Naples in 1820 and 1848, and was freed from them in 1860 by Garibaldi. But since then it has been only a provincial capital.—The province of Palermo has an area of 1985 sq. m. and a pop. (1921) of 868,937.

Palestine. The name now given to the whole of Southern Syria. Although the Philistines disappeared considerably over 2000 years ago, and never actually occupied but a small part of it, their memory has remained in the successive names Palaistiné (Gr.), Palestina (Latin), and Palestine. 'The Land of Canaan,' the 'Land of Israel,' and, most suitable of all, 'The Holy Land,' are all more expressive terms.

The area of Palestine has varied much during the centuries. 'From Dan to Beersheba' fairly describes its length, and from the Mediterranean to the Syrian Desert its breadth; yet at few periods has the whole area belonged to one race or one government. The northern boundary has always been uncertain. The lower course of the Kasimiyeh (Litani) River is a natural line which was chosen in the Palestine Exploration Fund survey, but the new northern frontier begins at the Ras en Nakura (Ladder of Tyre), and runs east upon the southern edge of the lofty ranges of Upper Galilee. The Upper Jordan Valley is left to Palestine, but the eastern shore of the Lake of Galilee is given to French Syria, a division which is against all the teachings of topography and history. As indeed is the division further south between Western Palestine directly under the British High Commissioner and Transjordan under its Emir.

Physical Description of the Holy Land.—The simplest way of grasping the main features of Palestine is to think of it as disposed in a series of four parallel lines running from north to south. These are (1) the Maritime Plain; (2) the Western Highlands; (3) the Jordan Valley; (4) the Eastern Plateau.

(1) The maritime plain is a strip of relatively level land lying between the foot of the mountains and the sea. It has an average elevation of 200 feet and a breadth varying between 200 yards at the western end of Carmel and over 20 miles at Gaza. The plain is built up of alluvial deposits carried down from the mountains, superimposed upon thick beds of gravel, sand, and marl, laid down at a period, not geologically very remote, when the sea washed against the foot of the western range. These beach deposits again rest upon a calcareous sandstone of perhaps the Miocene period, which is entirely denuded from the mountains further inland.

The maritime plain may be regarded as divided naturally into three parts. North of Carmel the plain exists as a great bay running into the Galilean hills, which borders the Bay of Akka. Anciently a part of Phœnicia, it is separated from the Plain of Tyre by the steep Ras en Nakura. Once thickly inhabited and well cultivated, this Plain of Akka is now marshy in places along the course of the sluggish Nahr Na'mein (the ancient Belus) and the Nahr el Mukutta or Kishon, which skirts the northern foot of Carmel.

South of Carmel the plain gradually widens, and as far south as Jaffa was of old known by the name

of Sharon. This district was once a forest, of which to-day only a few scattered groups of oaks survive. Several winding sluggish streams, with marshy banks, cross the plain, notably Nahr ez Zerka, the ancient Crocodile River, where crocodiles have been seen within living memory; Nahr el Mufjir, the 'Dead River' of the Crusaders; Nahr Iskanderuneh, the 'Salt River'; and Nahr el 'Aujeh, along which General Allenby's army long stood on the defensive in 1917-18. After heavy winter's rain the coastal side of the plain becomes not uncommonly water-logged. South of Jaffa the plain widens out to the 'country of the Philistines,' where stood their great cities—Gaza and Askalon on the seaboard and Ashdod, Ekron, and Gath inland. The district consists of rolling downs deeply eroded to the underlying rocks in places by winter torrents. It is a corn-growing country with rich alluvial soil, which only requires water to become immensely productive, as is seen in the irrigated orange gardens around Jaffa. Near the sea-coast water is met with in many parts at no great depth. Almost the whole sea-coast from Jaffa southwards is bordered by lofty wind-born sand-dunes which in places attain a breadth of 2½ miles. The whole coast of Palestine is strewn with the 'wreck of harbours.' Akka is half a ruin and its harbour useless. Haifa, on the southern extremity of the bay, alone along this coast is adapted—and that none too well—for modern ships.

South of Carmel, Athlit, the Château des Pèlerins of the Crusaders, is now a mighty ruin; Tantura, the ancient Dor, Kaisariyeh, the desolate ruin of Palestine's once proud Roman capital Cæsarea, and Arsuf, the ancient Apollonia, are all sites of ancient maritime activity. Jaffa, the Joppa of earlier days, is but an open roadstead, while farther south the ruins of Askalon show no surviving remnant of its harbour. Gaza is now separated from the sea by two miles of sand-dunes.

Palestine has been described as a bridge between Asia and Africa, but this really applies only to portions of the land and more particularly to the maritime plain. The great route followed by all the armies, as well as by the commerce, of all the nations lay along this plain. From Egypt it enters Palestine at Gaza, traverses the plain either near the coast or gradually approaching the hills, and then crosses into the Plain of Esdraelon by one of the famous passes, either that by Tell Mutasellim (Megiddo) or by Tell Dothan (Dothan). It was one of the most famous and most frequented roads in all the East.

(2) The central mountain backbone in Palestine, a southward prolongation of Lebanon, consists of strata of limestone of various density—some hard as marble, some soft as chalk, belonging to the Carboniferous and Eocene age, the whole having a thickness of about 3500 feet. These limestone rocks are subdivided from above downwards into Senonian, Turonian, and Cenomanian. The beds rise from beneath the calcareous sandstone of the maritime plain at the Shephelah and form a vast crenellated arch, the central axis of which passes in a meridional direction under the summit of the tableland upon which lie Jerusalem, Bethlehem, and Hebron. Here the strata are horizontal, and the softer Senonian chalks and limestones have been denuded, exposing the hard Turonian rock. The ascent on the western side is gradual, especially in the northern districts, but the last drop to the Jordan Valley is commonly abrupt. In districts bordering upon the Upper Jordan Valley several outflows of volcanic rock overlie the limestone in places. The mountain chain is divided by nature into three distinct areas, known familiarly to us by the names Galilee, Samaria, and Judæa.

Upper Galilee, the continuation southwards of the Lebanon range, rises to many heights of over 3000 feet, notably at Jebel Jermak (3934 feet), Palestine's highest mountain. Lower Galilee consists of a series of parallel ranges of hills running from west to east, intersected by wide open valleys. The highest point is only about 1800 feet above sea-level. The district of Galilee is relatively well supplied with springs, and in the autumn months enjoys heavy 'dews'; for these reasons, and because of its gently sloping hills, fertile valleys, and rich soil, it has always been recognised as the richest agricultural province in Western Palestine.

South of it the Merj el Amir, the Plain of Esdraelon, makes a wide break in the range. The existence of this plain is due to a 'fault' in the underlying rocks. The main expanse is triangular in shape (20 miles, 15, and 15 in measurement), and lies about 250 feet above sea-level. In winter months parts of it become a swamp; in the spring it is a mass of verdure. At its north-west corner it drains by the Kishon through a narrow break in the hills into the Plain of Akka; towards the east the wide fertile Vale of Jezreel descends steeply to the Jordan

wide. Compared with the more northern regions it is, except at favoured spots, bare and sterile. The hard rock strata tend to be horizontal and retain but shallow soil; the springs are few and 'dew' scanty. This district is characterised by its comparative isolation. It is traversed by no trunk road; it has but little natural fertility or attractiveness, and nature has provided it with defences on three sides. Thus it was that the Hebrew people were able to maintain their own in a security and isolation impossible to the inhabitants of other parts of the Holy Land. Only on the north, where the frontier was always ill defined, was there easy access. Its other borders require some mention. On the east the boundary was in theory at the Jordan and the Dead Sea; but between these and the inhabited part of the Judean plateau lies a far more effectual barrier in the strip, some miles wide, of almost waterless 'wilderness'—the Jeshimon or 'Devastation' of the Old Testament. Here for eight months in the year the scorched hillsides show no blade of grass, and not a spring exists for miles. The westerly breezes, which bring moisture elsewhere, in traversing this region become heated, and in rising suck up the scanty humidity of the soil.

The western side of the plateau is approached by three historic passes—the famous 'Bethhoron' pass from the Vale of Ajalon, the scene of many a battle in past ages and the route of the British army in 1917; the pass up the Wady es Surar (the Vale of Sorek), up which the Jaffa-Jerusalem railway runs; and the route up the Wady es Sūr (Vale of Elah), which reaches the plateau at Beth Sūr, five miles north of Hebron, up which the Syrians advanced to the defeat of Judas Maccabæus. But Judæa had a second natural defence. Between the foot of the mountains and the plain there is a strip of fertile hilly country known as the Shephelah—the 'lowlands.' The existence of this district is due to the calcareous sandstone, which underlies the maritime deposits, coming to the surface here and abruptly breaking off.

Along this line of cleavage a series of hills and valleys running north and south parallel with the mountains has developed. The soft stone is full of caves, natural and artificial. Here were the frontier forts, and here were waged many border fights between the dwellers in the mountains and those in the plains.

To the south of Judæa lies the Negeb or 'dry-land' (the 'South' of the Old Testament). Beginning at Beersheba, it extends as a series of mountain ridges running east and west, until it loses itself in the actual desert to the south. Springs are few; the most famous are 'Ain Guderat and 'Ain Kedes, which belong to the district of 'Kadesh Barnea.' What settled inhabitants it had in its most prosperous days were chiefly clustered around a few monastic establishments of the Byzantine period. It has always proved an effective defence to Southern Judæa.

(3) The Jordan Valley is one of the natural wonders of the world. This great depression lies along a great 'fault' or dislocation of strata, which begins in Northern Syria, passes down the Jordan Valley, and continues southwards through the Wady el 'Arabah into the Gulf of Akaba. All along this crack the strata to the east have risen many hundreds of feet, so that on the east side of

Dome of the Rock, Jerusalem.

Valley at Beisan, the ancient Beth Shean. A chain of isolated hills link up on this eastern side the mountains of Galilee with those of Samaria. Of these Jebel et Tōr, Mount Tabor (1843 feet high), is the most famous; south of this lies Jebel Dahi or 'Little Hermon,' and still further south, beyond the Vale of Jezreel, are the barren mountains of Gilboa.

The district south of Esdraelon, known in the Old Testament as Mount Ephraim and later as Samaria, is more open, and, on account of its softer rocks, more fertile than the loftier and wilder plateau to its south. The great roads from the maritime plain cross its north-western corner. In its centre lies Nablus (Neapolis), near, if not on, the site of ancient Shechem. It stands astride the great west and east route between Jebel Sulimiyeh or Ebal (3032 feet) and Jebel et Tōr or Gerizim (2849 feet). The long ridge of Carmel, which runs north-west from the mountain mass of Samaria, belongs geographically to this region. It is a vine-growing district, as its name implies; something of its ancient fertility has been restored in the Jewish colony at Zammarrin.

South of Samaria lies Judæa, the cradle of the Hebrew race. It is a tableland from 2000 to 3000 feet high, about 35 miles long and some 12 to 17

the Jordan layers of Nubian and Lower Carboniferous sandstone appear which are deeply buried in the west. In the Jordan Valley itself a long slice, as it were, of the earth's crust seems to have dropped down some thousands of feet along the line of this fault. During the early Glacial period this valley was occupied by a vast inland sea over 200 miles long by 30 miles broad. The existence of ancient beaches shows that, at its greatest extent, its shores were for a considerable period over 100 feet above the level of the Mediterranean. The diminution of the vast rainfall of the Pluvial period (which was contemporaneous with the Glacial period in Europe) led to the gradual drying-up of the ancient lake, leaving a dried lake-bottom of stratified gravel and marl with three collections of water. In the north—just above sea-level—is Baheiret el Kheit or Lake Huleh, a shallow lake some 9 miles long lying in the midst of a marshy plain. Here the waters of the Jordan from the three sources, the Nahr Banias, the Nahr Leddan, and the Nahr Hasbany, converge and flow out to the south as the Es-Sheri'at el Kebireh or Jordan, a stream 60 feet wide. This in 9 miles descends over 600 feet to the Bahr Tabariyeh or Lake of Tiberias (or Galilee), some 13 miles long by 7 miles broad. On or near its northern shores stood Capernaum, Bethsaida, and Chorazin, famous in sacred history, and now represented by shapeless ruins, while on the western shore is the only surviving town, Tiberias. Below this lake the valley receives the Arabic name of El Ghor. The river itself runs a very winding course through a narrower valley of its own making—which it floods at times—known as El Zor. The Nahr Yarmuk or Heiromax and the Nahr ez Zerka or Jabbok are important tributaries from the east. Sixty miles south of the Lake of Galilee lies the Dead Sea, its surface nearly 1300 feet below sea-level. It is some 47 miles long and 10 miles broad, and its waters are five times as salt as the open ocean. A low promontory of stratified marl (part of the old lake-bottom), called *El Lisan*, 'the tongue,' projects from the eastern shore, dividing the lake into a deeper two-thirds—where a depth of 1300 feet occurs in places—and a shallower, saltier bay, some 30 feet deep. On the south-western shore of this bay is a mountain ridge, Jebel Usdum, the main part of which consists of pure rock-salt.

(4) The eastern plateau. East of the Jordan Valley there is a rapid ascent to a wide plateau—the fertile edge of the Syrian Desert. Here a rich soil, abundant rainfall, and in some parts springs and streams, combine to create a fruitful district. It is divided by the deep channels of the rivers Yarmuk, Zerka, and Mojib, into three main districts. That between Hermon and the Damascus district in the north and the Yarmuk in the south is the old land of Bashan, and consists of the lava-strewn Jaulan (ancient Golan) to the west, the Hauran, a vast wheat-growing expanse in the centre, and between that and the eastern desert the low-lying volcanic expanse of laval rocks, known as El Leja (Trachonitis), which forms the inviolable refuge of the untamable Druzes. South-east of this volcanic activity has thrown up a lofty mountain mass, reaching in places a height of 6000 feet, known as Jebel Hauran or Jebel Druze—the ancient Mount Bashan.

Between the Yarmuk and the Zerka is the fertile and once well-wooded Jebel Ajlun, a district in which once flourished most of the Greek cities of the Decapolis. South of the Zerka lies El Belka' (Peræa), a pastoral land, the northern half of Moab, the other half being south of the Mojib (the ancient Arnon), around their ancient capital, Kir, now Kerak. South of the Dead Sea lay Edom,

inhabited at a later age by the Nabataeans, whose wonderful fortress capital was at Petra.

Climate, Fertility, and Natural Resources.—In a land like this, ranging in altitude from nearly 4000 feet above to almost 1300 feet below sea-level, there must necessarily be considerable variations in climate. Rain falls only in the colder months—almost all in December, January, February, and March—but the 'former rains' moisten the ground for ploughing in October and November and the 'latter rains' continue the annual fall into April, and on their abundance largely depends a successful harvest. In the mountains the rainfall is between 20 and 30 inches, in the plain somewhat less, and in the Lower Jordan Valley considerably less. In some seasons heavy falls of snow occur over the higher ground. In the mountains the summer heat is by no means extreme, being tempered by cool breezes. A temperature of over 100° F. in the shade is exceptional. In the maritime plains the greater moisture makes the heat more trying, while those parts of the Jordan Valley below sea-level are tropical and dangerous because of endemic tropical malaria. The most trying—and most unhealthy—days in Palestine are those when the dry Shurkiyeh or Sirocco wind blows from the south-east, spoiling some periods of the otherwise pleasant seasons of spring and autumn. Palestine is not a land of natural riches, and has lost its ancient prosperity with the destruction of its trees and the once elaborate terracing of its mountain slopes. It has no mineral products of importance, and the harvest of the soil can only be obtained by hard manual labour. At best, large districts can never be more than barren deserts. Wheat and barley are cultivated everywhere, and in the Plain of Esdraelon, in the Hauran, and in parts of the Jordan Valley, yield excellent crops. Tobacco of an inferior quality, simsim for sesame oil and durra or Egyptian maize are also grown. Olives, figs, pomegranates, quinces, grapes, and almonds all do well. Apricots, oranges, and citrons reach considerable perfection in suitable and well-chosen spots. Melons and the prickly pear flourish in the plains. In the Jordan Valley rice, bananas, American maize, dates, colocynth, sugar, and cotton all are, or have been, grown, and could be widely cultivated. Droughts have occurred from time to time in all ages, and locusts invade the land in some years in countless millions and eat up everything. The barrenness of much of the land greatly strikes the western tourist, especially if he has not spring's myriad wild flowers to delight his eye. With regard to the fauna, the most characteristic animals are the coney or hyrax, which is still plentiful in the wild rocks bordering the Dead Sea, the striped hyena and the cheetah, the jackal and the fox, the gazelle and the fallow deer, the ibex or wild goat, and the little jumping jerboa of the Jericho plain. The lion is extinct, the bear almost so; the wolf, now no longer indigenous, appears occasionally in the track of flocks of sheep driven from the mountains of Armenia on their way to Egypt. Porcupines, hedgehogs, and tortoises are not uncommon. The mole-rat (a rodent) in appearance and habit closely resembles our insectivorous European mole. Water tortoises, crabs, and cray-fish occur in the waters of the Jordan; there are also many species of fish peculiar to that region. Bird-life is plentiful. Of the larger birds, vultures, eagles, pelicans, flamingoes, storks, wild duck, and geese are common. Snakes—some deadly—and scorpions abound. Bees thrive well, and of insect life generally there is no lack.

History.—Considerable light has been thrown upon pre-Hebrew Palestine by the results of modern excavation both inside and outside the land.

MEDITERRANEAN SEA

We know that no inconsiderable degree of Semitic civilisation was flourishing there many centuries before the Exodus, and that during much of that time Palestine was dependent upon Egypt both in politics and in culture. About the 15th century B.C. we have in the Tell el Amarna Babylonian cuneiform tablets a picture of the gradual decay of Egyptian power and influence, and many authorities consider that they can identify the Hebrews under the name Khabori, one of the invading tribes mentioned in these letters. The tribal life of the Hebrews gave place to a monarchy, which in turn divided into two, one centred in the recently conquered Jerusalem and the other successively at Shechem, Tirzah, and Samaria. The northern kingdom ended with the capture by Sargon of Samaria (722) and the removal of its inhabitants to Assyria; the kingdom of Judæa succumbed at the final capture of Jerusalem and the destruction of the temple at the hands of Nebuchadnezzar, king of Babylon (586 B.C.). Half a century later (539) the Jews, by the permission of Cyrus, king of Persia, commenced to return, the temple was in time rebuilt, and by 445 the walls of Jerusalem were, in spite of the opposition of the Samaritans and Arabs, restored. In 333 Alexander the Great conquered Syria and Palestine, and after his death the latter became a prey alternately of the Græco-Syrians and of the Ptolemies. Many Greek settlements were made, particularly east of the Jordan, the more important of which united to form the League of Decapolis. Persistent efforts to paganise the Jews were made by Antiochus IV., leading at last to a rising of the orthodox and pious Jews under the Hasmonæan Mattathias (167) and his sons. After many heroic battles at length the Jews achieved their freedom, and shortly after a revived monarchy. But the rule of Aristobulus II., the last degenerate monarch of the once noble Hasmonæan house, ended in the establishment in Palestine of the growing Roman power. In 37 B.C. Herod the Great, aided by the Romans, captured Jerusalem and commenced a brilliant but unhappy reign as king. Monuments of his ambitious building activities abound in Palestine to-day, notably at Jerusalem, Hebron, Cesarea, and Samaria. The simmering rebellion of the Jews, which was gathering head during the days of Jesus Christ and the early church, broke in 67 A.D. into frightful activity, and ended in a veritable sea of blood with the capture of Jerusalem (70 A.D.) by Titus. A second insurrection under Bar Cochba (q.v.) was ruthlessly suppressed in 135, and Palestine became first a pagan and then, after the conversion of Constantine, a Christian province of the Roman empire. Churches and monasteries multiplied, and pilgrims commenced to come in increasing numbers from distant lands. In 616 Chosroes II., king of Persia, conquered the land, barbarously destroying churches and massacring the Christians. Scarce had the tide turned again in favour of the Byzantine Emperor Heraclius when the followers of Mohammed, flushed with victory, utterly defeated the Byzantine forces on the Yarmuk, and all the Holy Land passed under the rule of the Khalif Omar (636). After long and varying fortunes, and on the whole not inconsiderable prosperity under the Arabs, the land, towards the end of the 11th century, passed into the hands of the Seljuk Turks, whose ferocious treatment of the Christian pilgrims stirred Europe to embark upon the Crusades. In 1099 the Crusaders captured Jerusalem, and Baldwin (1100) became first monarch of the Latin kingdom of Jerusalem. For a time the land greatly prospered; but as years went on a steady deterioration occurred in the character of the leaders. At length in the battle of Hattin (1187) Saladin destroyed the flower of

the chivalry of the Franks and captured Jerusalem with all Palestine except a strip along the maritime plain. To this and a few inland fortresses the Christians clung with ever-lessening hold, until, after the storming of Acre in 1291, they completely withdrew. During these centuries several wild tribes from Asia stormed the unhappy land, plundering and massacring—the Kharezmians (1244), the Mongols (1259–60), and the followers of Tamerlane (1400).

In 1517 Selim I., Sultan of the Ottoman Turks, wrested the land from the Mamelukes of Egypt and incorporated it into the Turkish empire. Under these Turks the condition of the land steadily deteriorated, and the only recognised law was that of the robber chief. In 1799 Napoleon, and in 1831 Ibrahim Pasha, son of the ruler of Egypt, each conquered Palestine; each in turn met serious reverse from British arms at Acre. Since the middle of the 19th century there has been a steady increase in the number of resident Europeans—missionaries and commercial agents, consuls and colonists, the last either German or Jewish settlers. The German colonists were originally from Württemberg, and migrated to the Holy Land in 1860, under the leadership of a pietist called Hoffmann, who, on the strength of the literal interpretation of certain Old Testament prophecies, directed his followers to found 'Temple Colonies.' The first colony was at Haifa at the foot of Carmel, later they occupied Jaffa and Jerusalem, and Sarona and Wilhelma near Jaffa. Originally mainly agriculturists, these colonists have become shopkeepers, hotel proprietors, tourist agents, carpenters, &c., in many parts of the land. As many of the younger men were called up for military service in the German or Turkish armies, these prosperous colonies have suffered a considerable set-back.

The Jewish colonies are on a more extended scale, and are likely now considerably to increase in size and in number. The beginning of this Jewish agricultural movement was the founding of the agricultural school of Mikveh Israël by the Alliance Israélite in 1870. In Southern Palestine the more important settlements are Rishon le Zion, 'the First in Zion,' founded 1881, with about 3000 acres and over 1000 inhabitants, Rechoboth, founded 1890, with over 2500 acres and nearly 1000 inhabitants, and Petach Tikveh, founded 1883, with 8000 acres, including valuable orange groves, and over 3000 inhabitants. All these and a dozen smaller ones are in the neighbourhood of Jaffa. In Jaffa itself is a new modern Jewish quarter known as Tell Aviv, 'the Hill of Spring' (Ezek. iii. 15). On the slopes of Carmel is Zichron Jacob, near the native village of Zammarin, beautifully situated 800 feet above sea-level, surrounded by cornfields and orchards. It was founded in 1883 by Baron Edmund de Rothschild in memory of his father, and now has about 4700 acres and a population of nearly 2000. There are several branch colonies. In Galilee Rosh Pinah, the 'corner-stone,' near Safed, founded in 1882, is the best-known colony. It has about 9500 acres under cultivation and upwards of 1000 inhabitants. Other colonies exist in the Plain of Esdraelon, in the mountains of Galilee, on the shores of Lake Huleh, and to the north and south of the Lake of Galilee. The vicissitudes of these colonies have been great. The most successful have received unstinted financial assistance from their supporters in Europe, and even now are scarcely self-supporting. Mistakes have been made in the past in the selection of the type of persons fitted to make useful colonists. Many have been sent out whose last desire was to become themselves actual workers on the soil, whose idea

of colonisation was to make the fellahin do all the hard work. Then, too, the question of health was not at first scientifically studied, and great numbers have suffered, especially in the plains and in the Jordan Valley, from malaria and black-water fever. But now things are greatly improving. There is a large agricultural station at Haifa for the training and assistance of colonists, and the health service, both government and Jewish, are embarking upon a vigorous campaign to put down malaria. The whole colonisation movement is the best and most obvious result of the propaganda of 'Zionism,' and if allowed to develop gradually, will be an ever-increasing benefit to all the people of Palestine.

Railways in Palestine have undergone considerable extension during and since the Great War. Before that event there was a single-track narrow-gauge railway, constructed by French capital, from Jaffa to Jerusalem, and another line—part of the Turkish Hejaz railway—from Haifa, across the Plain of Esdraelon and south of the Sea of Galilee to ed Dura'a, a station on the great Damascus to Medina line. During the war several emergency lines were constructed, some of which have now been removed. The railways now in use consist of: (1) a double track, on the standard gauge (4 feet 8½ inches) from Kantara on the Suez Canal to Rafa (this is, strictly speaking, an Egyptian line, but it is administered by Palestine). At Rafa the line branches, one track running to Beersheba, the other passing northwards through Gaza and Lydd to Haifa. (2) The old French line to Jerusalem is now relaid on the standard gauge, and runs from Jaffa to Jerusalem, effecting a junction with the Kantara-Haifa line at Lydd. (3) On the narrow gauge (3 feet 6 inches) there is a line from Akka to Haifa and thence to Semakh on the shore of the Lake of Galilee. (4) From Afûleh on the above line a branch runs to Nablus and on to Tûlkeram on the main Kantara-Haifa line. Altogether there are some 353 miles of line on the broad gauge and 129 miles on the narrow gauge in Western Palestine. In Transjordan under British control there are some 200 miles of the old Hejaz line running from Nasib on the French-Syrian frontier to Ma'an. The railway system was transferred from military to civil administration, 1st October 1920. Railway headquarters are now at Haifa, to which place the locomotive shops have been transferred. The Welsh steam coal used for the locomotives is landed at that port. There is an excellent daily service of trains from Egypt to Palestine in connection with the Egyptian State Railway. Roads, which were few and very bad till the end of last century, have now been constructed in many directions. The increasing motor traffic and the soft nature of the stone used in road-construction make them very dusty in summer and muddy in winter, but they have now become such a necessity that their proper maintenance is an obvious and urgent responsibility of the government.

The years 1917-18 witnessed the complete delivery of this land from Turkish domination by the army of General Allenby in two dramatic phases, one ending with the capture of Jerusalem (8th December 1917), the other with the conquest of all Palestine and Syria as far north as Aleppo, when an armistice was concluded, 31st October 1918.

The population of Western Palestine in the 1923 census was 757,182, and in Eastern Palestine up to, but not including, Damascus, is estimated at about 400,000, but is probably less. Of the inhabitants of Western Palestine 78 per cent. are Moslems, 1 per cent. Druzes, nearly 10 per cent. Christians, and 11 per cent. Jewish. The last-mentioned own about 2 per cent. of the land itself, but are acquiring more rapidly.

This land has now passed by mandate to the administration of Great Britain, who has pledged herself to establish there a 'National Home' for the Zionists, while guarding the interests of the native population, whose 'national home' they and their ancestors have had here for many centuries. The carrying out of this policy in opposition to the wishes of the indigenous population, the adjudication of the claims of the Christians of the various churches in connection with the holy sites and with their propaganda generally, and to the satisfaction of the religious feelings of the Mohammedans towards their holy cities—Jerusalem, in particular, being only second in sacredness to Mecca and Medina—together furnish a problem which will tax the powers of British diplomacy and statecraft to its utmost for years to come.

Exploration of the Land.—This naturally divides itself into three main headings: (a) Travel, (b) Survey, (c) Archaeological Excavations.

(a) *Travel.*—The stream of pilgrims began in the 2d century, and has never ceased. Among the writers whose accounts of the Holy Land are most important may be mentioned Eusebius, who in the 4th century produced an onomasticon or gazetteer of the land, Jerome, Eucherius, Theodorus, Antoninus Martyr, and Procopius. All these wrote accounts of the condition of the country and of Jerusalem before the Mohammedan conquest. After the conquest pilgrims were allowed to come and go unmolested, and Arculphus, Willibald, Bernard, and others have left us descriptions which belong to the 7th, 8th, and 9th centuries. In the 10th century Moslem writers, like El Mukadassi and Nazir-i-Khusran have recorded much of value in their descriptions of the land. The Crusaders left copious accounts of their wars, occupations, and employments, and pilgrims from all lands have left travel-tales in many languages. Modern exploration, with fuller knowledge of what was worth recording, began in the 19th century with Seetzen, Burckhardt, Buckingham, Irby and Mangles, Tobler, De Saulcy, Van de Velde, and Williams. To Robinson in his *Researches* (1838-52) belongs pre-eminently the credit of putting on a scientific basis the scattered work of his predecessors. Since his time many writers have built upon the foundations he laid. Of the innumerable modern writers none have surpassed the great work of Sir George Adam Smith in his *Historical Geography of the Holy Land*.

(b) *Surveying.*—The earliest map of Palestine known is the mosaic map of the 6th century discovered at Madaba. A long stretch of time separates this from the quaint production of Marino Sanuto in the 15th century. The writers of the 19th century produced many maps as accurate and detailed as the existing imperfect surveys allowed. It was not until the establishment of the P. E. F. (1865) that the idea of a really scientific survey was seriously contemplated. Between 1871 and 1877 a complete survey of the Holy Land was undertaken by the P. E. F., with the able assistance of such distinguished members of the Royal Engineers as Stewart, Anderson, Conder, Warren, Wilson, and Kitchener. As a result of this work a complete map on the scale of one inch to a mile was published in 1880—other maps on a smaller scale being produced from it. The *Survey of Western Palestine*, seven massive volumes, dealing with every aspect of the land—topographical, archaeological, zoological, and botanical—was issued in 1881-84. Meanwhile Conder made a hurried survey, much hampered by the Turks, of Eastern Palestine, which was later (1885) considerably added to by the work of Dr G. Schumacher, financed by the P. E. F. During 1883-84 Professor Hull completed a survey and geological reconnaissance of the Arabah. These

labours have been supplemented by the *Karte des Ostjordanlandes*, by G. Schumacher, published (1908) in Leipzig, and the map of *Arabia Petrea*, by A. Musil (1906), in Vienna. In 1913 the P. E. F. again resumed surveying, and completed the map of Palestine by a survey of the Negeb to the frontier of Egypt, made by Newcombe and Greig, both officers of the Royal Engineers, assisted by the archaeologists Woolley and Lawrence. During the Great War all these maps were put through a searching test, as they were used by combatants on both sides. Errors have been corrected and much detail has been filled in, particularly through photography by aeroplane. There are now few Eastern lands more thoroughly surveyed and mapped than Palestine.

(c) *Archaeological Excavation*.—While the surface work has thus been gradually becoming more complete, recent times have witnessed the increasing exploration of the buried remains of past civilisation. In 1890 Professor Flinders Petrie, on behalf of the P. E. F., inaugurated, and laid the scientific foundations of, this work in his excavations at Tell el Hesi (Lachish), where his pupil F. J. Bliss succeeded him. During 1894–97 Messrs F. J. Bliss and A. C. Dickie made various excavations in Jerusalem. During 1898–1900 Messrs F. J. Bliss and R. A. S. Macalister excavated several 'tells' in the Shephelah, and during 1902–5 and 1907–9 R. A. S. Macalister made his historic and thorough excavation of Tell el Jezeri (Gezer). During 1911–12 Messrs D. Mackenzie and F. G. Newton partially excavated 'Ain Shems (Bethshemesh); in 1920–21 Professor Garstang made a preliminary excavation of part of Askalon; and during 1923–25 R. A. S. Macalister and Garrow Duncan explored the hill Ophel in Jerusalem. While this British society was carrying out this work, other foreign societies were not idle. Among the chief excavations made may be mentioned those by the Germans at Tell Mutasellim and Tell Tanaak, by the Austrian professor Sellin at Jericho, by Reisner, on behalf of the university of Harvard, at Samaria, by Fischer, on behalf of the university of Pennsylvania, at Beisan.

Under the favourable conditions established by the archaeological department of the new government an increasing activity in archaeological work is manifesting itself. One of the first acts of the High Commissioner was to appoint a director of antiquities and an international board for the protection of ancient monuments and the control of scientific excavation.

BIBLIOGRAPHY.—This is enormous; only a few of the most important books need be mentioned. *Survey of Western Palestine* (7 vols.), *Survey of Eastern Palestine*, *The Geology of Palestine and Arabia Petrea, Fifty Years' Work in the Holy Land*, published by the Palestine Exploration Fund. The thirteen volumes of the 'Palestine Pilgrims Text Society's' library contain translations of all the important descriptions of the land and the holy places from the 4th century to the period of the Crusades. *Palestine under the Moslems* (P. E. F.) gives translations of Moslem writers, Baedeker's *Palestine and Syria*, by Socin and Bensing; *The Land and the Book*, by Thomson; *Historical Geography of the Holy Land*, by G. A. Smith; *The Historical Atlas of Palestine*, by G. A. Smith; *History of Civilization in Palestine and Bible Sidelights from the Mound of Gezer*, by R. A. S. Macalister; *Palestine and its Transformation*, by Huntington; *The Land of Three Faiths*, by P. Graves; *Palestine*, by Hyamson (the modern Jewish view); *The Handbook of Palestine* (1922), by H. C. Luke and E. Keith Roach—are among the most useful books dealing with a variety of aspects. See, too, JERUSALEM, JEWS, SAMARIA, ZIONISM, &c.

Palestine, capital of Anderson county, Texas, 151 miles by rail N. of Houston. There are cotton-seed oil, saw, and grist mills, brass and iron foundries, brick-yards, salt-works, &c. Pop. 11,000.

Palestrina, the ancient *Præneste*, an Italian city, 22 miles E. by S. of Rome, on the slope of an offset of the Apennines, contains the palace of the Barberini family, the owners (by purchase from the Colonna) since 1630. It was the birthplace of the composer Pierluigi da Palestrina. It is built almost entirely upon the gigantic substructions of the ancient Temple of Fortune, one of the greatest religious edifices in all Italy, celebrated not only for its splendour, but also for its oracle, which was consulted down to the time of Constantine. Fine mosaic pavements belonging to it still exist. Portions of the ancient city walls of Cyclopean blocks of limestone also still remain. Præneste was a member of the Latin League, until in 499 B.C. it joined the Romans. Yet it took a prominent part in the Latin war (340–338 B.C.) against Rome. Having given shelter to the younger Marius in 82 B.C., it was taken and sacked by Sulla. Its elevated and healthy situation, at no great distance from the capital, made it a favourite summer-resort of the Romans. Augustus and Tiberius frequented it; Horace found it a pleasant retreat; Hadrian built there an extensive villa; and Marcus Aurelius also resorted there. Numerous valuable works of art and other remains have been recovered, dating principally from the 7th, and from the 3d century B.C., the former showing Phœnician influence, the latter being Etruscan. Pop. 8000.

Palestrina, GIOVANNI PIERLUIGI DA, the greatest of Italian musical composers, was born at Palestrina in 1524. He studied music at Rome under Goudimel, and in 1551 was made *maestro di capella* of the Julian Chapel of St Peter's by Pope Julius III. In 1554 he published a collection of Masses, which the pope so highly approved of that he appointed their composer one of the singers of the Sixtine Chapel. Being a married man, he lost that office on the accession to the pontificate of the severer Paul IV. But in 1555 he was made choir-master of the Lateran, and in 1561 was given the similar post in St Maria Maggiore, and held it till 1571, when he was restored to his office in the Julian Chapel. The Council of Trent, having undertaken to reform the music of the church, entrusted to Palestrina the task of remodelling this part of religious worship. He composed three masses as examples of what could be done; one of them, the Mass of Pope Marcellus (to whose memory it is dedicated), saved music to the church by establishing a type infinitely superior, in its blending of devotional with artistic feeling, to anything that had preceded it, a type which, amid all the changes that music has since gone through, continues to attract admiration. Palestrina must be considered the first musician who reconciled musical science with musical art, and his works form a most important epoch in the history of Music (q.v.). He died in the arms of St Philip Neri on 2d February 1594. His compositions, very numerous, are all sacred, except two volumes of Madrigals; they have been published at Leipzig (1868 *et seq.*). The authoritative Life was written by the Italian Baini (Rome, 1828).

Paley, FREDERICK APTHORP, classical scholar, grandson of the author of the *Evidences*, was born at Easingwold, near York, in 1816. He had his education under Dr S. Butler at Shrewsbury, and at St John's College, Cambridge, but, not obtaining mathematical honours, by the regulations of the time was shut out from the classical tripos, and likewise did not obtain a fellowship. He resided, however, at Cambridge till his conversion to the Roman Catholic faith in 1846, and later from 1860 till 1874, when he was appointed professor of Classical Literature at the abortive Roman Catholic college at Kensington. He next

went to live at Bournemouth, was twice classical examiner to London University and for the classical trips at Cambridge, and continued till the sudden close of his life (11th December 1888) his arduous labours in classical scholarship. In early life at Cambridge he helped to found the Camden Ecclesiological Society, and published books on Gothic architecture; but the important work of his life began in 1844 with the first part of his edition of *Æschylus* with Latin notes. Here-edited *Æschylus* for the 'Bibliotheca Classica,' as well as *Euripides*, *Hesiod*, the *Iliad*, and completed the *Sophocles* of *Blaydes*, all for the same series; and also prepared minor editions of similar works, or parts of these, for the 'Cambridge Texts' series. His *Propertius*, *Ovid's Fasti*, and *Martial* were less successful; but his three comedies of *Aristophanes*, *Theocritus*, and his *Select Private Orations of Demosthenes* (in conjunction with Dr Sandys) were recognised as works of the very highest value. He published prose translations of the *Philebus* and *Theætetus* of *Plato*, the 5th and 10th books of *Aristotle's Ethics*, the *Odes* of *Pindar*, and the *Tragedies of Æschylus*, and renderings in verse of the 5th book of *Propertius* and *Fragments of the Greek Comic Poets* (1888). Other works were a treatise on *Greek Particles* (1881), *Greek Wit* (1881), and an unsatisfactory edition of the *Gospel of St John* (1887). Paley received the degree of LL.D. from *Aberdeen* in 1883. A sagacious textual critic and sound exegete, he left behind him traditions of a high type of scholarship, of the age when yet scientific philology was not, and German might be neglected. In his later years he adopted a late date for *Homer*.

Paley, WILLIAM, a celebrated English divine, was born at *Peterborough*, son of a minor canon of the cathedral, in 1743. His family belonged to the *West Riding of Yorkshire*, and not long after his birth his father returned to his native parish of *Giggleswick* to become master of the grammar-school there. In 1759 he entered *Christ's College, Cambridge*, as a sizar, and led for two years an idle (though not dissipated) life, but thereafter became a severe student, and in 1763 came out senior wrangler. After three years as an assistant-master at *Greenwich*, he was elected in 1768 a fellow and tutor of *Christ's College*, and here he lectured on moral philosophy till his marriage in 1776 and presentation to the rectory of *Musgrave* in *Westmorland* and the vicarage of *Dalston* in *Cumberland*, which were soon exchanged for the more profitable living of *Appleby*. In 1780 he was collated to a prebendal stall in *Carlisle Cathedral*, in 1782 he became archdeacon, and in 1785 chancellor of the diocese. In the latter year he published his *Principles of Moral and Political Philosophy*, for which he received £1000. In this work he propounds his ethical theory—a form of what is usually known as utilitarianism. He begins by adducing a series of strong objections against the popular doctrine of the moral sense, next takes up the question of the source of obligation, and resolves it into the will of God, enforced by future punishment, it being admitted candidly that virtue is prudence directed to the next world. The will of God, in so far as it is not rendered explicit by revelation, is to be interpreted by the tendency of actions to promote human happiness, the benevolence of the Deity being assumed. Objection may fairly be taken to the principles on which Paley rests his system, but the lucidity and appositeness of his illustrations are beyond all praise; and if his treatise cannot be regarded as a profoundly philosophical work, it is at anyrate one of the clearest and most sensible ever written, even by an Englishman. In 1790 appeared his most original work, *Horæ Paulineæ*, the aim of which is to prove, by a great variety of

'undesigned coincidences,' the great improbability of the common hypothesis of the unbelief of that day, that the New Testament is a cunningly devised fable. It was followed in 1794 by his famous *View of the Evidences of Christianity*, in which dexterous use is made of *Lardner's Credibility* and *Bishop Douglas' Criterion of Miracles*. The treatment is on the historical method, flanked by auxiliary arguments drawn from the superior morality of the gospel, the originality of *Christ's* character, and the like. But the bases of controversy have now entirely shifted, and the work, able as it is, is no longer, even at *Cambridge*, regarded adequate as a defence. The champion of the faith was splendidly rewarded. The *Bishop of London* gave him a stall in *St Paul's*; shortly after he was made subdean of *Lincoln*, with £700 a year; *Cambridge* conferred on him the degree of D.D.; and the *Bishop of Durham* presented him to the rectory of *Bishop Wearmouth*, worth £1200 a year. Perhaps his latitudinarianism and essentially unspiritual temperament, as well as such homely sarcasms as comparing the 'divine right of kings' with the 'divine right of constables,' may have hindered him from yet higher preferment. After 1800 he became subject to a painful disease of the kidneys, yet in 1802 he published perhaps the most widely popular of all his works, *Natural Theology, or Evidences of the Existence and Attributes of the Deity*, largely based on the *Religious Philosopher* of *Nieuwentyt*, a Dutch disciple of *Descartes*. An excellent edition is that by *Lord Brougham* and *Sir Charles Bell* (1836–39). Paley died May 25, 1805.

A complete edition of his works was published by one of his sons, the *Rev. Edmund Paley* (7 vols. 1825); later editions are those by *Wayland* (5 vols. 1837) and *Faxton* (5 vols. 1838). The best biography is that by *G. W. Meadley* (*Sunderland*, 1809); and see *Sir Leslie Stephen, English Thought in the Eighteenth Century* (1876).

Palghat, a town of *Malabar* district, 68 miles SE. of *Calicut* by rail. Its old fort was of great strategic importance. For the *Palghat Gap*, see *GHÂTS, MADRAS PRESIDENCY*. Pop. 45,500.

Palgrave, SIR FRANCIS, historian, was born in *London* in July 1788, the son of *Meyer Cohen*, a Jewish stockbroker. He was privately educated, and showed a quite remarkable precocity, having at eight translated into French a Latin version of the *Battle of the Frogs and Mice*, which his father printed in 1797. His father's fortunes failing in 1803, he was articled as a solicitor's clerk, and here he remained until 1822, when he took chambers in the Temple and was employed under the *Record Commission*. On his marriage (1823) he assumed his mother-in-law's maiden name of *Palgrave*. He was called to the bar in 1827, and soon acquired considerable practice in pedigree cases before the *House of Lords*. As early as 1818 he had edited a collection of *Anglo-Norman chansons*; in 1831 he contributed a *History of England* to the 'Family Library'; and in 1832 he published his *Rise and Progress of the English Commonwealth*, also *Observations on the Principles of New Municipal Corporations*. The same year he was knighted. From 1833 to 1835 he served on the *Municipal Corporation Commission*, and in 1838, on the reconstruction of the *Record Service*, he was appointed deputy-keeper of *Her Majesty's Records*, an office he held till his death at *Hampstead*, 6th July 1861.

Besides the works already mentioned, *Palgrave* edited for the government: *Calendars of the Treasury of the Exchequer* (3 vols. 1836), *Parliamentary Writs* (1830–34), *Rotuli Curie Regis* (1835), *Ancient Kalendars and Inventories of the Treasury of Her Majesty's Exchequer* (1836), and *Documents and Records illustrating the History of Scotland* (1837). In his private capacity he produced the *Merchant and the Friar*, and a learned and

still valuable *History of Normandy and of England* (4 vols. 1851-64). His collected historical works were edited by his son, Sir R. H. I. Palgrave, and grandson, G. Palgrave Barker (1919-22).

Palgrave, FRANCIS TURNER (1824-97), a gifted poet and critic, eldest son of the preceding, was born in London. He was educated at Charterhouse School, became scholar of Balliol College, Oxford, and Fellow of Exeter, filled for five years the office of vice-principal of the Training College for Schoolmasters at Kneller Hall, was private secretary to Earl Granville, an official of the Privy-council, professor of Poetry at Oxford in 1886-95, and was a contributor to *Chambers's Encyclopædia*. He is best known as the editor of the admirably selected *Golden Treasury of English Lyrics* (1861; 2d series, 1897) and other anthologies. See the *Life* by his daughter (1899).

Palgrave, SIR ROBERT HARRY INGLIS (1827-1919), also a son of Sir Francis, was born in Westminster, and educated at Charterhouse. He rose to a position of eminence as a banker, edited the *Economist* (1877-83), wrote much on banking, taxation, and finance, edited the *Dictionary of Political Economy* (1894-1906; new ed. 1923, &c.), and was a contributor to *Chambers's Encyclopædia*.

Palgrave, WILLIAM GIFFORD (1826-88), another son of Sir Francis, was born in Westminster, and educated at the Charterhouse School and Trinity College, Oxford, graduating with great distinction in 1846. Next year he obtained a commission in the Bombay Native Infantry, which, however, he soon resigned to become a priest in the Society of Jesus. After a course of study at Laval in France and at Rome he was sent at his own request as a missionary to Syria, where he acquired a wonderfully intimate knowledge of Arabic. Summoned to France in 1860 by Napoleon III. to give an account of the Syrian massacres, he went disguised as a physician on a daring expedition at the emperor's expense through central Arabia, traversing the entire Wahabi kingdom, and returning to Europe through Bagdad and Aleppo (1862-63). With the consent of the emperor, he published his *Narrative of a Year's Journey through Central and Eastern Arabia* (2 vols. 1865). Palgrave quitted the Society of Jesus in 1864, and was sent by the British government in 1865 to treat for the release of Consul Cameron and the other captives in Abyssinia, receiving later various consular and diplomatic appointments, till he died at Monte Video. His other works are *Essays on Eastern Questions* (1872); *Hermann Agha: an Eastern Narrative* (2 vols. 1872); *Dutch Guiana* (1876); *Ulysses: Studies in Many Lands* (1887); *A Vision of Life* (1891, unfinished).

Pāli is the term first applied to the canon of the Theravāda school of Buddhism which flourished first in northern India and later in Ceylon, Siam, and Burma, and then to the language in which the canon was redacted. This language is essentially a literary dialect, representing the outcome of a prolonged period of intercourse between Buddhist monks from different parts of India, and it is difficult to decide on what local speech it is based. Late tradition asserts that the Buddha used the speech of Magadha, but Pāli shows none of the salient characteristics of the Māgadhī speech, and it is more probable that the teaching of the Buddha was at first handed down in the Ardha-Māgadhī dialect of a district west from the area of Māgadhī proper. Pāli, however, seems to represent the dialect of Avanti, and this accords well with the fact that it bears a much closer resemblance to the western than to the eastern dialect of the inscriptions of Asoka. Part of the canon seems

to have been redacted in this dialect from originals in Ardha-Māgadhī, part composed originally in it, while, after the canon was definitely closed, Pāli was freely employed as a suitable literary medium, not only for commentaries on the canon but for original works on Buddhist dogma and discipline, though at the present day it has usually been superseded by the use of vernaculars for this purpose.

See E. Müller, *The Pāli Language* (London, 1884); W. Geiger, *Pāli, Literatur und Sprache* (Strassburg, 1916); R. O. Franke, *Pāli und Sanskrit* (Strassburg, 1902); M. Winternitz, *Geschichte der indischen Literatur*, II. i. (Leipzig, 1913); Pāli Text Society's *Pāli-English Dictionary* (1921-25).

Pāli, the commercial capital of Jodhpur (q.v.), 45 miles by rail SE. of Jodhpur city.

Palikao, a place on the canal between Peking and its port on the Peiho. Here in 1860 was fought an engagement between the Anglo-French troops and the Chinese, and hence the French general, Cousin-Montauban (1796-1878), who was minister of War in August and September 1870, received his title of Count Palikao.

Palikars, a name for the Armatolos (q.v.).

Palimpsest. See PALÆOGRAPHY.

Palindrome (Gr. *palin*, 'backwards,' and *dromos*, 'a running'), the name given to a kind of verse very common in Latin, the peculiarity of which is that it may be read the same backwards as forwards. A few examples will suffice.

Si bene te tua laus taxat sua lautē tenebis.
Et necat eger amor non Roma regente taceat,
Roma reges una non anus eger amator.

A Greek palindrome, sometimes inscribed on English fonts (e.g. Hadleigh and Worlingworth, in Suffolk), runs: *Νίχον ἀνδρῆμα μὴ μόναν ἑψω* ('Wash my sin, and not my face only'). A Roman lawyer gets the credit of *Si nummi immunitis*, which Camden translates 'Give me my fee, and I warrant you free.' It is said that in the reign of Queen Elizabeth a certain lady of rank, having been compelled to retire from the court on account of some *fama*, the truth of which she denied, took for her motto: *Ablata at alba*, 'Retired but pure.' The English language has few palindromes, but one at least is inimitable. It represents our first parent politely introducing himself to Eve in these words: 'Madam, I'm Adam.' Compare Henry B. Wheatley's book on *Anagrams* (1862); G. R. Clark, *Palindromes* (Glasgow, 1887).

Palinurus, the helmsman of Æneas, was lulled to sleep at his post, and fell into the sea. When Æneas visited the lower world he related to him that on the fourth day after his fall he made the coast of Italy, and was there barbarously murdered, and his body left unburied on the strand. The Sibyl prophesied that his death should be atoned for, a tomb erected to him, and a cave (Palinurus, the modern *Punta dello Spartivento*) named after him.

Palisander Wood, a name sometimes given to Rosewood (q.v.).

Palissy, BERNARD, the great French potter, was born about 1509 in the diocese of Agen, and, after wandering for ten or twelve years all over France as a glass- and portrait-painter, about 1538 married and settled at Saintes. There he employed himself also as a land-surveyor, when the chance sight of an enamelled cup made him resolve to discover how to make enamels—an art at this time little known save in North Italy. So, neglecting all else, he devoted himself to experiments for sixteen years, by which time he had exhausted all his

resources and was burning his furniture and flooring as fuel. His neighbours, even his wife, mocked at him; his children cried to him for food; but in spite of all these discouragements he persisted, and was at length rewarded with success (1557). His ware, bearing in high relief plants and animals, coloured to represent nature, soon made him famous; and, though as a Huguenot he was in 1562 imprisoned at Bordeaux, he was speedily released by royal edict, and appointed 'inventor of rustic figulines' to the king. Removing to Paris in 1564, he established his workshop at the Tuileries, and was specially exempted by Catharine de' Medici from the massacre of St Bartholomew (1572). During 1575-84 he delivered a course of lectures on natural history and physics, and was the first in France to substitute facts for fancies, as also to give right notions of the origin of springs, the formation of fossil shells, the fertilising properties of marl, and the best means of purifying water. In 1588 he was again arrested as a Huguenot, and thrown into the Bastille, where he died in 1589. Palissy's writings, published between 1557 and 1580, and edited by France (Paris, 1880), possess much interest; but the man himself is more interesting still. Many regard him as an impostor.

See works by H. Morley (2 vols. 1852), and C. L. Brightwell (1921); and French Lives by Audiat (1868), Bury (1886), Dupuy (1902).

Palit, or PERLIS. See MALAY STATES.

Paliurus, a genus of trees and shrubs of the family Rhamnaceæ, nearly allied to *Zizyphus* (see JUJUBE), but very different in the fruit, which is dry, orbicular, and girded with a broad membranous wing. *P. Spina-Christi*, often called Christ's Thorn, and by the Germans Jews' Thorn (*Judenborn*), is a deciduous shrub or low tree, with slender, pliant branches and ovate three-nerved leaves, each of which has two sharp spines at the base, one straight and the other re-curved. It is a native of the countries around the Mediterranean, of India, and many parts of Asia. It is often used for hedges in Italy and other countries, its sharp spines and pliant branches admirably adapting it for this purpose.

Palk Strait, the northern portion of the shallow passage between the south coast of India and the island of Ceylon (q.v.).

Palladio, ANDREA, Italian architect, was born at Vicenza, 30th November 1518. After studying the writings of Vitruvius and the monuments of antiquity at Rome, he settled in his native city, and soon acquired a high reputation throughout the country from his designs for numerous buildings in Vicenza and the neighbourhood. He is the most conspicuous of the architects who, following Brunelleschi, led the way in establishing the modern Italian school of architecture, as distinguished from the earlier Italian Style (q.v.) of the Renaissance. His style, known as the Palladian, is modelled on the ancient Roman as apprehended by Vitruvius, reproducing its dignity and strict proportions, but often to the neglect of usefulness; and his buildings are constantly encumbered by a superfluity of pilasters and columns, broken entablatures, and inappropriate ornament, even where there is real beauty of detail. The palaces Barbarano, Della Ragione, Chiericati (now the Museo Civico), Tiene, and the Olympic theatre at Vicenza; the country mansions of Capra, Maser, and Rotunda in the vicinity; and the churches of San Giorgio Maggiore and Il Redentore, the façade of San Francesco della Vigna, and several palaces, in Venice, are his greatest achievements. He died at Vicenza, 19th August 1580. Palladio wrote a work on architecture (*I quattro Libri dell' Architettura*, 1570, and often reprinted) which had a great influence

upon the styles of his successors, especially upon Inigo Jones, the 'English Palladio,' whose notes on the book are published in Leoni's Eng. trans. (1715). The term Palladian was long synonymous with the perfect in architecture.

See the Monograph by B. F. Fletcher (1903); and Italian Lives by Zanella (1880) and Barichella (1880).

Palladium, among the ancient Greeks and Romans, an image of Pallas, who was generally identified with Athena (q.v.), upon the careful keeping of which in a sanctuary the public welfare was believed to depend. The Palladium of Troy was especially famous, and was the gift of Zeus to the founder of Ilium. It has been supposed it may have been originally a meteorite (see METEORS). Ulysses and Diomedes stole the Palladium, and so helped to secure victory for the Greeks; and both Athens and Argos boasted to have afterwards secured the possession of the charm.

Palladium (sym. Pd; atom. number 46; atom. wt. 106.5; sp. gr. 11.4) is one of the so-called noble metals, in colour and ductility closely resembling platinum. It is not fusible in an ordinary wind-furnace, but melts at a somewhat lower temperature than the last-named metal; and, when heated beyond its fusing-point, it volatilises in the form of a green vapour. It undergoes no change in the open air at ordinary temperatures; but at a low red heat it becomes covered with a purple film, owing to superficial oxidation. It is soluble in nitric acid, and in aqua regia. It combines readily with gold, which it has the property of rendering brittle and white. (When it forms 20 per cent. of the mass the alloy is perfectly white.) See OCCLUSION.

It was discovered in 1803 by Wollaston in the ore of platinum, of which it seldom forms so much as 1 per cent. Another source of this metal is the native alloy (termed *ouro poudre*) which it forms with gold in certain mines in Brazil; it is from this alloy that the metal is chiefly obtained.

Palladius, RUTILIUS TAURUS ÆMILIANUS, a Roman author of the 4th century A.D., who wrote a work, *De Re Rustica* (On Agriculture), in fourteen books, the last of which is a poem of eighty-five elegiac couplets.

Palladius, ST. See SCOTLAND (*Church History*); also PATRICK (SAINT).

Pallas. See ATHENA, MINERVA.

Pallas, PETER SIMON, traveller and naturalist, was born 22d September 1741, at Berlin, studied medicine and natural history at Berlin, Göttingen, and Leyden, and, already famous, was in 1768 invited to St Petersburg by the Empress Catharine. Appointed naturalist to a scientific expedition to observe the transit of Venus, he spent six years (1768-74) exploring the Urals, the Kirghiz Steppes, part of the Altai range, great part of Siberia, and the steppes of the Volga, returning with an extraordinary treasure of specimens in natural history. He wrote a series of works on the geography, ethnography, flora and fauna of the regions visited. He settled in the Crimea in 1796, and there he died, 8th September 1811.—The Sand-grouse (q.v.) is often called Pallas's Sand-grouse.

Pallavicino, SFORZA, an Italian historian, was born at Rome, 20th November 1607. Having taken priest's orders in 1630, he became in 1638 a member of the Jesuit Society, and was created a cardinal in 1659 by Pope Alexander VII. He died at Rome, 5th June 1667. The best known of his writings is *Istoria del Concilio di Trento* (Rome, 1656-57), intended as a reply to the equally celebrated and liberal work of Paul Sarpi, whose narrative is not altogether acceptable to Catholics.—FERRANTE PALLAVICINO (1618-44) wrote pasquin-

ades which bitterly offended the papal curia and the Barberini family; and being betrayed into his enemies' hands near Avignon, he was tried, condemned by a foregone conclusion, and beheaded.

Pallice, LA, a harbour opened in 1889 to receive large vessels for La Rochelle in France, whence it is less than 3 miles distant.

Palliser, SIR WILLIAM, C.B., was born at Dublin on 18th June 1830, and entered the army as a cavalry officer. In 1863 he invented the chilled shot (see SHELL) that bears his name, and a system of strengthening cast-iron ordnance by the insertion of a steel tube. He retired in 1871, sat for Taunton as M.P., and died 4th February 1882.

Pallium, the name given in the Roman Catholic Church to one of the ecclesiastical ornaments worn by the pope, by patriarchs, and by archbishops. It is worn by the pope at all times, as a symbol of his reputed universal and abiding jurisdiction. By archbishops it cannot be worn until it has been solemnly asked for and granted by the pope, and even then only during the solemn service of the great church festivals, and on occasions of the ordination of bishops or of priests, and other similar acts of his episcopal office. The pallium is a narrow annular band of white woollen web, about 3 inches wide, upon which black crosses are embroidered, which encircle the neck of the archbishop, and from which two narrow bands of the same material depend, one falling over the breast, the other over the back of the wearer. It is made wholly or in part from the wool of two lambs, which are blessed annually on the festival of St Agnes.

Palm (*Palme* or *Palmaceæ*), a family of monocotyledons, the products of which are of extreme importance and utility to man. They are arborescent, with erect stems, usually slender as compared with the extreme height to which some of the species attain, and simple or rarely branching; some are stemless, their leaves springing direct from the ground; others are sarmentose, twining about the stems and branches of neighbouring trees, by means of hooks or prickles, or trailing on the ground with stems of almost incredible length and extreme slenderness, as in the case of many of the Calami. Externally the stems are hard and horny, often coated with a siliceous deposit hard as flint, and finely polished; they frequently are armed with spines, and marked with the scars of dead leaves, or clothed in the upper part with the remains of the dead leaf-stalks enveloped in masses of fibre. The interior of the stem is generally soft and pithy, intermingled with bundles of fibre longitudinally. So soft and easily extracted is the internal substance of the stems of many palms that the outer hard case may readily be formed into a cylindrical tube. The leaves vary much in form superficially, but all the variations belong to two types—the fan-veined and the pinnate-veined. In the former the general outline is that of a fan, with veins arising from the top of the leaf-stalk and radiating like the ribs of a fan. In the other type the leaves are more or less elongated, with a distinct midrib extending to within a little of the extremity of the blade, which is always there cleft in two down to the point of the midrib, and with the veins springing from the sides of the midrib like the pinnales of a feather. Leaves of this type are sometimes entire, but more generally pinnate, and impart much elegance and grace to the figure of the particular species to which they belong. The size of palm-leaves varies extremely, some being only a few inches in length, as in some species of *Malortia*, while in *Manicaria saccifera* they attain the enormous proportions of 35 feet in length by 5 or 6 feet in breadth. The inflorescence is a simple

or many-branched spadix enclosed in a spathe of one or several valves. The flowers are small individually, but numerous, usually of a yellow tint, and in some species powerfully odorous. They are unisexual, bisexual, or polygamous, the male and female flowers being borne in some species on different plants. The fruit when ripe is berry-like, drupaceous, or, as in the coconut, nut-like.

Palms are natives chiefly of the tropical regions of the earth. A few are found in extra-tropical countries extending to 36° N. lat. in America, 34° N. lat. in Asia, and in Europe *Chamærops humilis*, which is the only indigenous species, extends to 44° N. lat.; no species are found beyond 43° S. lat. *Trachycarpus excelsa* from Japan, a hardier palm than *Chamærops humilis*, with which it has been confused, may be seen in London gardens. *Chamærops* is not to be met with north of the Alps. Linnæus, whose knowledge of palms was limited to the more arborescent species, very appropriately named them the 'Princes of the Vegetable Kingdom.' Their stately habit, the elegant proportions of the stems, and the grace and beauty of the leaves of the majority of the larger species, coupled with the great variety and utility of the products of all, mark them as a most distinguished and valuable group of plants, gratifying the eye by their adornment of the landscape, and ministering abundantly to the necessities and the pleasures of both savage and civilised man. Their stems when young and tender are delicious and nutritious food; when old and mature those of certain species yield valuable farinaceous substances; some are valuable as timber-trees, and the terminal bud of several consists of a mass of tender mucilaginous leaves, which are esteemed a delicate and delicious vegetable. Many yield by incision or otherwise an abundance of sweet sap, from which sugar, refreshing drinks, wines, spirits, and vinegar are obtained. Their leaves are used for thatch, and for the making of mats, baskets, hats, umbrellas, thread, cord, and clothing. They yield excellent and inexhaustible materials, and they are in some cases a natural substitute for writing-paper, the records and writings of many eastern peoples being inscribed upon them. Other useful products are oils, vegetable ivory, and edible fruits.

The family comprises well over 1000 species.

The genus *Chamædorea* is composed of about sixty species, all of slender, graceful habit, their smooth stems often not exceeding an inch in diameter, though they may be twenty or more feet high. They are used in South America for making

Fig. 1.—*Chamædorea aurantiaca*.

bridges, as the bamboo is in China and India. The flowers of several of the species—including those of *C. aurantiaca* (fig. 1)—are highly esteemed as a culinary vegetable in some of the countries of Central America, but for this purpose they must be extracted from the spathe before it bursts. The fibre of *Leopoldinia Piassaba* is mentioned in the latter part of this article. The fruit of *Leopoldinia major*, called by the natives of Brazil *Jará-assu*, is collected by them and burned, and the ash, after being washed, is used as a substitute for salt. It is described, however, as being

bitter rather than saline. *Euterpe edulis*—also a native of Brazil—produces fruit in size, shape, and colour like that of the sloe. From the fruit of this species a beverage is made by infusion, which is much relished. *E. oleracea* produces an edible and nutritious cabbage. The *Nibong* of the Malays of the Eastern Archipelago is *Oncosperma filamentosum*, the cabbage of which is more highly esteemed than that of any other palm indigenous to that region. From the fruit of *Enocarpus Bataua* a wholesome beverage called *Patawa-yukissé* is made on the Rio Negro. The fruit of *Oreodoxa regia*, an extremely handsome palm, a native of Cuba, is too acrid for human food, but is used there for fattening hogs.

Areca Catechu is the Betel-nut Palm (see ARECA). The fruit enters into the masticatory of that name so much used in India. It contains gallic acid, much tannin, a principle analogous to catechu gum, a volatile oil, a red insoluble matter, a fatty substance, and some salts. A spurious kind of catechu is obtained from the nuts in two colours—one dark or black, which is extremely astringent; the other yellowish brown, which is less astringent and more pure. Besides being used as a masticatory and in medicine in cases of dysentery, the substance is employed in tanning leather and in dyeing calico. The terminal shoot of this palm furnishes an excellent cabbage, as also do several other *Arecae*. But the true Cabbage Palm is *Oreodoxa oleracea*, a noble species indigenous to the West Indies, 100 feet high, with a diameter of stem of about 4 feet. The leaves are pinnate, about 20 feet long, the pinnules in full-sized leaves being often 3 feet in length. The terminal bud or cabbage is enclosed among many thin snow-white brittle flakes. It has the flavour of the almond, but with greater sweetness, and is boiled and eaten with meat. As its removal causes the death of the tree, it is regarded as an extravagant delicacy only rarely to be enjoyed, because of the great importance of the other products which the tree yields. The nuts yield a useful oil by decoction. The outer hard crust of the stem is employed in making gutters, and the pith yields a kind of sago if extracted immediately the tree is felled; but, if allowed to lie and decay on the ground, it becomes the breeding-ground of a peculiar grub, which is greatly esteemed as a delicate article of food in Martinique and San Domingo.

Ceroxylon Andicola, a native of Peru, growing at an elevation of 8000–10,000 feet above sea-level, is a handsome species rising to the height of 160 feet or more. The stem exudes from the annular cicatrices of the fallen leaves a resinous substance called by the inhabitants *cera de palma*. It is composed of about two parts of a yellow resin and one part of wax, the texture of which is more brittle than beeswax. A sub-resinous matter is also extracted from it named *ceroxilin*, which assumes the form of silky crystals, is soluble in alcohol, and phosphorescent by friction. The exudation, mixed with certain proportions of wax or tallow, is employed in candle-making. Besides the resinous exudation the trunk yields a valuable and durable timber, the leaves are excellent and durable material for thatch, and they supply a strong, useful fibre for the manufacture of ropes and cordage. The *Paxiuba* Palm (*Iriarteia exorrhiza*) is a native of Central and South America, and is a singular and interesting tree on account of its peculiar habit of growth. The roots all spring from the stem above ground, every new root emerging from a point somewhat higher on the stem than the one which preceded it. And as the old roots decay as the new are produced and penetrate the ground, a tree of some age presents the curious spectacle of being supported on three or four legs long enough and

wide enough apart to enable a man to pass between them erect. The timber is used in flooring and for making umbrella-sticks, musical instruments, &c. Blowpipes (q.v.) for poisoned arrows are made from the stems of *I. setigera*.

The Sugar Palm (*Arenga saccharifera*, see fig. 2) is a native of the Moluccas, Cochin-China, and the Indian Archipelago, and is of immense value to the

Fig. 2.—*Arenga saccharifera*.

natives of these countries on account of its various products. It yields an abundant sweet sap, from which a chocolate-coloured sugar named *jaggery* is made. The sap fermented makes an intoxicating drink variously named by the inhabitants of the different countries *neroo* or *brum*. From the pith of the stem sago is obtained in great quantity, a single stem yielding as much as from 150 to 200 lb. The leaves supply *Gomuto fibre*, which is celebrated for its great strength and durability when formed into cordage and ropes, and at the base of the leaves a fine woolly material, named *baru*, is developed in mature trees, which is employed in caulking ships, stuffing cushions, and making tinder.

Caryota urens (see fig. 3), one of the noblest palms of India, yields some remarkable products. The flesh of the fruit, which resembles a plum in size and structure, is very acrid, and corrodes and burns the lips and mouth. From the terminal bud a sweet watery liquor is obtained, which, when boiled, yields *jaggery*. The terminal bud is also

Fig. 3.—*Caryota urens*.

eaten as a cabbage. From the pith of the stem sago is obtained, which is made into bread, and

prepared in various other ways, and is a valuable article of food to the natives. The tree is named *Kittul* in Singhalese, and the fibre called *Kittul*, obtained from its leaves, is most valuable to brushmakers (see FIBROUS SUBSTANCES).

The genus *Calamus* and its immediate allies have in some cases the habit of grasses. Certain species—viz. *C. Rotang*, *C. tenuis*, and *C. viminalis*—furnish the rattan-canes employed in making ropes and cables, chair-bottoms, couches, baskets, mats, &c. The walking-sticks known as Malacca-canes are made from the stems of *C. Scipionum*, a species which grows not in Malacca, but in Sumatra, and the canes are chiefly exported from Siak in that island. The stems of the Great Rattan (*C. rudentum*) and others are of prodigious length, extending to hundreds of feet, clinging by hooks attached to their leaves to the trunks and boughs of neighbouring trees, or trailing on the ground. They are extremely hard externally, and usually smooth, with a dense siliceous crust on the surface. *Dremonorops Draco* furnishes the finest quality of the resinous substance known as *Dragon's Blood* (q.v.), although a similar substance is obtained from various other plants. In this case it is exuded from the surface of the fruit, and is separated from it by rubbing or shaking the fruits together in a bag. An inferior quality of the same substance is also obtained from the tree by incision

of the stem, and by steaming the fruit after the natural exudation has been collected. Few species are more singular than *D. adspersus* (see fig. 4), which resembles a creeping or twining grass rather than a palm, the stem rarely exceeding in thickness stout wheat straw. *Zalacca edulis* is regularly cultivated by the Burmese for the sake of its pleasantly acidulous fruit, which grows to the size of a walnut.

Fig. 4.—*Dremonorops adspersus*.

The succulent scaly pulp which encloses the seed is the edible part.—*Raphia vinifera*, a native of Guinea, yields a rather abundant sap, from which a strongly spirituous wine is obtained. One of the most beautiful and singular of palms is *R. vinifera* var. *tædigera*, an inhabitant of the banks of the Amazon. The trunk of the tree is short, from 6 to 10 feet high, but from the summit the leaves rise almost perpendicularly to the height of 40 feet or more, arching gracefully outward towards the apex. The footstalks of these enormous leaves alone are often 12 or 15 feet long by 4 or 5 inches in diameter. The integument of these footstalks is thin, extremely hard and elastic, and light as a quill, and, being easily split into straight strips, is made into window-blinds, baskets, &c., by the Indians.

The true sago of commerce (see SAGO) is derived from various species of the genus *Metroxylon* or *Sagus*, although other species of palms, as has already been stated, and also plants widely different botanically, such as *Cycas revoluta*, also yield a kind of sago. *M. Sagu* is the species from which

the largest quantity of true sago is obtained. It is a native of the Indian Archipelago, cultivated in Malacca, Borneo, Sumatra, Celebes, and the Moluccas. The tree is small, rarely exceeding 30 feet in height of stem, which consists of a hard shell about 2 inches thick enclosing a mass of spongy pith—the sago. This pith is gradually absorbed after the tree reaches maturity, leaving the stem quite hollow. The proper time to fell the trees, before the pith begins to diminish in bulk or quality by absorption, is indicated by the upper leaves becoming covered with a sort of farina or white dust. When felled the stem is cut into lengths of 6 or 7 feet, which are split, the better to remove the pith. There are various modes of extracting the fecula from the insoluble substances with which it is combined in the stem, but washing and straining are the principal features of every process. A single tree, it is said, will yield from 500 to 600 lb. of sago.—The Bache, or Moriche (*Mauritia flecuosa*), a native of Guiana, supplies the chief wants of the people wherever it grows; the stems furnish timber for building their dwellings, the leaves thatch for the same, and material for mats, couches, hammocks, &c.; the pith yields sago; the juice by fermentation gives an excellent beverage; the kernels of the fruit are ground into meal and made into bread; and the fibre is converted into cordage and clothing.—The Palmyra Palm (*Borassus flabellifer*) is one of the most common of its tribe in India. In some parts of the country it grows spontaneously, and it is found as far north as 30°; in others it is the subject of careful cultivation. It furnishes the greater part of the palm-wine or toddy of India. The fruit is about the size of a child's head, somewhat triangular, and within a thick, fibrous rind contains three seeds about the size of a goose's egg. The seeds when young are eaten by the natives, being jelly-like and palatable. The toddy is obtained by wounding the spathe before the inflorescence expands. After a few days a clear, sweet liquor exudes from the wound, and is carefully collected in pots suspended under the wounded spathe. A tree yields about three quarts daily. The liquor is drunk fresh, and will only keep sweet for about three days, when it undergoes fermentation and becomes sour, and is distilled into arrack. Jaggery is also made from the juice. The young plants when a few inches high are cooked and eaten as a vegetable. The leaves, which are fan-shaped and large, are turned to the various uses alluded to in connection with species already described, and in India they are almost universally used for writing upon with an iron stylus.

The Double Coconut, or Sea Coconut as it has been called, is *Lodoicea Seychellarum*. The nuts of this tree are seen occasionally in museums and in the cabinets of collectors of curios, often beautifully polished and carved by native workmen, and formed into caskets and other ornaments. For long their origin was shrouded in mystery. They were frequently found floating about in the ocean before the discovery of the tree, and an absurd belief was entertained by Malay and Chinese sailors that they were the fruit of some marine tree. The tree, a native of the Seychelle Islands, is very elegant, attaining a height of from 50 to 80 feet, with leaves 20 feet long supported on stalks of equal length. The fruit is one of the largest produced by any of the palms, being a foot or a foot and a half in length. The kernel near the base is divided into two parts—hence the name Double Coconut—and while young part of the fleshy substance in which it is enclosed is edible. The chief products of the tree are timber and fibre for cordage, and a downy kind of fibre which envelops the

young leaves is used for filling mattresses and pillows.

The Talipat Palm of Ceylon (*Corypha umbraculifera*) is notable for the variety of uses to which its leaves are put in Ceylon and other parts of India to which it is indigenous. The leaves are of immense size, and, being palmate with the leaf-stalk attached near the middle, they are readily formed into umbrellas and tents; the cane-like ribs being removed and the blades neatly stitched together, they may be folded up with great facility. They are also very much used for the books of the inhabitants. Many of these alleged to be made of Egyptian papyrus are formed of the leaves of this palm. The tree grows to the height of 100 feet, and has a very grand and imposing appearance.—A closely allied species (*C. Taliera*) is the Talipat Palm of the Indian peninsula. It grows to about the same height as the preceding species, with leaves of a more durable kind for the purposes of thatch, but not so adaptable to more delicate and artistic uses.—*Licuala peltata* is the Chittah-pat of Assam, the leaves of which are extensively used for making umbrellas, punkahs, and hats. The stems of *L. acutifida* are made into walking-sticks, named by Europeans *Penang Lawyers*.—*Copernicia cerifera*, a native of northern Brazil, produces an edible fruit; and from the leaves, after they have been removed from the trees and dried, is obtained an inferior kind of vegetable wax, which is used in candle-making and to adulterate beeswax. See CARNAHUBA.

Of the American Palmetto Palm, a native of the Carolinas and Florida, the most important species is the Cabbage Palmetto (*Sabal Palmetto*), which sometimes grows to 50 feet in height and 15 inches in diameter, with leaves 5 feet long and broad. It is found also in the Bermudas. Its products are timber and the leaves, the former being exceedingly durable, very porous (see MOULTRIE), and especially valuable for wharf-building, as it resists water and is not attacked by the teredo. The fruit is not edible.—The Palmetto of Europe is *Chamærops humilis*, which inhabits the countries on both shores of the Mediterranean, occupying great tracts. It rarely reaches 10 feet in height, and usually is much less, its growth being exceedingly slow. The leaves are fan-shaped and abound in excellent fibre, made in Algeria into *crin végétal*, a substitute for horse-hair. *Nannorrhops Ritchieana*, a native of Sind and Afghanistan, and *C. excelsa*, a native of China and Japan, both produce excellent fibre. The leaves of *Thrinax argentea* supply the material called *chip*, of which ladies' hats are made. The trunks of *T. parviflora*, a native of Jamaica, though of slender diameter, are said to be very suitable for piles and marine buildings subject to immersion, as they are impervious to the influence of water, and are not attacked by borers or worms. *Sabal mauritii-forme*, a native of New Granada (fig. 5), is a low-growing but very handsome palm, not remarkable for any products of special utility.

The *Piritu* of Venezuela, the *Paripou* of Guiana, and the *Papimba* of the Amazon are one species of palm—*Bactris speciosa*. It produces fruits somewhat triangular in shape, about the size of an apricot, and bright reddish yellow in colour. They have a peculiar oily flavour, and are eaten boiled or roasted, when they resemble chest-nuts. They are also ground into meal, which is baked in cakes.—The Great Macaw or Gru-gru tree (*Acrocomia sclerocarpa*) is a native of Jamaica, Trinidad, and the adjacent islands and continent. In Brazil it is called *Macahuba*, and in Guiana *Macoya*. The tree grows from 20 to 30 feet high, with a crown of leaves, each of which measures from 10 to 15 feet in length. The fruit yields

an oil of yellow colour, sweetish taste, and odour of violets, which is employed by the natives as an emollient for painful affections of the joints; and in Europe it is used in the manufacture of toilet soaps. The nuts are capable of receiving a high polish, and are converted by the natives and the negroes into ornaments.—The Tucum Palm (*Astrocaryum Tucuma*), a native of

Fig. 5.—*Sabal mauritii-forme*.

the Rio Negro and the Upper Amazon, yields a very superior fibre, the cordage from which is knitted into hammocks, which are in great demand with the Brazilians. The fleshy outer covering of the fruit is eaten by the natives.—The Murumuru Palm (*A. Murumuru*) produces a very agreeable fruit with the fragrance of musk. Cattle eat the fruit with avidity, but evacuate the hard stony seeds undigested. In times of scarcity these seeds are carefully collected and used to feed pigs, which are very fond of them, and find no difficulty with their powerful teeth and jaws in masticating them.—*Attalea funifera* furnishes piassava, the whalebone-like fibre now much used for making brooms and brushes. The tree attains the height of 20 or 30 feet. At the base of the leaves a valuable thick, dark-brown, very long fibre, Bahia bass, is obtained, sometimes 12 feet long; Para or Monkey bass, a softer, shorter kind, usually about 3 feet in length, is got from *Leopoldinia Piassaba* (see FIBROUS SUBSTANCES). The fruit of *Attalea funifera* is the *Coquilla* nut, much used in turnery for the making of knobs to walking-sticks and umbrellas, handles to bell-pulls, &c. The nuts are extremely hard and susceptible of a fine polish, and exhibit a beautifully mottled surface of light and dark brown.—The fruit of *A. Cohune* yields from its kernel a valuable oil called *Cohune Oil*, which is said to be superior in quality to the best coconut oil. It is a native of Honduras and the Isthmus of Panamá. The trunk, which attains the height of about 40 feet and is crowned with leaves some 30 feet long, yields by tapping a kind of palm-wine.—The *Palm-oil* of Africa is the product of the fruit of *Eleis guineensis*. The tree is cultivated now in the West Indies and tropical South America for the sake of the oil. It attains a height of 60 feet, with a spreading crown of pinnate leaves, each about 15 feet long, the footstalks of which are armed with stout hooked spines. The flowers have a strong peculiar smell, like anise and chervil in combination. The fruit forms a large head, consisting of a great number of orange-coloured drupes; when ripe each drupe has an oily pulp with a stone and kernel in the centre, and it is from this

pulp that the oil is obtained. To extract the oil the pulp is first bruised to a paste in wooden mortars, and is then boiled in water. The oil which rises to the surface of the water is reddish or orange in colour, and has an agreeable odour of violets; it is allowed to cool, and is then skimmed off. In warm countries it retains its oily consistence, but in cooler climates it acquires the solidity of butter. It is used as butter is in Europe. The quantity of palm-oil now imported to Europe is enormous. It is employed in cooking, in the manufacture of margarine, candles, toilet and common soaps, and as a lubricant of railway-carriage wheels, &c. The kernel yields palm-kernel oil. Palm-kernel cake and meal are used as cattle-foods. The tree yields from its trunk abundance of palm-wine.—The *Coguito* of Chile is *Jubæa spectabilis*, a tree of about 50 feet in height, with a spreading crown of leaves. From its trunk a syrup is extracted, called *miel de palma*, which is much esteemed by the Chileans and Europeans in cookery in various ways. It is obtained by cutting down the tree and lopping off its crown of leaves, when the sap flows from the wound, and is carefully collected. By cutting off a fresh slice from the wound daily, or when the flow of sap becomes weak, it may be kept flowing for several months; a good tree is said to yield as much as ninety gallons of sap, which on being boiled down assumes the consistence of treacle.

Much information on palms and their products will be found in the *Historiæ Palmarum*, by Martius; in the *Flora Brasiliensis*, by Drude; in a *Popular History of Palms*, by Seemann; and in *Pflanzenfamilien*. See ARECA, COCONUT, CHAMEROPS, DATE PALM, DUM PALM, FIBROUS SUBSTANCES, NUT, &c.

Palm, a measure of length, originally taken from the width of the hand, measured across the joints of the four fingers. In Britain a palm is, somewhat loosely, understood to be the fourth part of an English foot, or 3 inches.

Palma, (1) the capital of the island of Majorca (q.v.) and of the Balearic Islands, stands on the Bay of Palma, on the south coast. The cathedral, a Gothic edifice (1232–1601), contains the tomb of King Jayme II. of Aragon and a valuable collection of church ornaments. The tomb of Raymond Lully (q.v.) is in the church of St Francis. There are, further, a beautiful exchange (1426–46), an old Moorish palace, and a 16th-century town-hall, with pictures. Palma is one of the most aristocratic cities in Europe. Pop. 77,000. It makes boots and shoes, silver chain purses, jewellery, matches, silks, woollens, &c. The port is protected by a mole, and the town by a wall and batteries.—(2) A town of Sicily, 14 miles S.E. of Girgenti; pop. 18,000.—(3) The name of one of the larger of the Canary Islands (q.v.), with an area of 718 sq. m.; pop. 50,000. Drawn-thread work, bananas, and almonds are exported.

Palma, JACOPO, commonly called PALMA VECCHIO (i.e. Old Palma), painter of the Venetian school, was born about 1480 at Serinalta, near Bergamo, and died at Venice just about the middle of the year 1528. At first working under the influence of the Bellinis, he subsequently painted in the spirit and style of Giorgione and Titian, and may be placed at the head of the second class of great Venetian artists. His pictures are either religious subjects or portrait groups. Of the former the best are a series of six figures of saints, St Barbara and others, in the church of Santa Maria Formosa at Venice. The best portrait group is three sisters, generally called the 'Three Graces.'—His brother's grandson, likewise called JACOPO (1544–1623), and nicknamed IL GIOVANE

(the Younger), painted religious pictures of greatly inferior merit, though he modelled his style on that of Titian, Palma Vecchio, and Tintoretto.

Palma Christi. See CASTOR-OIL PLANT.

Palm Beach, a great winter resort on the east coast of Florida, about 264 miles S. of St Augustine; the Gulf Stream is within about a mile of the shore; pop. 1000.

Palmblad, VILHELM FREDRIK, a Swedish historian, was born 16th December 1788 at Liljested, in East Gothland, studied at Uppsala, and became professor of Greek there in 1835. He died 2d September 1852. Amongst his works (which deal with geography, history, and classical philology) are the *Biografisk Lexikon* (23 vols. 1835–59) and the historical novel *Aurora Koningsmark* (1847).

Palmellaceæ. See ALGÆ, GORY DEW.

Palmer (Lat. *palmifer*, 'a palm-bearer'), properly so called, was a pilgrim who had performed the pilgrimage to the Holy Sepulchre, and had returned or was returning home after the fulfilment of his vow. The Palmers were so called from their carrying branches of the oriental palm, in token of their accomplished expedition. On arriving home they repaired to church to return thanks to God, and offered the palm to the priest, to be placed upon the altar.

Palmer, EDWARD HENRY, the 'Sheikh Abdullah,' was born 7th August 1840 at Cambridge, and while a schoolboy there picked up Romany (the Gypsies' tongue), while a clerk in the City, Italian and French. In 1859 he all but died of consumption; in 1860 at Cambridge began to devote himself to oriental studies—Arabic, Persian, and Hindustani; in 1863 obtained a sizarship at St John's; and in 1867, graduating with a third-class in classics, was yet elected a Fellow of his college. During 1868–70 he was engaged for the Palestine Exploration Fund in the survey of Sinai, and, with Charles Tyrwhitt Drake, of the Desert of the Wanderings, acquiring meanwhile a marvellous knowledge of the wild Arab tribes. In 1871 he was appointed Lord Almoner's professor of Arabic at Cambridge (his stipend £40, 10s., augmented next year by £250); and in 1874 he was also called to the bar. So ten years went by of work and play—he was a wonderful conjurer—of sorrow, too, and trouble, for he lost his first wife and got involved in money difficulties, till in 1881 he turned London journalist, writing principally for the *Standard*. Finally, in June 1882, on the eve of Arabi's Egyptian rebellion, he was pitched on by government for the perilous mission of winning over the Sinai tribes to Britain and hindering the destruction of the Suez Canal. He made two expeditions—the first his great ride from Gaza to Suez (July 15–31), and the second when, starting from Suez with Captain Gill, R.E., and Lieutenant Charrington, R.N., he and they on August 11 were betrayed and murdered in the ravine of Wady Sadr. Eight months later the three were buried in St Paul's.

Of a score of works by Professor Palmer may be mentioned his *Desert of the Exodus* (1871), *Arabic Grammar* (1874), *Song of the Reed* (1876), *Poems of Behâ ed Din Zohair* (1876–77), *Persian-English and English-Persian Dictionary* (1876–83), *Haroun Alraschid* (1880), and a translation of the *Koran* (1880). See his *Life* by Sir W. Besant (1883); also Capt. A. E. Haynes, *Man-hunting in the Desert* (1894).

Palmer, ROUNDELL. See SELBORNE (LORD).

Palmer, SAMUEL. See ENGRAVING.

Palmerston, HENRY JOHN TEMPLE, VISCOUNT, was born at the family mansion, Broad-

lands, near Romsey, Hants, 20th October 1784, and belonged to the Irish branch of the ancient English family of Temple, taking name from Temple in Leicestershire. Sir W. Temple, the diplomatist and patron of Swift, was a member of this family, which removed to Ireland about 1601, and which was ennobled in 1722, when Henry Temple was created a peer of Ireland with the dignities of Baron Temple and Viscount Palmerston. His grandson, Henry, second Viscount (1739-1802), was father of the great minister, and superintended his education at Broadlands, until he sent him to Harrow. Young Temple in 1800 went to the university of Edinburgh, where he attended the lectures of Dugald Stewart and other professors. In 1802 he succeeded his father as third Viscount, and in 1803 he matriculated at St John's College, Cambridge. His eminent abilities were early recognised, for he was scarcely of age when the Tory party in the university selected him (1806) as their candidate to succeed Pitt in the representation. Unsuccessful at Cambridge then and again in 1807, he entered parliament in the latter year for Newport, in the Isle of Wight, his colleague being Arthur Wellesley, then Chief-secretary for Ireland. In 1811 he exchanged Newport for the university of Cambridge, enjoyed the distinction of representing his *alma mater* for twenty years, and only lost his seat when he became a member of the Grey administration and supported the Reform Bill. For the last two years of the unreformed parliament he sat for the now extinct borough of Bletchingly. At the first election after the Reform Act he was returned for South Hampshire, but lost his seat at the general election of 1835. He immediately afterwards found a seat for the borough of Tiverton.

Having traced his representative, we now turn to his official career. Palmerston entered life as a member of the Tory party, and accepted the office of Junior Lord of the Admiralty and Secretary at War (without a seat in the cabinet) in 1809. This office he held during the successive governments of Perceval, Liverpool, Canning, Goderich, and Wellington—a period extending from 1809 to 1828. There was ample scope at the War Office for Palmerston's administrative talents and activity. The military system swarmed with abuses, and the labour thrown upon the Secretary at War during the Peninsular campaigns was prodigious. In 1816 an attempt was made to assassinate Palmerston by an insane army-lieutenant, named Davis, who fired a pistol at him as he was entering the Horse Guards; the bullet, however, only inflicted a slight wound. Palmerston early attached himself to the Canning section of the Liverpool administration. His official connection with the Tory party ceased in 1828, when the 'Great Duke' insisted on accepting Huskisson's resignation, which was followed by Palmerston's retirement. The Duke's government was swept away in the reform flood of 1830; and Earl Grey, who became prime-minister, offered the seals of the Foreign Office to Palmerston. The European horizon was so disturbed at this crisis that a great political authority declared that if an angel from heaven were in the Foreign Office he could not preserve peace for three months. Palmerston falsified the prediction. Louis-Philippe then filled the throne of France; and for the first time on record England and France acted in concert, and without jealousy, under Palmerston's foreign ministry. He took a leading part in securing the independence of Belgium, in establishing the thrones of Queen Isabella of Spain and Queen Maria of Portugal on a constitutional basis, in endeavouring, in alliance with Austria and Turkey, to check Russian influence in the East, and in

the war with Mehemet Ali. In 1841 Palmerston went out of office with the Whigs on the question of free trade in corn; but on their return in 1846 he resumed the seals of the Foreign Office. His second foreign administration furnished various subjects of hostile party criticism, among which may be mentioned the civil war in Switzerland, the Spanish marriages (see GUIZOT), the European revolutions in 1848, the rupture of diplomatic relations between Spain and Great Britain, and finally, the affair of Don Pacifico (a Gibraltar Jew living in Athens, who claimed the privileges of a British subject), and the consequent quarrel with Greece. His strenuous self-asserting character, his brusque speech, his frequently hasty interferences in foreign affairs, were little calculated to conciliate opponents at home, and secured him many enemies abroad—the name 'Firebrand Palmerston' still clinging to him on the Continent. A vote of censure on the foreign policy of the government was in 1850 carried in the House of Lords on the motion of Lord Stanley (afterwards Earl of Derby). A counter-resolution, approving the foreign policy of the government, was thereupon moved by Roebuck in the Lower House. The debate lasted four nights. In a speech of five hours' duration—'that speech,' said Sir Robert Peel, 'which made us all so proud of him'—Palmerston entered upon a manly and dignified vindication of his foreign policy; and Roebuck's motion was carried by a majority of forty-six.

In December 1851 the public were startled at the news that Palmerston was no longer a member of the Russell cabinet. He had expressed to the French ambassador in London his approbation of the *coup d'état* of Louis Napoleon, without consulting either the premier or the Queen; and, as explanations were refused, Lord John Russell advised his resignation. Palmerston, in the general opinion, was 'smashed;' but he soon got his 'tit for tat;' for in the following February, soon after the meeting of parliament, he avenged himself by shattering the Russell administration to pieces on a comparatively trifling question—a Militia Bill. He refused an offer from the Earl of Derby to join the government which he was commissioned to form, but accepted the post of Home Secretary in the coalition administration of the Earl of Aberdeen in 1852. The fall of this coalition government in the winter of 1854-55, on Roebuck's motion for a Sebastopol committee, placed Palmerston in his seventy-first year in the position of prime-minister, to which he was unanimously called by the voice of the nation; in his own phrase he was 'the inevitable.' He vigorously prosecuted the Russian war until Sebastopol was taken and peace was made. His government was defeated in March 1857 on Cobden's motion condemnatory of the Chinese war. Palmerston appealed to the country, and met the House of Commons with a largely increased majority. But his administration fell in February 1858, over the Conspiracy Bill, intended to protect the French emperor against the machinations of plotting refugees. A short Conservative administration followed; but in June 1859 Palmerston was again called to the post of First Lord of the Treasury, which he continued to fill up to his death, the chief events of this premiership being the American civil war (with its *Trent* and *Alabama* incidents), Napoleon's war with Austria, and the Austro-Prussian war with Denmark. His last great speech was his defence of the policy of his government, delivered in July 1864, in reply to the attack of Disraeli. He died at his country seat, Brocket Hall, 18th October 1865, and was buried in Westminster Abbey. Both his titles became extinct with him.

It was his ambition to be considered the minister of a nation rather than the minister of a political party; and his opponents have been constrained to admit that he held office with more general acceptance than any English minister since the time of the great Lord Chatham. As an orator he was usually homely and unpretending, but always sensible and practical. He was a dexterous tactician, of irrepressible spirit, and a ready, witty, and often brilliant debater. He was popular as a minister, because he was thoroughly English in his ends and aims; even his robust health, off-hand manner, jaunty bearing, and physical vigour were elements of his popularity. He always and ardently desired to promote the prosperity, influence, and grandeur of Great Britain, and his national spirit was heartily appreciated by his countrymen.

The title is taken from a village 3 miles W. of Dublin. See *Life of Palmerston*, by Lord Dalling (3 vols. 1870), continued by Evelyn Ashley (2 vols. 1879); and smaller works by Anthony Trollope (1882), Lloyd Sanders (1888), and the then Marquis of Lorne (1892). The *Correspondence of Queen Victoria* (1907) shed a flood of light on the (generally embarrassed) relations between the Queen and a minister she distrusted and disliked.

Palmerston. See PORT DARWIN.

Palmer-worm, a name given to many large kinds of grub, the larvæ of coleopterous insects, destructive to various vegetable substances.

Palmetto-leaves, the leaves of the Palmyra palm, imported into Europe for the manufacture of hats and mats. For this palm and those known as Palmetto (*Sabal* and *Chamærops*), see PALM.

Palmi, a picturesque Italian coast-town in Calabria, 21 miles NNE. of Reggio. It has been the scene of many disastrous earthquakes, including that of 1908. Pop. 15,000.

Palmieri, LUIGI, meteorologist, born 22d April 1807, taught mathematics, became in 1847 professor at Naples, and in 1854 director of the observatory on Vesuvius. He invented many meteorological instruments, and wrote on volcanoes and seismology. He died 6th September 1896.

Palmiet (*Prionum Palmita*), a South African juncaceous plant, aloe-like in appearance, spreads by runners on the banks of streams, where it grows to 6 feet high.

Palmipedes, also called NATATOIRES, or SWIMMERS, the web-footed birds, in some classifications an order of Birds (q.v.).

Palmistry, or CHIROMANCY (Gr. *cheir*, 'the hand, and *mantikê*, 'divination'), is the art of 'reading the palm'—the art which professes to discover the temperament and character of any one, as well as the past and future events of his life, from an examination of the *palm* of his hand, and of the lines traced upon it. As a considerable body of very complicated rules and directions have been laid down by authorities, ancient and modern, to enable the student to read the palm, palmistry claims to be regarded as a 'science,' or at least as a branch of an interpretative science of the hand in general, to which the name *Chirosophy* has been given. The other branch of this general science has been called *Chiromancy*, and is concerned with the interpretation of the form and character of the hand and fingers, while Chiromancy treats of the palm only (see DIVINATION).

Palmistry has an ancient literature of its own in India. Aristotle in his *Historia Animalium* observes (i. 15) that long-lived persons have one or two lines which extend through the whole hand; short-lived persons have two lines not extending through the whole hand. Other references to this subject occur in the doubtful works, the *Problemata* and the *Physiognomika*, attributed to him. Pliny,

too, in his *Natural History* (xi. 114) directly asserts that Aristotle regarded numerous broken lines in the palm of the hand as a prognostic of short life. Of the cultivation of palmistry among the Romans there is little evidence; but Juvenal describes the woman who 'frontemque manumque præbebit vati' (*Sat.* vi. 581). In the 2d century Artemidorus of Ephesus, the author of a work on the interpretation of dreams, is said to have devoted a whole treatise to the subject, which, however, is not extant.

In writers of the middle ages there is much reference to the subject, and the names of Paracelsus, Albertus Magnus, and Cardanus have been associated with it. But the most important work on chiromancy belonging to this period seems to be *Die Kunst Chiromantia*, of Johann Hartlieb, which was printed at Augsburg in 1475. In the 16th century we find several treatises on the subject, of which the most important seem to be those of Johannes ab Indagine, and of Barthelémy Cocles of Bologna, doctor of natural philosophy and of medicine. The former has been Englished by Fabian Wither (1651). In the end of the 18th century palmistry found an important exponent in the celebrated Marie Anne Lenormand (1772-1843), who in her *Souvenirs Prophétiques d'une Sibylle* (1814) foretold the downfall of Napoleon. In modern times D'Arpentigny (1843) expounded principally chiromancy. On his book and those of Desbarrolles (1859, 1874) subsequent writers have chiefly founded.

Palmitic Acid, Palmitin. See FATS.

Palm-oil. See PALM.

Palm Sunday (Lat. *Dominica Palmarum*, or *Dom. in or ad Palmas*), the Sunday before Easter, is so called from the custom of blessing branches of the palm-tree, or of other trees substituted in those countries in which palm cannot be procured, and of carrying the blessed branches in procession, in commemoration of the triumphal entry of our Lord into Jerusalem. The date of the origin of this custom is uncertain; the procession cannot be traced back beyond the 8th century, though the name Palm Sunday is found two or three centuries earlier. The Greeks appear to have adopted the festival long before the Latins; their procession is at matins. In the Roman Catholic Church the celebrant blesses the branches before the mass, and they are then distributed to the people; the clergy in procession pass out of the church, the doors are closed, and the ancient hymn known in English as 'All glory, laud, and honour' is sung by the choir within and those without, until, on the sub-deacon's knocking at the door, it is again thrown open, and the procession re-enters. During the singing of the Passion in the solemn mass which ensues, the congregation hold the palm-branch in their hands, and at the conclusion of the service it is carried home to their respective houses, where it is preserved during the year. Afterwards it is burned, and the ashes employed, as a rule, for Ash-Wednesday. At Rome the pope himself distributes the palm branches to all the churches of the city. In Moscow until 1700, and in parts of Germany until the beginning of the 19th century, a wooden image of an ass was led about the streets, followed by the people bearing the consecrated branches.

Palm-tree. See PALM.

Palmyra, in ancient times, from about 100 A.D. to the 14th century, more especially in the 2d and 3d centuries, a wealthy and magnificent city of northern Syria, situated in an oasis on the northern edge of the Arabian desert, about 150 miles NE. of Damascus and nearly midway between that city and the Euphrates. The Semitic

name was Tadmor, Palmyra (= 'city of palms') being the Greek and Latin equivalent. According to the old tradition, it was founded by Solomon. There is stronger probability that it was an Arabic settlement, planted at a spot that formed a convenient station on the great caravan route between the Persian Gulf and the Mediterranean. At all events, after the decline of Petra (q.v.; also NABATÆANS) in 105 A.D., Palmyra took its place as the chief commercial centre in northern Arabia. Its merchant aristocracy reaped great advantage from the long-protracted wars between Rome and Parthia by acknowledging the supremacy of Rome. From both Hadrian and Septimius Severus it received special favours and privileges. One of its chiefs, Odaenathus, husband of the more famous Zenobia (q.v.), extended his power over most of the adjoining countries, from Egypt to Asia Minor. Aurelian at length crushed in 272 the attempt of the Palmyrenes to found an independent empire. After the Roman empire became Christian, Palmyra was made a bishopric. When the Moslems conquered Syria, Palmyra also submitted to them. From the 15th century it began to sink into decay, along with the rest of the Orient. Magnificent remains of the ancient city still exist, chief among them being the great temple of the Sun (or Baal); the great colonnade, nearly a mile long, consisting originally of some 1500 Corinthian columns; and sepulchral towers, overlooking the city. The ancient Palmyrenes, besides conducting and controlling the caravan

on the premises. Opened in 1891, the magnificent buildings were hardly completed when the earthquake of 1906 sadly injured them. The city of Palo Alto, chartered in 1909, has sprung up, one mile to the north-east, since the founding of the university. There is also a Roman Catholic theological seminary. Pop. 6000.

Palo de Vaco. See COW-TREE.

Palolo (*Eunice viridis*), an edible Annelid, common around Samoa and Fiji and some other Pacific islands. It has an extraordinary breeding swarm in October and November every year, on or near the day of the last quarter of the moon. Just before sunrise the waters become thick with worms, like vermicelli soup. The swarming worms, which

are eagerly collected by the natives, are really headless parts of worms, laden with eggs and sperms, which they liberate by rupture. The head-ends remain in the burrows in the coral-reefs, and grow new posterior ends. There is an Atlantic Palolo, *Eunice fucata*, common at Tortugas for instance, which swarms within three days of the day of the last quarter of the moon between 29th June and 28th July. There is also a Japanese Palolo.

Palos, a small Spanish port at the mouth of the Río Tinto, 5 miles E. by S. of Huelva. Once an important place, whence Columbus started on his great voyage, it has now sunk to a village.

Palpitation is the term used of the condition in which a person becomes painfully aware of the beating of his own heart. This occasionally happens even when the heart's action is apparently quite natural; but much more generally the pulsations are found to be greatly increased in force, and in most cases in frequency

as well. It may be either functional or a symptom of organic disease of the heart. Here we shall merely consider it as a functional disorder. Although it may be persistent, it far more frequently comes on in paroxysms, which usually terminate within half an hour, recurring afterwards quite irregularly, sometimes daily or several times a day, and sometimes not till after a long interval. The attack often comes on under some mental or physical excitement, but sometimes when the patient is quite composed, or even asleep. If the paroxysm is a severe one the heart feels as if bounding upwards into the throat; and there is a sensation of oppression over the cardiac region, with hurried or difficult respiration. Excluding organic diseases, the causes of this affection are either (1) an abnormally excitable condition of the nerves of the heart, or (2) an unhealthy condition of the muscle.

(1) Amongst the causes of disturbed innervation

a, *Eunice viridis*, half natural size; b, c, anterior and posterior extremities (mag.).

Portico of the Great Colonnade, Palmyra.

trade across the desert, extracted salt, tanned leather, and worked in gold and silver.

Palmyra Wood, properly the wood of the Palmyra palm (see PALM); but the name is generally used for all kinds of palm-tree wood imported into Britain; much of which is the wood of the coconut palm, *Cocos nucifera*, and the allied species *C. plumosa*.

Palni Hills, a range of Southern India, linking the southern extremities of the Eastern and Western Gháts; average height of the higher ridge, 7000 feet. The climate of the Palni Hills is singularly pleasant and equable, many preferring the sanatorium of Kodaikanal to Ootacamund.

Palo Alto, 33 miles SE. of San Francisco, the seat of a university founded at a cost of \$30,000,000 by Senator Leland Stanford, designed to provide, gratis, education from the Kindergarten stage to the most advanced instruction; all the pupils board

may be especially noticed the abuse of tea (especially green tea), coffee, spirits, and tobacco. Any irritation of the stomach and intestinal canal may be reflected to the heart; and hence palpitation may frequently be traced to flatulence, undue acidity, and intestinal worms, especially tapeworms. Everything that causes pressure on the heart, such as abdominal dropsy or an enlarged uterus, is also liable to occasion this affection.

(2) The muscle of the heart possesses certain inherent qualities, such as that of contraction, of excitability, of conducting a stimulus from one part to the next, and that of acting in a regular and rhythmic manner. When the muscle is degenerated or stretched by dilatation, or imperfectly supplied with nutriment, some of these qualities deteriorate, and the heart in consequence acts with unnatural force and irregularity.

The age at which palpitation most usually comes on is from fifteen to twenty-five; and the affection—especially if it arise from anæmia—is very much more common in the female than in the male sex.

The treatment of palpitation must entirely depend upon its cause. The use of all nervous stimulants (tea, coffee, alcohol, and tobacco) should be suspended or abandoned. If the patient is clearly plethoric, with a full strong pulse, he should take saline cathartics, and live upon comparatively low diet (including little animal food) until this condition is removed. When, on the other hand, the palpitation is due to an anæmic condition, the remedies are preparations of iron, aloetic purgatives, an abundance of animal food, bitter ale, the cold shower-bath, and moderate exercise.

Palsy. See PARALYSIS.

Paltock, ROBERT, born in London apparently in 1697, and educated at St Paul's School, was bred to the law, and while in Clement's Inn secured his title to remembrance by writing the wondrous tale of *Peter Wilkins, a Cornish Man*, published anonymously in 1750, and often reprinted. The authorship, known to some in 1802, remained generally a mystery till 1835, and first appeared on the title-page in 1839. Paltock died 20th March 1767.

Paludan-Müller, FREDERIK, Danish poet, born at Kjørteminde in Fünen on 7th February 1809, led a quiet, uneventful life, and died at Copenhagen on 29th December 1876. Whilst still a student at the university in that city he gained the ear of the public with a play, *Love at Court* (1832); a poem, *The Dancer* (1833); and a lyric drama, *Amor and Psyche* (1834)—all three decidedly romantic in temper, the second especially showing Byronic influence. But his fame rests on that typical classic of Danish poetry, *Adam Homo* (3 vols. 1841-49), a humorous, didactic poem, full of deep and suggestive thought, with no small share of satiric wit and irony, and strong realistic touches, and of the most finished literary workmanship; on *Kalanus* (1854), a contrast between Alexander the Great and the Indian sage Kalanus, as representatives of Greek culture and Hindu religion, a work written in the loftiest spirit of idealism; and on *Adonis* (1874), an exquisitely finished little mythological poem. Along with *Kalanus* he published the poems *Paradise*, *Abel's Death*, *Cain*, *Ahasuerus*, and *Benedict of Nursia*; and he wrote also two prose romances, *The Source of Youth* (1865) and *Ivar Lykke's History* (3 vols. 1866-73). See Georg Brandes, *Danske Digtere* (1877), and F. Lange, *Frederik Paludan-Müller* (1899).

Pamir', the nucleus of the central Asian highland system, is a lofty plateau-region, with a mean elevation of 13,000 feet, uniting the western terminations of the Himalaya and the Tian-Shan Mountains, and both with

the Hindu-Kush. It is traversed by mountain-ridges that rise from 4000 to 5000 feet above the plateaus, and the culminating points attain in some cases 25,500 feet above sea-level. Between these ridges are a series of broad valleys, to which the generic name 'pamir' is given. On the west side this plateau-region sinks rapidly in terraces to the deserts of Turkestan. These lofty plateaus are exposed to great extremes of heat and cold, and are visited by terrible snow and sand storms. Nevertheless the Kirghiz drive up their flocks and herds for summer pasture, and from time immemorial traders have crossed them along celebrated routes. It was crossed by Marco Polo (q.v.). Mammal and bird life is plentiful. Amongst the lakes are Karakul, 120 sq. m., and Shivakul, 100 sq. m.

Pamlico Sound, a shallow body of water, some 75 by 10 to 25 miles, on the coast of North Carolina, separated from the ocean by long, narrow islands of sand, with narrow passages.

Pampa. See ARGENTINA.

Pampas (Quichua, 'plains') is a term properly confined to the immense treeless plains of the Argentine Republic, which rise, almost imperceptibly, in a series of terraces from the coast to the base of the Cordilleras. Extending some 2000 by 500 miles, they differ greatly in various districts. The north-eastern portion, in the Paraná basin, is one of the most fertile regions in the republic; and stretching from this through Buenos Aires and the south of Córdoba and Santa Fé is the rich grassy pampa-land proper, supporting great herds of cattle, horses, and sheep. The rest is for the most part waterless and sterile. The soil, which is a diluvium composed of sandy clay, and abounds in the bones of extinct mammals, is more or less impregnated with salt, especially in the west, where strips of desert, known as *travesías*, are numerous. Great tracts of pasture have been converted into farmland, but stock-raising is still the most important industry. The half-white herdsmen are called Gauchos (q.v.).—The name Pampas is also given to the level districts of Peru, where those of the Sacramento occupy an area estimated at 180,000 sq. m., covered with primeval forest.

Pampas Grass (*Cortaderia argentea*, from the vernacular *cortadera*), a grass which grows in

Pampas Grass (*Cortaderia argentea*).

damp places in the pampas of South America. A noble grass now well known in British gardens as an ornamental plant, it is quite hardy, and its

tufts have a splendid appearance. The leaves are 6 or 8 feet long, the ends arching gracefully over; the flowering stems 10 to 14 feet high; the panicles of flowers silvery white, and from 18 inches to 2 feet long. It is dioecious; the spikelets two-flowered, one flower stalked, and the other sessile; the paleæ of the female elongated, awn-shaped, and woolly. The herbage is too coarse to be of value.

Pampas Hare. See VISCACHA.

Pampeluna, or PAMPLONA, a fortified city of northern Spain, stands on a tributary of the Ebro, 111 miles by rail NW. of Zaragoza (Saragossa) and 50 S. by W. of Bayonne in France. It has a citadel (a copy of that of Antwerp), a Gothic cathedral (1397), a viceregal palace, a fine aqueduct, and some manufactures. It was called by the ancients *Pompeopolis*, because built by Pompey in 68 B.C. It was taken by the Goths in 466, by the Franks in 542, and by Charlemagne in 778. From 907 it was the capital of Navarre. The town was seized by the French in 1808, but captured by Wellington in 1813. It again capitulated to the French in 1823. In the Carlist wars it was held by Queen Christina's adherents (1836-40), and in 1873-76 it was vainly attacked several times by the Carlists. Pop. 33,000.

Pampero. See ARGENTINA.

Pamphylia, anciently a country on the south coast of Asia Minor (q.v.), between Lycia and Cilicia. The inhabitants—a mixed race of aborigines, Cilicians, and Greek colonists—spoke a language the basis of which probably was Greek, but which was disfigured and corrupted by the infusion of barbaric elements. See Dr Lanckoroński, *Die Städte Pamphyliens und Pisidiens* (1890 et seq.).

Pan, among the Greeks, a divinity of pastures, forests, and flocks, usually described as a son of Hermes. His worship originated in Arcadia, but spread gradually over the rest of Greece, although it did not reach Athens until after Marathon. Pan is represented as having horns, a goat's beard, a crooked nose, pointed ears, a tail, and goat's feet. Sometimes he appeared to travellers, startling them with sudden fear, whence a sudden fright was called a *panic* fear. During the heat of the day he used to sleep in the shady woods, and was exceedingly wroth if his slumber was disturbed by the halloo of the hunters. He was the patron of all persons occupied in the care of cattle and of bees, in hunting and in fishing. He is also represented as fond of music, and of dancing with the forest nymphs, and as the inventor of the syrinx or Pan-dean pipes. Cows, goats, lambs, milk, honey, and new wine were offered to him. The fir-tree was sacred to him, and he had sanctuaries and temples in various parts of Arcadia, at Trœzene, at Sicyon, at Athens, &c. The Romans identified the Greek Pan with their own god Faunus. Plutarch (*De Orac. Defectu*) is the first to tell the story that in the reign of Tiberius one Thamus a pilot, when steering near the islands of Paxæ, was commanded by a loud voice to proclaim that 'the great Pan is dead.' As soon as he had reached Palodes he cried the news aloud from the poop of his ship, whereupon was heard a great noise of lamentation, as of nature itself expressing its grief. The coincidence of this story with the birth or the crucifixion of Christ gave occasion to an explanation that it marked the end of the old world and the beginning of the new when the old oracles became dumb. Rabelais has the story, there is a well-known allusion to it in Milton's *Ode on the Nativity*, and it has been finely treated by Schiller and Mrs Browning. The Devil of popular Christian superstition owes some of his attributes to Pan.

Pamplona. See PAMPELUNA.

Panamá, formerly called the Isthmus of Darien (q.v.), consists of the neck or narrowest part (35 miles) of Central America, connecting Costa Rica with Colombia. A department of Colombia, it rebelled in 1903, and became an independent republic. It has an area of 32,400 square miles and a population of 450,000, exclusive of about 23,000 in the Canal Zone (area, 502 sq. m.). This zone was ceded by treaty to the United States in 1903 with a view to the construction of a canal, and consists of a strip of territory extending 5 miles on either side of the present canal, and stretching 3 miles into the sea at each terminal, but not including the towns of Colón and Panamá, which are, however, under United States jurisdiction in matters relating to sanitation and quarantine. In return for this cession Panamá received a lump sum of £2,000,000, and £50,000 annually as from 1913 onwards. The isthmus is traversed by a low chain of mountains, forming the barrier between the Atlantic and Pacific Oceans. Numerous streams, the largest of which is the Tuira (160 miles long, and navigable for more than 100 miles), fall into both oceans. Off the Pacific shore are numerous beautiful islands, among which Las Perlas, so called from their pearl-fisheries (now almost discontinued), Naos, and Taboga are the chief. There are no good natural harbours. The chief trading ports are Panamá (see below) and Colón (Aspinwall). A railway, 47 miles in length, and completed in 1855, connects these ports; it was built by and belongs to the United States, and lies within the canal zone. The exports embrace bananas, sugar, hides, tallow, caoutchouc, indigo, vanilla, coffee, gold dust, coconuts, tortoiseshell, timber, &c. Commerce is entirely in the hands of foreigners. Gold, once abundant, is still worked, and copper, iron, &c., exist. The Canal Zone, formerly a fever-infested region, has now a death-rate lower than that of the average United States city. 'Panamá hats' are made not in Panamá but in Ecuador and Peru.

PANAMÁ, the capital of the country, stands on a projecting volcanic rock on the Pacific side of the isthmus; the massive walls the Spaniards built to protect their treasure city still stand in places. *Old Panamá*, founded in 1518, was captured and destroyed by the buccaneers under Morgan (1671). *Modern Panamá* was built two years later, 4½ miles distant from the old city. In 1920 it had a population of about 60,000, the majority Indians, negroes, and half-breeds. The town derives its renewed importance from the completion of the Panamá Railway in 1855. Fires have destroyed Panamá repeatedly, as well as its sister city Colón. The principal buildings are the cathedral (1760), a Spanish structure, built of yellow stone; the town-hall, in which the Colombians signed the declaration of their independence; and the bishop's palace (1880).

Panamá Canal. See CANALS.

Panathenæa, the most famous festival of Attica, celebrated at Athens in honour of Athena, patron goddess of the city. All writers who mention it speak of a Lesser and Greater Panathenæa, the former held annually, the latter every fourth year. The procession of the festival was sculptured by Phidias and his disciples on the frieze of the Parthenon.

Panax. See GINSENG.

Panay. See PHILIPPINE ISLANDS.

Pančevo, a town of Yugoslavia (till 1920 Hungary), inhabited by 20,000, mainly Serbs and Germans, stands 9 miles NE. of Belgrade, on the Temes, not far from its junction with the Danube.

The people breed silkworms, brew beer, distil brandy, make starch, grind flour, &c. The Austrians took the place from the Turks in 1716, routed them there in 1739, burned the town in 1788, and in 1849 defeated the Hungarians under Kiss.

Panchatantra ('The Five Cases-of-Good-Sense'), or **TANTRĀKHYĀYIKA** ('Collection of Tales of Cases-of-Good-Sense'), is the title of a collection of Hindu tales which has exercised a greater influence than any other Indian work on the literature of the world. The oldest form of the work (before 500) is now lost, but from it was made a translation into Pahlavi by order of the Sassanian king Khosru Anūshīrvān (531-79); from the Pahlavi were made versions in Syriac (c. 570) and in Arabic (before 760). The latter, which bears the name *Kalīlah wa Dimnah*, from the names of two jackals who are prominent characters in the original, was the source whence the *Panchatantra* won widespread and remarkable influence on the literature of western Europe.

In India itself the original is represented by a very large number of varying recensions, of which the *Tantrākhyāyika* of Kashmir (before 1000) is closest to the original; the Southern *Panchatantra* is current in the Dekkan, and the so-called *textus simplicior* (c. 1000) and the more elaborate version of a Jain Pūrṇabhadra (1199) are of north-western origin. Metrical versions, derived from a common source, are preserved in the *Kathāsaritsāgara* of Somadeva (c. 1065) and the *Bṛīhatkathāḍmanjarī* of Kshemendra (c. 1040), both Kashmirian poets. In Bengal there is current the *Hitopadeśa* of Nārāyaṇa (before 1373), which is based on the *Panchatantra* but also on another work; in it the number of books is reduced to four, and the order of the first two is inverted. There are also many versions and imitations in Indian vernaculars.

The *Panchatantra* belongs to the class of literature known in India as *Nītīśāstra* ('Science of Conduct'), being composed for the instruction of princes and those engaged in the direction of affairs, private or public, in regard to prudent and effective action rather than morality, though in the main the lessons taught are in accord with a practical ethical standard for ordinary life. The mode of teaching adopted is the use of fables, especially beast fables, and the literary form is remarkable and ingenious. The five books composing the work are independent, but are connected by an introduction showing a king dissatisfied with the ignorance of his sons entrusting their education to a Brahman, Vishnuśarma, who composes the text, and by narrating it to his pupils redeems them from sloth and vice. In each book there is a frame story into which subsidiary stories are introduced by the dramatic device of placing them in the mouths of the characters in the frame story, and occasionally the structure is further complicated by the introduction of stories within these subsidiary stories. The tales are in prose, but the doctrines they inculcate are often summed up in verse, and the narrative is enlivened by the insertion of gnomic verses, maxims, quotations from works on law and conduct, epic poetry, &c. While in the *Hitopadeśa*, and some other versions, the style has been simplified partly in order to adapt the works for use in learning Sanskrit, in the original a distinct effort was clearly made to achieve literary effect.

The first and longest book deals with the estranging of friends, and by narrating how two jackals severed the firm friendship of a lion and a bull it warns kings of the dangers of paying heed to the perfidious counsel of those whose interest it is to sow divisions between a prince and his true adherents. The second proves by the tale of the effective alliance between the dove, mouse, crow,

tortoise, and deer the advantage of the winning of friends. The third tells the story of the war of the crows and the owls as a warning of the danger of trusting to unknown men or to enemies. The fourth uses the frame story of the ape and the crocodile to show how men lose by imprudence their hard-won gains. The fifth warns us of the danger of inconsiderate action, and narrates the tale of the Brahman and his mongoose, famous in the parallel of Llewelyn the Great and his faithful hound Gellert.

The pioneer work of Benfey in his translation (Leipzig, 1859) is supplemented and superseded in many details by J. Hertel in a long series of works, including editions of the Southern *Panchatantra* (1906), of Pūrṇabhadra's version (1908-12), the *Tantrākhyāyika* (1910; trans. 1909), and a monograph on the *Panchatantra* (Leipzig, 1914). See also F. Edgerton, *The Panchatantra* (New Haven, 1924).

Panch Mahals. See GUJARAT.

Pancras, St, the son of a heathen noble of Synnada in Phrygia, lost both parents whilst a boy, and was taken to Rome by an uncle, and there baptised, but immediately afterwards was slain (304) in the Diocletian persecution, being only fourteen years old. The first church that St Augustine consecrated in England was dedicated to St Pancras; it stood at Canterbury.—The London terminus of the London, Midland, and Scottish Railway, St Pancras Station, is situated in the metropolitan borough of St Pancras.

Pancreas (from the Gr. *pan*, 'all,' and *kreas*, 'flesh') is a conglomerate gland, lying transversely across the posterior wall of the abdomen, varying in length from 6 to 8 inches, having a breadth of about an inch and a half, and a thickness of from half an inch to an inch. Its usual weight is about three ounces. The head of the pancreas lies in the concavity of the duodenum. For the action of the pancreatic juice, and an illustration of the pancreas, see DIGESTION.

The diseases of the pancreas are few, and do not signify their existence by any very marked symptoms. The most common form of disease is cancerous deposit in the head of the gland, which frequently induces jaundice by obstructing the common biliary duct near its opening. An accurate diagnosis of disease of this organ is extremely difficult, and cannot lead to efficient treatment; all that can be done in these cases being to palliate the most distressing symptoms. The pancreas of ruminating animals is a favourite article of food under the name of sweetbread. See GLANDS.

Pancsova. See PANČEVO.

Panda (*Ailurus fulgens*), a rare and remarkable animal in the bear section of Carnivores. It

Panda (*Ailurus fulgens*).

lives among rocks and trees by the sides of streams at great altitudes in the south-east Himalayas, and

in eastern Tibet. Like a large cat in size, it has long, thick, brilliant reddish-brown fur, black beneath, high pointed ears, stout plantigrade limbs, with large, very slightly retractile claws, and woolly soles. The bushy tail is almost as long as the body, and has beautiful rings of red and yellow. The molar teeth are very broad, with numerous cusps; the diet consists of fruits, roots, and other parts of plants. A captive panda in the Zoo in London sucked water like a bear, and ran like a weasel in a jumping gallop. In its native haunts it climbs trees dexterously. The call varies from a curious bird-like chirp to a loud squeal. By the large bear-like *Ailuropus melanoleucus*, with snow-white fur and black legs, the panda is linked to the bears, but in several features it is nearer the raccoons of the New World.

Pandanaceæ, a family of monocotyledons, mostly natives of the tropics, though *Pandanus* is found in Australia, and Freycinetia in Australia, New Zealand, and Norfolk Island. They are trees or bushes, often sending down adventitious roots, sometimes weak and decumbent, or climbing. The leaves are imbricated linear-lanceolate and spiny, or pinnate and palmate without spines. The flowers are unisexual, naked, polygamous, or arranged on a spadix, and wholly covering it. The stamens are numerous; the ovaries usually clustered, one-celled, each crowned with a stigma; the fruit consists of fibrous, one-seeded drupes, collected or almost combined, or of berries with many seeds. Some species are valuable for the fibre of their leaves, some for their edible fruit, &c. See SCREW PINE.

Pandavas. See MAHÁBHÁRATA.

Pandean Pipes, a series, fastened side by side, of short reeds or pipes, graduated in length so as to give out different notes when blown across their mouths. See PAN.

Pandects. See JUSTINIAN.

Pandharpur, a town of British India, 112 miles SE. of Poona, on a branch of the Kistna. It is highly revered by the Hindus on account of a temple dedicated to an incarnation of Vishnu. Pop. 25,000.

Pandit. See PUNDIT.

Pandora (i.e. the 'all-endowed'), according to Greek myth, was the first woman on the earth. When Prometheus had stolen fire from heaven Zeus instigated Hephestus to make woman out of earth to bring vexation upon man by her graces. The gods endowed her with every gift necessary for this purpose, beauty, boldness, cunning, &c.; and Zeus sent her to Epimetheus, the brother of Prometheus, who forgot his brother's warning against accepting any gift from Zeus. A later form of the myth represents Pandora as possessing a vessel or box filled with every form of human ills, which spread over the earth. A still later version makes the box filled with winged blessings, which mankind would have continued to enjoy if curiosity had not prompted Pandora to open it, when all the blessings flew out, except Hope.

Pandours (French spelling of Serbo-Croatian *pándūr*, from mediæval Lat. *bänderius*), were light-armed Croatian infantry in the Austrian service against the Turks. Their appearance was exceedingly picturesque, being somewhat oriental in character, and their arms consisted of a musket, pistols, a Hungarian sabre, and two Turkish poniards. Their habits of brigandage and cruelty rendered them, however, as much a terror to the people they defended as to the enemy, and about 1750 they were put under stricter discipline, and gradually incorporated with the regular army.

Pandulf, CARDINAL, the commissioner sent by Innocent III. to King John in 1213, who returned to England as legate (1218-21), and in 1218 was made Bishop of Norwich. Langton strongly opposed his pretensions as legate, and got his commission cancelled.

Pange Lingua (Lat., 'Now, my Tongue, the mystery telling'), one of the most remarkable of the hymns of the Roman Breviary, and like its kindred hymn, *Lauda Sion*, a most characteristic example of mediæval Latin versification. The Pange Lingua is a hymn in honour of the eucharist, and belongs to the service of the Festival of Corpus Christi. Written by Thomas Aquinas, it consists of six strophes of verses in alternate rhyme. Besides its place in the office of the Breviary, the 'Tantum ergo,' a portion of this hymn, forms part of the service called Benediction with the Blessed Sacrament, and is sung on all occasions of the exposition, procession, and other public acts of eucharistic worship. For an earlier 'Pange Lingua,' see HYMNS (Latin).

Pangenesis. See HEREDITY.

Pangolin, or SCALY ANT-EATER, a name given to the various species of the genus *Manis* belonging to the mammalian order Edentata, and confined to the Oriental and Ethiopian regions. The most

Pangolin (*Manis pentadactyla*).

marked peculiarity of these animals is their covering of horny scales, between which (in the young at least) there are hairs. The pangolin is most nearly allied to the Aardvark (q.v.) of South Africa, and like it is edentate and feeds upon ants. When threatened with danger these animals roll themselves into a ball like the hedgehog.

Panicle. See GRASSES.

Panicum. See MILLET.

Pāṇini, the greatest grammarian of ancient India, whose work has up to the present day remained the standard of Sanskrit grammar. Of his life little is known save that he was born near Attock. His date is still doubtful: Goldstücker placed him in the 7th century B.C.; Weber and Böhtlingk give about 350 B.C., and his reference to *Yavanānī*, Greek writing, accords well with that or a somewhat later date, contemporaneous with Alexander the Great's invasion of India. The precision of statement and analytical skill of his work are equally admirable. See SANSKRIT.

Panipat, a town of the Punjab, is situated 53 miles N. of Delhi, near the old bank of the Jumna, and on the great military road of northern India between Afghanistan and the Punjab. Hence it has been at various times the scene of strife between the people of India and her invaders. The first great battle of Panipat was fought in 1526, when Baber, at the head of 12,000 Mongols, defeated the army, 100,000 strong, of the emperor of Delhi. The second great battle was fought in 1556 by the Mongols under Akbar, grandson of Baber, and third of the Mogul emperors, against Hemu, an Indian general of the Afghan Sher Shah, the latter being

defeated. The *third* battle was fought on 7th January 1761 between Ahmed, ruler of Afghanistan, and the till then invincible Mahrattas, who on this occasion suffered a total defeat and great slaughter. The existing town is enclosed by an old wall, and manufactures copper utensils, cloth, blankets, hardware, silver and glass ornaments. Pop. 27,000.

Panizzi, SIR ANTHONY, principal librarian of the British Museum from 1856 to 1866, was born 16th September 1797, at Brescello, in the duchy of Modena. He studied at Padua, and became an advocate, but, sharing in the revolution of 1821, had to flee. Condemned to death in absence, he settled in Liverpool, where the friendliness of Roscoe procured him employment as a teacher of Italian. Through Brougham's help he was in 1828 made professor of Italian in University College, London, and in 1831 assistant-librarian in the British Museum. As keeper of the printed books (1837) he undertook the new catalogue, and it was he who designed the new reading-room (see BRITISH MUSEUM). He was long a fast friend and correspondent of Prosper Mérimée, and died April 8, 1879, having been made K.C.B. in 1869. He retained to the end a lively interest in the cause of Italian freedom. See his *Life by Fagan* (1880).

Panjab. See PUNJAB.

Panjdeh. See AFGHANISTAN.

Panna, capital of a small Indian state in Bundelkhand, 173 miles SW. of Allahabad. Pop. of town, 11,000; of state, 197,600.

Pannonia, a province of the ancient Roman empire, bounded on the N. and E. by the Danube, on the W. by the mountains of Noricum, and on the S. reaching a little way across the Save; it thus included part of modern Hungary, Austria, Yugoslavia, and Italy. It received its name from the Pannonians, a race of doubtful origin, but who at first dwelt in the country between the Dalmatian Mountains and the Save, in modern Bosnia, and afterwards more to the south-east in Moesia. The Roman arms were first turned against them and their neighbours, the Iapydes, by Augustus in 35 B.C. After repeated defeats the Pannonians settled about 8 A.D. in the more northern countries, which received their name, and of which the former inhabitants, the Celtic Boii, had been in great part destroyed in Caesar's time. The country was now formed into a Roman province. Great numbers of the Pannonian youth were drafted into the Roman legions. In the 5th century it was transferred from the Western to the Eastern Empire, and afterwards given up to the Huns. After Attila's death, in 453, the Ostrogoths obtained possession of it. The Longobards under Alboin made themselves masters of it in 527, and relinquished it to the Avari upon commencing their expedition to Italy. Slavonian tribes also settled in the south. Charlemagne brought it under his sceptre. In the reigns of his successors the Slavonians spread northward, and the country became a part of the great Moravian kingdom, till the Magyars or Hungarians took it in the end of the 9th century.

Panorama (Gr. *pan*, 'all,' and *horama*, 'a view'), a word coined by or for Barker in 1788 to mean 'a view all round.' The word is used loosely for all that the eye can see at once, or by a person's simply turning round, from an eminence; also for a series of pictures, such for example as what is called a 'panorama of the Rhine,' folded up in a kind of portfolio. The name is also given to a continuous series of painted pictures exhibited at one end of a room, and moved so as successively to pass into and out of the field of view by some mechanical arrangement. This when seen from a distance

through an opening, and under a combination of direct and reflected light (as invented by Daguerre and Bouton), is called a *diorama*. But the word *panorama* properly belongs to what is now called, by way of distinction, *cyclorama*—a continuous painting on the interior of a cylindrical surface, the spectator standing in the centre. It is claimed that Breising of Danzig proposed such a plan. But Robert Barker (1739–1806), an Irish painter resident in Edinburgh, is entitled to the credit of having not merely conceived the method, but of having successfully carried it out on a large scale; his first 'panorama' being a view of Edinburgh, painted in water-colour on paper pasted on a cylinder of canvas 25 feet in diameter, and exhibited in Edinburgh in 1788. This he took to London in 1789; and in 1793 he erected a special building, one of the rooms of which admitted a circular picture 90 feet in diameter. Robert Fulton is said to have painted and exhibited shortly after this the first panorama seen in Paris. But on the Continent the panorama in this sense first became very popular after the Franco-German war of 1870–71. In various towns of Germany and in Paris panoramas of the war were exhibited in buildings specially built for the purpose.

Panormus. See PALERMO.

Pansy. See VIOLET.

Pantagraph, or PANTOGRAPH (Gr. *panta*, 'all;' *graphein*, 'to delineate'), an instrument invented for the purpose of making copies, reduced or enlarged, of drawings or plans. It is made in various forms, one of which is shown in the figure. Four rods are so hinged to one another that AE is equal to DF, and AD to EF; hence ADFE is always a parallelogram. If from a given point C on AE any straight line BH (or *a*, *b*) be drawn, cutting the other arms, the triangle

ABC will always, no matter how the arms of the instrument be moved, be similar to the triangle DBH. It follows that, if the instrument be pivoted on a point at B (usually by a weight), a pencil-point inserted at H and a tracing-point at C, and the latter traced over the lines of a drawing, the pencil-point at H will trace a reduced copy of the drawing. The proportion of the reduction will be as BH is to BC. B and H are made to slide on their respective rods, so that any proportion of reduction can be made. By changing the places of the pencil and tracing-point, an enlarged copy may be made. The instrument is fitted with little castors to facilitate its free motion. The pantagraph was invented by the Jesuit Christoph Scheiner prior to 1631, and improved by Professor W. Wallace of Edinburgh prior to 1831.

Enlargements or reductions can now be done so much more accurately by means of photography that the pantagraph is nearly obsolete. See COPYING.

Pantellaria, a volcanic island in the Mediter-

reanean, 36 miles in circumference, and lying 60 miles SW. of the Sicilian coast.

Panthalops. See CHIRU.

Panthays, a Mohammedan community occupying the province of Yun-nan in the south-west of China, who asserted their independence in 1855. In 1859 they captured Talifu, the second city of the province, and in 1858 the capital. Their leader Wen-soai (King Suleiman) established his authority over about 4,000,000 of people, of whom not above a tenth were Mohammedans. In 1866 the Chinese government recognised the independence of the Panthays, and in 1872 their king sent his son Hassan on a mission to Europe. Meanwhile the Chinese again attacked the Panthays, defeated them utterly, and finally suppressed their empire. Panthays is an anglicised form of *Pan-si*, their own name. They are still numerous.

Pantheism (Gr. *pan*, 'all,' and *theos*, 'God'), the name given to that system of speculation which, in its spiritual form, identifies the universe with God (*akosmism*), and, in its more material form, God with the universe. It is only the latter kind of pantheism that is logically open to the accusation of atheism; the former has often been the expression of a profound religiosity. The word Pantheist is comparatively modern, and seems to have been coined by the Deist John Toland in 1705, and is used shortly after that date by his opponents and orthodox writers like Waterland. Earlier pantheistic systems, such as Spinoza's, were regularly assailed under the name of atheism. But the antiquity of this mode of belief is undoubtedly great; it is prevalent in one of the oldest known civilisations in the world—the Hindu. Though it may dimly underlie various polytheistic systems, it is obviously in any definite shape a later development of thought than polytheism, and most probably originated in the attempt to divest the popular system of its grosser features, and to give it a form that would satisfy the requirements of philosophical speculation. Hindu pantheism as *akosmism* is taught especially by the Upanishads, the Vedānta and Yoga philosophies, and by those poetical works which embody the doctrines of these systems; for instance, the Bhagavad Gītā, which follows the Yoga doctrine. It is poetical and religious, rather than scientific, at least in its phraseology; but it is substantially similar to the more logical forms developed in Europe. The Hindu thinker regards man as born into a world of illusions and entanglements, from which his great aim should be to deliver himself. Neither sense nor reason, however, is capable of helping him; only through long-continued, rigorous, and holy contemplation of the supreme unity (Brahma) can he become emancipated from the deceptive influence of phenomena, and fit to apprehend that he and they are alike but evanescent modes of existence assumed by that infinite, eternal, and unchangeable Spirit who is all in all. Hindu pantheism is thus spiritual in its character; matter and (finite) mind are both alike absorbed in the fathomless abyss of illimitable and absolute being. Buddhism (q.v.) denies or ignores the existence of God, but in many modes of regarding the universe is rather akin to pantheism than to absolute atheism. Sufism is a pantheist outgrowth of Islam.

Greek pantheism, though it doubtless originated in the same way as that of India, is at once more varied in its form, and more ratiocinative in its method of exposition. The philosophy of Anaximander may be described as a system of atheistic physics or of materialistic pantheism. Xenophanes, the founder of the Eleatic School (q.v.), has been held to be the first classical thinker who promulgated the higher or idealistic form of pantheism.

Alexandrian Neoplatonism is substantially pantheistic; the universal reason and the world-soul of mediæval thinkers have the same tendency.

Gnosticism is based on an essentially pantheistic doctrine of emanation. Dionysius (q.v.) the Areopagite and Scotus Erigena (q.v.) were pantheists within the Christian fold; and the later Christian Mysticism (q.v.) has a highly pantheistic flavour (see ECKHART, BOEHME). Bruno, Vanini, and Paracelsus were outspoken pantheists; and there were various minor pantheistic sects in the middle ages. Spinoza is perhaps the greatest, certainly the most rigorous and precise of the whole class that either the ancient or the modern world has seen. Schelling's Nature-Philosophy proposed to limit the meaning of the term pantheism to the doctrine of the immanence of all things in God, but leaving doubtful the precise scope of what was meant by immanence; and some forms of Hegelianism are directly pantheistic in character. Neither England, France, nor America has produced a single great pantheistic philosopher; but there is an immense amount of pantheistic sentiment floating about in the poetry, criticism, theology, and even in the speculative thinking of these and all European countries in the present age.

See the articles on the thinkers mentioned, and those on PHILOSOPHY, RELIGION, and THEISM; the works on Pantheism by Jäsche (1826-32), Böhmer (1851), Weissenborn (1859), Fellenz (1873), and Driesenbergh (1880); Saisset, *Modern Pantheism* (1863); Hunt, *Pantheism and Christianity* (1866; 2d ed. 1884); Flint, *Anti-Theistic Theories* (1877); Plumptre, *History of Pantheism* (2 vols. 1881); Urquhart, *Pantheism and the Value of Life* (1919).

Pantheon (Gr. *pantheon*), a temple built in a modified Corinthian style with a great vaulted roof, dedicated to all the gods. The 'Pantheon'

Half-section of Pantheon (from Fergusson).

of Rome is the only ancient edifice in Rome that has been perfectly preserved, and is lighted through one aperture in the centre of its magnificent dome. It was long thought to have been erected by Agrippa in 27 B.C.; but the temple of Agrippa was destroyed by fire with the exception of the portico, and it has been shown that the present Rotonda is the work of Hadrian. In 610 it was

consecrated as a church—Santa Maria Rotonda. Under Pope Urban VIII. the architect Bernini erected on it two little campaniles, but his 'ass's ears' were removed in 1883. The building belongs to the state, and is now a place of sepulture for great Italians. See ROME, ROMAN ARCHITECTURE.—For the Panthéon at Paris, see PARIS.

Panther. See LEOPARD, PUMA.

Pantograph. See PANTAGRAPH.

Pantomime, among the ancient Romans, denoted not a spectacle but a person. The pantomimes were a class of actors who acted wholly by mimicry in gesture, movements, and posturings, corresponding therefore pretty closely to the modern ballet-dancers. When they first made their appearance in Rome cannot be ascertained; probably the *histriones* (Etrusc. *hister*, 'a dancer') brought from Etruria to Rome 364 B.C. were pantomimes; but the name does not once occur during the republic, though it is common enough from the very dawn of the empire. Augustus showed great favour to this class of performers, and is consequently supposed by some writers to have been himself the inventor of the art of dumb acting. The most celebrated pantomimes of the Augustan age were Bathyllus (a freedman of Mæcenas), Pylades, and Hylas. The class soon spread over all Italy and the provinces, and became so popular with the Roman nobles and knights that Tiberius reckoned it necessary to administer a check to their vanity, by issuing a decree forbidding the aristocracy to frequent their houses, or to be seen walking with them in the streets. Under Caligula they were again received into the imperial favour; and Nero, who carried every unworthy weakness and vice to the extremity of caricature, himself acted as a pantomime. From this period they enjoyed uninterrupted popularity as long as paganism held sway in the empire.

As the pantomimes wore masks, no facial mimicry was possible; everything depended on the movements of the body. It was the hands and fingers chiefly that spoke; hence the expressions, *manus loquacissimæ, digiti clamosi*, &c. To such perfection was this art carried that it is said the pantomimes could give a finer and more precise expression to passion and action than the poets themselves. The subjects thus represented in dumb show were always mythological, and consequently pretty well known to the spectators. The dress of the actors was made to reveal, and not to conceal, the beauties of their person; and as, after the 2d century, women began to appear in public as pantomimes, the effect, as may easily be supposed, of their costume, or lack of costume, was prejudicial to morality. Hence pantomimic exhibitions were denounced by the early Christian writers, as they were even by pagan moralists like Juvenal.

The pastoral drama in mediæval Italy gave birth to the opera, and already in the 16th century we find on the Spanish stage ballets with allegorical figures. Into France also about the same time the ballet was introduced. But the improvised Italian comedy was already familiarly known far beyond Italy, with its conventional comic figures, Pantalone and Arlecchino. In England the mask and so-called opera of the 17th century supplied the place of the modern pantomime, which grew out of an attempt to reproduce a popular light dramatic entertainment, varied with song and dance, itself the parent of the modern French *vaudeville*. Colley Cibber mentions as the first example a piece on the *Loves of Mars and Venus*. Geneste gives the year 1723 as the commencement of pantomime in England, with *Harlequin Dr Faustus* by John Thurmond, presented at Drury Lane. John Rich

(1681–1781) produced splendid pantomimes at Lincoln's Inn Fields and Covent Garden, and from that time this form of entertainment became a traditional institution.

In the older English pantomimes the harlequin played a serious as well as merely comic part; columbine (originally his daughter) was a village maiden whose lover was pursued by the constables—the prototypes of the modern policemen. The predominance of the clown seems to be a development mainly due to the exceptional ability of Joseph Grimaldi. Present-day pantomime has the character of a variety entertainment, usually a travesty of a fairy-tale, relying much on spectacular effects, the harlequinade being dropped.

Pa'oli, PASQUALE DE, a famous Corsican patriot, was born at Rostino in Corsica, 25th April 1725, son of that Giacinto Paoli who fought bravely, but without success, for independence against the Genoese and their French allies, and died at Naples in 1756. Thither he was carried in 1739 by his father, but returned to take part in the heroic struggle of his country, and in July 1755 was appointed to the chief command in a full assembly of the people. He struggled bravely against disaffection within and a powerful enemy without, governed the island with rare wisdom and moderation, and would have achieved the independence of Corsica had not the Genoese sold it in 1768 to France. For a year he held out against a French army, under the Comte de Vaux, of 22,000 men, but was at length overpowered and forced to make his escape to England, where he was warmly received and granted a pension by the crown. Boswell, who had visited him in Corsica, introduced him to Dr Johnson, who described him as having 'the loftiest port of any man he had ever seen.' The two became warm friends; at Paoli's house, Johnson wrote to Mrs Thrale, he loved to dine. Twenty years later the French Revolution recalled Paoli to Corsica, of which, as a free department of France, he consented to become lieutenant-general and governor; but the excesses of the Convention soon alienated his sympathies, and he organised a fresh insurrection. Despairing of maintaining unaided the independence of the island, he promoted its union with England, but failed to obtain the post of viceroy, and returned a disappointed man to England in 1796. He died near London, 5th February 1807; and in 1889 his remains were exhumed from Old St Pancras Churchyard, and reinterred in his native island.

See Boswell's *Account of Corsica* (1768), and the Lives of Paoli by Arrighi (Paris, 1843), Klose (Brunswick, 1853), Bartoli (new ed., Bastia, 1891).

Papa (Lat., 'father'), the Latin form of the title now, in the Western Church, given exclusively to the Bishop of Rome (see POPE). Originally, however, meaning simply 'father,' it was given indiscriminately to all bishops. In the Greek Church, whether in Greece Proper or in Russia, papa is the common appellation of the clergy.

Papacy. See POPE.

Papain is a nitrogenous body, isolated from the juice of the tropical Papaw (q.v.). The juice from which it is extracted is a milky, white, inodorous fluid, obtained by making incisions in the ripe fruit. From this papain is isolated by precipitation with alcohol after the fatty matters present have been removed. The juice has been for a long time used in the West Indies for making meat tender; papain has, like pepsin and trypsin, the power of digesting meat-fibre; and this digestion will go on in an alkaline, a neutral, or an acid solution. Hence it belongs to the group of digestive ferments, and like them is employed in some

cases of dyspepsia, being either administered internally or employed for the pre-digestion of food. It has also been used for the removal of warts and for the solution of the 'false membrane' in cases of diphtheria.

Papal States. See CHURCH (STATES OF THE).

Papaveraceæ, a natural order of dicotyledons, herbaceous or half shrubby, usually with a milky or coloured juice. The leaves are alternate, without stipules; the flowers on long, one-flowered stalks. The fruit is pod-shaped or capsular, the seeds numerous (see POPPY). The order is distinguished for narcotic properties. Opium (q.v.) is its most important product. The juice of *Celandine* (q.v.) is very acrid. The *Blood-root* or *Sanguinaria* (q.v.) is another representative of the order. A number of species are used in their native countries for medicinal purposes. The seeds yield fixed oil, which, with the exception of that obtained from *Argemone mexicana*, is quite bland. The flowers of many species are large and showy, most frequently white or yellow, sometimes red. There are in all over 400 known species, natives chiefly of north temperate climates, especially western North America.

Papaw (*Carica Papaya*), a small South American tree, the type of a small family, *Papayaceæ* or *Caricaceæ*, by some included in *Passifloraceæ*, is cultivated in many tropical and subtropical countries. The fruit is eaten either raw or boiled. The seeds when chewed have in a high degree the pungency of cresses. The powdered seeds and the juice of the unripe fruit are most powerful anthelmintics and have valuable digestive properties. The juice of the fruit and the sap of the tree render tough meat tender (see PAPAÏN); even the exhalations from the tree have this property, and joints of meat, fowls, &c. are hung among its branches to prepare them for the table. It bears fruit all the year, and is exceedingly prolific. Sir Harry Johnston notes that in Central Africa and Liberia the male flower produces a fruit apparently seedless—a long, pendulous drupe, quite unlike the melon-like female. The *Chamburu* (*C. spinosa*) of Brazil is remarkable for the extremely acrid and poisonous character of its juice, and the disgusting stercoraceous odour of its flowers.—In the United States the name Papaw is given to the *Asimina triloba*, a small tree of the natural order *Anonaceæ*, the fruit of which, a large oval berry, 3 inches long, with soft, insipid pulp, is eaten by negroes, but not generally relished by others. All parts of the plant have a rank smell.

Papenburg, a small port in the north-west of Hanover, 25 miles W. of Oldenburg by rail and near the Ems, with which it is connected by canals. In the neighbourhood are extensive moors.

Paper. According to the views of historians, papyrus is regarded as coming under the category of paper; if this view be accepted, the Egyptians may be looked upon as the first makers. Papyrus was made by paring the reed into longitudinal ribbons, laying these out on a table well sprinkled with water, and placing a second layer at right angles to the first, the two being cemented together by means of a gum-like substance. This material was dried in the sun, and finally polished. According, however, to the modern acceptation of the term, paper may be defined as an aqueous deposit of any vegetable fibre in the form of sheets. One of the nearest approaches to this in nature is to be found in the construction of wasps' nests. From the time of its discovery up to the beginning of the last century all paper was made by hand, either by dipping a 'mould,' consisting of a sieve covered with network, into a vat containing water in which fibres are suspended, or by pouring the liquid

pulp upon the sieve. The mass, after the water has been allowed to drain, is removed and dried. This constitutes crude paper. For perhaps two thousand years paper was so produced. It seems probable that paper was independently discovered by different peoples, such as the Aztecs and Maoris, and that the discovery came to them through draining natural deposits on the sides of pools. It has been asserted that the Chinese were acquainted with paper in 123 B.C.; but the merit of its discovery is attributed to the Marquis Tsai, a minister of agriculture under the Han dynasty, who is said to have invented and taught in a complete manner the art of paper-making from the mulberry and bamboo, as well as from pieces of hemp, old ropes, and fishing-nets. Tsai Lun was born in the province of Hu-nan, and in 89 A.D. was in charge of the imperial arsenal; the date of his discovery of paper is placed by a Chinese chronicler at 105 A.D. The Chinese seem to have kept the art of paper-making secret for many centuries, for it is not until about 610 A.D. that a knowledge of it was taken to Korea, and thence to Japan. The Arabs acquired their knowledge through their conquests in Tartary, and probably at the capture of Samarkand, and it is said to have been introduced at Mecca in the same year—viz. 707 A.D. According to Karabacek, the Arabs learnt the art of paper-making from the Chinese in the year 751 A.D.

Of the work of identifying the composition of paper of early dates, that of Wiesner is of particular importance. East Turkestan papers of the 4th to the 7th centuries consist of mixtures of crude bast fibres. During the latter half of the period papers are found consisting of rags, which from their character appear to indicate that they have been reduced in stamping-machines and more carefully prepared. The Chinese must be regarded as the discoverers of starch-sizing, and perhaps of sizing with a gelatinous extract from mosses. An old Chinese paper from East Turkestan of the year 768 A.D. appears to be the oldest paper of which the exact date is known; but an older paper, discovered by Sir Aurel Stein in 1901-8, is now in the British Museum. The Moors appear to have brought the art of paper-making to Europe early in the 11th century, and at the same time appear to have much improved the treatment of rags for paper-making. The oldest known linen document in Spain is a treaty of peace between the king of Aragon and Castile, 1178 A.D. Prescott refers to manuscripts on cotton-paper in the Escorial of 1009, and to a linen-paper of 1106. Paper-mills are recorded as being in operation in Toledo making rag-paper in 1085. The first manufacture in France is put at 1260. Italy is recorded as making paper in 1367, and linen-paper was in common use in Germany in 1324.

Kirchner states that there is a large collection of paper MSS. in the Prussian archives in Berlin, dating from the 10th and 11th centuries, but that these papers are of Arabian origin. What appears to be the earliest paper document of known date in Germany is a letter to the town of Aix-la-Chapelle, and kept in the archives of that town. It is dated 1302 A.D. In 1469 the authorities of the Sorbonne invited certain German craftsmen to demonstrate the printing-machine. They trained pupils who went to work in the paper-mills, thus showing that the arts of paper-making and printing were carried on side by side. Encouraged by Louis XI., the paper-makers and printers increased, and the processes were known and practised throughout France.

The Royal Society of Sciences at Göttingen, in the years 1755 and 1763, offered premiums to any one who could trace the date of the discovery of linen-paper, but failed in the attempt. The

difficulty in tracing it appears to be partly due to the gradual introduction of linen into cotton-papers, and partly to the fact that it is extremely difficult, even to the present day, to distinguish some cotton and linen fibres from one another with any degree of certainty. The earliest example of paper of authentic date to be found in Great Britain is to be seen in the Public Record Office Museum. It is a letter from Raymond, son of Raymond, Duke of Narbonne, Count of Toulouse, to King Henry III., praying him to enforce payment of three marks and of one pound in money for three shiploads of salt, sold by R. de Carof to David, a linen-draper of London (1216-1222). The fibres of the above paper have been examined microscopically, and are found to consist of flax fibres in a good state of preservation. The paper is of a loose, velvety texture; but it is significant that the paper has suffered less deterioration during the seven hundred years of its existence than a common newspaper would do in a few days if exposed under similar conditions.

The first English paper-mill was erected at Hertford or Stevenage—the Sele Mill, where John Tait the younger, the son of John Tait who was Lord Mayor of London in 1476, made the first white printing-paper. In *De Proprietatibus Rerum*, printed by Wynkyn de Worde, one of our earliest English printers, in 1495, appear the following words:

And John Tait the Younger joye mote he broke
That late hath in England do make thys paper
thyne
That now in our Englyssh thys booke is printed
inne.

When Henry VII. stopped at Hertford Castle on 25th May 1498, he visited the mill, as is shown by an entry in his household book, which still exists, and under that date is an item 'for a reward given at the paper mylne 16/8.' There is also one in the following year: 'Geven in rewarde to Tate of the Mylne 6/8.' Tate's water-mark was a circle enclosing a star or wheel of eight points. Spielman, who erected the second and a larger mill at Dartford, was jeweller to Queen Elizabeth. It has been assumed that the paper of the first folio edition of Shakespeare, printed by Isaac Jaggard and Edward Blount in 1623, was made at Spielman's mill; but from a careful examination of the copy in the British Museum Library, it appears evident that this paper, as also paper of books of a similar nature, was got together from various mills, and probably derived from Continental sources. Spielman adopted the crest of a fool with cap and bells, which can be seen on his tomb at Dartford Church—a mark which was common at his time, and which, no doubt, he borrowed. The first English patents in connection with paper-making were taken out in 1665.

The first paper-mill in Scotland appears to have been erected at Dalry, on the Water of Leith (now part of Edinburgh), in 1675. The Privy Council granted the permission for the establishment of further mills in Scotland, 'but without hindering any already set up,' and also 'to put the coat-of-arms of this kingdom upon the paper which shall be made at these mills.'

The 'water-mark' of a paper is produced by twisted wire attached to the surface of the mould in the shape of a design or device, which is permanently imparted to the texture of the paper in the course of manufacture. It is probable that water-marking originated in France, where, in the 14th century, the authorities made it compulsory for the manufacturers to seal all their goods by a particular mark by which they could be recognised, and which would serve as a guarantee of its good quality and its origin. The first authentic water-mark is in an account-book dated 1301, and con-

sists of a circle or globe surmounted by a cross. Most of the early marks are of ecclesiastical or biblical origin, adopted by monasteries or great families, who owned or controlled most, if not all, of the factories. The early water-marks are simple. Out of the 600 marks of France of the 14th and 15th centuries the following simple marks are given in order of frequency: anchor, the letter 'P,' hand, bull's head, unicorn, Holy Grail, the letter 'Y,' crossbow, dog, leopard, crown (single), fleur-de-lis, lion, stag's head, bell, pear, dolphin, paschal lamb, crescent, sword (single and crossed), rose, trefoil, pair of scales, dragon, cock, heart, cardinal's hat, dove, post-horn. About the end of the 17th century many marks bearing royal arms or the arms of cities, in paper made either here or in Germany, were as well executed as the best produced at the present day. The initials of firms were introduced into marks of the 15th and 16th centuries; names followed later, and these constitute the chief water-marks of the present day.

We find some quaint remarks by Fuller about the papers of his time (1608-61 A.D.) which may aptly be quoted here. He says: 'Paper partakes, in some sort, of the characteristics of the country which makes it—the Venetian being neat, subtle, and court-like; the French, light, slight, and slender; and the Dutch, thick, corpulent, and gross, sucking up the ink with the sponginess thereof.'

An examination has been made by the authors of between two and three thousand water-mark papers of German origin in their possession, dating from the middle of the 14th century up to the present time. These papers, which are derived from various sources, may be taken as representative of the above-mentioned period, at least in so far as Germany is concerned. They nearly all consist of linen rags or flax, and a large number of them are elaborately, although in some cases somewhat crudely, 'water-marked' with the arms of cities which denote their origin; others being designs similar to those indicated above for France.

The so-called wire-mark in a paper is the mark imparted to the paper by the wire sieve. This mark is either 'laid' or 'wove.' The 'laid' is produced by a number of parallel wires placed side by side in the mould, with sufficient space between to allow the water to pass through, and held at equal distances apart by finer cross wires. In the earlier papers such laid marks were very coarse and crudely finished, and sometimes irregular. Early papers were made in this fashion until John Baskerville, the famous Birmingham printer, introduced in 1750 the woven wire to obviate the roughness of the laid paper. His beautiful edition of *Virgil* of 1757 is chiefly printed on this wove paper. Woven wire as a cover to the paper mould opened up fresh possibilities in water-marking, which took at least one hundred years from this date to come to maturity. Laid and wove papers can easily be distinguished by the ordinary observer by holding the papers up to the light.

The use of the wove wire gave rise in time to shaded water-marking. Specimens of this are to be found in Herring's book of 1855. The process then employed was to make an electrotype of any model or design, forming a matrix or mould, which was mounted upon lead or gutta-percha, and pressed in contact with the wire-gauze. The gauze, bearing in relief the impression of the design, was then mounted as a cover on the wire mould. Sometimes the design is engraved upon a plate, and then transferred to the wire-gauze. Photo-mechanical processes cannot be used, as they do not afford sufficient relief. Paper made upon such moulds varies in thickness in parts according to the depth of impression in the wire. With fine gauze every

gradation of tone may be produced. A portrait of the Emperor Napoleon was so produced, and exhibited at the Industrial Exhibition in Paris in 1849, since which time both Italian and English firms have produced similar effects of a very high order. The same process has been largely used for special bond, bank-note, and such-like papers.

A process for introducing coloured water-marks into the body of a paper was patented by Messrs A. & G. B. Fornari, paper-makers, of Fabriano, Italy, and is fully disclosed in their British patent, 1901. Each sheet is made in two layers, and between them is placed a third layer as a design in any colour. Sheets can be so manufactured as to render the colour design only visible by reflected light. The design or lettering is produced by placing a stencil over the mould cut in the form of the lettering. Certain Italian makers of hand-made papers excel in this production.

The earliest record we have of the use of blotting-paper is in 1465, and of brown paper in England in 1570 and 1571. Evelyn describes his visit to a paper-mill, and from his description it appears that it bears reference to a mill making brown papers.

Up to the middle of the 18th century nothing but rags had been tried in the manufacture of paper with any degree of success, and the demand for paper was steadily outstripping the supply of rags. Certain learned men had paid great attention to this question, among whom may be mentioned Bruyset, Levrier de Lisle, Klaproth, Linnæus, Mayer, Strange, Schäffer, Réaumur, and others. Réaumur published a brochure on the subject in 1719, which appears to have had chiefly in view the utilisation of wood. A book was published by Jacob Schäffer of Regensburg, Germany, the paper of which was made from about sixty different substances. The poems of the Marquis de Villette were printed in book-form in 1786; the leaves of this book consist of paper made from a number of different substances. These books are to be seen at the Patent Office Library.

The British government at the close of the 18th century awoke to the necessity of legislating on behalf of paper-makers. Parliament had enacted that rags, old nets, and ropes (which are used for the manufacture of pasteboards, wrappers, and packing-paper) should be imported duty free. It likewise allowed the free importation of all waste-paper, provided that it was torn to pieces and could be used for nothing but remanufacture. Parliament had also prohibited the burial of the dead in shrouds made of cotton or linen on account of the loss it would occasion to paper-makers. At the end of the 18th century many paper-mills were shut down for want of rags, and the scarcity of foreign supplies was popularly attributed to the use of rags as 'lint' in the European wars.

Matthias Koops (London, 1801) published a book on paper-making, one-half of which is printed on paper made entirely of wood. It would appear from an examination of this paper that the wood was chopped into small fragments and macerated with milk of lime, or a weak lye, in an open pan. In 1800 Koops was granted a patent for the manufacture of paper from straw. The other half of the above-mentioned book is made of paper entirely prepared from straw of a brown colour, and much inferior in colour to the paper Koops made from wood. The manufacture of paper from straw is now a large industry, particularly in Holland, where straw is cheap and is used chiefly in the manufacture of straw-boards.

The manufacture of 'mechanical' wood-pulp was first conducted by Keller, a Saxon watchmaker, with the assistance of an engineer called Völter. This is produced by mechanically reducing wood to the condition of pulp. Keller died a poor man,

in spite of the fact that during his lifetime this product had created a large industry. It is now produced in millions of tons per annum, and is the most abundant and cheapest source of supply for common paper.

In 1839 attempts were made to utilise esparto in the manufacture of paper. Thomas Routledge exhibited the fibre at the 1851 Exhibition. Its real introduction to paper-making is said to date from 1852. Some copies of the *Society of Arts Journal*, 28th November 1856 issue, were printed upon esparto paper. Up to 1861 Routledge, on his own statement, was the only paper-maker using esparto in England. When the American war broke out, entailing a short supply of cotton, esparto came into general use. From that time until 1890 the consumption of esparto rapidly increased, Great Britain to this day being practically the only user of it. The amount of esparto consumed annually in the United Kingdom is approximately 200,000 tons per annum, and the consumption is a fairly constant quantity, having long since reached the limits of supply. The grass grows on what is known as the 'Esparto zone,' bordering the shores of the Mediterranean. From early historical times esparto grass has been, and is still, used for such articles as carpets, sandals, ropes, baskets, nets, sacks, &c. It produces a soft paper particularly suitable for fine printing and illustrative work. In 1866 Tilghmann, an American, patented the manufacture of wood-pulp by the sulphite process, the pulp being prepared by macerating wood under pressure with sulphite liquor. He has been described as 'the father of the sulphite process.' Like Keller, he benefited very little by his discoveries. It was left to such men as Mitscherlich, Francke, Ekman, Graham, Kellner, and Partington to bring these processes to a commercial success. Sulphate as distinguished from sulphite wood-pulp is now one of the chief sources of supply. Simultaneously the treatment of wood with caustic soda was developed, and has now been brought to a high state of perfection. Of late years sulphate wood-pulp has taken the place of soda wood-pulp; this differs from the last mentioned only in that the sulphate of soda is used to make up the loss occasioned during the recovery process, the sulphate of soda being chiefly converted into caustic soda.

Paper that is not sized is known as waterleaf, and is more or less of the nature of blotting-paper. In order to render it ink-proof and suitable for most commercial purposes a sizing material has to be used. According to Wiesner, papers after 1339 were sized with gelatine; for centuries prior to that starch had been used, but starch alone does not render paper suitable for writing upon. Gelatine was probably first prepared by macerating vellum and parchments; but as supplies of this material became inadequate, horns, wet-hide pieces, and such-like materials came into use. A cheaper method of sizing, and one which is now universally used except on the highest class of papers, was discovered about 1800 by M. F. Illig, and is known as rosin-sizing. He appears to have kept this secret until 1806 or 1807, when he communicated it in a pamphlet, translated as *Instructions for Sizing Papers in the Pulp, after a Sure, Simple, and Cheap Method*. This size is made by dissolving rosin in a boiling solution of carbonate of soda to produce resinate of soda. By using an excess of rosin a thick viscous liquid is obtained which yields a milky liquid when dissolved in water. This solution is added to the pulp, after which alum is added in sufficient quantity to precipitate the rosin. The effect upon the finished paper is to harden and strengthen it, and render it ink-proof.

Various mineral matters are used in the manufacture of paper, the chief of which is china-clay. It was first used secretly to adulterate paper about the middle of the 19th century. Although used primarily to cheapen the production of papers, it is found to impart useful qualities, and gives to the paper an improved surface for printing upon, and renders it more opaque. Paper can be made to contain up to 20 or 30 per cent. of china-clay, but if the clay be used in such large quantities the strength and durability of the paper is much impaired. For very strong papers, such as those used for bags in banks and for the insulation of electric cables, hemp and manila fibre are used, the source of supply being old ropes and cordage. For common brown papers jute bagging is the chief source of supply, and for cheap yellow wrappers, newspaper wrappers, &c., the jute is used in a semi-bleached condition in admixture with wood-pulp. Hemp, carefully bleached and beaten in a particular manner, is used in the manufacture of India paper. The papermaker converts his own waste papers into paper again by mixing with new material. Waste papers from all sources, such as envelope cuttings, trimmings, surplus copies of newspapers, old books of all descriptions, come into the hands of dealers, and are sorted and graded and sold, largely to cardboard-makers. Common newspaper is made of about four-fifths mechanical and one-fifth chemical wood-pulp, rosin-sized. The better-class printings are made of chemical wood-pulp with different proportions of mechanical; those better still, of chemical wood-pulp containing esparto fibre in varying proportions. Papers such as cheques are made almost entirely of esparto fibre. Esparto,

Side-view of a Continuous Paper-making Machine.

being without strength, requires some admixture with chemical wood-pulp. Blotting-papers are made almost entirely of cotton, beaten in a special manner to render it spongy and absorbent. High-class writings, account-books, drawing and such-like papers are made almost entirely of rags. All hand-made papers are made from rags.

Before completing our account of the mechanical development of paper-making it is necessary to view briefly the whole *modus operandi*. Rags as received are dusted, sorted by hand into different grades, cut into small fragments either by hand or machine, again dusted through a revolving sieve, boiled in spherical boilers with caustic soda or lime under pressure, from whence they are discharged, drained, washed, and 'broken-in' in breakers, beaten to pulp in the beaters, and discharged into a 'stuff' chest, ready for the machine. Esparto is mechanically dusted, picked by hand free from roots, &c., as it passes over a travelling belt into vomiting boilers, where it is boiled with caustic soda under pressure, washed and bleached in 'potchers,' and beaten in the beaters. Chemical wood-pulp is treated, after reduction to small pieces and the removal of the bark, by one or other of the processes already referred to at the pulp-mills, and shipped as pulp, either wet or dry, bleached or unbleached, to the paper-maker, who adds it to his potcher or bleaching-engine if required to be bleached, or direct to the beater. Mechanical wood-pulp, as received from the pulp-mills, is furnished direct to the beater. The waste liquors from the boiling of esparto and soda wood-pulp, together with the washings, are evaporated, incinerated, and the alkali recovered, causticised, and used over again. All weaker liquors, such as rag liquors, are too dilute for recovery, and sulphite liquors are discharged with effluent waters. The mixing of the various ingredients is done in the beater; this is a machine the common form of which is an oblong trough with a midfeather round which the material circulates, the beating being performed by a revolving roll furnished with knives which come in contact with fixed knives. The beating process—i.e. the reduction of the raw material to the condition of finished pulp—takes from two to eight hours, according to requirements. The rosin-sizing, minerals, starch, colour, &c., are added to the beater. On completion of the beating operation the stuff is discharged into the stuff-chest. From the stuff-chest (which is kept agitated to preserve uniformity, and which acts as a reservoir for the machine), the stuff flows over sand-tables to deposit any heavy impurities, and through strainer-plates provided with very narrow slots for keeping back any unbeaten or foreign particles, to the pulp-vat, A, provided with a rotating-hog or wheel, from whence it flows over a lip along a rubber apron to an endless travelling wire-gauze, BB, which carries on each side of it a rubber band or *deckle* strap, which determines the edge of the paper. The wire is supported by a number of small brass rollers. The water passes through the wire-gauze into a shallow trough or *save all*, *ee*. Further water is sucked through by the suction-boxes, which are operated by the vacuum pumps. Towards the end of the wire and close to the suction-boxes a *dandy roll* rotates upon the surface, and imparts to it the laid or wove marks and water-mark. Further water is removed as the web passes between the *couching-rolls*, *b*, which consist of metal or wood, either or both being covered with a thick felt jacket. During its passage the wire receives a lateral 'shake'; this 'shake,' an essential process in paper-making, assists in felting the fibres—that is, causes them to lie in various directions, otherwise they tend to set themselves parallel to the flow of the liquid and movement of the wire. The

frame covering the tubes and wire is pivoted close to the suction-boxes, and the maximum 'shake' is at the end of the wire which first receives the stuff. On some modern machines the upper couching-roll and some of the vacuum-boxes are dispensed with, the lower couching-roll serving as a vacuum or suction-roll. The gauze-wire returns underneath from the couching-roll to the press-roll, the web of paper passing from the couching-roll to an endless felt through the first press-rolls, where it comes in contact with the bare press-roll on its upper surface, and through the second press-rolls, where it receives contact on its under surface. At this point it contains about 25 to 27 per cent. dry fibre and 75 to 73 per cent. moisture. The rest of the moisture has to be removed by heating. This is accomplished by the web being brought over and under a series of steam-heated rollers, and kept in direct contact therewith by means of a series of dry felts. When partially dry it is sometimes submitted to a treatment between *smoothing-rolls*, after which it is completely dried by further steam-heated cylinders and a surface given to it by a series of calendars, the rough deckle edge being removed by rotating circular knives, and finally reeled at F. If necessary it is cut into narrow widths, and at the same time re-reeled on another machine or into the form of sheets. High-class papers have to pass through the *salle*, where the sheets are individually inspected and graded into 'good,' 'retree,' and 'out-sides.' If the paper is to be gelatine-sized, this condition is secured by passing the reel through a trough containing gelatine solution, through squeezing-rolls, and over and under a series of skeleton drums, in each of which a fan rotates; or if the paper is in the form of sheets, these are dipped by hand or passed continually by means of a travelling felt through a bath of gelatine, the sheets being afterwards air-dried in a room at a suitable temperature.

Paper-hangings. See WALL-PAPER.

Paphlagonia, anciently a province of Asia Minor, extending along the southern shores of the Black Sea, from the Halys on the east to the Parthenius on the west (which separates it from Bithynia), and inland on the south to Galatia. Its limits, however, were somewhat different at different times, and it successively belonged to Lydia, Persia, and Rome. Its capital was Sinope. The Paphlagonians are supposed to have been of Syrian origin, like the Cappadocians.

Paphos, two ancient cities in Cyprus. Old Paphos (now *Kyklia*) was situated in the western part of the island, about 1½ miles from the coast. It probably was founded by the Phœnicians, and was famous, even before Homer's time, for a temple of Aphrodite, who was said to have here risen from the

sea close by, whence name 'foam-sprung.' This was the home of the 'Paphian Aphrodite,' and hither crowds of pilgrims used to come. The other Paphos (*Papho* or *Baffa*) was on the seacoast, about 8 miles west of the older city, and was the place in which the apostle Paul proclaimed the gospel before the proconsul Sergius.

Papias, Bishop at Hierapolis, in Phrygia, in the earlier half of the 2d century, is known to us only from references by Irenæus, Eusebius, and a few others, and from fragments of his lost work preserved in their writings (see especially Eusebius, *Historia Eccl.* iii. 39). Irenæus speaks of him as a 'hearer of John'—evidently meaning the apostle. Eusebius aptly quotes Papias himself against Irenæus on the point; but, while the quotation justifies his criticism thus far, it does not fully bear out his own view that Papias claimed to have been a hearer of two other disciples of the Lord, Aristion and the elder (not the apostle) John. There is, then, no very reliable evidence of personal intercourse with any of the immediate followers of Jesus. On the other hand, some of the links between Papias and the apostles are definitely known; for two daughters of the apostle Philip, living in Hierapolis, related traditions to him, and he was a 'companion of Polycarp' (69–155 A.D.), Bishop at Smyrna, who in his youth had been a disciple of the apostle John. The statement, however, in the *Chronicon Paschale*, that Papias suffered at Pergamum in the year of this contemporary's martyrdom at Smyrna, rests on the compiler's misreading of Eusebius (*Hist. Eccl.* iv. 15).

The only work which he is known to have written is the *Logiōn kyriakōn exegēsis* ('Exposition of Oracles of the Lord'), in five books, which on various grounds, including an expression in a fragment discovered in modern times, may be probably assigned to the period 140–150. It is now generally agreed that the signification of 'oracles' is not to be absolutely limited to 'discourses,' and that by 'Oracles of the Lord' we are to understand a record, or records, of the Lord's sayings, including at least a setting of narrative. Part of the author's design was to supplement his expositions with trustworthy oral traditions. But the scanty remains are enough to show that Papias was, as Eusebius says, 'of very small intellect,' credulous, and fond of recording the wonderful. His doctrinal characteristic is a quaint millenarianism, with traces of the *Apocalypse of Baruch*.

But it is in relation to the New Testament canon, and especially to what is known as the synoptic problem, that Papias is of real importance. The fragment bearing on Mark runs thus: 'This also the elder (John) said: "Mark, having become the interpreter (recorder) of Peter, wrote down accurately whatever he remembered, without, however, recording in order what was either said or done by Christ,"' &c. Many scholars maintain that the words suit the second gospel as we have it, while others who deny this accept them as an account of its groundwork. Still greater interest attaches to the short fragment on Matthew: 'Matthew, then, composed the oracles in the Hebrew (Aramaic) language, and each one interpreted them as he could.' This statement has often been called in question, but the best authorities now hold that Papias is correct as to the Aramaic original, and that the canonical gospel, while evidently not a translation, is a Greek edition, by either Matthew himself or some writer unknown. On the whole, the two-document hypothesis of the origin of the synoptics coincides remarkably with the above two fragments (see GOSPELS). As to the rest of the canon, Papias quoted 1 John and 1 Peter, and was cited as an authority for the 'credibility' of the *Apocalypse*.

There are also some indications that he knew the fourth gospel.

See the *Apostolic Fathers* of Gebhardt, Harnack, and Zahn, of Lightfoot (1891), or of Funk (1901); Smith's *Dictionary of Christian Biography*, and Herzog-Hauck's *Realencyklopädie*; for an English translation, the *Ante-Nicene Library*, vol. i.

Papier-mâché (Fr., 'chewed paper'), a name given (not by the French) to a material consisting of paper-pulp, or of sheets of paper pasted together, and treated to resemble varnished or lacquered wood or sometimes plaster. Among eastern nations, where varnished and decorated articles in papier-mâché (such as boxes, trays, and pen-cases) have long been made, the finest work has been produced in Persia, and next to it in Kashmir. The Japanese kind of papier-mâché, manufactured by glueing together a number of damped sheets of soft and flexible paper upon moulds, is light, strong, and elastic, and was at one time used in that country for helmets and other parts of armour. No doubt it was from one or other of these eastern countries that the art of working in papier-mâché was acquired by Europeans.

Articles of papier-mâché were extensively made in France in the first half of the 18th century, and later in Germany. The painted papier-mâché Vernis Martin snuff-boxes and other articles, made by a coach-painter named Martin, who had a peculiar way of varnishing them, were in the 18th century popular throughout Europe, and fine specimens are still sought after by collectors. Papier-mâché appears to have been introduced into England for the purpose of imitating Japanese trays of lacquered wood. In 1772 Henry Clay of Birmingham took out a patent for making papier-mâché of sheets of specially prepared paper pasted together upon a mould, and produced panels for doors and walls, besides cabinets, screens, tables, tea-trays, &c. The best papier-mâché is made by Clay's method. A second variety is made from paper-pulp to which glue has been added; it is pressed between dies to give it the required shape. A third kind is made of coarse fibrous material, mixed with earthy matters and size, certain chemicals being added to render it incombustible. *Carton-pierre*, which has been extensively employed for the internal decoration of buildings (much in the same way as plaster), is formed of paper-pulp mixed with whiting and glue. It is moulded, backed with paper, allowed to set, and dried in a hot room. *Ceramic Papier-mâché* (Martin's patent, dated March 15, 1858) is a very plastic substance, which can be readily worked into any required form. It is composed of paper-pulp, resin, glue, drying oil, and sugar of lead, well kneaded together. For ordinary papier-mâché wood-pulp is now the principal ingredient, though the high-class article as described above is still made to some extent.

The article after being moulded is heated, dipped in a mixture of linseed-oil and spirits of tar (other mixtures are used) to harden it and make it resist moisture, placed again in a stove, and when taken out planed and filed to give it the required finish. It now gets several coats of tar varnish and lamp-black, each of which is rubbed down with pumice. It is then stoved once more, decorated, treated with transparent varnish, and finally polished by hand.

There are various ways of decorating papier-mâché. For objects with a black varnished surface, what is called 'inlaying' with plates of mother-of-pearl shell, scarcely thicker than stout writing-paper, is largely practised. The pieces of shell are stuck on with varnish, and the design painted on them with a protecting varnish. An application

of acid dissolves away the unprotected parts, and then the interspaces are filled up with varnish. The surface is rubbed with pumice-stone, the superfluous varnish removed, and the shell ornaments displayed. Similarly the surface can be 'inlaid' with cut-out metal devices. Flower and landscape painting is often employed for decoration, as well as ornaments in leaf gold. Inexpensive decoration by transfer-printing, which can be done by boys and girls instead of highly-paid artists, has now been largely resorted to, in order to compete with cheap Japanese lacquer wares. (See LACQUER.) The variety of papier-mâché adopted for architectural ornaments, which are usually more or less in relief, can be readily painted, gilded, or bronzed.

Papilionaceæ (from Lat. *papilio*, 'butterfly'), a sub-family of Leguminosæ (q.v.), the plants of which have flowers of the peculiar structure called *papilionaceous*. The Pea and Bean afford familiar examples. Papilionaceous flowers have five petals, imbricated in estivation (bud), one of which, called the *vexillum*, or *standard*, is superior, turned next to the axis, and in estivation folded over the rest; two, called the *alæ*, or *wings*, are lateral; and two are inferior, which are often united by their lower margins, forming the *carina*, or *keel*. The number of the Papilionaceæ is very great—about 6000 species being known. Found in all parts of the world, they abound in the tropics. Many have superb and beautiful flowers; many are plants of beautiful form and foliage, trees, shrubs, and herbaceous plants; many possess valuable medicinal properties; and many are of great importance as furnishing food for man and for domestic animals, others as furnishing dyes, fibre, timber, &c. See BROOM, LABURNUM, CLOVER, BEAN, PEA, LUCERNE, LIQUORICE, INDIGO, SANDALWOOD, &c.

Papillæ. See SKIN, TASTE.

Papin, DENIS, a French physicist, was born at Blois, 22d August 1647, and studied medicine in Angers, where he practised for some time as a physician. But, becoming acquainted with Huygens, he helped him in his experiments with the air-pump; then, crossing to England, he assisted Boyle in his physical experiments, invented the condensing pump and the steam digester (1681)—a sort of steam cooking apparatus, to which was applied for the first time a safety-valve—and was made a member of the Royal Society (1680). Shortly afterwards he proceeded to Venice for the purpose of helping to conduct a newly-founded academy of science, but was back in London in 1684. Three years later he was appointed professor of Mathematics at Marburg, but from 1696 to 1707 worked in Cassel. Then, returning to England, he died in obscurity, probably in 1712. To Papin belongs the honour of having first applied steam (1690) to produce motion by raising a piston, and with this he combined the simplest means of producing a vacuum beneath the raised piston—viz. by condensation of aqueous vapour. In virtue of this his biographer claims that he is really the inventor of the steam-engine. He is the inventor of the safety-valve, an essential part of his digester; of the siphon; and according to some, of steam-navigation. See SHIPBUILDING; also DIGESTER.

His papers were mostly printed in the *Philosophical Transactions*, *Acta Eruditorum*, *Journal des Savans*, &c. He also wrote *Novelles Expériences du Vide* (Paris, 1674). See LIVES by Ernouf (Paris, 1874) and Gerland (Berlin, 1881). His correspondence with Huygens and Leibnitz was published by Gerland (Berlin, 1881). See *Nature*, vol. xxiv. (1881).

Papineau, LOUIS JOSEPH, Canadian statesman, was born at Montreal in October 1789. At twenty he was elected to the Legislative Assembly, and speedily worked his way to the head of the

Radical or French-Canadian party, and in 1815 was chosen speaker of the House of Assembly for Lower Canada, a post that he held until 1837. He opposed the union of Upper and Lower Canada, formulated the grievances and demands of his party in the Ninety-two Resolutions, and agitated actively against the imperial government. When the province rose in rebellion in 1837, a warrant was issued against Papineau for high-treason, though he took no active part in the fighting. He took refuge first in the United States, then escaped to Paris; but he returned to Canada, pardoned, in 1847. He died at Montebello, in Quebec, 23d September 1871. See book by De Celles (1905).

Papini, GIOVANNI, Italian author, critic, and editor, was born in 1881 at Florence, and educated there. A powerful writer, he has attracted considerable attention by his books, amongst which have been translated *The Twilight of the Philosophers* (1906), *Twenty and Four Minds* (1912), *A Finished Man* (1913), and, following on his conversion, *The Story of Christ* (1921).

Papinianus, ÆMILIUS, down to the time of Justinian the most celebrated of the Roman jurists, lived at Rome during the reign of Septimius Severus, whose second wife is said to have been his relative. Both he and Septimius were pupils of Scævola; Papinianus succeeded the prince as *advocatus fisci*, and afterwards held the office of *prefectus prætorio*. The son and successor of Severus, Caracalla, caused Papinianus to be put to death in 212. His works consist of 37 books of *Questiones*, 19 of *Responsa*, 2 of *Definitiones*, and *De Adulteriis*; from these works 595 excerpts were incorporated in Justinian's *Pandects*.

Pappenheim, GOTTFRIED HEINRICH, COUNT VON, an imperial general of great note in the Thirty Years' War, was born at Pappenheim, in Middle Franconia, Bavaria, 29th May 1594, of a very ancient Swabian family, in which the dignity of Marshal of the Empire became hereditary about the 13th or 14th century, and many of whose members had greatly distinguished themselves in the wars of the middle ages. At twenty he went over to the Roman Catholic Church, and thenceforth signalled himself by his fiery zeal in its cause. After serving under the king of Poland in his wars with the Russians and Turks Pappenheim joined the army of the Catholic League, and in the battle of Prague (1620) stayed the flight of the Austrian cavalry, and by a well-timed and furious charge turned the tide of battle against the Bohemians. In 1623 he received from the emperor the command of a cavalry regiment of the famous 'Pappenheimer Cuirassiers.' In 1625 he became general of the Spanish horse in Lombardy; but in 1626 he re-entered the Austrian service, and after suppressing a dangerous revolt of the peasants of Upper Austria, in which 40,000 of the peasants perished, he joined the army which was opposed to the Protestant League, and, in association with Tilly, carried on many campaigns against the Danes, Swedes, and Saxons. It was Pappenheim who induced Tilly to attack Magdeburg (q.v.), and on his head rests in great measure the guilt of the ferocious massacre. His reckless bravery involved Tilly against his will in the disastrous battle of Breitenfeld; but to some extent he retrieved his character by his heroic efforts to remedy the loss and protect the retreat of the army. After Tilly's death he served under Wallenstein, who detached him with eight regiments to protect Cologne, but, on hearing of the advance of Gustavus, sent an urgent order for his return. Pappenheim arrived at Lützen at the moment when Wallenstein's army was on the point of being completely routed, and at the head of his cuirassiers he charged the left wing of the

Swedes with such fury as to throw it into confusion, and for a moment change the fortune of the battle. He was mortally wounded in the last charge, and died a few hours afterwards at Leipzig, November 7, 1632, with a smile on his countenance, after learning that Gustavus Adolphus was dead. 'God be praised!' he said: 'I can go in peace, now that that mortal enemy of the Catholic faith has had to die before me.'

Pappus. See COMPOSITEÆ.

Pappus OF ALEXANDRIA flourished about the end of either the 3d or the 4th century A.D. Which of these dates is the more probable it is difficult to determine, owing to conflicting evidence, but opinion inclines to the former. Suidas states that Pappus was a contemporary of Theon, thus placing him towards the end of the 4th century, and ascribes several treatises to him. These treatises have not survived, and the only work by which Pappus is now known, his *Mathematical Collection*, receives no mention from Suidas. This work consisted of eight books, the first and the earlier part of the second of which are lost, and its interest is mainly, though not exclusively, historical. From what remains of the second book, it is conjectured that the first two books were arithmetical. The third book explains some of the methods for the duplication of the cube, treats of the progressions and the five regular polyhedra. The fourth book discusses the figure called the *arbelos* ('a shoemaker's knife'), the spiral of Archimedes, the conchoid of Nicomedes, and the quadratrix of Dinostratus. The fifth book contains some theorems regarding isoperimetrical figures plane and solid, and a short account of the semi-regular solids of Archimedes. The sixth book comments on some of the works of Theodosius, Aristarchus of Samos, and Euclid. From the seventh book, which is the longest and most valuable of the *Collection*, is derived a large part of our knowledge of Greek geometry. Many of the writings here analysed are no longer extant, and it is on the indications (in the notable instance of Euclid's *Porisms*, the very obscure indications) which Pappus gives of the object or the contents of them that the geometers of the 17th and 18th centuries relied for their restorations of these writings. The eighth book is devoted mainly to mechanics. The mathematical interest of the *Collection* does not equal the historical, but several of the books contain important theorems, the discovery of which is probably due to Pappus himself. One of these has been long associated with the name of Guldinus (1577-1643). Some others have received a brilliant development from the mathematicians of modern times. The last six books of the *Mathematical Collection* were translated into Latin by Commandinus, an Italian geometer, and were published in 1588; another edition appeared in 1660. Fragments of the Greek text have been printed at various times in England, France, and Germany, but the only complete edition is that of Fridericus Hultsch, *Pappi Alexandrini Collectionis quæ supersunt* (3 vols. Berlin, 1876-78).

Papua. See NEW GUINEA.

Papules, or PIMPLES, are 'solid small elevations of the skin,' and may be either pale in colour or inflammatory and more or less red. Papules occur as an early stage in the development of the eruption in many skin diseases—e.g. in herpes, where they speedily become vesicles; or in acne,

where they become pustules. The papular diseases proper, where the eruption in its fully developed form consists of papules, are lichen and prurigo.

Papyrus, a genus of Cyperaceæ, better included in *Cyperus*, the most important species being the Egyptian Papyrus (*P. antiquorum*, *Cyperus Papyrus* of Linnaeus)—a kind of sedge, 8 to 10 feet high, with a very strong, woody, aromatic, creeping root, long, sharp-keeled leaves, and naked, leafless, triangular, soft, and cellular stems, as thick as a man's arm at the lower part, and at their upper extremity bearing a compound umbel of extremely numerous drooping spikelets, with a general involucre of eight long filiform leaves, each spikelet containing six to thirteen florets. By the ancient Egyptians it was called *papu*, from which the Greek *papyrus* is derived, although it was also called by them *byblos* and *deltos*. The Hebrews called it *gomé*, a word resembling the

Papyrus.

Coptic *gom*, or 'volume;' its modern Arabic name is *berdi*. The plant is nearly extinct in Lower Egypt, but is found in Nubia (whence it was probably introduced into Egypt) and Abyssinia. It still grows in the Jordan Valley, in the neighbourhood of Jaffa, and also of Sidon, in parts of the Sinai Desert, and in Sicily. It is often a conspicuous feature in African vegetation. It is represented on the oldest Egyptian monuments, and as reaching the height of about ten feet. It was grown in pools of still water, growing ten feet above the water, and two beneath it, and restricted to the districts of Sais and Sebennytus. The papyrus (not merely *C. Papyrus*, but also *C. alopecuroides*, which is still found in Egypt) was used for many purposes, ornamental and useful, such as wreaths for the head, sandals, boxes, boats, and cordage, but the *C. Papyrus* was valued principally for a kind of paper called by its name. Its pith was boiled and eaten, and its root dried for fuel. The papyrus or Paper (q.v.) of the Egyptians, made of strips of its pith in layers, was of the greatest reputation in antiquity, and it appears on the earliest monuments in the shape of long rectangular sheets, which were rolled up at one end, and on which the scribe wrote with a reed called *kash*, with red or black ink made of an animal carbon. When newly prepared it was white or brownish white and lissom; but in the process

of time those papyri which have reached the present day have become of a light or dark brown colour, and exceedingly brittle, breaking at the touch. Papyrus was commonly used in Egypt for the purposes of writing, and was, in fact, the paper of the period; but, although mentioned by early Greek authors, it does not appear to have come into general use among the Greeks till after the time of Alexander the Great, when it was extensively exported from the Egyptian ports under the Ptolemies. It was, however, always an expensive article to the Greeks. Among the Romans it does not appear to have been in use at an early period, although the Sibylline books are said to have been written on it. It was cultivated in Calabria, Apulia, and the marshes of the Tiber, but the staple was no doubt imported from Alexandria. So extensive was the Alexandrian manufactory that Hadrian, in his visit to that city, was struck by its extent. It continued to be employed in the eastern and western empire till the 12th century, and was used amongst the Arabs in the 8th; but after that period it was quite superseded by parchment or by paper made of rags. During the later periods it was no longer employed in the shape of rolls, but cut up into square pages, and bound like modern books.

The discovery in Egypt of classical Greek authors written on papyrus began about the middle of the 19th century, and the results have been on the whole beyond expectation. The great orator Hyperides (q.v.), then only known by name, is now represented by four or five pretty complete orations; fragments of Euripides and Aeschylus have been added to what we possess of these authors, and early MSS. have been obtained of parts of Homer, Plato, Thucydides, Demosthenes, and Isocrates. In 1888-89 Mr Flinders Petrie found near Medinet el Fayûm papyri which were identified as fragments of Plato's *Phædo*, transcribed about 250 B.C., and a part of the lost *Antiope* of Euripides, besides quantities of letters and documents of the Ptolemaic period. In January 1891 more than 160 ancient mummies (dating from the 20th and 21st Dynasties) were found in a subterranean passage at Deir el Bahari, near Thebes; with these were many papyri, containing, as usual, many ritual passages and extracts from the Book of the Dead (q.v.); there were also 'boxes crammed with papyri.' And at the beginning of the same year the world was surprised by the announcement that papyrus rolls obtained from Egypt by the British Museum authorities had been found to contain almost the whole of a lost but famous work of Aristotle on the constitution of Athens. These rolls, written by four different copyists, are mainly in a small semi-cursive hand, and date from about the end of the 1st century A.D. Other finds at Oxyrhynchus (q.v.) and elsewhere have been the *Mimes* of Herodas (q.v.), the *Odes* of Bacchylides, fragments of Pindar's *Pæans*, an important continuation of Thucydides by an unknown author, the *Logia* or *Sayings* of Jesus, and scraps of unknown gospels.

See Paoli, *Del Papiro* (1878), Baikie, *Egyptian Papyri* (1925), works by Grenfell and Hunt, and by Kenyon; also the articles BOOK (and works there quoted), EGYPT, PALÆOGRAPHY, PAPER.

Par. See SALMON.

Pará, the name which the river Tocantins (q.v.) receives in its lower course, from Cametá downwards (138 miles). It is 20 miles broad opposite the city of Pará, and 40 miles broad at its mouth. The Paranan, an arm of the Amazon, which cuts off Marajó Island from the mainland, pours into it part of the waters of the great river.

Pará, the third in size of the Brazilian states, bordering on Guiana and the Atlantic. It is a prolific rubber region, and presents a luring field for scientific exploitation. Lumbering and stock-raising are important industries, while products of the soil are nuts, cacao, cotton, rice, and tobacco. The state is divided by the Amazon, which along with its arms and tributaries affords much of the internal communication. There is a railway (108 miles) from Pará to Bragança and another in the valley of the Tocantins. The state has an area of 444,000 sq. m. and a population of 1,000,000. The capital PARÁ (official name *Belém*) is a thriving city and seaport, standing on the east bank of the river Pará, 70 miles from its mouth, on a point of land formed by the entrance of the Guamá. The harbour, nearly landlocked by wooded islands, is well constructed on modern lines, and admits vessels of large size. Pará, as a whole, is a plain-looking commercial town, compactly built, and without straggling suburbs, the dense tropical forest coming close up to the outskirts. The streets are narrow, but regular, well shaded with mangoes and palms, and the houses, with their blue and white tiled roofs and whitewashed walls, are very pretty. The city contains a cathedral (1720), naval arsenal, museum, zoological gardens, and a unique public park called the Bosque. The place is not unhealthy, though the wet season extends over nearly two-thirds of the year. Pará, accessible to ocean-going steamers, is the headquarters of several steamboat companies, and the emporium of the Amazon river-trade, supplying the towns of the interior with foreign goods, and exporting india-rubber, cacao, Brazil nuts, timber, tonka-beans, isinglass, hides, guarana, copaiba, tobacco, &c. Pop. 236,000. See Cooper, *The Brazilians and their Country* (1920), Tomlinson, *The Sea and the Jungle* (1912, new ed. 1920), and BRAZIL, and books there noted.—'Para Grass' is a name given to piassava; see FIBROUS SUBSTANCES.

Para, a Turkish coin, generally of copper, the 40th part of a Piastre (q.v.). Five, ten, and twenty para pieces are nickel coins.

Parable (Gr. *parabolē*, 'a comparison') was originally the name given by the Greek rhetoricians to an illustration avowedly introduced as such. In Hellenistic and New Testament Greek it came to signify an independent fictitious narrative, employed for the illustration of a moral rule or principle. This kind of illustration is of eastern origin, and the greatest examples are to be found in the Old and New Testaments, particularly in the discourses of Christ. The parable differs from the fable in the probability or verisimilitude of the story itself, and agrees with it in the essential requisites of simplicity and brevity. In the course of time the word parable came to lose its significance of figurative speech, and to mean speech generally. See ALLEGORY, APOLOGUE, and FABLE.

Parabola, the section of a cone by a plane which is parallel to a generating line. As a particular case, when the plane passes through the vertex of the cone, the parabola closes up into a straight line. A property of the parabola is that the distance of any point on the curve from a certain fixed point is equal to its distance from a certain fixed straight line. The fixed point is called the *focus* of the parabola, and the fixed line is called its *directrix*. In the figure, PAP' represents a parabola of which S is the focus and BC is the directrix. The point A is called the *vertex* of the parabola. The line ASO is the *principal diameter* of the curve; and any line drawn through a point such as P parallel to AO is called a *diameter*.

From the above property it is easy to prove that $PN^2 = 4AS \cdot AN$, where N is the foot of the perpendicular from P upon OA. It is obvious that the parabola is not a closed curve. The centre (corresponding to the centre of the ellipse) is situated

at infinity. The tangent to the curve at P bisects the angle SPD. Hence a reflecting surface formed by the revolution of PAP' about OA as axis is such that parallel rays falling upon it in the direction of OS are reflected to S. Conversely, rays diverging from S will be reflected parallel to SO. Hence the intensity of the reflected beam of light remains constant at

all distances from the source, except in so far as it is affected by absorption, and the parabolic is therefore the most perfect form of reflector (see LIGHTHOUSE, REFLECTION). If the resistance of the air were negligible, the path of a projectile would approximately be a parabola with its axis, or principal diameter, vertical, and its vertex at the highest point of the path. Let $PN = y$, $AN = x$, $AS = a$. The equation of the parabola referred to its vertex as origin is $y^2 = 4ax$. All curves the equations of which are of the form $y^n = px^m$ are classed as parabolas. Thus, the curve represented by the equation $y^3 = px$ is called the *cubical parabola*; and that one whose equation is $y^3 = px^2$ is called the *semi-cubical parabola*.

Paraboloid is a solid figure traced out by a Parabola (q.v.) revolving round its principal axis.

Paracelsus, a name coined for himself by Theophrastus Bombastus von Hohenheim, was apparently meant to imply that he was greater than Celsus; there is no good authority for further adding the names Philippus Aureolus. Paracelsus was the son of Wilhelm Bombast von Hohenheim, a physician at Einsiedeln, in the Swiss canton of Schwyz, and was born in December 1493. He owed his early education mainly to his father; went to Basel University at sixteen, but soon left to study alchemy and chemistry with Trithemius, Bishop of Würzburg; and next at the mines in Tyrol belonging to the Fugger family learned the physical properties of metals and minerals, and the disposition of rock strata, and began to realise that the observation of nature is of surpassingly greater value to the student than academic prelections or the lucubrations of the study. Here and in subsequent wanderings over great part of Europe he amassed a vast store of facts, learned the actual practice of medicine amongst various peoples, but lost all faith in scholastic disquisitions and disputations. He acquired no little fame as a medical practitioner, and on his return to Basel in 1526 received the appointment of town physician. He also lectured on medicine at the university, but defied academic tradition not merely by lecturing in German (not Latin), but by flouting at Galen and Avicenna—burning their books in public, it was affirmed—and denying all that was most firmly believed by the faculty.

Bitterness, backbiting, enmities soon rose and pursued him throughout the rest of his life, aggravated and justified in some measure by his

own vanity, arrogance, and aggressiveness, as also by his intemperate habits. A dispute with the magistrates in 1528 led to his leaving Basel in haste; he wandered for more than a dozen years, visiting Colmar, Nürnberg, Zürich, Augsburg, and many other towns, but seldom sojourning more than a few months, and at last settled in 1541 under the protection of the archbishop at Salzburg. But he died on the 24th September of the same year—murdered by his enemies, said his friends; in consequence of a drunken debauch, said his enemies. Both statements are probably extreme.

He is said to have written some 364 works, of which only some 230 were printed; and of these the critics only admit from ten (Marx) to twenty-four (Häser) as genuine, the others being by his followers the 'Paracelsists.' They were mainly written in Swiss-German, the Latin versions being by other hands. The earliest printed work was *Practica D. Theophrasti Paracelsi* (Augsburg, 1529). His *Paragranum* was published after his death. Collected German editions appeared at Basel in 1589-91 (11 vols. 4to) and again in 1603-5 (4 vols. folio; re-issued 1618), Latin editions in 1603-5 (11 vols. 4to) and 1658 (Geneva, 3 vols. folio).

His system was based on a cosmogonic view of the universe, the disturbances in the economy of the human microcosm corresponding to and being determined by the movements of the all-embracing macrocosm. Repudiating the current pseudo-Aristotelianism, Paracelsus turned sympathetically to Neoplatonism and the Cabbala; but it seems difficult not to admit in him an element of pure charlatanism, as well as of mysticism. Unquestionably, however, his method and his influence tended in the direction of the immediate observation of nature, the discarding of antiquated theories, the encouragement of independent research, experiment, and innovation. Paracelsus is often regarded as a chemist; he certainly made some new chemical compounds; but he is more famous because he applied chemical knowledge to improve pharmacy and therapeutics, and, in an empirical fashion, to revolutionise hide-bound medical methods.

See monographs by M. B. Lessing (1839), Marx (1842), Mook (Würzburg, 1876); the article MEDICINE, and the histories of medicine; the Lives (in English) by Hartmann (1886), Miss Stoddart (1911; new ed. 1915), and Prof. Stillman (1920), Waite's edition of some of his writings (1894); and Browning's famous poem on Paracelsus.

Parachute. See BALLOONS AND AEROPLANES.

Paraclete. See SPIRIT (HOLY), MONTANISM, ABELARD.

Paradise (Gr. *paradeisos*, 'a park,' 'a pleasure-ground;' originally an oriental, apparently Persian, word; cf. the Heb. *pardes*, and modern Persian, *firdaus*).—See ATLANTIS, AVALON, EDEN, HEAVEN; and BIRD OF PARADISE for the bird so named.

Paradise-fish (*Macropodus viridi-auratus*), a Chinese species of Macropod often kept in aquaria for its beauty of form and colouring. In the male the colours increase in brilliancy at the pairing-season, and he swims around his wished-for mate, fluttering the long, delicate filaments of the ventral fins, or erecting those of the tail fin like a peacock's train in miniature.

Paradox (Gr. *para*, 'beside' or 'beyond,' and *doxa*, 'an opinion'), a term applied to whatever is contrary to the received belief; not necessarily an opinion contrary to truth. There have been bold and happy paradoxes whose fortune it has been to overthrow accredited errors, and in the course of time to become universally accepted as truths. For paradoxists who square the circle, and invent per-

petual motion, see QUADRATURE OF THE CIRCLE, PERPETUAL MOTION; and De Morgan's *Budget of Paradoxes* (1872; new ed. 1915).

Paradoxides Series, the second lowest of the four main subdivisions of the Cambrian System, including the Menevian and Solva Beds of Wales, characterised by the presence of trilobites belonging to the genus *Paradoxides*. See CAMBRIAN SYSTEM.

Paraffin (so called as being *parum affinis*—i.e. having little affinity for other bodies) was a name given by Baron Reichenbach (q.v.) to a white transparent crystalline substance first obtained by him in 1830 from wood-tar. The honour of this discovery must be shared with Christison of Edinburgh, who independently and almost simultaneously obtained the same body (which he named petroleine) in making a chemical examination of Rangoon petroleum. Dumas, a French chemist, obtained it also from coal-tar in 1835. But for twenty years after its discovery paraffin-wax remained a chemical curiosity only. It was not till 1850 that it began to be produced, by James Young (q.v.), in quantity sufficient to occupy the attention of manufacturers. Since then it has become of great importance commercially, and has for years been the principal material employed in the manufacture of candles in Great Britain and Germany, having for that purpose, to a large extent, superseded the use of beeswax, spermaceti, stearic acid, and tallow, besides being used in many other branches of the arts and manufactures, and in surgery.

The word paraffin, at first applied by Reichenbach to the solid body, is now used by chemists as a generic term for the series of saturated Hydrocarbons (q.v.), the higher members of which are paraffin-wax, lower members are liquid, and the lowest are gases; marsh-gas or firedamp being lowest of all. Paraffin-oil was Young's term for his mineral burning oils, and in Britain this name still applies to all the oils associated with the manufacture of paraffin, in which the olefine series of non-saturated hydrocarbons is largely represented along with liquid paraffins. On the Continent and in America paraffin is used only for the oils heavier than lamp-oil, or the oils pressed directly from the solid paraffin; petroleum for the natural oils, which are mostly mixtures of the same two series of hydrocarbons. In 1872 Watts used the name paraffin for all the saturated hydrocarbons of that series of which the first four—ethane, methane, propane, quartane—are at ordinary temperatures gaseous, those higher in the series oily liquids, and those higher still solids; all remarkable for their chemical indifference. Scotland is the main seat of the paraffin-oil industry; but Germany, France, Italy, and Australia also use coal and shale or schist for the production of hydrocarbon oils. Large deposits of shale are known to exist in America, but petroleum can be worked more cheaply.

In December 1847 James Young was informed that a dark oily liquid had been found in a coal-mine at Alfreton in Derbyshire. Young, recognising the commercial importance of the products that could be obtained from it, erected a refinery, and produced a light oil for burning, a heavy oil for lubricating, and paraffin-wax. This petroleum spring soon exhausted itself, but meanwhile Young, reflecting on the probable origin of the oil, succeeded in distilling an analogous oil from coal. This process he patented in 1850. Works were erected at Bathgate, in West Lothian, in which neighbourhood was found a highly bituminous cannel coal, known as Torbanehill Mineral or Boghead Coal (q.v.). This mineral, employed by Young, yielded under distillation about 120 gallons of crude oil per ton, but in 1862 the supply ceased.

Young's patent, which covered the distillation of oil from coal at a low red heat, expired in 1864. In 1859, however, Robert Bell erected oil-works at Broxburn (q.v.), and was the first in Scotland to distil oil from shale, although Du Buisson had obtained a patent in France before 1850 for a similar process. Bell also recognised the importance of the sulphate of ammonia (for sale as a fertiliser), which had hitherto been wasted. Since 1862 shale has been employed to a very large extent in Scotland for oil-making. Young allowed his patent to be used in the United States of America, where oil for several years was distilled from cannel-coal; but, public attention being thereby directed to the natural petroleum which have since been found in such abundance, the use of cannel-coal was discontinued.

The shale-oil industry in Scotland has been more than once threatened with extinction. It was only saved from collapse about 1872 by the energy and inventive resource of some of the persons engaged in it. The history of the industry naturally falls into various periods; during these periods can be observed the rise of by-products to a position of prime importance. The first period was a brief one (1848–50), when Young utilised the petroleum-spring at Alfreton for the production mainly of lubricating oil, used in mills as a substitute for sperm-oil. The second period extended over the duration of Young's patent (1850–64), when the burning oil had become of the greatest importance to the manufacturer. The third period (1864–72) witnessed the great development of the petroleum trade in America, during which the price of burning oil fell so low that about half of the works in Scotland were closed. The fourth period (1872–78) was a period of severe struggle for existence. The smaller and weaker works disappeared. The production became concentrated in fewer hands with greater outputs. Burning oil being now less remunerative, the utmost attention was paid to the recovery of all waste-products and to the development of the by-products; paraffin-wax and sulphate of ammonia then becoming of chief importance to the manufacturer. The inventive genius of those concerned in the industry, principally of Henderson, of William Young, and Beilby, applied itself to the introduction of new and economical processes whereby methods of retorting the shale were improved, manufacturing costs reduced, and the yield of the products that had now become of most value much increased. The fifth period (1878–87) was in consequence a time of much prosperity, ending, however, in a partial collapse by reason of over-production in Scotland combined with ever-increasing imports of wax from America. In 1894 further improvements in retorting were introduced by Bryson, Jones, and Fraser. The Scottish shale industry, however, is finding it more and more difficult to compete with the immense output of natural petroleum from other countries, and all but the strongest companies have by this time succumbed.

Geologically, the position of the shale in the east of Scotland is in the Lower Carboniferous series, but in the west of Scotland it is found in the Coal Measures. There are some seven or eight different seams of shale, all varying in position and quality from each other; but the same shale may be thick and rich in one place, and thin and poor in another. The Broxburn seam of shale at its best is probably the richest and most profitable quality to work; but the Pumpherston seams, though poor in oil, became of value because they are rich in ammonia. The shale is procured in the same manner as in coal-mining. In Germany considerable quantities of paraffin are made

by distilling certain varieties of brown coal or Lignite (q.v.).

The shale when taken from the pits is broken into small pieces and put into the retorts, where destructive distillation takes place. The shale yields from 18 to 33 gallons of crude oil per ton, and from 25 to 70 lb. of sulphate of ammonia.

Crude oil is composed of a very wide range of hydrocarbons, each varying in specific gravity and boiling-point and in the percentage of carbon present; but in the practical operations of the refiner the fractionation of the oil is confined within certain definite limits which have been found of most convenience commercially—viz. *Naphtha*, specific gravity, 680 to 750 (water = 1000); volatile at ordinary temperatures; the lighter portions are used for carburetting air-gas and for petrol or motor spirit; the heavier portions are principally used as solvents. *Burning oils*—(a) for domestic use; specific gravity, 800 to 805; flash-point, Abel test, over 100° F. (b) Lighthouse oil, specific gravity, 810 to 815; flash-point, Abel test, about 150° F. (c) High Test oils, specific gravity, 830 to 840; flash-point, Abel test, about 240° F.; used in special lamps for lighting railway-carriages and in ships, and for internal combustion engines. *Intermediate oils*, of specific gravity 840 to 870, are used as fuel in the navy, for gas-making, and for gas-enriching. *Lubricating oils* of standard specific gravities—865, 875, 885, 890–5—are used principally for mixing with animal and vegetable oils in lubricants. *Paraffin-waxes*, with melting-points varying from 80° to 130° F. The soft wax from 80° to 100° is employed in the preparation of ordinary and safety matches, and for burning in miners' lamps; while the harder qualities are manufactured into candles.

The operations of the oil-refinery are: (1) distillation, (2) treatment with chemicals, (3) cooling and pressing the heavy oil containing paraffin so as to separate the solid hydrocarbons from the liquid. The oils are distilled several times, and are fractionated into the various qualities required; and after each distillation the oil is treated with oil of vitriol and with caustic soda. The soda compounds retained in solution by the oil have to be carefully removed by washing with water. In lubricating oils the essential features are high viscosity, high flash-point, and low setting-point. The first two depend on proper fractionation; and the third is secured by careful refrigeration. The crude paraffin scale or wax is refined either by chemicals, by sweating, or by treatment with naphtha. The sweating process, which is simple and effective, is the one most commonly adopted, although the best qualities of refined paraffin require a treatment or two with shale naphtha. The distillations are carried out in a series of connected boiler-stills, which work continuously, and are connected with residue-stills working intermittently. See Scheithauer, *Shale Oils and Tars* (rev. ed. 1923); also articles CANDLE, HYDROCARBONS, NAPHTHA, PETROLEUM, WAX.

Paraguay, a river of South America, an affluent of the Paraná (q.v.), rises in the high plateau of the Brazilian state of Matto Grosso, in several deep lakes, believed also to send some of their waters to one of the headstreams of the Amazon. It flows SW. and S., forming from 20° to 22° S. the boundary line between Brazil and Bolivia, thence SSW. through Paraguay, forming the boundary with Argentina, to its junction with the Paraná, a few miles above Corrientes. Affluents are the Cuyabá, Tacuary, Apá, Jejui, and Tebicuary on the left, and the Jauru, Pilcomayo, and Vermejo on the right. Except in the extensive marshy areas on the upper course, the country on both banks of

the Paraguay is rich and fertile, and abounds in excellent timber. The river, which is 1500 miles long, is navigable for steamers to the mouth of the Cuyabá. Steamers drawing nine feet can at all seasons reach Corumba; and the river is almost the only commercial outlet for Matto Grosso and Paraguay. The Paraguay was discovered by Sebastian Cabot, who in 1526 ascended as far as the confluence of the Pilcomayo. See Hills and Dunbar, *The Golden River* (1922).

Paraguay, an inland republic of South America, divided into two distinct portions by the river so named. The area of Paraguay is estimated at 160,000 sq. m.—a territory nearly three times as large as England. The population of Paraguay is composed of whites of Spanish descent, Indians (see GUARANÍ), a few negroes, and a mixture of these several races, and is estimated at 700,000, exclusive of the Indians in the Gran Chaco (q.v.). A mountain-chain called Sierra Amambay, running in the general direction of from north to south, and bifurcating to the east and west towards the southern extremity, under the name of Sierra Mbaracayú, divides the tributaries of the Paraná from those of the Paraguay, none of which are very considerable, although they are liable to frequent and destructive overflows. The northern portion of Paraguay is in general undulating, covered by low, gently-swelling ridges, separated by large grass plains, dotted with palms. There are mountains in the north-east and north-west corners. The southern portion is one of the most fertile districts of South America, consisting of hills and gentle slopes richly wooded, of wide savannahs, which afford excellent pasture-ground, and of rich alluvial plains. Some of these, indeed, are marshy, or covered with shallow pools of water, but a large proportion are of extraordinary fertility and highly cultivated. Two lakes only, Ypoá and Ipacará, are worthy of note. The climate, for the latitude, is temperate, the temperature occasionally rising to 100° in summer, but in winter being usually about 45°. In geological structure the southern part belongs generally to the Tertiary formation; but the north and east present greywacke rocks in some districts. Much valuable timber is found in the forests, and the wooded districts situated upon the rivers possess a ready means of transport. Among the trees are the tannin-bearing *Quebracho* (q.v.), rubber, and the *Maté* (q.v.), which forms one of the chief articles of commerce, being in general use throughout great part of South America. The shrub or tree grows wild in the north-eastern districts, and the gathering of its leaves gives employment in the season to a large number of the native population. Orange trees were introduced by the Jesuits and now abound. Many trees also yield valuable gums. Wax and honey are collected in abundance, as is also cochineal, and the medicinal plants are very numerous. The chief cultivated crops are maté, sugar-cane, tobacco, fruits, cotton, maize, rice, and mandioca.

Game, both large and small, is very abundant. Tapirs, jaguars, pumas, ant-eaters, wild-boars, peccaries, and deer of many descriptions are inhabitants of the forests and plains; birds are innumerable, and for beauty and variety of plumage are perhaps unsurpassed by any in the world; the rivers teem with fish, and their banks are the resort of alligators and coypús. Snakes are numerous, but very few of them are venomous. Some of the boas are exceedingly large, and there is a remarkable water-serpent which is said to attain a length sometimes of eight yards.

The stock-raising industry is rapidly increasing in importance, and with it go the tanning and tinned meat industries. There is considerable mineral

wealth, especially iron, manganese, and copper, while petroleum has also been discovered. These resources await exploitation under proper organisation, a remark that might be extended to agriculture. The chief exports are hides, yerbamaté, oranges, tobacco, timber, tinned and preserved meats, cattle, petit-grain oil, and quebracho extract; the imports, cotton goods, hardware, wine, grain, linen, silk, petroleum, &c. Trade in the towns is almost wholly in the hands of Italians, French, and Germans. The principal native industries are tanning and the manufacture of pottery and bricks, laces, ponchos, soap, food-pastes, brandy, &c.

The regular army consists of about two thousand men. The established religion is the Roman Catholic, the ecclesiastical head of which is the Bishop of Asunción. Marriage, to be legal, must be by civil ceremony. Education is free and said to be compulsory; but of the adult Paraguayans only two in five can read and write. At the same time, schools are numerous, and there is a university at Asunción. Communication by river is good, by road bad, by rail improving (511 m. in 1923). Asunción, the capital (pop. 100,000), has railway connection with Buenos Aires. Other towns are Villarrica, Concepción, Carapeguá, Laque, Encarnación.

The history of Paraguay is highly interesting. It was discovered by Juan Díaz de Solís in 1515, and further explored by Diego García in 1525, and by Sebastian Cabot in 1526; but the first colony was settled in 1535 by Pedro de Mendoza, who founded the city of Asunción, and established Paraguay as a province of the viceroyalty of Peru. The warlike native tribe of the Guaranis, however, a people who possessed a certain degree of civilisation, and professed a dualistic religion, long successfully resisted the Spanish arms, and refused to receive either the religion or the social usages of the invaders. In the latter half of the 16th century the Jesuit missionaries were sent to the aid of the first preachers of Christianity in Paraguay; but for a long time they were almost entirely unsuccessful, the effect of their preaching being in a great degree marred by the profligate and cruel conduct of the Spanish adventurers, who formed the staple of the early colonial population. In the 17th century the home government consented to place in the Jesuits' hands the entire administration, civil as well as religious, of the province, which, from its not possessing any of the precious metals, was of little value as a source of revenue; and, in order to guard the natives against the evil influences of the bad example of European Christians, it gave to the Jesuits the right to exclude all other Europeans from the colony. From this time forward the progress of civilisation as well as of Christianity was rapid. On the other hand, by their 'sterile extravagant theocratic despotism' the Jesuits are held to have made the people a '*servum pecus* knowing no rule but that of their superiors.' On the expulsion of the Jesuits from Paraguay in 1768, the history of which is involved in much controversy, the province was again made subject to the Spanish viceroys. For a time the fruits of the older civilisation maintained themselves; but as the ancient organisation fell to the ground great part of the work of so many years was undone, and by degrees much of the old barbarism returned. In 1776 Paraguay was transferred to the newly-formed viceroyalty of Río de La Plata. It was the first state to establish its independence (1811). In 1814 Dr Francia (q.v.), originally a lawyer, and the secretary of the first revolutionary junta, was proclaimed dictator for three years; and in 1817 his term of the office was made perpetual. He continued

to hold it till his death in 1840, when anarchy ensued for two years; but in 1842 a national congress elected Don Mariano R. Alonzo and Don Carlos Antonio López, a nephew of the dictator, joint consuls of the republic. In 1844 a new constitution was proclaimed, and Don Carlos was elected sole president, with dictatorial power, which he exercised till his death in 1862, when he was succeeded by his son, Don Francisco Solano López, whose name has become notorious in connection with the tragic struggle of 1865-70, in which the Paraguayans made a heroic but unavailing fight against the combined forces of Brazil, the Argentine Confederation, and Uruguay. The war was brought to a close by the defeat and death of López at the battle of Cerro Corá, 1st March 1870. The results of the war may be read in the population returns—(1857) 1,337,439, (1873) 221,079, including only 28,746 men and 106,254 women over fifteen years of age. Paraguay has had its share of general emigration to South America. The constitution of 1870 was modelled on that of Argentina; but revolutions still take place with disturbing frequency. A settlement of 500 Australian Socialist workmen in 1893 at New Australia and a secession from it at Cosme, 100 miles away, struggled with difficulties for some years and then collapsed, save in so far as they returned to ordinary capitalist lines. A later co-operative association of lumbermen from California and Canada perished in less than a year.

Paraguay Tea. See MATÉ.

Parahyba, capital of the Brazilian state of Parahyba, on the river of the same name, 10 miles from the sea. Its chief buildings are the cathedral and the government palace (formerly the Jesuit college). A large sugar-mill was erected in 1889. At the mouth of the river is a bar; but a railway (12 miles) was built in 1889 to the port of Cabedello, there terminating in a pier in deep water. The exports are sugar, cotton, and cotton-seed. Pop. 53,000.—The state, the easternmost in the republic, has an area of 28,846 sq. m. and a population of 960,000. The staple products are cotton, sugar, skins, hides, and cotton-seed.—There is a more important Parahyba River farther south, which enters the Atlantic, in the state of Rio de Janeiro, after a course of nearly 500 miles. It is navigable for 50 miles from its mouth.

Parallax is the apparent displacement of an object caused by a change of place in the observer. When an object at M is looked at from P it

Fig. 1.

appears in line with some object, S; but after the observer has moved to E, M has apparently moved to a position in line with S'; the amount of apparent motion is called *parallax*. The angle PME

is called the 'angle of parallax,' or the 'parallactic angle,' and is the measure of the amount of parallax. To astronomers the determination of the parallax of the heavenly bodies is of the utmost importance, for two reasons—first, from the necessity of referring all observations to the earth's centre—i.e. so modifying them as to make it appear as if they had been actually made at the earth's centre; and secondly, because parallax is our only means of determining the magnitude and distance of the heavenly bodies. The *geocentric* or *daily* parallax—as the apparent displacement of a heavenly body, due to its being observed from a point on the surface of the earth instead of from its centre, is called—is determined as follows: Let

Fig. 2.

Let the *zenith distances*, ZPM and $Z'P'M$, be observed simultaneously, and, since the latitudes of P and P' , and consequently their difference of latitude, or the angle PEP' , are known, from these three the angle PMP' (the sum of the parallaxes at P and P') is at once found; and then, by a trigonometrical process, the separate angles or parallaxes PME and $P'ME$. When the parallax of M , as observed from P , is known, its distance from E , the centre of the earth, can be at once found. When the heavenly body is on the horizon, as at O , its parallax is at a maximum, and is known as the *horizontal parallax*. The geocentric parallax is of use only in determining the distances of those heavenly bodies at which the earth's radius subtends a considerable angle.

In the case of the fixed stars, at which the earth's radius subtends an infinitesimal angle, it becomes necessary to make use of a much larger base-line than the earth's radius, and, as the largest we can employ is the radius of the earth's orbit, it accordingly is made use of, and the displacement of a star, when observed from a point in the earth's orbit instead of from its centre, the sun, is called the *annual* or *heliocentric* parallax. Here the base-line, instead of being, as in the former case, 4000 miles, is about 92,000,000 miles, and the two observations necessary to determine the parallactic angle are made from two points on opposite sides of the earth's orbit, at an interval as nearly as possible of half a year. Yet, notwithstanding the enormous length of the base-line, it bears so small a proportion to the distances of the stars that the parallax is very small and never exceeds $1.0''$. The geocentric horizontal parallax of the moon is about $57' 4.2''$; that of the sun, about $8.8''$. The annual parallax of a Centauri, the nearest of the stars, is $0.76''$. See the articles STARS and SUN.

Parallelepiped (Gr. *parallēlepipedon*), a solid figure having six faces, the faces being invariably parallelograms, and any two opposite faces equal, similar, and parallel. If the faces are all squares, and consequently equal, the parallelepiped becomes a cube.

Parallel Forces are forces which act in parallel lines, such for example as the weights of

the portions that make up any framework or structure on the earth's surface. With the exception of a particular case (see COUPLE), parallel forces have always a single resultant, which is readily found by the method of moments. See MOMENT; also FORCE.

Parallel Motion, a name given to any linkage by which circular motion may be changed into straight line motion. The most familiar instance is Watt's parallel motion (see STEAM-ENGINE), which is essentially a three-bar linkage, and, although not theoretically perfect, is sufficiently good for all practical purposes. It is impossible, indeed, to obtain a straight line motion without the use of at least five bars in the linkage; and till 1874, when Hart discovered the method, even this simplest mode of obtaining a true parallel motion was not deemed possible. The Peaucellier cell, a linkage of seven bars, was, however, the earliest linkage discovered for solving the problem of how to draw a straight line. It dates from 1864, and is, perhaps, the most convenient form that has yet been devised. It is shown in the figure. The equal links AP , AQ , BP , BQ , form a rhombus; the long links OA , OB , are also equal, and have the common point O fixed. The seventh link, QC , has its end C fixed, so that Q describes a circle passing through O —i.e. QC equals the fixed distance CO . In these circumstances, when Q moves in its circle P moves in a straight line. See A. B. Kempe's *How to draw a Straight Line* ('Nature' series, 1877).

Parallelogram of Velocities. See COMPOSITION.

Parallels, in military language, are trenches cut in the ground before a fortress, roughly parallel to its defences, for the purpose of giving cover to the besiegers from the guns of the place. See SIEGE.

Paralysis. The term paralysis, while ordinarily used to express loss of power of movement, is used medically in the wider sense of loss of function, so that there may be paralysis of motion, of sensation, of secretion, &c. The term *Paresis* is used to indicate a diminished activity of function. Thus, paresis of a limb means diminished power of moving the limb.

From what is said under the articles BRAIN, NERVOUS SYSTEM, and SPINAL CORD it will be seen that paralysis may arise (1) from destruction of the nerve-cells in the motor area of the surface of the brain; (2) from interruption of the nerve-fibres in their path through the brain to the spinal cord; (3) from interruption of the nerve-fibres in their path through the spinal cord; (4) from disease of the nerve-cells in the spinal cord; (5) from disease or injury to the nerves passing from the spinal cord to the muscles; or (6) from affections of the muscles themselves. Thus we speak of *Cerebral*, *Spinal*, and *Peripheral Paralysis*. As this pathway from the cerebral cortex to the muscle fibre consists of two principal nerve-fibres, it is customary to divide motor paralysis into an upper and a lower neurone type. The upper neurone type is associated with spasticity, increased reflexes in the paralysed limbs, no muscular atrophy except from disuse, and normal electrical reactions. The lower neurone type is characterised by flaccidity, diminished or absent

reflexes, muscular atrophy, and reaction of degeneration.

Cerebral Paralysis.—The most common causes of paralysis are hæmorrhage, thrombosis, and embolism. Two conditions are necessary for the production of cerebral hæmorrhage, (a) a structural weakening of the blood-vessel, and (b) a blood-pressure sufficiently high to rupture the weakened vessel. Continued high blood-pressure leads to arterial vascular degeneration. Rupture of a normal artery is well-nigh impossible. The vessels which give way are those which are least well supported, and thus although hæmorrhage may occur in any part of the brain, it is most common in the region of the internal capsule. Thrombosis, or the clotting of blood in the vessels, is generally the result of disease in the vessel walls or syphilis, but may also occur in cases with enfeebled circulation. In embolism the obstruction of the blood-stream is produced by a clot or foreign body carried from a distant part, usually detached from the valves of the heart. The most usual form of paralysis resulting from the above lesions is paralysis of the opposite side of the body, or 'hemiplegia.' If the paralysis is on the right side it is usually accompanied by loss of speech, or 'Aphasia' (q.v.). Loss of sensation on the same side as the paralysis occurs if the optic thalamus is involved. The face is usually found to recover before the leg, the leg before the arm, and the coarser movements of the hand before the finer. (See APOPLEXY.)

Spinal Paralysis is usually the result either (1) of pressure upon the spinal cord from the results of curvature or injury of the spine, or of growths such as tumours or abscesses; (2) of disease of the spinal cord itself, especially from tumours or acute or chronic inflammations, which may lead to interruption of the nerve-fibres which pass downwards from the brain to the nerve-cells in the gray matter of the spinal cord; or (3) of direct injury to the spinal cord. If the conducting paths from and to the brain are interrupted in any way there is complete paralysis of voluntary motion and of sensation below the level of the affected part of the spinal cord, because the motor impulses cannot pass down nor the sensory impulses upwards. At the same time, below the injury reflex movements may be preserved and certain forms even increased. Such spinal paralysis is termed paraplegia. If the injury to the spinal cord is unilateral, there will be paralysis of the muscles of the same side below the injury and some dissociated anæsthesia of the opposite side below the injury, a condition known as 'Brown-Séquard paralysis.' (See SPINAL CORD.)

In certain cases the nerve-cells in the anterior horns of the gray matter of the cord (and the same may be said of the corresponding cells of origin of the motor nerves of the brain) may be diseased without implication of any other part of the spinal cord. The result of this is paralysis of the muscles supplied by those nerve-cells, and consequent gradual wasting of the muscles. Under this head comes 'infantile paralysis,' now known to be caused by an infective virus which has a specially intense action on the central nervous system. A large number of muscles are usually first paralysed, but in a week or two most of the paralysis clears up, leaving only a few muscles paralysed, and these undergo rapid wasting. A similar disease occurs in adults known as 'progressive muscular atrophy' or 'chronic anterior poliomyelitis.' This has a gradual onset, usually shows itself first in the small intrinsic muscles of the hand, and runs a very slow course. If the pyramidal tracts be also involved the disease is termed 'amyotrophic lateral sclerosis.' If the bulbar nuclei are affected the condition is termed 'bulbar paralysis,' and is

associated with weakness of the muscles of articulation and swallowing. In consequence it is more rapidly fatal.

Peripheral Paralysis.—(a) *From Affections of Nerves.*—These are of extremely frequent occurrence, and may be due to pressure upon, injury to, or disease of the nerves. The most common of these diseases are the inflammations arising from cold, from the excessive use of alcohol, or from exposure to the poison of lead. If the nerve affected be a purely motor nerve the resulting paralysis is purely motor. The typical example is the so-called 'Bell's' or 'facial paralysis,' from affection of the seventh cranial nerve. This arises most commonly either from exposure to draught or from disease of the ear, in the neighbourhood of which the nerve passes through the bones of the skull (see EAR). There results a complete paralysis of the muscles of expression on the corresponding side of the face; the mouth is twisted to the opposite side, the lips cannot be pursed or retracted, the eye cannot be shut, and the forehead can be neither raised nor depressed, while the usual furrows on the forehead and cheek are either obliterated or diminished. The disease is in many cases amenable to treatment, but when associated with disease of the ear it should always be regarded as of grave import. If proper treatment be neglected, the paralysed muscles may waste, and recovery become impossible. 'Lead palsy' is usually indicated by a loss of the power of extending the wrists (wrist-drop) without impairment of sensation (see LEAD-POISONING). An example of paralysis resulting from pressure on a nerve is seen in the not uncommon result of sleeping with the arms over the back of a chair (sleeping or crutch palsy). As the musculo-spinal nerve is compressed, and the muscles which it supplies—namely, those which extend the wrist and fingers, and which turn the forearm outwards (supination)—are paralysed, there is a wrist-drop like that of lead palsy, but in addition there is loss of sensibility (anæsthesia) on the skin of the back of the thumb and first two fingers.

(b) *From Disease of Muscles.*—The group of diseases in which the muscle-fibres themselves are primarily affected, with healthy motor nerves and nerve-cells, is termed the 'muscular dystrophies' or 'myopathies.' Two varieties are known, one in which the affected muscles waste from the onset, the other in which they undergo a false enlargement before they ultimately become smaller, due to replacement by fat—so-called 'pseudo-hypertrophic paralysis.' The disease is congenital, although the onset may be delayed. The pseudo-hypertrophic variety tends to run in families, and usually selects patients of the same sex in each family.

Hysterical Paralysis.—Paralysis, following emotional shock, in which no organic injury is to be discovered, is termed 'hysterical' or 'functional.' The nerves and muscles affected are normal, the cause lying in the brain, and is of a psychic nature, the repressed emotional experience finding an escape by conversion into a physical symptom. It may be either flaccid or spastic in type, and was very common during the Great War. It can usually be cured by persuasion or analysis.

Paramaribo, the capital of Dutch Guiana, is situated on the Surinam, about 13 miles from its mouth. It has broad, tree-shaded streets, with clean wooden houses, painted light gray, and numerous canals and churches. There are also a governor's palace, two forts, a park, &c. The Herrnhuters (Moravian Brethren) are a strong body in the town. Except for the small harbour of Nickerie, all the trade of the colony is concentrated at Paramaribo. Sugar, cocoa, and gold are largely exported. Pop. 42,000.

Paramatta. See **PARRAMATTA**.

Paramecium, or **SLIPPER ANIMALCULE**, an Infusorian very common in pond water or in vegetable infusions. In shape it is an asymmetrical oval, in length about $\frac{1}{16}$ of an inch. If dry grass be steeped in a glass of water for some days, the animalcules dormant about the stems revive and multiply very rapidly. Each paramecium is covered with rows of cilia which lash it through the water and drive food-particles into an aperture which serves as mouth. As the food-particles enter they take bubbles of water with them, and are moved round and round in the living substance until they are digested or got rid of. There are two (excretory) contractile vacuoles; the large nucleus has a small one (micronucleus) lying beside it; within the firm rind there are remarkable eversible threads used in attachment. A paramecium often divides transversely into two; these two repeat the process, and rapid multiplication may thus proceed for a while. It has its limits, however, and then two individual Infusorians conjugate, exchange some micronuclear elements, and separate. This process seems to promote vigour and variability.

Paraná. (1) An important river of South America, rises as the Rio Grande in the Brazilian state of Minas Geraes, about 100 miles NW. of Rio de Janeiro. It flows north-west and west through and along the southern frontier of Minas Geraes, till it unites with the Paranahyba. It then receives the name Paraná, and turns to the south-west and afterwards to the south, separating Paraná state from Matto Grosso and from Paraguay, round the southern border of which republic it sweeps westward to its confluence with the Paraguay River. It then rolls southward through the Argentine provinces, past Santa Fé, below which its channel frequently divides and encloses numerous islands, and finally south-eastward, till it unites with the Uruguay, above Buenos Aires, to form the Río de la Plata. The entire length of the river is a little over 2000 miles; it drains an area of more than 1,100,000 sq. m. Its chief tributaries, besides those already mentioned, are the Mogy Guassu, Tieté, Paranapanema, Ivahy, Iguassu, and Salado; at San Pedro (33° 40' S. lat.) a delta begins. The principal towns on its banks are Corrientes, Paraná, Santa Fé, and Rosario—all Argentine. The river is navigable at all times to the influx of the Paraguay (705 miles), and except at low water to the mouth of the Iguassu (460 miles). Immediately above this point occurs one of the most remarkable rapids in the world. It extends for 100 miles in a straight line up the river, between ranges of frowning cliffs which confine the stream to a narrow, rocky bed, little more than 100 yards wide. Through this gorge the water pours in tumultuous fury; for above the rapid the river, then $2\frac{1}{2}$ miles broad, rushes down over the Salto de Guayra, an inclined plane 55 feet high, and then forces its waters, tossing and churning, into the narrow channel below. —(2) A southern state of Brazil, on the coast, with an area of 93,269 sq. m., and a population of 686,000, including several colonies of Germans and Italians. The capital is Curitiba (pop. 79,000), 69 miles by rail from Paranaguá, the port of the state (pop. 5000). —(3) Capital of the Argentine province of Entre Ríos, stands on a high bluff overlooking the Paraná, opposite Santa Fé, 364 miles by rail from Buenos Aires. The town was the capital of the Confederation from 1853 to 1861; afterwards it sank rapidly, but has now again a pop. of 36,000.

Paranoia. See **INSANITY**.

Parapet (Ital. *para-petto*, from *parare*, 'to protect,' and *petto*, 'the breast'), a wall raised

higher than the gutter of a roof for protection; in military works, for defence against missiles from without (see **FORTIFICATION**); in domestic buildings, churches, &c., to prevent accident by falling from the roof. In classic archi-

Ornamental Gothic Parapet.

ture balustrades were used as parapets. In early work parapets are generally plain, but later they are pierced and ornamented with tracery.

Paraphrase (Gr. *para*, 'beside,' and *phrazein*, 'to speak') is the name given to a verbal expansion of the meaning either of a whole book, or of a separate passage in it. A paraphrase consequently differs from Metaphrase, or strictly literal translation, in this, that it aims to make the sense of the text clearer by a lucid circumlocution, without actually passing into commentary. The verified passages of Scripture forming part of the Psalms of the Scottish Church are known as 'the Paraphrases.' See **HYMN**.

Paraplegia. See **PARALYSIS**.

Parasite (Gr. from *para*, 'beside,' *sitos*, 'food'; 'one who eats with another; hence one who eats at the expense of another), a common character in the Greek comedies; a low fellow, who is ready to submit to any indignity that he may be permitted to partake of a banquet, and who lives as much as possible at the expense of others.

Parasitic Animals, those that depend on other living creatures for food and for shelter, but are of no compensating benefit to their hosts. Tapeworms in the food-canal, lice on the skin, eelworms in wheat-plants, green fly on rose-bushes, may all be reckoned as parasitic animals, yet it is evident that these four instances are very different from one another. The fact is that parasitism is a mode of life that occurs in many different degrees. An animal may be parasitic on a plant, as the mite of 'Big Bud' on currant bushes; or it may be parasitic on another animal, as the liver-fluke is parasitic first in the water-snail (*Limnæa*) and then in the sheep. Or a parasite may be parasitic on another parasite, as when the young stages of various gall-flies (*Cynipidæ*) live inside Green-flies (hyper-parasitism).

Diverse Degrees of Parasitism.—The parasites may be external (ectoparasitic) or internal (endoparasitic); they may be temporarily parasitic like the gall-flies that emerge from galls, and the horse-hair worms that come out of insects, or they may be quite incapable of living except as parasites, as in the case of tapeworms. Sometimes almost the whole life is spent on or in one host, as in the small fluke, *Polystomum integerrimum*, found in frogs, where only the larvæ are free-swimming for a short period. But in many cases two hosts are required, as in the case of the liver-fluke of the sheep, which spends its young stages in the water-snail. In this case there is a short free-swimming larval stage after the eggs dropped from the sheep are hatched, and a free stage when the final larvæ leave the water-snail; yet there are many life-histories in which the parasite is never really free, but passes from host to host because one devours the other. Thus the *Trichina* passes from rat to pig, and from pig to man.

Another diversity is seen when only one sex is parasitic, in most cases the female. Thus in some of the scale-insects and Copepod crustaceans the females are stationary parasites, whereas the males move about freely. Very extraordinary is the

state of affairs in the green worm *Bonellia*, where the male is microscopic and lives, after a free larval life, in the reproductive duct of the female, which is about the size of a plum. In this case the pigmy male is in a state of arrested development except as regards the reproductive organs. It appears that the male larva is in some measure poisoned by sojourning for a time as an absorbing parasite on the proboscis of a female. Not less strange are the pigmy males of three kinds of deep-water Angler-fish (Ceratioids), which live attached by their mouth to the body of the female. It is obvious, then, that the term parasitism covers a notable diversity of forms and degrees.

But it is necessary to go further. No one would apply the term parasite to active insects like mosquitoes, which suck blood when they get a chance, but how difficult it is to draw the line between these and habitual blood-sucking flies, and between the latter and fleas. It seems that typical parasitism implies not only habitual dependence, but some associated adaptation of structure and some degree of degeneration. Thus fleas, though wingless and adapted for blood-sucking, do not show the degradation of parasitism to the same degree as lice. Or, again, a tapeworm fixed to the wall of the intestine by its head, and absorbing food by its whole surface, is a more characteristic parasite than a threadworm living freely in the food-canal and sometimes moving about within the body. The fact is that the idea of parasitism must be elastic: it implies a relation of dependence in very varied degrees. Some confusion may be avoided if the word is qualified as often as possible. Thus there may be distinguished ectoparasites and endoparasites, temporary parasites and permanent parasites, monogenic (with one host) and digenic (with two hosts). There are obligatory parasites which cannot live a free life, and facultative parasites which are sometimes free, but take to parasitism when an opportunity offers. It is also useful to distinguish parasites according to the part of their host which they infest. Thus intestinal parasites are usually very different from cutaneous parasites, and blood-parasites are often very different from pulmonary parasites.

It makes for clearness to distinguish parasites which feed on the food-material and debris of their host, such as threadworms and Infusorians in the large intestine of many Vertebrates, from those like tapeworms which absorb the digested food around them. On a different grade, however, are parasitic worms, such as the hook-worm (*Anchylostomum*), which draw blood from the wall of the intestine, with results necessarily more serious than those which follow an appropriation of part of the nutriment. Most serious of all are those parasites whose entire *modus vivendi* consists in destroying cells and tissues. Thus the micro-organisms of malaria and sleeping sickness destroy red blood corpuscles; the *Amœbæ* of dysentery destroy the cells lining the intestine, and, it may be, the tissue of the liver. The grubs that hatch out from the eggs which Ichneumon-flies have laid in caterpillars proceed to eat up the tissues of their host.

The question rises whether there is not need for an entirely separate category for those animals that are parasites in the wide sense, and yet show little or no trace of degeneracy. Thus the Trypanosomes of sleeping sickness and allied diseases are exceedingly active Infusorians. During part of their life in the blood of their final host they move about very rapidly and show great aggressiveness in reference to the blood corpuscles. Some term like 'endophagous' seems to be needed to express the fact that these Trypanosomes are microscopic beasts of prey devouring from within,

just as others of larger size might devour from without. Similarly, the larvæ of Ichneumon-flies are not always in any marked degree degenerate; they actively eat the caterpillar; they are sometimes almost as much predatory as parasitic. In any case, it must be allowed that parasitism occurs in many different modes and degrees.

Kinds of Animal Parasites.—There are some kinds of animals that could not readily become parasitic, such as lung-breathing animals and those that require fresh currents of water. Thus there is an exclusion of amphibians, reptiles, birds, and mammals, pulmonate snails, spiders with their lung-books, and so on. Yet there are some surprises. No one would expect such an animal as a fish to be capable of parasitic life, but three cases are known of Ceratioid Angler-fishes with the males intimately parasitic on the females. The Cyclostome Myxine, or hag-fish, is temporarily parasitic inside a fish—e.g. cod caught on the deep-sea lines of the fisherman. No one would expect such an intensely active air-breathing animal as an insect to be capable of parasitic life, yet the name of parasitic insects is legion. Most of them are of small size, sometimes with relatives that live in crevices. It seems impossible to think of a highly specialised, energetic, air-breathing animal like a scorpion becoming a parasite, and yet some of its not very distant relatives, among the book-scorpions, show ectoparasitism. On the other hand, there are entire classes of animals given over to parasitism, like the Sporozoa, the flukes or Trematodes, and the tapeworms or Cestodes. Of the Nematodes or threadworms, some are free-living and some live in rotten substances, but most are parasitic.

The Hosts of Parasites.—Most animals, except some of the simplest, are subject to parasites; but it is a very important fact that in most cases the infestation is not very prejudicial. In a multitude of cases a give-and-take *modus vivendi* has been established between the accustomed host and the parasite, so that little harm is done. Antelopes and some other wild animals in tropical Africa are abundantly infected with Trypanosome microbes (Infusorians in this case), which are regarded by many as identical with those that cause sleeping-sickness in man, and allied diseases in horses and cattle. In the antelope they are, so to speak, at home, and do little appreciable harm, perhaps because these 'natural reservoirs' produce counter-active anti-bodies in the blood; but, when the Tse-tse flies transfer these Trypanosomes from a wild host to man or cattle, there is very serious disease. In most cases where parasites are deadly it is because they have been transferred to an unwonted host that has no counteractives to check the over-multiplication of the intruder. To take another instance, the red grouse usually contains in its food-canal a great multitude of delicate transparent threadworms, but as long as the birds are vigorous there seems to be little injurious effect. Should the grouse become weakly, through lack of food or very bad weather or some other cause, then the parasites may begin to multiply greatly, and bring about a kind of disease. It looks as if vigorous health served as a check to parasites, keeping them within bounds. It is very unusual to find an earth-worm that does not contain numerous Sporozoa (*Monocystis*) in its reproductive organs, but it is difficult to say that they do much harm, unless some change in the host's condition induces their unusually prolific multiplication. Even ectoparasitic insects sometimes become extraordinarily numerous when the host is for some reason or other weakened and non-resistant.

Another important fact in regard to the hosts that tenant parasitic animals is that each host has

often its own particular parasites which do not occur elsewhere. In many cases there is a remarkable specificity even in regard to ectoparasites, such as fleas and lice. There are instances, no doubt, of the reverse, as with the liver-fluke, which occurs in cattle, horses, deer, camel, antelopes, goat, pig, beaver, squirrel, kangaroo, and even, very rarely, man. But this is altogether unusual; specificity is the rule. The discovery of a new bird or mammal is usually followed by the discovery of new parasitic worms in the food-canal. Some of these particular parasites of particular hosts are well-defined species; but there are others much less distinctive, and the question rises whether the peculiarities may not be modifications imprinted by slight peculiarities in the host. More experiments should be in the way of transplanting parasites from one host to another to see whether the change of environment modifies the structural characters.

While parasites are widespread, some hosts are more susceptible than others, partly because they are more accessible—e.g. more sluggish, and partly because they eat a greater variety of food. Thus the slow-going sun-fish is often copiously infested, and the omnivorous pig is the home of a multitude of parasites, and even man has far over half-a-hundred. It is a small point, yet often obscured, that a parasite that finds its habitat in the food-canal of the pig or the like is merely discovering safe and comfortable quarters with an abundant food-supply. The unwary are apt to read into the parasite an awareness of where it is and what it is doing!

Origin of the Parasitic Habit.—It is probable that most cases of parasitism began gradually. Animals found temporary shelter on or in others, and the habit grew upon them. In some cases it might begin fortuitously—e.g. as the embryos or adults wandered or were swallowed; or it might be that the change of habit saved those which adopted it from extreme keenness in the struggle for existence; or it might simply express a sluggish constitution. In many cases, however, we can hardly doubt that the habit began with the naturally more sluggish females, prompted not by hunger, but by the impulse to seek some conveniently sheltered place for the birth of the young. In fact, there are not a few parasitic female Crustaceans whose mates live freely. Of the evolution of parasites from free-living ancestors the free stages still included in the life-history of most, the close relationships between some free and some parasitic members of the same class—e.g. Crustaceans and Nematodes—and the frequent occurrence of temporary parasitism afford sufficient evidence. It is also instructive to consider the three classes of Plathelminthes—Turbellarians (Planarians, &c.), Trematodes (Flukes, &c.), and Cestodes (Tapeworms, &c.)—of whose genetic relationship there seems little doubt; the Turbellarians are almost all free-living; the Trematodes are mostly external, but sometimes internal parasites; the Cestodes are all endoparasitic.

Life-history of Endoparasites.—Most endoparasitic animals have an eventful life-history. They are not always parasites, or they are not always parasites within the same kind of host. Many of them are at some time free; many of them have some sort of metamorphosis. But, as their life-histories are very various, they do not readily admit of being summed up in general statements.

Let us begin, however, with the adult sexual animals. In this state they are always almost parasitic, partly because rich copious diet, warmth, and relative quiescence favour reproductive maturity; partly because many probably began their parasitic career at the reproductive period, when shelter and

readily attained food were specially advantageous; partly because it is not likely that animals which had become parasitic would relinquish this habit in adult and mature life. In fact, with the exception of some thread-worms (*Gordius*, *Mermis*, &c.) and some few insects (ichneumon-flies, gad-flies, &c.) which are parasitic in their youth and free as adults, it is generally true of parasitic animals that the eggs are produced, fertilised, and deposited in the parasitic stage. In regard to the reproduction it should be noted (1) that the fertility is often enormous, for a tapeworm may produce 42,000,000 eggs, and a female thread-worm 64,000,000 in a year; (2) that in those cases where the female alone is parasitic fertilisation may take place before parasitism has begun; that otherwise it occurs within the body of the host; that all Cestodes and most Trematodes are hermaphrodite, and that some of them show self-fertilisation or autogamy; (3) that in tapeworms the fixed 'head' buds off a long chain of joints, each of which is sexually complete, becomes eventually distended with eggs and embryos, and is liberated singly or along with others from the intestine of the host.

In connection with the prolific multiplication of many endoparasites, there are two ways of looking at the facts. In the first place, the stimulating nature of the food and the easy-going conditions of life will tend to promote reproductivity. In the second place, the chances of death are so great, when the life-history is intricate and involves two hosts, that the surviving types have been those that varied in the direction of prolific multiplication, or of working, so to speak, with a large margin. But the two aspects are not inconsistent: the constitutional nature may be favoured by the environmental nurture.

The eggs or embryos of the parent endoparasite usually pass from the host along with the excreta, and 'there are no intestinal worms, at least among the typical and constant parasites, whose embryos come to maturity near the parent; or, in other words, there are none which pass their whole life-cycle in one locality.' Some of the embryos are locomotor—e.g. those of the liver-fluke and of *Bothriocephalus latrus*; others are passively carried along with the food and drink into new hosts. There the embryos rarely become or remain quiescent, but wander from the food-canal through the tissues and organs of the host until a fit resting-place is found. But, to state another of Leuckart's general conclusions, 'the quiescent stage following upon the wandering embryonic stage does not conclude the life-history of the parasite, which requires, in order to complete its development, a radical change in its environment—in other words, a second migration.'

But before leaving the so-called intermediate host—which is different from that of the parent or that of the adult—we should notice that within it asexual multiplication may occur. Thus, several asexual generations characterise that part of a liver-fluke's life during which it sojourns in a water-snail (*Limnaea*) prior to reaching its final or 'definitive' host in the sheep. In other cases the asexual multiplication within the intermediate host is of a simpler kind, being restricted to budding, as when the bladder-worm or proscotex of *Tænia echinococcus* within ox or man develops many 'heads' or scolices, each of which on being transferred to dog or wolf will grow into a tapeworm. Or there may be no true multiplication—e.g. in the numerous bladder-worms which form only one head, and remain quiescent until the host happens to be devoured by another, within which the 'head' of the bladder-worm may bud off an adult tapeworm chain.

Connected with this change of host there are two main problems: (1) How is the change effected?

PROTOZOA. Rhizopoda. Gregarinida. Infusoria.	A few parasitic. All parasitic. Many parasitic—e.g. Ichthyophthirus Opalina Trypanosome	Amœbæ of dysentery, &c. in man. In all sorts of animals; e.g. the Malaria parasite (Plasmodium) in man and mosquito. Outside fishes. In gut of frog. Causing sleeping sickness in man.	Usually intracellular parasites during part of life. Many occur within the blood-cells of birds, reptiles, &c. Transmitted by Tse-tse fly.
SPONGES. Coelenterata.	Probably none in strict sense. Very rare instances: Medusoid <i>Cunina</i> (<i>Cunocanthina</i>) parasitica. <i>Cunina</i> (<i>Cunocanthina</i>) <i>octoraria</i> . The Hydroid <i>Polypodium hydri-</i> <i>forme</i> is in one stage parasitic. All parasitic.	In another Medusoid, <i>Geryonia</i> <i>proboscidioides</i> . In the bell of the Medusoid Turritopsis. On the ova of the sterlet (<i>Acipen-</i> <i>ser ruthenus</i>). Orthonectida (Rhopalura), in a brittle-star (<i>Amphipura squa-</i> <i>mata</i>), in a Nemertean worm (<i>Lineus lacteus</i>), Dicyemidæ (<i>Dicyema</i>) in cuttle-fish.	Clione bores in oyster-shells, &c., and cases of commensalism are recorded. A Medusa (<i>Mnestra</i>) on the neck of the pelagic Gasteropod Phyllirhoe, and the frequent occurrence of a sea-anemone on a hermit-crab illustrate com- mensalism. These forms are perhaps very primitive, perhaps very degen- erate, worm-types.
'MESOZOA.' 'WORMS.' { Turbellaria (Plan- arians, &c.). Trematoda (Flukes, &c.). Cestoda (Tape- worms, &c.).	Mostly free-living; a few genera are parasitic: All parasitic, many externally, and usually on one host. Many internally, and then re- quiring two hosts. All parasitic; the mature sexual forms in vertebrates, except in the case of Archigetes, which becomes mature in the fresh- water worm Tubifex.	Graffilla in marine molluscs. Anopodium in or on Holothu- rians. Especially on fishes. The first usually a mollusc, the second some vertebrate. All sorts of vertebrates contain both stages, the adults in the gut, the immature forms usu- ally in the flesh. But the im- mature stages have also been found in some molluscs, Ar- thropods, and worms. Two occur on crabs. In bivalves. The majority in the digestive tract of vertebrates; but they may be transferred from a lower host to a higher—e.g. from insect to mammal. <i>Ech. proteus</i> lives as adult in pike, &c., in youth in the amphi- pod <i>Gammarus pulex</i> ; <i>Ech.</i> <i>angustatus</i> of perch in the isopod <i>Asellus</i> . <i>Ech. gigas</i> occurs in the pig. The minute males of Bonellia and Hamingia live within the females. On Crinoids.	'Monogenetic.' 'Digenetic.' Two hosts are requisite to com- plete the life-history of the parasite. The final host usu- ally devours the intermediate one.
Nemerteans (Rib- bon-worms). Nematoda (Thread-worms). Acanthocephala.	Almost all free-living. Malacobdella. Many parasitic; many free. In man occur <i>Ascaris lumbricoides</i> , <i>Oxyuris vermicularis</i> , <i>Filaria</i> <i>sanguinis hominis</i> , <i>Filaria med-</i> <i>inensis</i> , <i>Trichinella spiralis</i> , &c. The class includes several genera, all parasitic, notably Echino- rhynchus.	Two occur on crabs. In bivalves. The majority in the digestive tract of vertebrates; but they may be transferred from a lower host to a higher—e.g. from insect to mammal. <i>Ech. proteus</i> lives as adult in pike, &c., in youth in the amphi- pod <i>Gammarus pulex</i> ; <i>Ech.</i> <i>angustatus</i> of perch in the isopod <i>Asellus</i> . <i>Ech. gigas</i> occurs in the pig. The minute males of Bonellia and Hamingia live within the females. On Crinoids.	The life-histories are often very complex, and may include al- ternation of generations. Many infest plants.
Chaetopoda (bristle-bearing worms). Hirudinea (Leeches). Rotifera.	Almost all free-living. Three or four marine forms are parasitic. Myzostomidæ are ectoparasitic and form galls. Most are ectoparasitic (the rest wandering carnivores). Mostly free-living, a few parasitic —e.g. Seison. Albertia.	On molluscs, fishes, amphibians, &c. On crustacean Nebalia. In earthworm and slug.	Branchiobdella, which some rank among Chaetopods, is parasitic on fresh-water crayfish. This family probably represents Chaetopods degenerated by parasitism. In many, however, the ecto- parasitism is very temporary.
ECHINODERMATA.	None parasitic.		
ARTHROPODA. Crustaceans.	There are many parasites among Copepoda—e.g. Chondracanthus. Caligus. Lernæa. Among Cirripedia—e.g. Sacculina. Among Isopods—e.g. Bopyrus and Entoniscus.	Usually on skin, gills, &c. of fishes. Beneath the tail of crabs. On fishes.	These illustrate (a) many grades of parasitism—temporary, peri- odic, thoroughly established, and (b) corresponding grades of degeneration.
INSECTS.	The vast majority are free-living, but ectoparasitism is illus- trated by Bird-lice (Mallophaga). Lice (Pediculidæ). Strepsiptera. (Many are parasitic on plants.) Endoparasitism by the larvæ of Ichneumon-flies. Gad-flies.	} Mostly on birds and mammals. In bees and wasps. In other insects. In mammals, cattle, horses, &c.	The females only are parasitic, the males free.
Arachnida.	The majority are free-living, but parasitism is illustrated by Linguatulina (Pentastomum). By some Acarina (mites).	Embryo in rabbit; adult in frontal sinuses of dog and wolf. <i>Demodex folliculorum</i> , Sarcop- tes (itch-mite), in skin of man, &c.	With little trace in adult of Arachnid appearance.
MOLLUSCA.	All free-living, except a few Gasteropods. <i>Entoconcha mirabilis</i> . Eulima and Stylifer.	Within Holothurian Synapta. On or in various Echinoderms.	
VERTEBRATA.	The hagfishes (Myxinoidei) bore in cod and the like. The males of three or more kinds of Deep-sea Angler-fishes are external parasites on the females.		

(2) how did this extension of the life-history to two distinct hosts arise? In regard to the modes of transference it will be enough to give two illustrations. The young liver-fluke actively migrates from a water-snail and from the water, encysts on stems of grass, and is then eaten by a sheep. Here, and in some other cases, the migration is in part active. On the other hand, the bladder-worm of the pig lies quite passive in the muscles or connective tissue of that animal, and cannot reach its final host unless 'measly' pork be eaten by man. Here, and in most other cases, the migration is passive. The second problem is very difficult. Is the host in which the adult is found the primitive host, and has that of the immature stages been intercalated? or is the intermediate host really the primitive one in which the animals used to become mature, while the final host represents a secondary prolongation of the life-history? Leuckart expresses himself unconditionally in favour of the second theory that 'the intermediate hosts were originally the true definitive carriers, which formerly brought their intestinal worms to sexual maturity, but have since become merely intermediate, because the development of the parasites has extended itself over a greater number of stages in the course of further differentiation.' It should be kept in mind that many of the Trematodes require only one host, while others require two; the first state of affairs is probably the more primitive. In Archigetes we have an example of a primitive tapeworm which completes its life-history in the river-worm, Tubifex. This, again, is probably primitive.

Environment of Parasites.—Parasites vary in different parts of the body and in different hosts, and it is admitted by all that parasites exhibit 'adaptations' to their life and surroundings. It is therefore important to take account of the precise relations between host and parasite. Ectoparasites will experience mechanical influences due to the movements of their bearers, they will often be carried from one locality to another, they will sometimes share in the warmth of their hosts, they usually find abundant food, and they are often not only sheltered but sedentary. Endoparasites will experience pressure from the tissues in which they lie, or from the peristaltic movements of the food-canal in which they are lodged; their immediate environment usually involves confined space, scant oxygen, considerable warmth, and total darkness; they will be affected by abundant and rich nutrition, by surrounding gases and juices, and by their frequently sedentary life. The frequent absence of sense-organs may be associated with the unstimulating conditions of life; the absence of a food canal in Cestodes and the absorptive character of the skin may be associated with the fact that these parasites float in the digested food of their host; the prolific multiplication may be associated with the abundant and rich nutrition; and so on. There are many obvious adaptations, e.g. the possession of attaching organs, and many subtle adaptations, e.g. the occurrence in the parasite of a substance counteractive to the digestive juice of the host. It is unlikely that these adaptations have arisen by the hereditary accumulation of direct modifications or adjustments; it is likely that they represent the result of the action of natural selection on germinal variations. But it is important to bear in mind (1) that the peculiar environment of parasites may have served as a stimulus, prompting germinal variations some of which were in an effective direction, and (2) that the peculiar environment supplies in each individual development the appropriate and essential stimuli for the expression of the hereditary characters.

Very instructive is the parasitism of the microscopic male Bonellia. The female of *Bonellia viridis* is a green marine worm with a body about the size of a plum and a slender, bifid proboscis, that may be two feet long. Out of the liberated eggs there emerge microscopic free-swimming larvae. Some of these eventually settle down in the mud or between stones, and these develop into females. Others settle down on the proboscis of an adult female and become mouthless males, with arrested development. The arrest appears to be due to the absorption of some substance from the skin of the proboscis, and experiment has shown that a very short sojourn on the proboscis is followed by the development of inter-sex forms between male and female. In the ordinary course of events, the pigmy males leave the proboscis and undergo a final change within the mouth-cavity of the female. Eventually they leave this and pass into the reproductive duct, where they spend the rest of their life. In that strategic position they are obviously able to fertilise the eggs produced by the female.

Effects of Parasites on their Hosts.—In the 17th and 18th centuries the injurious effects of parasites were much exaggerated. All sorts of diseases, including many which we now know to be associated with Bacteria, were said to be due to 'worms,' and physicians gravely discussed '*An mors naturalis sit substantia verminosa?*' As accurate diagnosis began to be less unusual, a strange reaction in favour of parasites found many supporters. Intestinal worms were called 'the good angels and unfailing helpers of children,' and were said to aid digestion and even development. But since the middle of the 19th century, when the experimental study of parasites began in earnest, a knowledge of the various injuries which parasites may do, to man and to domesticated animals at least, has become more and more precise and complete. Only a few illustrations need be given. Numerous large parasites will diminish the nutritive supplies of their host; large bladder-worms and the like press upon adjacent organs, cause obstructions, and give rise to many troubles; the movements and migrations of parasites within the body of their host produce inflammation, and may even result in the perforation of important organs. Some parasitic worms produce injurious toxins. Even external parasites may do internal damage; e.g. those crustaceans which occur beneath the tails of crabs, and sometimes effect the castration of their hosts. While there are many parasites whose effects are very slightly injurious, some of these act as disseminators of other parasites, e.g. Bacteria, or prepare the way for them. The three most important measures to be taken against parasites are to secure (1) cleanliness of body and surroundings; (2) wholesome, and, in the case of man, sufficiently cooked food; and (3) pure water.

Historical.—Most of the ancient and mediæval naturalists and physicians who expressed any opinion on such matters believed that parasites were spontaneously generated within the bodies of their hosts. It was not till the 17th century, when Swammerdam and Redi showed how maggots, lice, &c. developed from eggs, that the belief in *generatio æquivoca* began to be seriously disputed. It was gradually replaced by the theory that parasites came from without, that, ceasing to be free-living, they entered the bodies of other animals and were there modified. But this conclusion was too hastily leaped at, and no care was taken to prove that the free-living forms in question did really develop into parasites. In many cases, indeed, it was soon shown that they did not, and this disappointing result helped Pallas and others in the latter part of the 18th century to recognise rightly that parasites were propagated like other

animals by means of eggs. They concluded, however, that these eggs were more or less directly carried from one host to another, there to develop into the original form, while we know that the life-history of parasites is rarely so simple; nor was there more than a slight warrant for another favourite idea that young animals inherited parasites from their mothers. At the beginning of the 19th century the helminthologists, such as Rudolphi and Bremser, were very active and greatly extended the list of known parasites, but the life-histories remained a puzzle, and many naturalists relapsed into a belief in spontaneous generation. The increasing use of the microscope led to most important results: in 1831 Mehlis discovered the Infusorian-like embryo of certain flukes; Von Siebold (1832) detected the six-hooked embryo within the still unliberated ova of the tapeworm; Eschricht (1841) compared the life-history of internal parasites to that of ichneumon-flies and bot-flies; Steenstrup (1842) published his famous essay on alternation of generations; Von Siebold (1843-50) and Van Beneden (1849-50) worked out the metamorphoses of several parasitic worms; Küchenmeister (1853), Leuckart (1856), and others showed experimentally how infection with larval stages resulted in the development of adult parasites. The foundations of modern helminthology were thus laid, and we have now a vastly increased knowledge of the number of parasites, a precise acquaintance with the life-history and migrations of some of the most important, a scientific system of medical diagnosis and treatment, and some realisation of the general biology of parasitism.

The importance of animal parasites in human history deserves consideration. The world-shaking diseases of malaria and sleeping-sickness are due to parasitic Protozoa. It is likely that the Guinea Worm was the fiery serpent that troubled the Israelites on their desert journeys, and it troubles man still. The formidable Bilharzia is the cause of serious disease—e.g. among British soldiers in Egypt. The heaviest mundane cloud of disease and despair that has ever rested on the human race is caused by hookworms in warm countries. When we think of stock and crops as well as of man himself, we become still more convinced of the economic and historical importance of animal parasites. But they are being gradually conquered or circumvented.

See ACARINA, ASCARIS, BOT, BOTHRIOCEPHALUS, COMMENSALISM, CORN INSECTS, DEGENERATION, ENVIRONMENT, FISH-LOUSE, FLUKE, GALLS, GREGARINIDA, GUINEA-WORM, HAG, LEECH, LICE, TAPEWORMS, THREAD-WORMS, TRICHINA; also Leuckart, *Parasites of Man* (trans. by Hoyle, 1896); Küchenmeister, *Animal and Vegetable Parasites of the Human Body* (trans. Sydenham Society 1857); Cobbold, *Parasites* (1879); Van Beneden, *Animal Parasites and Messmates* (trans. 1876); Massart and Vandervelde, *Parasitism Organic and Social* (1897); Braun, *Animal Parasites of Man* (trans. 1905); Brumpt, *Précis de Parasitologie* (1910); Hegner and Cort, *Diagnosis of Protozoa and Worms Parasitic in Man* (Baltimore, 1921).

Parasitic Diseases constitute an important sub-group in the accepted classification of Disease (q.v.). In these diseases certain morbid conditions are induced by the presence of animals or vegetables which have found a place of subsistence within some tissue or organ, or upon some surface of the body of man or other animals. Plants are not exempt from disorders of this nature (see PARASITIC PLANTS). The forms of animal life giving rise to parasitic diseases are described in articles on Ascaris, Cestoid Worms, Flea, Guinea-worm, Itch, Lice, Nematelmia, Tape-worms, Thread-worms, Tick, Trichina, &c.

The vegetable organisms which are associated with special diseases are almost all of microscopic

size, and their effects are of much greater importance than those of animal parasites, while they are much more difficult to study and control. Certain minute fungi have long been recognised as the causes of diseases in the skin and mucous membranes: Favus, Pityriasis versicolor, Ringworm, Thrush (q.v.). It was shown in 1861 by Carter that a serious disease of the foot which occurs in India (Madura-foot, fungus-foot, &c.) is due to the presence of a fungus; and in 1877 what is now called Actinomycosis (q.v.) was put in the same category.

But the most important and interesting of the vegetable parasites are those belonging to the Schizomycetes or Bacteria (q.v.), whose study has assumed such prominence that it has now become an independent science (Bacteriology). The relations of these organisms to their host are much more intimate than in the case of the larger parasites, and the problems presented by the diseases associated with them are consequently much more difficult of solution; but in many cases the bacterial cause of these diseases has been completely established. In other cases minute animals, e.g. trypanosomes in sleeping-sickness, amœbæ in dysentery, cause the infection. See GERM.

Parasitic Plants are those which, unable to nourish themselves, prey upon other plants or animals; becoming attached, they gain access to the tissues of their host and feed upon its juices. They are more or less degenerate, according to the extent of their parasitism. Many parasites have probably developed from climbing plants. The mistletoe, on the other hand, has no roots in the ground; its seed is left by a bird upon a tree, to which, when it begins to grow, it becomes attached by means of special organs called haustoria, which act as roots and enable it to draw crude sap, water, and salts from its host; and having green leaves it can absorb carbonic acid gas from the air, and elaborate food for its tissues. In the case of the dodder, again, which begins life as an independent plant, the seed germinates underground; when the young plant reaches the surface it fastens upon some host, twining round it, sending its haustoria deep into the tissues, and drawing almost all its nourishment from them. It has, indeed, some chlorophyll, but not enough to do its own assimilation. The part in the ground soon dies. In the Rafflesiaceæ, a foreign family, remarkable for the size of the flowers of some of its genera, the degradation has gone still further, and the whole plant consists of haustoria, a knob-like mass of tissue half formed by the host, and the flowers. There are some parasites which are attached to the roots instead of the stems of their hosts—e.g. Yellow Rattle, Cow-wheat, Eye-bright. The attachment by the haustoria is always remarkably intimate; the tissues are always joined to the corresponding ones of the host, often in such a way that it is difficult to say which plant they belong to. The ovules of many parasites are rudimentary, the embryo is small and without chlorophyll; in cases of advanced parasitism it may even produce no leaves. There are parasitic genera in many families—e.g. Corallorrhiza in the Orchideæ, Cuscuta in Convolvulaceæ, Orobanchæ in Orobanchaceæ, Monotropa in Pyrolaceæ. The Loranthaceæ, of which is Viscum the mistletoe, the Balanophoraceæ, and the Santalaceæ are families of doubtful affinity. Nearly all these parasites have a marked preference for a particular species of host, and they are all flowering plants. But there are many others; the Fungi are either parasitic or, what is much the same thing, saprophytic—i.e. dependent upon decaying organic matter for food. Many of them are a trouble in agriculture, causing corn, hop, and vine mildew, potato disease (see PLANTS, DISEASES OF); others, like the mushroom, are saprophytes. The bacteria may have animals as their hosts, and

cause in them many diseases, the species being often recognised by the disease. When they are saprophytic they cause fermentation and putrefaction. Allied to parasitism is Symbiosis (q.v.), a sort of mutually arranged and beneficial parasitism; as in the case of the Lichens, which consist of Algae and Fungi in partnership.

Parathyroid. See GLANDS.

Paratoluidin. See TOLUIDIN.

Paravane, a torpedo-shaped contrivance towed from both sides of a ship, and so constructed as to remain at a certain depth and at a certain distance from the vessel. The device, a British invention of the Great War, was used (1) for the destruction of submerged submarines; (2) for the protecting of ships against mines, and more generally for the breaking up of hostile minefields. In the first case, in encountering a submarine a heavy explosive charge borne by the paravane was exploded by means of an electric current passing along the towing line; in the second, the mooring wires of anchored mines were deflected along the paravane's towing line to a shear-like arrangement at its head, and there being severed, the attached mines floated and were exploded by rifle-fire. Destructive paravanes were inferior in destructive power to depth-charges. The protective paravanes of merchant ships were known as 'otters.'

Paray-le-Monial, a town of Saône-et-Loire, 48 miles by rail W. by N. of Mâcon, celebrated for its chapel, in which Mary Alacoque (d. 1690) believed herself to have had a vision of the Saviour; the chapel is the object of pilgrimages by the confraternities of the Sacred Heart (q.v.).

Parcæ. See FATE.

Parchim, a town of Mecklenburg-Schwerin, 23 miles SE. of Schwerin; pop. 11,000.

Parchment (Fr. *parchemin*, Lat. *pergamena*, through Gr. from *Pergamos*), a writing material made from the skins of animals. The material was used from very early times, but its manufacture is said to have been brought to perfection by Eumenes II. of Pergamos (197-158 B.C.), the exportation of papyrus having been forbidden from Egypt. The Romans appear to have written chiefly on papyrus, and this practice was continued in Italy till about the 10th century, but parchment was also used; and from that time till ordinary paper became available in the 14th century parchment was almost the only material employed (see PALÆOGRAPHY, PAPER). Some of the earliest printed books, however, were done on vellum (by which was meant originally a parchment made of calf-skin), and on a specially fine vellum, made from the skins of calves prematurely born, some of the best of the early miniature portraits were painted. Ordinary parchment is chiefly made of sheep-skins, but those of calves and goats are also used. Fine parchment and vellum are prepared from the skins of kids, lambs, and young calves. A coarser parchment for drumheads, tambourines, &c. is manufactured from the skins of male goats, wolves, and calves. A peculiar kind is made from asses' skin, and for bookbinders' use a parchment is sometimes prepared from pig-skin. The early stages in the manufacture of parchment are the same as for Leather (q.v.). After being unhaired and cleaned, the skins are stretched evenly upon a stout wooden frame called a *horse*. The flesh side of the skin is first gone over with a double-edged semicircular knife (fleshing-tool) to remove adhering particles of flesh. With the fleshing-tool inverted, to prevent any cutting of the epidermis, the other side of the skin is then scraped to remove dirt and to squeeze out some of the absorbed water. For some purposes for which

stout parchment is required the skin is now merely allowed to dry on the frame, no further treatment being required. But fine parchment for writing or drawing upon, some of which is made from split skins, is sprinkled over with sifted chalk on the flesh side and rubbed smooth with a flat surface of pumice-stone. The grain side of the skin also is rubbed over with pumice, but no chalk is used. Great care requires to be taken not to fray the surface, and certain precautions are necessary during the drying of the parchment. Any considerable roughness or unequal thickness is removed by the skin being again scraped and pumiced.

VEGETABLE PARCHMENT.—This substance was first patented by W. E. Gaine in 1853. It is made by dipping ordinary unsized paper for a few seconds in concentrated sulphuric acid mixed with one-half its volume of water, and then quickly removing all trace of the acid by passing through water, then through a weak solution of ammonia, and once more through water. This simple treatment produces a remarkable change in the paper. It acquires a parchment-like texture; turns translucent, especially when thin; and becomes about five times stronger than ordinary paper. Vegetable parchment is also impervious to water, but is rendered soft and limp when dipped into it. A solution of chloride of zinc acts on paper in a similar way. Stout qualities of vegetable parchment have been used for book-covers and for writing deeds upon. Thin sheets of it serve as a convenient material for tracing designs, plans, &c. But it is now chiefly employed for covering jars of preserves and for like purposes.

Pardo Bazán, EMILIA, CONDESA DE (1851-1921), Spanish novelist, was born at Coruña. Her early works were romantic in type, but, passing under the influence of Zola, she became a realist and apologist for the French naturalistic school; her *Un Viaje de Novios* (1881) first revealed these tendencies. Her greatest works are *La Cuestión palpitante* (1883), *Los Pazos de Ulloa* (1886), *La Madre naturaleza* (1887), *La Piedra angular* (1891), and *Dulce dueño* (1911). Of her dramas, *Verdad* and *Cuesta abajo* were most successful. Pardo Bazán has been claimed as the greatest Spanish novelist of her time. She was an ardent feminist.

Pardoe, JULIA (1806-62), born at Beverley, published poems and a novel in her fifteenth year. Thereafter travels in Portugal, Turkey, and Hungary provided material for various vivid descriptive works. These were followed by several studies, not always historically accurate, in French history, and by numerous novels.

Pardon, in Law, is the remission of the penalty imposed on a person who has been tried and convicted. A pardon is outwith the range of judicial discretion. The power to grant a pardon is the prerogative of the crown. The crown, in exercise of the prerogative of mercy, may grant either an absolute pardon, by which the execution of the sentence is altogether remitted and the offender is restored to the status which he held before conviction, or what is known as a conditional pardon, by which the sentence is modified or commuted. The crown's power of pardon is not entirely universal. Thus, under the Habeas Corpus Act, 1679, the king cannot pardon the offence of sending a prisoner out of England to evade the writ of *habeas corpus*. Again, he cannot pardon a person convicted of a common nuisance until after the nuisance has been abated; for this offence, during its continuance, partakes more of the character of an injury to persons in the neighbourhood than of a public wrong and a pardon, while the nuisance continues, might prejudice the rights of the private persons injured by the nuisance.

Moreover, by the Act of Settlement (12 and 13 Will. iii. cap. 2), a pardon by the crown cannot be pleaded as a defence to an impeachment by the Commons in Parliament so as to prevent the trial; but, after conviction on impeachment, the crown may pardon the offender. The duty of advising the crown in the exercise of the prerogative of mercy rests, in England, with the Home Secretary, and, in Scotland, with the Secretary for Scotland. At common law, pardons must be under the Great Seal; but, by the Criminal Law Act, 1827, it is enacted that a pardon by a warrant under the royal sign manual (countersigned by a principal secretary of state) shall have the effect of a pardon under the Great Seal as to the felony for which the pardon is granted. The Criminal Appeal Act of 1907, which provides, subject to safeguards, an appeal from the verdict of a jury or the sentence of a judge, has, in England, had the effect of diminishing the number of cases falling to be dealt with in the exercise of the royal prerogative of mercy. Under the act, the execution of a judgment is suspended from the time of giving notice of appeal and, where an appeal is brought by leave or of right, until the appeal is determined. The act, too, in sect. 19, contains provisions which empower the Secretary of State, if he thinks fit, on the consideration of any petition for the exercise of His Majesty's mercy, having reference to the conviction of a person on indictment, or to the sentence (other than sentence of death) passed upon a person so convicted, either (a) to refer the whole case to the Court of Criminal Appeal for its decision, in which case the court may set aside the conviction; or (b), if he desires the assistance of the Court of Appeal on any point arising out of the petition, to refer that point to the court for its opinion thereon, in which case the court furnishes the Secretary of State with its opinion upon the point so referred. The Children Act, 1908, enacts (sect. 84) that, where a youthful offender has been sentenced to imprisonment or penal servitude, and has been pardoned by His Majesty on condition of his placing himself under the care of some charitable institution for the reception and reformation of youthful offenders, the Secretary of State—in Scotland, the Secretary for Scotland—may direct him, if under the age of sixteen years, to be sent to a certified reformatory school for a period of not less than three and not more than five years, but not in any case extending beyond the time when he will attain the age of nineteen years. The endurance of the punishment awarded an offender by the court, or of that substituted by the crown, has (in the case of a non-capital felony) the effect of a pardon under the Great Seal, as to the felony whereof the offender was convicted. Accomplices, when admitted to give evidence for the crown, are so admitted under an implied promise of pardon, on condition of their making a full and fair confession of the truth. On performance of this condition, they, though not of right entitled to pardon, have an equitable title to a recommendation for the king's mercy. The crown's right of pardon is usually delegated to the colonial governor, in the case of persons convicted in the courts of a colony. A pardon may also be granted by Act of Parliament. By an act of indemnity any person may be relieved from disabilities and penalties which he has incurred by having contravened the law. Thus by the Indemnity Act, 1920, legal proceedings are forbidden against persons in the service of the crown for anything done in good faith in the public interest during the war within or without the British dominions.

Pardubitz, a town of Bohemia, on the left bank of the Elbe, 55 miles by rail E. of Prague, has a fine 16th-century castle. Pop. 20,000.

Paré, AMBROISE, the father of modern surgery, was born about the beginning of the 16th century, at Laval, in the French department of Mayenne, was trained at the Hôtel Dieu of Paris, and in 1537 as surgeon joined the army starting for Italy. In a later campaign he improved the mode of treatment of gunshot wounds, a treatment which had up to then been of the most barbarous kind—cauterisation with boiling oil. It was during this campaign that he substituted ligature of the arteries for cauterisation with a red-hot iron after amputation. Many other important improvements in surgery were introduced by him at this time. In September 1552 he was appointed surgeon to King Henry II., and afterwards to Charles IX. and Henry III. He died at Paris in December 1590. His writings, of which the principal was *Cinq Livres de Chirurgie* (1562), have exercised a great influence on the practice of surgery in all countries. See Stephen Paget, *Ambroise Paré and his Times* (1897); and F. R. Packard, *Life and Times of Ambroise Paré* (1922).

Paregoric, or PAREGORIC ELIXIR (from the Gr. *parégorikos*, 'soothing'), the *Compound Tincture of Camphor* of the British Pharmacopœia, consists of an alcoholic solution of opium, benzoic acid, camphor, and oil of anise, every fluid ounce containing 2 grains each of opium and benzoic acid, and $1\frac{1}{2}$ grains of camphor. This preparation is much used both by the profession and the public. In doses of from 30 to 60 drops it is an excellent remedy for the chronic winter-cough of old people, the opium diminishing the bronchial secretion and the sensibility of the pulmonary mucous membrane, while the benzoic acid and oil of anise act as stimulating expectorants. It has also been found useful in chronic rheumatism, and, especially in the case of children, to relieve slight pains in the stomach and bowels.

Pareira-Brava, a lofty climbing shrub inhabiting the forests of Peru and Brazil, and bearing bunches of oval berries resembling grapes. The botanical source was for some time obscure, but it is now known that the plant yielding the root of commerce is the *Chondodendron tomentosum* (Menispermaceæ). The plant has a long branching woody root, of a yellowish to greenish brown colour internally, and this has attained considerable reputation in medicine. The root contains a bitter principle, and is used in chronic catarrhal affections of the bladder and in calculus. The decoction and fluid extract are most usually employed, but it is sometimes given in the simple form of powder.—This medicinal root has been referred also, but erroneously, to the allied *Cissampelos Pareira*, a climbing shrub of the West Indies and Mexico, whose roots have similar properties.

Parella, a name given to some of those crustaceous lichens which are used to produce Archil, Cudbear, and Litmus, but more strictly belonging to one species, *Lecanora parella*, and the red or crimson dye prepared from it.

Parenchyma, a technical name for that kind of vegetable tissue in which the component cells are roundish or polyhedral, touching each other by their broad faces, fitting more or less closely, as in the green 'palisade-parenchyma' of the upper part of a leaf, or leaving wide intercellular spaces, as in the 'spongy parenchyma' of the lower part. See CELL, LEAF.

Parent and Child.—The legal relation between parent and child arises out of marriage, and is one of the incidents or consequences of the relation of husband and wife. The legal is to be distinguished from the natural relation, for two persons may be in the natural relationship of parent and child while they are not legally or

legitimately so. In law—although cognisance is taken for certain purposes of the natural relationship between a bastard and his parents—the distinction between legitimate children and natural or illegitimate children is fundamental. For a statement of the law relating to illegitimate children and the rights and liabilities of the mother, the putative father, and other persons towards such children, see the articles **BASTARD**, **AFFILIATION**, **LEGITIMATION**, **INFANT**.

A lawful or legitimate child, in English law, is a child born in lawful wedlock or within a competent time after the dissolution of the marriage. A child between whose parents the relation of marriage subsists at the time of his birth is legitimate, although they were unmarried when he was begotten; and a child begotten of parents married at that time, or married afterwards but before he was born, is legitimate, although the marriage may have been dissolved by death or divorce before he was born. In some systems of law—e.g. in Roman law and in Scots law—marriage has, or may have, a retroactive effect in legitimating previously born children; but in English law the intermarriage of the parents of a child after the birth of the child does not make the child legitimate. There is a strong presumption in law that a child born during marriage, or born not more than nine months after the dissolution of the marriage, is legitimate. The fact that the wife had immoral relations with other men is not in itself sufficient to displace the presumption of legitimacy. This presumption can be rebutted only by clear proof that the husband is not in fact the father of the child—e.g. by proof that the husband was impotent or that the husband and wife had no sexual intercourse within the period during which the child must have been begotten. The non-access of the husband to the wife must be proved otherwise than by the evidence of the spouses. It is, indeed, now settled in England that neither a husband nor a wife is permitted to give evidence of non-intercourse after marriage, with the object, or possible result, of bastardising a child born in wedlock—*Russell v. Russell*, 1924, A.C. 687.

The moral duty of parents to provide for the maintenance of their children is recognised by the courts; but in England, except under the operation of the poor-law and certain modern statutes, there is no enforceable legal obligation on a father or mother to maintain a child. Hence a father is not liable to pay a debt incurred by a child, or money expended on the child's behalf, even in respect of necessities supplied for the use of the child, unless he has expressly or impliedly contracted to do so or has authorised the incurring of the debt or the expenditure of the money. The Poor Law Acts, however, render it compulsory upon the father and mother, and also the grandfather and grandmother, if able to do so, to provide a maintenance for a child who cannot support himself. Under these acts, too, a man is liable to maintain the children of his wife by a former marriage as part of his own family, and is chargeable with all poor-law relief granted to them until they attain the age of sixteen or until the death of their mother. Under the Married Women's Property Acts a married woman who has separate property is under the same legal liability as her husband for the maintenance of her children and grandchildren; but she is not liable to maintain the children of her husband by a former marriage. Under the Vagrancy Act, 1824, a father who, although able to do so, neglects or refuses to maintain his children, or who runs away and leaves them chargeable to the parish, is criminally liable. Under the Children Act, 1908, sect. 12, a parent

who fails to provide food, clothing, medical aid, or lodging for his child, or who, being unable to do so, fails to take steps to procure these by having recourse to the poor-law authorities, is deemed to have neglected him in a manner likely to cause injury to his health, and may be punished. This enactment has the effect of making it clear that the wilful omission of a parent to provide medical aid for his child is such neglect as may come within the purview of the criminal law. By sect. 75 of the same act, where a child is ordered to be sent to and detained in a reformatory or industrial school, the parent, if able to do so, is made liable to contribute to his maintenance therein. Again, by sects. 82 to 85 of the Education Act, 1921, a local authority has power to take measures for the provision of meals for children in attendance at any public elementary school within its area, and is directed to require and recover payment from parents in respect of meals so supplied. As to the statutory obligations on parents in respect of the education of their children, see **EDUCATION**.

On the same principle, relying on the sense of filial duty, English law, apart from the statutes relating to the poor, does not compel children to maintain their parents. By the Poor Law Acts, however, the children of any old, blind, lame, impotent, or other poor person not able to work are required, being of sufficient ability, at their own charges to relieve and maintain him or her, in the manner and according to the rate which the justices at petty sessions shall order. Under the Married Women's Property Act, 1908, a married woman, if she has separate estate, can be made liable to support her parents.

A father has a right to restrain and control the actions of his children until they arrive at years of discretion, and to chastise them in a reasonable manner for disobedience. This parental power of control and correction may be delegated, for instance, to a schoolmaster, who is then to that extent *in loco parentis*. A father has, as a general rule, a right to the custody of his child. The right to custody may be enforced by writ of *habeas corpus* or by an application to the High Court of Justice; but, under the Custody of Children Act, 1891, where the parent of a child applies to the High Court for a writ or order for the production of the child, the court may in its discretion refuse to issue the writ or make the order, if the parent has abandoned or deserted the child, or has otherwise so conducted himself that the court is of opinion that his right to the custody of the child should not be enforced. At common law the mother had, during the lifetime of the father, no legal rights as against him with respect to the custody and control of the child. But, under the Guardianship of Infants Acts, 1886 and 1925, the court has wide powers to determine a question as to the custody of a child independently of the rights possessed by the father at common law. Thus the act of 1886 provides that, upon the application of the mother, the High Court or a county court may make such order as it thinks fit with regard to the custody of her infant child and the right of access thereto of either parent, having regard to the welfare of the child and to the conduct of the parents and to the wishes as well of the mother as of the father. The court, if it makes an order giving the custody of the child to the mother, may, under sect. 3 of the act of 1925, further order that the father shall pay to the mother a weekly or other periodical sum towards the maintenance of the child. Moreover, the Guardianship of Infants Act, 1925—which came into operation on 30th September 1925—provides (sect. 1) that where in any proceeding before any court the custody or upbringing of an infant or the

administration of any property belonging to, or held in trust for, an infant is in question, the court, in deciding that question, shall regard the welfare of the infant as the first and paramount consideration, and shall not take into consideration whether, from any other point of view, the claim of the father, or any right at common law possessed by the father, in respect of such custody, upbringing, or administration is superior to that of the mother or the claim of the mother is superior to that of the father. Where a decree of judicial separation is pronounced the court has an absolute discretion to give the custody of the infant children of the marriage to either parent and to regulate the access of the other parent to them. Again, if the father, mother, or any person having the custody of a child under the age of sixteen years is convicted of certain offences by any court, that court may order the child to be taken out of the custody of that person. The rights of a parent or other person having the lawful custody are in some measure also protected by provisions of the criminal law. Thus it is a criminal offence for any one unlawfully, either by force or fraud, and without any *bona fide* claim of right to take or entice away, or to detain any child under the age of fourteen years, with intent to deprive the parent, guardian, or other person having the lawful care or charge of such child, of its possession; or, with such intent, to receive or harbour the child, knowing it to have been so taken or decoyed away. Recent statutes, and, in particular, the Children Act, 1908, contain numerous provisions designed to prevent cruelty to, or maltreatment of, children by parents or other custodians (see CHILDREN).

The father, and after his death the mother, has, at common law, the guardianship of a child up to the age of twenty-one years. The right to guardianship on the death of the father or of the mother is now regulated by sects. 4 and 5 of the Guardianship of Infants Act, 1925. Under that act the mother, if she survive the father, is guardian of the child, either alone or jointly with any guardian appointed by the father; and the father, if he survive the mother, is guardian of the child either alone or jointly with any guardian appointed by the mother. When no guardian has been appointed by the predeceasing parent, or if the guardian appointed by the predeceasing parent is dead or refuses to act, the court, if it thinks fit, may appoint a guardian to act jointly with the surviving parent. Either the father or the mother of an infant may by deed or will appoint any person to be guardian after his or her death. Any guardian so appointed acts jointly with the mother or father, as the case may be, so long as the mother or father is alive, unless the mother or father objects to his so acting. If the mother or father objects, or if the guardian so appointed considers that the mother or father is unfit to have the custody of the child, the court, on the application of the guardian, determines whether the surviving parent shall be sole guardian, or whether the guardian appointed by the predeceasing parent shall act jointly with the surviving parent or shall be sole guardian.

A father has the right to determine in what religious faith his children shall be brought up. On the death of the father, if he has left no directions on the subject and has done nothing to forfeit or abandon his right to have his children educated in his own religion, the court will direct that the children be brought up in the father's religion, unless it be plain that the welfare of the children renders that course undesirable.

The consent of parents or guardians required by English law to the marriage of a child who is under age is now regulated by sect. 9 of the Guardianship of Infants Act, 1925, and the schedule appended to

that act. In the case of a legitimate child, if both parents are alive and living together the consent of both parents is requisite. If one parent is dead the consent of the surviving parent is sufficient where there is no other guardian. When one parent is dead and a guardian has been appointed by the deceased parent, the consent required is that of the surviving parent and the guardian if acting jointly, or the surviving parent or the guardian if the parent or guardian is the sole guardian. Where both parents are dead the consent of the guardians or guardian appointed by the deceased parents or by the court is required.

In many systems of law—e.g. in Scots law—the testamentary power of a parent is subject to restraints in favour of his or her children; but in English law a parent has power, if he pleases, to disinherit children by will. As to the distribution of the estates of parents or of children on intestacy, see *INTESTACY*, *KIN* (NEXT OF), *HEIR*.

The parental power comes to an end when the child attains full age. On the marriage of a daughter under full age the parental rights of custody and control are terminated. In some systems of law the parental power over a child is alienable and may be transferred to another person who adopts the child. But adoption, in the sense of the transfer of the rights and duties of a parent in respect of a child to another person and the assumption by that other person of these rights and duties, is not recognised by the law of England. A contract under which a parent is to be divested of his or her rights in favour of another person who is to have the rights which the law gives the parent in relation to the child, and is to undertake the duties which the law imposes on the parent, is invalid.

Scotland.—The Scots law of parent and child differs in important respects from the law of England. Thus in Scotland a child who is illegitimate at birth may become legitimate by the subsequent marriage of his father and mother. Legitimation *per subsequens matrimonium* was recognised by the Canon Law, and has been adopted in all the legal systems of Western Europe except England. An exception is made where a legal impediment existed to the marriage of the parents at the date of the conception of the previously born child. Thus a child conceived in adultery cannot be legitimated even though at its birth the parents are free to marry. Again, a father's legal right of control may terminate by express or tacit consent before the child attains full age, in which case the child is, in the language of law, 'forisfiliated'—i.e. is out-with the power of the father as head of the family. A parent is under a legal obligation to support the child and a child to support the parent, and either may sue the other for aliment. The obligation of aliment, however, is enforceable only where there is indigence on the one side and surplus means of livelihood on the other. As circumstances may change, and either the indigence of the one party or the ability of the other may cease, decree in an action for aliment is granted *in hoc statu*, and may at any time be restricted or recalled by the court on cause shewn. On the bankruptcy of the parent or child liable in aliment, the claim for aliment is not good in competition with his creditors; for his bankruptcy is conclusive evidence that he has no superfluity. The amount of aliment claimable in law is not limited to what is necessary for bare subsistence, but depends in some degree on the claimant's station in life. On the death of the person liable the claim cannot be enforced like an ordinary debt against his executors. But where a person who is liable *ex debito naturali* to aliment another dies leaving property, heritable or move-

able, the persons who succeed to his property are bound *ex jure representationis* to implement the deceased's obligation out of the property to which they have succeeded. This principle applies whether the property of the deceased passes under a will or *ab intestato*. Scots law restricts in favour of children the power of a father or mother to dispose of his or her moveable property by will, and so prevents the parent from disinheriting the children. Where the parent leaves children, one or more, and is not survived by a wife (or husband) the children get one-half of his or her moveable estate as their legitim. Where the parent leaves children and is survived by a wife (or husband) the children get one-third of his or her moveable estate as their legitim. The right of representation does not extend to legitim, so that grandchildren have no claim for legitim upon the death of their grandparent (*vide* LEGITIM). A parent's right to the custody of children is subject to the jurisdiction of the Court of Session, which may make such regulations as it deems fit with regard to the custody. The court, in any action for separation or for divorce, may from time to time make such interim orders, and may in the final decree make such provision as to it seems proper with respect to the custody, maintenance, and education of any pupil children of the marriage. The recent statutes mentioned above relating to the custody, protection, and guardianship of children apply, generally speaking, to Scotland as well as to England. In Scots law the consent of parents or guardians is not necessary to the validity of the marriage of a person in minority; and accordingly sect. 9 of the Guardianship of Infants Act, 1925 (*supra*), dealing with the consent of parents or guardians to the marriage of a child who is under age, has no application to Scotland.

Parhelion. See HALOS.

Pariahs is the Tamil name given to the lowest class of the Hindu population of Southern India—the 'out-castes' who do not belong to any of the four castes of the Brahminical system (the Telugu name is *Mala*, the Kanarese *Holia*, the Malayalam *Paliyar*). They are now commonly described as the depressed classes. In the Madras Presidency they numbered, in 1921, 6,372,086, or 15 per cent. of the total population, or four times as numerous as the Brahmans. Presumably they represent the aboriginal race conquered by the Sudras, themselves a stock vanquished by the Vedic peoples. In the 18th century Pariahs were slaves to the higher castes; they must still dwell in huts outside village bounds, but are frugal, pleasure-loving, and laborious. The government has taken measures in recent years to improve their conditions, and the community has come into prominence by its assertion of equal rights of citizenship with the superior castes. See CASTE.—For the Pariah Dog, see DOG.

Parietaria. See PELITORY.

Paris, the capital of France, is situated in 48° 50' N. lat. and 2° 20' E. long., on the river Seine, about 110 miles from its mouth. It lies in the midst of the fertile plain of the Ile-de-France, at a point to which converge the chief tributaries of the river, the Yonne, the Marne, and the Oise. These streams, navigable for the small vessels formerly used in commerce, gave it until recent times the advantages of a seaport, while the great trade-routes passing along their valleys connected it with all parts of France. It has thus become the centre of a great network of canals, roads, and railways. Paris has occupied since Roman times a constantly increasing series of concentric circles. Down to the year 1922 the city was bounded by fortifications, begun in 1840 and completed twenty years after-

wards. The extension of the city boundary to this line explains the increase of population from 1,174,346 in 1856 to 1,696,741 in 1881; subsequent pop. (1886) 1,825,274; (1881) 2,269,023; (1901) 2,714,068; and (1921) 2,906,472; this last figure represents a density of 150 persons per acre as against 60 per acre in the county of London, but outside the demolished fortifications population is comparatively sparse. Paris has within the old fortifications a mean elevation of about 120 feet, but it rises in low hills north of the Seine, Montmartre (400 feet) and Belleville (320 feet), and south of the Seine, the Montagne Sainte Geneviève (190 feet). These elevations are encircled at a distance of from two to five miles by an outer range of heights, including Villejuif, Meudon, St Cloud, and Mont-Valérien (650 feet), the highest point in the immediate vicinity of the city. The Seine, which enters Paris in the south-east at Bercy, and leaves it at Auteuil in the west, divides the city into two parts, and forms the two islands of La Cité and St Louis, which are both covered with buildings.

France has long been the most highly centralised country in Europe, and Paris as its heart contains a great population of government officials. As a city of pleasure it attracts the wealthy from all parts of the world. It can boast of possessing the best dressmakers in the world; and through some of them (Paquin, Beer) sets the pace of fashion every season at the race-courses that adjoin Paris. But it is also, as the capital of the thriftiest nation there is, a city of capitalists and a great financial centre. Further, in the realm of learning, the provincial universities of France have been largely deprived of their attraction by the schools of Paris, to which flock the pick of the country's youth. The publishing trade has followed the same course. Paris, with the notable exceptions of the motor and aeroplane trade, cannot be described as a manufacturing town. Its chief and peculiar industries produce articles which derive their value not from the cost of the material but from the skill and taste bestowed on them by individual workmen. They include jewellery, bronzes, artistic furniture, and decorative articles known as 'articles de Paris.'

Before speaking in detail of the streets, boulevards, and *places* or squares of Paris, it is proper to mention that the private houses as well as the public buildings are built of a light-coloured limestone, quarried in the neighbourhood of the city, easily cut with the saw and carved ornamentally with the chisel. With this material they are reared in huge blocks to a height of six or seven stories, each floor comprising generally two distinct flats; access to all the floors in a tenement being gained by a common stair and common gate (the *porte cochère*), which are placed under the charge of a porter or *concierge* at the entrance; he, by pulling a *cordon* or rope, gives admission to the tenants at night. In the great new streets this general plan has been adhered to, but with this difference, that instead of being narrow and crooked they are wide and straight. Among the finest are the Rue de Rivoli, the Rue de la Paix, the Rue Royale, Avenue de l'Opéra, the Avenue de Champs-Élysées, the Avenue du Bois de Boulogne (the two latter forming the finest avenue of any city in Europe), and the avenues that radiate from the Arc de Triomphe generally. The Boulevards, which extend in a semicircular line on the right bank of the Seine, between the nucleus of the city and its surrounding quarters, present the most striking feature of Paris life. In all the better parts of the city they are lined with trees, seats, stalls, kiosques, and little towers covered with advertisements. Restaurants, cafés, shops, and

an impatience of everything not in the latest fashion, long neglected their old buildings in the style they had originated. Their Gothic churches were disfigured by incongruous additions and tawdry ornaments, which make them uninteresting if not repulsive to visitors. This remark does not apply, however, to the first two churches we shall mention. They have been admirably restored, and it is now difficult to say whether their incomparable beauty is to be more attributed to mediæval builders or to the modern architects by whom they have been renovated.

Among the district churches of Paris (upwards of sixty in number) the grandest and most interesting, from a historical point of view, is the cathedral of Notre Dame, which stands on a site successively occupied by a pagan temple and a Christian basilica of the time of the Merovingian kings. The main building, begun in the 12th century, is 400 feet long, 150 feet wide, and 110 high. The height of two towers is 218 feet, that of the *flèche* 300 feet. The interior consists of a principal and two flanking

of oak and lead; and under the care of some of the ablest architects of France the church was converted into what is now described in Paris as the noblest of Gothic buildings. The *Salute Chapelle*, built by St Louis in 1245-48, for the reception of the various relics which he had brought from the Holy Land, is perhaps the greatest existing masterpiece of Gothic art. Restored by Napoleon III. at a cost of £50,000, it was threatened by the Commune, but saved. One of the most interesting churches in Paris is St Séverin, buried in narrow streets of the Quartier Latin. A large part of it is in the English Gothic of the 15th century, showing that it was erected during the English occupation of Paris. St-Germain-des-Prés, which is probably the most ancient church in Paris, was completed in 1163; St Étienne du Mont and St Germain l'Auxerrois, both ancient, are interesting—the former for its picturesque and quaint decorations, and for containing the tomb of Ste Geneviève (q.v.), the patron saint of Paris; and the latter for its

rich decorations and the frescoed portal, restored at the wish of Margaret of Valois. Among modern churches is the Madeleine (1806-42), built in the style of a Corinthian temple, and originally intended by Napoleon I. to be a monument to the Grande Armée. It forms an oblong building, 328 feet long by 138 wide, independently of the flights of steps. The height of the columns is 62 feet, that of the entablature 14 feet, and the entire height from the ground 116 feet. There are in all fifty-two columns. The roof is of iron and copper. The interior is elaborately decorated with gold, white marble, paintings, and sculptures; but in spite of their religious subjects the building still produces on northern eyes the impression of a pagan temple rather than of a Christian church. The Panthéon (1764) was begun as a church, but converted by the Constituent Assembly of republican France into a temple dedicated to the great men of the nation, next restored to the church by Napoleon III. and rededicated to Ste Geneviève, but

Notre Dame: from the River.

naves, which are continued round the choir. It has been said that if the pillars of Notre Dame could speak they might tell the whole history of France. The kings, however, were crowned at Reims, and the only royal coronation celebrated at Notre Dame was that of Henry VI. of England in 1431. There, too, was sung in 1486 a memorable *Te Deum* when Paris was retaken by the troops of Charles VII. During the French Revolution the church was mutilated in order to destroy what were supposed erroneously to be emblems of royalty. In 1793, after childish and repulsive mockeries of the ceremonies of the Roman Catholic Church, it was converted into a 'temple of reason.' In 1804 Napoleon I., at the height of his power, resolved to impress Europe by an imposing ceremony—that of his coronation—in Notre Dame; and there it was that he, in presence of the pope, who never before had crossed the Alps at the bidding of king or emperor, placed the crown upon his own head. In 1831 the novel of Victor Hugo, *Notre Dame*, made the church interesting to all Europe. In France there was a general desire for its restoration, and in 1845 this great work was undertaken by the state. Viollet-le-Duc added to the building the great *flèche*, a structure

once more, on the occasion of the funeral of Victor Hugo (1885), reconverted into a monument, with the old inscription 'Aux grands hommes la patrie reconnaissante.' The Panthéon has been spoken of as rivalling St Peter's at Rome and St Paul's in London. The frescoes of the interior are very fine. In the crypt are the tombs of Voltaire, Rousseau, Victor Hugo, and Zola. The *Chapelle des Invalides* is particularly beautiful; there lie the remains of Napoleon I. The sarcophagus, hewn from a huge block of Russian granite, is of a grandeur and solemnity of design well worthy of that great warrior. Notre Dame de Lorette, erected in 1823, is a flagrant specimen of the meretricious taste of the day; St Vincent de Paul, completed in 1844, is somewhat less gaudy and more imposing in style. Among the few Protestant churches, l'Oratoire is the largest and the best known. For the great church of Sacré Cœur at Montmartre, see SACRED HEART.

Paris abounds in places of amusement suited to the tastes and means of every class. It has upwards of forty theatres, mostly cheaper than London theatres. The leading houses are the Opéra, the Théâtre Français—chiefly devoted to classical French drama—the Opéra Comique, and the Odéon,

which receive a subvention from government. The opera-house, completed in 1875, is one of the most magnificent buildings of its century, having cost, exclusive of the site, £1,120,000. The lighter side of amusement is provided by music-halls and café-concerts and cabarets artistiques. Among the latter should be mentioned the Chat Noir, La Pie qui chante, La Lune Rousse; some of the best French wit is to be heard there; the Moulin Rouge and Bal Tabarin are dancing places in Montmartre that recruit little of their coarse and jaded clientèle from the French Parisians. In addition to the noble gardens of the various once imperial palaces, the most densely-crowded parts of the city have public gardens, shaded by trees and adorned with fountains and statues, which afford the means of health and recreation to the poor. At the west of Paris, beyond the old fortifications, is the Bois de Boulogne, converted by Napoleon III. from a wood covered with stunted trees into one of the most beautiful gardens in Europe. It takes the place of the London parks for the fashionable world of Paris. East of Paris is the Bois de Vincennes, an admirable recreation ground for the working-classes. While, however, the parks of London are centrally situated, those of Paris are on the outskirts of the town.

Paris has three large and twelve lesser cemeteries, of which the principal one is Père-la-Chaise (see LACHAISE), extending over 200 acres, and filled in every part with monuments erected to the memory of celebrated persons buried there. The famous mortuary, the Morgue, was pulled down in 1924, and a mortuary with the new name Institut Médico-Légal built on the riverside at the Quai de la Rapée; its former site behind Notre Dame is now a public garden. The southern parts of Paris are built over beds of limestone, which have been so extensively quarried as to have become a network of vast caverns. These quarries were first converted in 1784 into catacombs so-called, in which are deposited the bones of the dead, collected from the ancient cemeteries of Paris.

It has been frequently remarked that Paris contains few important civil buildings of the middle ages, which is to some extent due, apart from actual destruction, to the reckless way in which improvements have been carried out. A government commission now watches over the historic monuments of Paris, so that further destruction is checked. Two most interesting civil buildings of the 15th century still exist. One is the Hôtel de Cluny (see CLUNY), one of the finest existing monuments of the Gothic Flamboyant style. The other is the Hôtel de Sens, the old palace of the archbishops of Sens, formerly metropolitans of Paris. It is unfortunately buried among narrow streets north of the Seine and opposite the Cité. For many years it has been put to business purposes, both private and public, and it presents an essentially derelict appearance.

The Louvre, the greatest of the modern palaces of Paris, forming a square of 576 feet by 538 feet, was erected on the site of an old castle of the 13th century (see below). The first part, the south-west wing, was erected in 1541 on the plan of Pierre Lescault. It remains a masterpiece of architectural design and monumental sculpture. The principal portion of the great square was completed under Louis XIV. in the latter part of the 17th century, the physician Claude Perrault being the architect. The colonnade of the eastern façade is more admired than any other part of the building.

The Palace of the Tuileries was begun in 1566 by Catherine de Médicis, and enlarged by successive monarchs, while used as a royal residence,

until it formed a structure nearly a quarter of a mile in length, running at right angles to the Seine. It was connected with the Louvre, which lay to the west, by a great picture-gallery overlooking the Seine, and 1456 feet in length. North of the picture-gallery, and between the two palaces, lay the Place du Carrousel, in the midst of the most magnificent palatial structure in the world. The Tuileries continued to be occupied as the residence of the imperial family; but the Louvre proper formed a series of great galleries filled with pictures, sculptures, and collections of Egyptian, Greek, and Roman antiquities. The Commune attempted to burn the whole pile, but only succeeded in destroying the Tuileries and a corner of the Louvre. The Place du Carrousel enclosed between them and the Louvre is now thrown into the great line of gardens stretching west to the Arc de l'Étoile. In the midst of the old palaces a statue of Gambetta, surrounded by allegorical figures, has been erected. North of the Louvre is the Palais Royal. It forms a mass of buildings, including the old palace of the Orleans family, the Théâtre Français, and a quadrangle of shops, restaurants, and cafés, enclosing a large garden open to the public, 700 feet long by 300 feet wide. Its galleries were long one of the liveliest and most frequented spots in Paris. Its cafés had a world-wide reputation, which has faded, however, since the great improvements of Napoleon III. sent the current of life into other quarters. The most valuable part of the palace, fronting the Rue St Honoré, was set on fire by order of the Commune in 1871. The Palace of the Luxembourg, on the south side of the Seine, was built by Marie de Médicis in the Florentine style. It contains many magnificent rooms, and in 1879 became the meeting-place of the French senate. Close to it a gallery has been constructed for the reception of the works of living artists acquired by the state. On the north bank of the Seine, opposite the Island of the Cité, stands the Hôtel de Ville. It was burned by the Commune, but has been rebuilt and restored in the style of its predecessor, and is now one of the finest buildings in Paris. On the Island of the Cité stands the Palais de Justice, a vast pile, also set fire to by the Commune; some parts of it date from the 14th century, and others are modern. It is the seat of some of the courts of law, as the Courts of Cassation, of Appeal, and of Police. Within the precincts of this palace are the Sainte Chapelle, and the noted old prison of the Conciergerie, in which Marie Antoinette, Danton, and Robespierre were successively confined. The Conciergerie is still one of the several prisons of Paris. Others are La Santé, St Lazare (for females), La Petite Roquette (for juveniles), and, some little distance outside Paris, Fresnes les Rungis, a modern institution on novel, and it is even said on palatial, lines.

The number of benevolent institutions is enormous. The largest of the numerous hospices or almshouses is La Salpêtrière, probably the largest asylum in the world, extending over 78 acres of land, and appropriated solely to old women; Bicêtre receives only men. The Hospice des Enfants Trouvés, or Foundling Hospital (q.v.), provides for the infants brought to it till they reach the age of maturity, and only demands payment in the event of a child being reclaimed. The Crèches (q.v.) receive the infants of poor women for the day. Besides institutions for the blind, deaf and dumb, convalescents, sick children, &c., Paris has many general and special hospitals. Of these the oldest and most noted are the Hôtel Dieu, La Charité, and La Pitié.

The chief institutions connected with the University of Paris, and with education generally, are still situated in the Quartier Latin. The Sorbonne

(q.v.), the seat of the Paris faculties of letters, science, and Protestant theology, has been rebuilt and increased in size (1899). The Sorbonne contains lecture-halls and class-rooms, and an extensive library open to the public. Near the Sorbonne is the Collège de France, where gratuitous lectures are also delivered by eminent scholars and men of letters, as well as a large number of colleges and lycées, the great public schools of France for secondary instruction, filling the Quartier Latin with huge barrack-like buildings. The Scots College stands as it did in the 17th century, five stories high, with eleven windows in a row, a good specimen of the old Paris colleges. The École Polytechnique, the School of Medicine and the School of Law, the Observatory, and the Jardin des Plantes, with its great museums of natural history, lecture-rooms, and botanical and zoological gardens, are situated in the same quarter of Paris. The principal of the public libraries is that of the Rue Richelieu, called the Bibliothèque Nationale (see LIBRARY), which originated in a small collection of books placed by Louis XI. in the Louvre. It is surpassed only by the British Museum in the number of its books and manuscripts.

No city on this side of the Alps is richer than Paris in fine-art collections, and among these the museums at the Louvre stand pre-eminent. Among its chief treasures may be mentioned, in the museum of antique sculptures, the famous Venus of Milo, and in the Salon Carré the great works of the Italian, Flemish, and Spanish masters, one of which, Leonardo da Vinci's masterpiece, *La Joconde* (*Mona Lisa*), was stolen in 1911, but was subsequently found in Italy and returned to France by the Italian government. It is impossible to do more than refer to the long succession of galleries in which are exhibited Egyptian, Assyrian, Elamitic, Greek, Roman, mediæval, and Renaissance relics and works of art. The Musée Carnavalet or historical museum of the city of Paris has been specially devoted to the collection of everything interesting connected with the municipality. On the demolition of the old houses many objects were found which formed the nucleus of the collection, which is constantly receiving large additions which make it one of the most interesting of the Paris museums. The Hôtel de Cluny contains curious relics of the arts and usages of the French people, from the earliest ages of their history to the Renaissance period. The potteries, sculptures, paintings, arms, furniture, and tapestries of the middle ages and of the 16th and 17th centuries are of the highest historical interest and value. The Museum of Artillery at the Hôtel des Invalides is devoted to arms and armour, flags and war dresses. The Musée Guimet, or 'National Museum of Religions,' includes objects used in religious ceremonies, savage, Indian, Chinese, &c. The Mint deserves notice for the perfection of its machinery; and the Gobelins (q.v.), or tapestry manufactory, may be included under the fine arts, as the productions of its looms are all manual, and demand great artistic skill. The Conservatoire des Arts et Métiers, in the Rue St Martin, contains a great collection of models of machinery, and class-rooms for the instruction of workmen in all departments of applied science. The great Paris exhibitions have all left behind them important buildings. The spacious building in which the exhibition of 1878 took place was named Palace of the Trocadéro, and is now used for musical entertainments and as an architectural and ethnological museum. For the exhibition of 1889 was erected one of the most striking monuments of modern Paris, the Eiffel (q.v.) Tower, while the exhibition of 1900 left as bequests the

Grand and the Petit Palais which the republic can justly boast of.

The fortifications, demolished in 1919-22, formed a rampart of over 22 miles. They were begun under Louis-Philippe, cost £5,500,000, and when completed entirely encircled the city except for the necessary openings for roads, for railways, for canals, and for the Seine. Long before the time of their destruction their strategic uselessness had been recognised. At the various gates was collected the octroi or town dues, an important but troublesome source of revenue to the city; the expectation that these dues would disappear with the fortifications was disappointed. On the left bank of the Seine is the École Militaire, founded in 1752, and used as barracks for infantry and cavalry; it can accommodate 10,000 men and 800 horses. Near it is the Hôtel des Invalides, founded in 1670 for disabled soldiers.

Paris is divided into twenty arrondissements. The prefect of the Seine is the chief of the municipal government, and is appointed by the government. There is a large municipal council, chosen by popular election. Each arrondissement has a maire and two assistant-councillors. The prefect of police is at the head of the civic guard or gendarmes, the fire-brigade, and the sergents de ville or city police, who are armed with swords and revolvers, since the spread of hooliganism (*apaches*) in many quarters of Paris. The cleaning, sewerage, and water-supplies of Paris are under the charge of the prefect. In some districts of the city, and in most suburban localities, there is no main sewerage system, but street improvement makes for extension. The water-supply is plentiful, though not invariably readily accessible. The street lighting is usually good, but the streets themselves, for the most part cobbled, are rough, and traffic is dangerous owing to lack of proper control. In 1818 public slaughter-houses, or abattoirs, were established at different suburbs; only there are animals allowed to be slaughtered. Large cattle-markets are held near the licensed abattoirs. There are in the heart of the city numerous *halles*, or wholesale, and *marchés*, or retail markets. The principal of these is the Halles Centrales, near the church of St Eustache, covering nearly 20 acres. A striking feature of modern Paris is its anglicisation. Tea-rooms are now to be found in nearly all quarters of Paris: so are English shops with English goods. English fashion for men is considered the height of *chic*, and to this craze probably must be attributed the increase in music-halls, bars, and saloons in fashionable parts of the town, and the eagerness of modern Parisian youth for sports, tennis, and so forth, at various clubs in and outside the city.

History.—The earliest notice of Paris occurs in Cæsar's *Commentaries*, in which it is described, under the name of Lutetia, as a collection of mud huts, composing the chief settlement of the Parisii, a Gallic tribe, conquered by the Romans. Lutetia soon acquired great strategic importance, due to its lines of defence—the windings and marshes of the Seine and Marne to the east and west, and the forest-clad hills on the north and south. It lay midway between the chief enemies of Rome in Gaul, the Germans on the east and the unsubdued Celts of Armorica on the west. In 53 B.C., accordingly, Cæsar assembled there the delegates of the Gallic tribes, and it became an important Roman town. Two ruins of this period remain south of the Seine. One formed part of the Palais des Thermes, the abode of the Roman governors of Lutetia and afterwards of the Merovingian kings of France. The other ruin is that of the *arènes* or amphitheatre of the Roman city. The foundations and parts of the old wall were discovered in 1870, and since then excavations have

laid them bare. In 1891 they were enclosed in a small park and thrown open to the public. The amphitheatre was 180 feet long by 153 feet wide. It is estimated that it could contain 10,000 spectators of the gladiatorial shows. Lutetia began in the 4th century to be known as Parisia, or Paris. In the 6th century Paris was chosen by Clovis as the seat of government; and after having fallen into decay under the Carolingian kings, who made Aix-la-Chapelle their capital, and in whose time it suffered severely from frequent invasions of the Northmen, it finally became in the 10th century the residence of Hugh Capet, and the capital of the French monarchy. From this period Paris continued rapidly to increase, and in two centuries it had doubled in size and population. The reign of Philippe-Auguste (1180-1223) is the great epoch in the mediæval history of Paris. It was then that were erected masterpieces of Gothic art, including the nave, the choir, and the chief façade of Notre Dame and the Sainte Chapelle. Then was founded the University of Paris, the great theological school of the middle ages, wielding a power over the church second only to that of Rome, and attracting from all parts of western Europe vast crowds of students, who, on returning to their homes, spread abroad a knowledge of the art and culture of Paris. Philippe-Auguste built a crenelated wall and flanking towers, one of which, the Tour de Nesle (q.v.), stood on the site of the Palace of the Institute. Outside the wall he erected the castle of the Louvre on the site of the present palace. It became the centre and stronghold of feudalism and the citadel of Paris, which was now, after Constantinople, the greatest city of Europe. In the 16th century the castle was still used as a royal residence, but after the reception of Charles V. there by Francis I. it was pulled down to make way for the new palace. Luckily the walls were not levelled to their foundations. In 1885 they were discovered to exist. Galleries have been excavated, and extensive ruins have been laid bare, which now form the most interesting sight of underground Paris.

In the middle ages Paris was divided into three distinct parts—the Cité, on the islands; the Ville, on the right bank; and the Quartier Latin, or University, on the left bank of the river, and on the Montagne Ste Geneviève. In 1358 broke out the first of the long series of Paris revolutions. It was headed by Étienne Marcel, the famous provost of the Paris merchants, who for a time ably ruled the town. Louis XI. did much to enlarge Paris and to efface the disastrous results of its hostile occupation by the English during the wars under Henry V. and Henry VI. of England; but its progress was again checked during the wars of the last of the Valois, when the city had to sustain several sieges. On the accession of Henri IV. of Navarre, in 1589, a new era was opened for Paris. The improvements commenced in his reign were continued under the minority of his son, Louis XIII. Louis XIV. converted the old ramparts into public walks or *boulevards*, organised a regular system of police, established drainage and sewerage works, founded hospitals, almshouses, public schools, scientific societies, and a library, and thus renewed the claim of Paris to be regarded as the focus of European civilisation.

The terrible days of the Revolution caused a temporary reaction; but the improvement of Paris was recommenced on a new and grander scale under the first Napoleon, when new quays, bridges, markets, streets, squares, and public gardens were created. All the treasures of art and science which conquest placed in his power were applied to the embellishment of Paris, in the restoration of which he spent more than £4,000,000 sterling

in twelve years. His downfall again arrested progress, and in many respects Paris fell behind other European cities. Renovation was recommenced under Louis-Philippe; but as lately as 1834 much of the old style of things remained; the gutters ran down the middle of the streets, there was little underground drainage from the houses, oil-lamps were suspended on cords over the middle of the thoroughfares, and, except in one or two streets, there were no side-pavements. It was reserved for Napoleon III. to reconstruct Paris. When he commenced his improvements Paris still consisted, in the main, of a labyrinth of narrow, dark, and ill-ventilated streets. He resolved to pierce broad and straight thoroughfares through the midst of these—thus putting an end to the possibility of forming barricades—to preserve and connect all the finest existing squares and boulevards, especially those surrounding the monuments of the Bonaparte family, and, in lieu of the old houses pulled down in the heart of the town, to construct, in a ring outside of it, a new city in the most approved style of modern architecture. With the assistance of Baron Haussmann (q.v.), the Prefect of the Seine, his schemes were carried out with rare energy and good taste. With a fresh supply of water, trees, parterres, and fountains were introduced everywhere, and Paris ceased to produce on visitors the impression that it stood in the midst of a chalky desert. It was converted into one of the greenest and shadiest of modern cities. Two straight and wide thoroughfares, parallel to and near each other, crossed the whole width of Paris from north to south through the Cité; a still greater thoroughfare was made to run the whole length of the town, north of the Seine, from east to west. The old boulevards were completed so as to form outer and inner circles of spacious streets—the former chiefly lying along the outskirts of the old city, the latter passing through and connecting a long line of distant suburbs. In the year 1867, when the international exhibition was opened, Paris had become in all respects the most splendid city in Europe. Many further improvements were then contemplated. Financial and political difficulties were, however, at hand (see FRANCE), and these schemes had to be postponed. The siege of Paris by the Germans, which lasted from 19th September 1870 to 28th January 1871, caused much less injury to the city than might have been expected—it was reserved for a section of the Parisian population to commit an act of vandalism without a parallel in modern times. On the 18th of March the Red Republicans, who had risen against the government, took possession of Paris. On the 27th March the Commune was declared the only lawful government. Acts of pillage and wanton destruction followed. On the 15th of May the column erected to the memory of Napoleon and the Great Army, in the Place Vendôme, was solemnly pulled down as 'a monument of tyranny.' The government troops under Marshal MacMahon attacked the insurgents, and kept them from doing further mischief. The former succeeded in entering Paris on the 20th of May, and next day the Communists began systematically to set fire with petroleum to a great number of the chief buildings of Paris, public and private. The fire for a time threatened to destroy the whole city. It raged with the greatest fury on the 24th, and was not checked until property had been lost to the value of many millions sterling, and historical monuments were destroyed which never can be replaced. The horror inspired by the Commune for a time drove the wealthy classes from Paris, and it was feared that it would lose its prestige as a European capital. This, however, has not proved to be the case. By the autumn of 1873 all the private houses burned had been rebuilt,

the monuments only partially injured had been restored, and the streets and public places were as splendid and gay as in the best days of the empire.

Since the establishment of the republic improvements have been executed little if at all inferior in importance to those of the second empire. New streets have been opened near the Paris Bourse de Commerce and the Post-office; the Champ de Mars, a waste of sand in which the Eiffel Tower was erected, has now become a beautifully built area, and the Grand and Petit Palais have already been mentioned; the museums of the Jardin des Plantes have been rebuilt; the Quartier Latin has been covered with educational buildings. Notable also has been the construction of the *Métros* and the *Nord Sud*, two systems of electrified underground railways, which hold within their network almost every part of the city. In 1910 and 1911 disastrous floodings of the Seine occurred. During the Great War in August and September 1914, and in June 1918, the German armies approached to within thirty miles of Paris; on the first occasion reinforcements despatched in the commandeered taxi-cabs of the city contributed memorably to the enemy's repulse. In 1918, too, Paris was bombarded from a distance of about fifty miles by a freak long-range gun, but little damage was done, and it, and such damage as resulted from sporadic air-raids, was quickly repaired on the conclusion of the war.

Somewhat conflicting opinions are expressed on the part Paris has played in the history of the world. After Athens and Rome, says one writer, it is the city that has made the deepest impression on men's minds. Paris, says another, has carried the torch of life and civilisation from century to century, and done most to spread culture and enlightenment throughout the globe. At this moment, says a third, the inhabitants are the best fed and best clad, the best educated of city populations. These views are generally accepted in France. There is, however, a reverse to the picture. The Parisians are declared to be a feeble people, dying out, and constantly recruited by immigration from Belgium, Alsace, Switzerland, and Italy. Paris is a modern Babylon; its domestic life, described in French novels, is a centre of corruption for Europe. There has been, no doubt, truth in all these views at different periods of the history of Paris. Certain it is, however, that in England it is too often forgotten that in Paris drunkenness is still rare, that among a large section of the population there has always been a pure domestic life, and that the profligacy of the second empire has now ceased to exist.

See the guidebooks of Murray, Baedeker, Joanne, and Muirhead and Monmarché; topographical works by Du Camp (7th ed. 6 vols. 1884), Colin (1885), Pontich (1884); the official *Annuaire Statistique* (since 1883); G. A. Sala, *Paris Herself Again* (1879); P. G. DECLARATION OF PARIS.—In 1856 the representatives of the Powers agreed to four points in International Law (q.v.)—viz. (1) Privateering is abolished; (2) the neutral flag covers enemies' goods, excepting Contraband of War (q.v.); (3) neutral goods, with the same exception, are not liable to be seized even under an enemy's flag; (4) blockades, in order to be binding, must be effective. The United States refused to accept the first point, because the European powers declined to affirm that thereafter all private property should be exempted from capture by ships of war. See NEUTRALITY.

TREATIES OF PARIS.—The Peace of Paris of 1763 terminated the Seven Years' War (q.v.); fixed the territorial relations of Germany, France, and Spain; gave to England the French colonies in America; and rearranged the possessions of France and England in the West Indies, India, and Africa. The Treaty of 1814, concluded by the Allies soon after the abdication of Napoleon, reduced France substantially to its old limits. That of 1815, after Waterloo, did so more completely, levied a heavy contribution towards the war expenses, and reconstituted the map of Europe on the old lines. The Treaty of 1856 concluded the Crimean War (q.v.). A Treaty of 1857 arranged relations between Britain and Persia.

Paris. (1) Capital of Bourbon county, Kentucky, on Stoner Creek, 19 miles by rail N.E. of Lexington. It contains a military institute, and manufactures tobacco, flour, cordage, &c. Pop. 6000.—(2) Capital of Lamar county, Texas, 98 miles by rail N.E. of Dallas. It has manufactories of brooms, furniture, sashes, wagons, ploughs, &c. Pop. 15,000.

Paris, a genus of monocotyledonous plants of the family Liliaceæ, of which one species, *P. quadrifolia*, called Herb Paris, is not uncommon in moist, shady woods in some parts of Britain. It is rarely more than a foot high, with one whorl of generally four leaves, and a solitary flower on the top of the stem, followed by a berry. The berry is reputed narcotic and poisonous, but its juice has been employed to cure inflammation of the eyes. The root has been used as an emetic.

Paris, also called ALEXANDER, was, according to Homer, the second son of Priam and Hecuba, sovereigns of Troy. His mother dreamed during her pregnancy that she gave birth to a firebrand, which set the whole city on fire, a dream interpreted by Æsacus or Cassandra to signify that Paris should originate a war which should end in the destruction of his native city. To prevent its realisation Priam caused the infant to be exposed upon Mount Ida, by a shepherd named Agelaus, who found him five days after alive and well, a she-bear having given him suck. Agelaus brought him up as his own son, and he became a shepherd on Mount Ida. An accident having revealed his parentage, old Priam became reconciled to his son, who married Enone, daughter of a river-god. But his mother's dream was to come true for all that. He was appealed to, as umpire, in a strife which had arisen among the three goddesses, Hera (Juno), Athene (Minerva), and Aphrodite (Venus), as to which of them was the most beautiful, the goddess Eris (Strife) having revengefully flung among them, at a feast to which she had not been invited, a golden apple (of discord) inscribed 'To the Most Beautiful.'

Each of the three endeavoured to bribe him. Hera promised him dominion and wealth; Athene, military renown and wisdom; Aphrodite, the fairest of women for his wife—to wit, Helen, the wife of King Menelaus. Paris decided in favour of Aphrodite—hence the animosity which the other two goddesses displayed against the Trojans in the war that followed. Paris now carried Helen away from Lacedæmon in her husband's absence. 'The rape of Helen' is the legendary cause of the Trojan war (see HELEN, TROY). Paris deceitfully slew Achilles in the temple of Apollo. He was himself wounded by a poisoned arrow, and went to Mount Ida to be cured by CEnone; but she avenged herself for his unfaithfulness to her by refusing to assist him, and he returned to Troy to die.

Paris, COMTE DE. See BOURBON, ORLEANS.

Paris, GASTON, born 9th August 1839, succeeded his father, Paulin Paris (1800–81), in 1872 as professor of old French at the Collège de France, became a member of the Academy of Inscriptions in 1872, and of the Académie Française in 1896. He wrote a long series of most valuable works on old French literature (*La Poésie du Moyen-Âge*, 1885–95; *La Littérature Française au Moyen-Âge*, 4th ed. 1909), and edited many texts (as *Le Roman de Renard*, 1895). He died in March 1903.

Paris, MATTHEW, chronicler, who probably inherited his family-name (then not uncommon in England), was born about 1200. In January 1217 he entered the Benedictine monastery of St Albans, grew up under the eye of Roger de Wendover, and in 1248 was sent by the pope's recommendation on a mission to repair the financial disorders in the Benedictine monastery on Monk's Island (Holm) near Trondhjem in Norway. In July 1251 he was in attendance at the court at Winchester, six months later he witnessed the marriage at York of Henry's daughter to Alexander II. of Scotland, and in March 1257 he had much conversation with the king during his week's visit to the monastery. His death occurred about the middle of 1259. Matthew Paris's principal work is his *Historia Major*, or *Chronica Majora*, a history from the creation down to the year 1259. The original edition is that published in 1571 under the authority of Archbishop Parker; but the authoritative edition of the work is that edited by Dr Luard in the Rolls series (7 vols. 1872–83). His conclusion as to its authorship is that down to the year 1189 it was the work of John de Cella, abbot of St Albans from 1195 to 1214; that from that point it was continued by Roger de Wendover down to the year 1235—the whole work to this point being often ascribed to him alone, and known as the *Flores Historiarum*; that Matthew of Paris next transcribed, corrected, and extended (by *interpretation* rather than *interpolation*) the work, which, moreover, from 1235 down to 1259 is entirely his own. As a historian he is vigorous, vivid, and accurate, and his pages are aglow with patriotic fervour. His *Historia Anglorum* is abridged from the greater work by the omission of what relates to foreign affairs. It was edited by Sir F. Madden in the Rolls series (3 vols. 1866–69). Other works are the *Abbreviatio Chronicorum* (1100–1255); *Liber Additamentorum* or *Supplementorum*; the dubious *Duorum Offarum Merciorum Regum Vitæ*; and the valuable *Viginti trium Abbatum S. Albani Vitæ*.

See the translations by Giles (1847), and the *Cambrian History of English Literature*, vol. i. (1907).

Paris Bordone. See BORDONE.

Parish (Lat. *parochia*; Gr. *paroikia*, 'neighbourhood') is a term originally used for the district assigned to a bishop or priest. In early times the bishop arranged all the church work of his diocese, and the minor churches were served by clergy sent from the bishop's church. Where the church was established and endowed parishes were assigned to resident priests, and tithes were, by special gift or by general rules of law, made payable to the parson of the parish. In England provisions relating to this matter were included among the laws of Edgar about 970. Parishes were formed on the basis of previously existing manors and townships; the lord of the manor often held the Advowson (q.v.) or patronage of the parish church; and the inhabitants held their meetings in the vestry of the church; the parson presided, and he was usually permitted to nominate one of the Churchwardens (q.v.). The parish was originally the unit of administration for poor-law and highway purposes, but modern legislation has transferred many of the functions of parish authorities to Boards of Guardians (see POOR-LAWS), County Councils (see COUNTY), and other authorities. There are about 15,000 civil parishes in England and Wales, and 1500 in Scotland; they vary widely both in extent and in population. The boundaries of an ancient parish are fixed by custom, the memory whereof was formerly, and in some cases is still, kept alive by an annual perambulation (see BOUNDS). Ancient parishes have been divided and altered in many cases in the exercise of statutory powers; in the case of civil parishes in England and Wales the Ministry of Health possesses large powers of alteration. For ecclesiastical purposes populous parishes may be divided and new vicarages constituted by the Ecclesiastical Commissioners; by the exercise of these powers the number of ecclesiastical parishes has been raised to over 14,000. The parson or incumbent is a corporation sole; he has a freehold in his office, and in the church and churchyard (see TITHE). The church is only used for the services of the Church of England; the Churchyard (q.v.) may be used by Nonconformists. The local government of a parish is now determined by the Local Government Act of 1894, which established district councils, parish meetings, and parish councils. The district councils are mainly the old rural and urban sanitary authorities under a new name, and have charge of highways, &c. The parish meeting in every rural parish includes all persons registered as local government electors, and retains, even where there is a parish council, the power of adopting certain Adoptive Acts (Lighting and Watching Act, Baths and Washhouses Acts, Burial Acts, Public Improvements Act, Public Libraries Acts), and of controlling to some extent the expenditure of the parish. When there is no parish council, the parish meeting (which must take place at least once a year) appoints the overseers, and may have some of the powers of the parish council conferred on it by the county council. Every rural parish with a population of 300 (though some parishes are grouped for the purpose) has now a parish council of a chairman and from five to fifteen councillors, elected annually at a parish meeting by show of hands, or by ballot, if demanded. Smaller parishes may have a council, but the consent of the county council is required if the population is less than 100. The parish council, which is a corporate body whose expenses are defrayed out of the poor-rate, appoints overseers and assistant-overseers, has the carrying out of the parochial Adoptive Acts by the provision of public offices and recreation grounds, the duty of looking after wells, streams, footpaths, rights of way, the regulation of minor nuisances, the power of acquiring and holding land

for allotments and other local purposes, and the administration of non-ecclesiastical charities. The offices of parish councillor, guardian, rural or urban district councillor, borough or county councillor are open to men and women subject to certain qualifying provisions. Local government franchise is open to men and women holding or occupying premises during a qualifying period. The wife of a man so qualified, if she is thirty years of age and resides on the same premises, is likewise entitled to registration.

The Vestry of a parish is either a common vestry—a meeting of all the ratepaying inhabitants, presided over by the incumbent—or a select vestry, elected under Hobhouse's Act (1831), or under a local act. In urban parishes it was unaffected by the Local Government Act of 1894 except where the urban district or borough council took over its duties; in rural parishes it continued to exist for ecclesiastical purposes only. The powers of the vestry and churchwardens, however, have been severely curtailed in England by the Parochial Church Council (Powers) measure of 1921. The administration of the Poor-laws (q.v.) in England is unaffected by the Act of 1894, save that now rural district councillors act as guardians. The care of the poor is almost entirely in the hands of the guardians; the overseers assist the guardians, but their duties as to poor relief are nominal. The assistant-overseers, when not appointed by the guardians, are officers of the parish council. A woman may be an overseer. See CHURCH-RATES, CHURCHWARDENS, CHURCHYARD, POOR-LAWS, VESTRY.

In Scotland, the Court of Session, acting as the Commission of Teinds, has power to unite and divide parishes, and to erect a disjointed part into a parish *quoad sacra*—i.e. for ecclesiastical purposes only. The poor-law was formerly administered by the kirk-session in country parishes and by magistrates in burghal parishes; but an Act of 1845 introduced a system of parochial boards, which since the Local Government Act of 1894 have been superseded by the parish councils. The church fabric is supported by the heritors; there are no churchwardens in Scotland; nor is there any meeting corresponding to the vestry. In the matter of parish schools Scotland was formerly far in advance of England. There are no parish meetings in Scotland or Ireland, and no parish councils in Ireland.

In the United States the term parish is not uncommonly used to denote the district assigned to a church or minister, but there are no civil parishes, except in the state of Louisiana.

See Beatrice and Sidney Webb, *Local Government*, Part I. (1906); Redlich and Hirst, *Local Government in England* (1903); Reichel, *Origin and Growth of the English Parish* (1921); Lord Selborne, *Churches and Tithes*; J. J. Clarke, *Local Government of the United Kingdom* (1924).

Parish Clerk. See CLERK.

Park, MUNGO, the African traveller, was born 10th September 1771, at Foulshields on the Yarrow, a farmer's seventh child in a family of thirteen. Educated at Selkirk, he was apprenticed to Dr Thomas Anderson, a surgeon there, and afterwards studied medicine in Edinburgh (1789-91). He was then introduced to Sir Joseph Banks by his brother-in-law, James Dickson, botanist, and obtained the situation of assistant-surgeon in the *Worcester*, bound for Bencoolen in Sumatra. On his return in 1793, the African Association of London had received intelligence of the death of Major Houghton, who had undertaken a journey to Africa at their expense. Park offered his services, was accepted, and sailed from England 22d May 1795. He spent some months at the English factory of Pisania on

the Gambia in making preparations for his travels, and in learning the Mandingo language. Leaving Pisania on the 2d of December he travelled eastward; but when he had nearly reached the place where Houghton lost his life, he fell into the hands of a Moorish king, who imprisoned him, and treated him roughly. Park seized an opportunity of escaping (1st July 1796), and in the third week of his flight reached the Niger, the great object of his search, at Sego, in 13° 5' N. lat. He followed its course downward as far as Silla; but meeting with hindrances that compelled him to retrace his steps, he pursued his way westward along its banks to Bammaku, and then crossed a mountainous country till he came to Kamalia, in the kingdom of Mandingo (14th September), where he was taken ill, and lay for some time. A slave-trader at last conveyed him again to the English factory on the Gambia, where he arrived, 10th June 1797, after an absence of nineteen months. Bryan Edwards drew up an account of his journey for the Association, and Park published an account of his travels after his return, under the title of *Travels in the Interior of Africa* (1799), a work which at once acquired a high popularity. He now married a daughter of Dr Anderson, his old Selkirk friend (2d August 1799), and settled as a surgeon at Peebles, where, however, he did not feel at home. He told Scott that he would rather brave Africa and its horrors than wear his life out in toilsome rides amongst the hills for the scanty remuneration of a country surgeon; and so, in 1805, he undertook another journey to Africa at the expense of government. As he parted from Scott on Williamhope ridge, his horse stumbled: 'I am afraid, Mungo,' said Scott, 'that is a bad omen.' To which Park replied with a smile, 'Freits (omens) follow those who look to them.' When he started from Pisania he had a company of forty-five, of whom thirty-six were European soldiers; but when he reached the Niger in August his attendants were reduced to seven. From Sansanding on the Niger, in the kingdom of Bambarra, he sent back his journals and letters in November 1805 to the Gambia, and embarked in an unwieldy half-rotten canoe with four European companions. Through many perils and difficulties they reached Boussa, where the canoe was caught in a cleft of rock; they were attacked by the natives, and drowned as they attempted to escape. An account of Park's second journey was published at London in 1815. Mrs Park was in receipt of a government pension till her death in 1840. Two of Park's sons joined the Indian army; Thomas, the second son, perished in trying to penetrate the mystery of his father's death. Park's narratives, which are well written, have long held their place amongst the classics of travel, and are of no inconsiderable value, particularly for the light which they throw upon the social and domestic life of the negroes, and on the botany and meteorology of the regions through which he passed; but he was unfortunately cut off before he had achieved the grand aim of his explorations—the discovery of the course of the Niger (q.v.). Park was tall and robust, and possessed of great hardihood and muscular vigour. 'For actual hardships undergone,' writes Joseph Thomson, 'for dangers faced, and difficulties overcome, together with an exhibition of the virtues which make a man great in the rude battle of life, Mungo Park stands without a rival.'

See the Life by Wishaw, prefixed to *Journal* (1815), and those by Joseph Thomson (1890) and T. B. Mac-lachlan (1898).

Parker, SIR GILBERT, born in Ontario in 1862, and educated at Trinity College, Toronto, travelled much in Canada and in the southern

seas, and for a time edited a Sydney paper. *Pierre and his People* (1892) is a fine presentation of Canadian character. Other stories of Canadian life, amongst *habitants*, half-breeds, and the rest, are *When Valmond came to Pontiac*, *The Seats of the Mighty* (a historical novel), and *The Lane that had no Turning* (1900). The scene of later stories is laid in Jersey, England, and Egypt; but none of these appealed so strongly as his Canadian stories. In his historical work on *Old Quebec* (1903) he had the help of a collaborator. Sir Gilbert settled in England, and from 1900 to 1918 sat as Conservative M.P. for Gravesend.

Parker, SIR HYDE (1739-1807) a British admiral, of a Devonshire family distinguished both before and after him in the naval service of the country, served in the American war and in the West Indies, and in 1801 was appointed to the chief command of the fleet which was sent to the Baltic to act against the armed coalition of the three northern states of Russia, Sweden, and Denmark. He had no share in the battle of Copenhagen, in which Nelson engaged under permissive orders; but by his appearance before Carlskrona he compelled the neutrality of Sweden; and he was on the point of sailing for Cronstadt when the news of the Emperor Paul's death put an end to hostilities.

Parker, JOSEPH (1830-1902), a popular preacher and author, the son of a stone-cutter, was born at Hexham, and began to preach in early youth. He studied at Moorfields Tabernacle and University College, London (1852), was ordained pastor of the Congregational Church, Banbury (1853), and became minister of the Cavenish Street Church, Manchester (1858), and of Poultry Chapel, London (1869), afterwards the City Temple (opened 1874). See his *A Preacher's Life* (1899), and *Life* by W. Adamson (1902).

Parker, MATTHEW, the second Protestant Archbishop of Canterbury, was born son of a calenderer at Norwich, August 6, 1504, studied at St Mary's Hostel and Corpus Christi College, Cambridge, took orders, and was elected to a fellowship. He was an arduous student of the Scriptures and of church history, yet, in spite of his strong leaning to the past, from an early period he was infected by the new doctrines. In 1535 he was appointed chaplain to the queen Anne Boleyn, and soon after he obtained the deanery of the college of St John the Baptist at Stoke near Clare in Suffolk. Here he lived mainly till 1545, his retiring temper finding pleasure enough in his studies and the administration of the college. In 1538 he was created D.D., next a royal chaplain and canon of Ely, and in 1544 master of Corpus Christi College, Cambridge, and the year after vice-chancellor of the university. Two years later he married. He was presented by Edward VI. to the deanery of Lincoln and the prebend of Corringham, but on the accession of Mary he resigned his mastership and was deprived of his preferments, finding safety, however, in strict retirement. The accession of Elizabeth called him from his retirement, and he was consecrated Archbishop of Canterbury in the chapel at Lambeth, 17th December 1559. The ridiculous fable about the informality of the ceremony, according to which it was performed at the Nag's Head Tavern, is not now believed.

During his fifteen years' primacy Parker strove to define more clearly the limits of belief and discipline, and to bring about more general conformity. The Thirty-nine Articles were passed by convocation in 1562, and four years later the archbishop issued his 'Advertisements' for the regulation of service, which, with the measures of repression perhaps forced upon him by the imperious queen,

provoked great opposition in the ranks of the growing Puritan party. To Parker belongs the merit of originating the revised translation of the Scriptures known as the Bishops' Bible. His wife died in August 1570. Her on one occasion Elizabeth insulted at Lambeth with the words, 'Madam I may not call you, and mistress I am loath to call you: however, I thank you for your good cheer.' Parker died 17th May 1575.

Parker did much for our native annals, but his methods as an editor have not commended themselves to modern scholars. He edited *Elfric's Anglo-Saxon Homily*, to prove that transubstantiation was not the doctrine of the ancient English church; the *Flores Historiarum*, as the work of an assumed Matthew of Westminster; the *Historia Major* of Matthew Paris, the *Historia Anglicana* of Walsingham, Asser's *Gesta Elfredi*, and the *Itinerarium* of Giraldus Cambrensis. The *De Excidio Britannice* of Gildas was edited under his eye by Joselin. He was an indefatigable collector of books, and the greater part of the treasures he had amassed he bequeathed to Corpus Christi College. This collection Fuller called 'the sun of English antiquity before it was eclipsed by that of Sir Robert Cotton.' Parker established a *scriptorium* at Lambeth, where he maintained printers, transcribers, engravers. His original writings are inconsiderable, the chief being a Latin treatise, *De Antiquitate Britannice Ecclesie et Privilegiis Ecclesie Cantuariensis* (1572). His letters fill a volume (1853) in the publications of the Parker Society, a fitting memorial of the book-loving archbishop. The Society published from 1841 till its dissolution in 1853 as many as fifty-three volumes of the works of Ridley, Bull, Grindal, Hooper, Cranmer, Coverdale, Latimer, Jewel, Tyndale, Bullinger, Whitgift, Rogers, and other fathers of the English Reformation. See *Lives* by Strype (1824) and Kennedy (1908); also Hook's *Lives of the Archbishops of Canterbury*, vol. ix. (1872).

Parker, THEODORE (1810-60), preacher, was born at Lexington, Mass. His grandfather held a command at Lexington, his father was an intelligent Unitarian farmer and wheelwright. He graduated at the Divinity School at Harvard in 1836, and settled the year after as Unitarian minister at West Roxbury, now a part of Boston. The naturalistic or rationalistic views which separated him from the more conservative portion of the Unitarians first attracted wide notice in an ordination sermon on *The Transient and Permanent in Christianity* (1841). The contest which arose on the anti-supernaturalism of this discourse led him further to develop his theological views in five Boston lectures, published under the title of *A Discourse of Matters pertaining to Religion* (1841), which was followed by *Sermons for the Times*. Failing health induced him to make an extended tour in Europe. In 1844 he returned to America, and for the remainder of his life preached to a congregation of three thousand at the Melodeon and Music Hall, besides incessantly writing and lecturing. He plunged with characteristic enthusiasm into the anti-slavery agitation. His writings reveal vast learning, keen spiritual insight, with great force of argument and felicity of illustration. Yet the thought is neither clearly defined, profound, nor always self-consistent, while the form is usually far inferior to the content.

The English edition of his works was edited by Frances P. Cobbe (14 vols. 1863-71). There are *Lives* by Weiss (2 vols. Boston, 1864), Frothingham (New York, 1874), Dean (Lond. 1877), Frances E. Cooke (3d ed. Boston, 1889), and White Chadwick (1900). See also vol. i. of Martineau's *Essays, Reviews, and Addresses* (1890).

Parkersburg, capital of Wood county, West Virginia, on the Ohio River (here crossed by a railway bridge $1\frac{1}{2}$ mile long), at the mouth of the Little Kanawha, 195 miles by rail E. by N. of Cincinnati. The city has a large trade in petroleum, and contains great oil-refineries, besides chemical

works, lumber-mills, and manufactories of furniture, wire, &c. Pop. 20,000.

Parkes, SIR HENRY (1815–96), Australian statesman, was born the son of a yeoman at Stoneleigh, Warwickshire, emigrated to New South Wales in 1839, and at Sydney became eminent as a journalist, editing *The Empire* in 1851–57. A member of the colonial parliament in 1854, he held various government offices and became premier in 1872, was repeatedly head of the ministry, and was identified with free trade and compulsory state education. He was president of the Australian Federation Convention of 1891. See his autobiographical *Fifty Years of the making of Australian History* (1892), and *Life* by Lyne (1897).

Parkesine. See CELLULOID.

Parkhurst, JOHN, born at Catesby in Northamptonshire in 1728, was educated at Rugby and Cambridge and took orders, but soon after retired to his estate at Epsom to give himself to study. Here he died 21st March 1797. In 1762 appeared his principal work, *A Hebrew and English Lexicon, without Points*, a very creditable performance for its time, and long a standard work, although disfigured by its fanciful etymologies. He also wrote a treatise (1787) against Dr Priestley, to prove the divinity and pre-existence of Jesus Christ.

Parkinson, JOHN (1567–1650), was apothecary to James I. and director of the Hampton Court gardens. He wrote *Theatrum botanicum* (1621), one of the best herbals, and *Paradisus terrestris* (1640). His name was chosen for a genus of Leguminosæ, represented by two species, *Parkinsonia aculeata* (inter-tropical) and *P. africana* (in South Africa).

Parkman, FRANCIS, historian, was born in Boston, Massachusetts, 16th September 1823, graduated at Harvard in 1844, next studied law for two years, then travelled in Europe, and returned to explore the Rocky Mountains. The hardships he endured among the Dakota Indians seriously injured his health, yet in spite of this and defective sight Parkman secured recognition as the authoritative historical writer on the rise and fall of the French dominion in America. He died 8th November 1893. His chief works form a connected series, and should be read in the following order: *The Pioneers of France in the New World* (1865), *The Jesuits in North America* (1867), *The Old Régime in Canada* (1874), *La Salle and the Discovery of the Great West* (1869), *Count Frontenac and New France under Louis XIV.* (1877), *A Half-Century of Conflict* (1893), and *Montcalm and Wolfe* (1884). See books by Farnham (1900) and Sedgwick (1904).

Parlement, the name applied in France, down to the Revolution, to certain superior and final courts of judicature, in which also the edicts of the king were registered before they became laws. Of these the chief was that of Paris, but there were no fewer than twelve provincial parlements, at Toulouse, Grenoble, Bordeaux, Dijon, Pau, Metz, Besançon, Douai, Rouen, Aix, Rennes, and Nancy. These, though not actually connected with that of Paris, invariably made common cause with it in its struggles with the royal power. The parlement of Paris dated from the 14th century, and already consisted of three chambers, the Grand Chambre, the Chambre des Enquêtes, and the Chambre des Requêtes. By 1344 it had grown in numbers and power, and consisted of 3 presidents and 78 counsellors, of whom 44 were ecclesiastics and 34 laymen. In 1467 Louis XI. made the counsellors irremovable. Its influence grew during the 16th century, and it now began to find courage to deliberate on the royal edicts as well as merely

register them, which the king could always force them to do by coming in person and holding a 'lit de justice' (see BED OF JUSTICE). Neither Richelieu nor Louis XIV. permitted such discussion of their edicts, and both the Regent Orleans and Louis XV. followed their policy. The latter exiled the members from Paris in 1753 for their interference in the struggle between the Jansenists and the Jesuits, and in 1770, on the advice of Maupeou, abolished the old parlement altogether and established the Parlement Maupeou. Louis XVI., however, recalled the former counsellors. These in the last days of their existence were grouped as follows: The Grand' Chambre, with 10 presidents and 37 counsellors, of whom 12 were clerics; the three Chambres des Enquêtes, each formed by 2 presidents and 23 counsellors; and the Chambre des Requêtes, in which sat 2 presidents and 13 counsellors.

Parley, PETER See GOODRICH.

Parliament (Low Lat. *parliamentum* or *parlamentum*; Fr. *parlement*, from *parler* 'to talk'), a meeting for conference and discussion (see PARLEMENT). In England the name of parliament has been given since the 13th century to the Great Council of the realm—the national assembly which succeeded to the powers exercised by the Witenagemot in Anglo-Saxon times. Under the influence of feudal ideas the Great Council became the high court of parliament. As the manor had its courts in which the lord met with his tenants, so the kingdom had its high court, in which the king met with the different estates or orders of his subjects, and conferred with them as to the enforcement of the good customs of the realm. At first the king claimed to exercise a measure of arbitrary discretion in issuing his writs of summons to parliament; but before the end of the 13th century it was settled and clearly understood that parliament should always consist of duly qualified representatives of the three estates of the realm—the Clergy, the Lords, and the Commons. The notion that the three estates are King or Queen, Lords, and Commons is a modern misconception.

The Three Estates—The Clergy.—The clergy were represented by the Lords Spiritual, the bishops, who sat among the Lords by virtue of their office. At one time proctors representing the lesser clergy sat among the Commons; but the clergy gave up this right in order to manage their own affairs in Convocation (q.v.). When Convocation gave up its right of taxation clergymen were permitted to vote in the election of members of the House of Commons. It would hardly be correct to say that the clergy still form a separate estate; but the Lords Spiritual still sit in the Upper House. The Archbishops of Canterbury and York, and the Bishops of London, Durham, and Winchester are always summoned to parliament; the other bishops are also summoned, but the junior members of the episcopal bench are excluded by the acts for the creation of new bishoprics, in which it is provided that the number of Lords Spiritual is not to be increased beyond the number as it stood in 1846, when the see of Manchester was founded. The Lords Spiritual do not vote as a separate order; in other words, a bill may pass in the House of Lords though all the bishops vote against it.

The Lords Temporal.—The lords or greater barons were originally those who held lands and honours of the king by the more dignified kinds of feudal service. They were barons by tenure, and as such entitled to receive the king's writ; among themselves they were peers or equals. In course of time the writ became the evidence of title to a peerage; but since the 15th century peers have always been created by a patent from the crown,

specifying the title by which the new peer is to be known, and the heirs to whom his dignity is to descend. The titles now in use are duke, marquis, earl, viscount, and baron (on which see separate articles); a peer is named as being of a particular place, but it is no longer necessary that he should have any land or feudal rights in the place named. In other words, our aristocracy is no longer a close feudal aristocracy; it owes its existence to the crown, and the crown may increase the number of peers at pleasure. Historically this has been a rule of first importance, for the right to create new peers has enabled the crown—i.e. the ministers governing in the name of the crown, and enjoying the confidence of the House of Commons—to overcome the resistance of the House of Lords. Thus the mere threat to exercise the right to create new peers in such a way as to outvote an unfavourable majority in the upper house, secured the passing of the Reform Bill of 1832, and obliged the Lords definitely to sanction the limitation of their powers in the Parliament Act of 1911. The dignity of peerage was always a hereditary dignity; the blood of the holder was ennobled. But the sons of a peer, though they bear courtesy titles and are nominally ennobled, are commoners for all legal and political purposes. This again is a most important rule, because it prevents the nobility from becoming a closely organised caste. It seems that the crown could always create a man a peer for his life; but it was resolved in the case of Lord Wensleydale, in 1856, that a life peerage, even if followed up by a writ of summons to parliament, would not entitle the holder to sit in the House of Lords. Since the Wensleydale case the Lords of Appeal in Ordinary have been made life peers by statute. These lords are appointed to take part in the judicial business of the House, and in 1913 their number was increased from four to six. In 1830 there were 401 peers on the roll of the House of Lords; at present there are over 700. Of these peerages more than one-third have been created since the beginning of the 19th century. The right of peeresses in their own right to sit in the House of Lords was, in 1922, first favourably reported on by the committee for privileges, but finally refused, and in 1925 a bill in the Lords to confer the right was rejected.

In ancient times the prerogative right to create peers was used but sparingly; there were only some 50 or 60 Lords Temporal in the parliaments of the 15th and 16th centuries. The number of Lords Spiritual was reduced by the removal of abbots and priors at the Reformation to 26, at which figure by arrangement it has ever since remained. Four sat as representatives of the Irish Church from 1800 down to its disestablishment in 1869, and previous to its disestablishment in 1920, under the Welsh Church Act of 1914, there were representatives of the church in Wales. In conferring peerages the Stuart kings were more generous, or more lax, than their predecessors. At the Revolution of 1688 the number stood at about 150. On the accession of George I. the leaders of the House of Lords proposed to restrain the crown from adding to the then existing number of 178 peerages; but this scheme was vehemently opposed in the House of Commons, and finally rejected. During the reign of George III. peers were created very freely. It was the avowed policy of the younger Pitt to fill the House of Lords with the wealthiest traders and landowners, and so to break down the family and personal factions into which a small aristocratic assembly tends to divide itself. With this object he conferred peerages so lavishly that the number created by George III. was 388.

In 1399 the Commons formally admitted 'that the judgments of parliament belong to the Lords

and not to the Commons.' The House of Lords is a court of final appeal for all parts of Great Britain and Northern Ireland; it exercises original jurisdiction in peerage cases, in trials of peers for treason or felony, and on Impeachments (q.v.) by the Commons. When the House is sitting judicially, convention dictates that only those members who hold or have held high judicial office take part in the proceedings. Lay peers formerly took part and voted on appeals; but this practice was justly regarded as a scandal. In 1844 some lay peers announced their intention to vote in the case of the *Queen v. Daniel O'Connell*, but they were persuaded to retire, and the case was decided by the legal members of the House. In its legislative capacity the House may deal with any matter affecting the public interest, and it claims the right to initiate bills which directly affect its own rights and privileges. By a convention of long standing, the Lords respect the right of the Commons to initiate money bills; their assent to such a bill is rendered unnecessary by the Parliament Act of 1911 (see below). Any member of the House may introduce a bill, and ask that it may be read a first time; the 'reading' is of a formal character—the bill is laid on the table, and the title is read out by the clerk. If the House consents to read the bill a second time it accepts the general principle of the measure; the bill is then referred to a committee of the whole House, or to a select committee, to be amended in detail; it may then be reported to the House and read a third time and passed. If the bill is afterwards passed, or has already been passed by the Commons, it only requires the royal assent to become an act of parliament. This assent is given by the sovereign in person, or by commissioners representing the sovereign; the Lords are present in their places; the Commons, headed by their Speaker, attend at the bar of the Lords; the clerk of parliaments utters the Norman-French formula, 'Le Roy (or La Reine) le veult.' In the case of a money bill the royal assent is coupled with an expression of thanks for the 'benevolence' of parliament. The clerk endorses on the bill the date of the royal assent which turns it into an act. If the sovereign were to refuse assent the form would be 'Le Roy (or La Reine) s'avisera'—the King (or Queen) will think about it. But since the cabinet council became the chief power in the state this form of refusal has never been heard. Ministers take the lead in the business of legislation; they obtain the assent of the sovereign on the one hand, and of parliament on the other; all open conflict of powers is avoided. Queen Anne refused her assent to a Scotch Militia Bill; but since that time the royal assent has been given to every bill which passed the two Houses. Bills which await the royal assent are usually deposited in the House of Lords for that purpose; but a money bill is returned to the Speaker of the Commons, and is handed by him at the bar of the House of Lords to the Clerk of the Parliaments to receive the royal assent.

Precedence and Privileges.—Members of the House of Lords were formerly required to sit according to their precedence, but this rule is no longer observed. The bishops sit to the right of the woolsack; on the same side is the bench usually occupied by ministers. Supporters of the government sit behind their leaders, members of the opposition on the other side of the House, and independent members on the cross benches in front of the table. Whether it is sitting as a legislative or a judicial body, the House of Lords possesses all privileges necessary to the safe and dignified conduct of business. Its members are free from arrest on civil process in coming, going, or returning.

They are free to speak their minds without being liable to action or indictment. They have access to the crown to explain their proceedings, and the crown should put the best construction on what they do. It is a breach of privilege to reflect on the honour of the House, or on the parliamentary conduct of its members. It is technically a breach of privilege to report its proceedings; but regular arrangements are now made for the admission of reporters. It was formerly doubtful how far the printers of the House were protected, but now, under an Act of 1840, the printers of parliamentary papers, if sued or prosecuted, may obtain a stay of proceedings on producing a certificate that such papers were printed by order. The House of Lords declares its own privileges; but in doing so it is bound by the law; it cannot create a new privilege by mere declaration. Persons guilty of breach of privilege may be attached and brought in custody, censured, fined, or imprisoned for a time certain or during pleasure. The privilege of the House may be used to protect the House and its committees, and all persons having lawful business before them, together with their counsel, solicitors, and witnesses.

Officers.—The chief officer of the House of Lords is the Chancellor, or Keeper of the Great Seal, who acts as speaker for formal purposes; he does not keep order; the Lords keep their own order. It is not even necessary that he should be a lord of parliament, and he sits on the woolsack, which is supposed to be outside the House. Deputy-speakers are appointed when necessary; and there is a salaried Chairman of Committees who exercises considerable powers, especially in regard to private bills. The Clerk of the Parliaments is appointed by the crown; and the Gentleman Usher of the Black Rod is one of the King's ushers, whom he permits to act as the messenger and executive officer of the Lords. The judges and law-officers rank as assistants of the House; they are summoned to attend in parliament, and they are present on occasions of state; the judges also come in, their place being on the woolsacks, when the Lords desire to take their opinions on a point of law. Formal messages to the Commons are conveyed by the Usher of the Black Rod. Judges and Masters in Chancery were formerly employed for the same purpose, but the Commons came to treat these ceremonious messages with levity, and messages now pass from one House to another by the hands of their respective clerks, except on certain important occasions, such as the opening of parliament, &c. Formerly, when the two Houses differed, a formal conference was held in the Painted Chamber, the Lords sitting with their hats on, the Commons standing and uncovered; but the modern practice of party government renders these conferences unnecessary.

The Commons.—The Commons, or 'communitas regni,' included originally three classes of persons. First, the proctors of the lesser clergy, who disappeared at an early date. Secondly, the knights of the shire, who were chosen by the lesser barons and the general body of freeholders. These free tenants held their land by honourable tenures, but they could not bear the expense of attendance in parliament. As early as the time of King John they were represented by delegates; and Simon de Montfort gave effect to the same principle when he ordered two knights to be sent to parliament from each shire. Thirdly, there were burgesses and citizens, representing the self-governing towns of the kingdom. The burgesses also found it hard to bear the expense of attending parliament; they usually received an allowance for doing so. From the earliest times, indeed, constituencies were liable for the expense of maintaining their members during their attendance upon parliament, but

by the beginning of the 17th century the practice had practically disappeared. In the 19th century, however, in the interests of more democratic representation, a movement began for the payment of members out of national funds. Not till 1911, however, as an indirect result of the Osborne judgment, whereby the payment of salaries to members out of trade-union funds was declared illegal, was provision first made for the payment of members; then an allowance to each member of £400 a year was made, and has since been annually renewed. The legal liability of constituencies for the payment of members has, however, never been removed. Payment of travelling expenses was first made in 1924.

Happily for the cause of popular government, the knights and burgesses were soon welded together in one body; there has never been any legal difference between county members and borough members. Early in the history of parliament, it would appear in the 13th or 14th century, the Commons refused to consider their own affairs in a separate chamber; one of their number presided, and acted as Speaker in communicating to the Lords the opinions of the third estate; and thus the Commons came to be organised as a separate House. The Lords remained in the old parliament chamber, and there the king continued to meet with the three estates; his throne was set in the House of Lords, and he never went into the House of Commons. Charles I. was therefore acting contrary to usage when he went in person to arrest the seven members. From about 1548 the Commons met in a room which had been known as St Stephen's Chapel, and the House of Commons is still occasionally spoken of as St Stephen's. Within the House all members are equal; but the bench immediately to the right of the chair is reserved for privy-councillors, and is now always occupied by ministers having seats in the House: their supporters sit behind them, and the members of the opposition sit to the left of the chair. Like the members of the other House, the Commons enjoy privilege of parliament; they are free from arrest on civil process in attending the House, and in coming or returning; but no person is privileged against arrest for any indictable offence or for contempt of court. In the days when arrest for debt was common the privilege claimed by members of parliament, and even by their servants, was sometimes used to defeat creditors; but now an action or a bankruptcy petition is in no way impeded by privilege. A member of either House who becomes bankrupt is not permitted to sit or vote. Freedom of speech is enjoyed by the Commons as by the Lords; and they may claim, as a House, free access to the sovereign. The Commons may deal with offenders against their privileges by directing a prosecution; they do not claim the right to impose a fine, or to imprison for a time certain, but they may commit a person to prison during pleasure; persons so imprisoned may not be detained after the end of the session. The House declares its own privileges, but it cannot create a new privilege by mere declaration. In the famous case of *Stockdale v. Hansard* the House assumed authority to protect its printer against an action for libel, but the courts disregarded this resolution, and the controversy was finally settled by the passing of the Act of 1840 which has already been cited. A question of privilege will be taken up without notice at any moment; but it should be observed that a member has no privilege except during the session and forty days before and after it. We have seen that the Commons claim no general judicial authority, but they have claimed to deal judicially with cases of privilege, and with questions relating to the election and conduct of

their members. Election petitions used to be tried by committees of the House, but this practice led to great abuses, and in 1868 these petitions were remitted to the judges for trial. The House may exclude, suspend, or expel a member for misbehaviour; but it was settled in the case of John Wilkes (q.v.) that expulsion creates no disqualification; the person expelled may be re-elected. Burke and other high authorities attach great importance to this rule of the constitution. If the House could disqualify a member for re-election, the majority might be tempted to strengthen itself by expelling the leaders of the minority. In 1711 Sir Robert (then Mr) Walpole was expelled the House, and there is reason to believe that the vote in his case was decided by considerations of party, and not by his guilt or innocence of the charges made against him.

As representing the whole community, and not merely a limited order, the Commons from early times assumed the lead in the financial and legislative business of parliament. Onwards from the Great Charter the crown frequently admitted that taxes were not to be levied without consent of parliament; and in the reign of Richard II., if not earlier, the Commons laid claim to the 'power of the purse.' This power, though generally acknowledged, was from time to time a source of conflict between the Commons and the Lords, memorably on the occasions of the Lords' rejection of the Paper Duty Repeal Bill of 1860 and of the Finance Bill of 1909; it was the rejection of the last which led to the passing of the Parliament Act of 1911, whereby the undivided authority of the Commons over finance was definitely established by law, it being provided that a bill certified by the Speaker of the Commons as a money bill and sent up at least one month before the end of the session might, if not passed by the House of Lords without amendment within one month after being so sent up, be presented for the royal assent and become an act of parliament independent of the concurrence of the Lords. Estimates of public expenditure are laid before the Commons by ministers, and considered in committee of supply. This is a committee of the whole House; the Speaker leaves the chair when the committee begins; the Mace (q.v.) is taken from the table; the Chairman of Committees takes his seat at the table; and the discussion which follows is of an informal character, members being allowed to speak more than once to the same question. When some of the necessary votes have been taken in supply the House resolves itself, in like manner, into a committee of ways and means. The resolutions adopted in committee are embodied in bills, which are sent up for the assent of the Lords or for the royal assent. At the close of the financial year (i.e. about the end of March) the Chancellor of the Exchequer, in committee of the whole House, opens his Budget (q.v.) of expenditure and revenue for the coming year. Legislative business is conducted with the same forms as in the Lords; but a member must ask leave of the House to introduce a bill. If a bill is read a second time it is considered in detail by a committee of the whole House, or by a select committee. A committee always reports its proceedings to the House, the Speaker resuming the chair for that purpose. As the supremacy of the Commons over finance was legally established by the Parliament Act of 1911, so also, by the same act, was its predominance in legislation secured. Thus by the provisions of the act, public bills other than money bills—a bill to extend the duration of parliament is outwith the scope of the act and must have the assent of the Lords—if passed by the House of Commons in three successive sessions, whether of the same parliament

or not, and rejected by the House of Lords each time, may be presented for the royal assent and become acts of parliament on their third rejection without the concurrence of the Lords, provided their passage through the House of Commons has occupied two years from their second reading in the first session. In the preamble to the act is a declared intention to substitute for the existing House of Lords a second chamber constituted on a popular, as distinct from an hereditary, basis, and were such an intention put into effect some readjustment of powers between the houses in the direction of restoring a more effective authority to the Upper House could only follow. Besides performing financial and legislative duties, the House of Commons acts as a 'grand inquest' to inquire into all matters of public concern. It is specially bound to watch the conduct of ministers, and to inform the sovereign whether they possess the confidence of the nation or not. In other words, the support of the Commons is necessary to the existence of a ministry, while a ministry may hold power though its supporters are in a minority in the Lords. Ministers take the lead in all important business; and party discipline tends to reduce the individual private member to comparative insignificance.

Union with Scotland and Ireland.—Down to the Treaty of 1707 Scotland had an independent parliament; the three estates of that kingdom sat together in one house, and the conduct of business was for the most part left to a smaller body called Lords of the Articles. At the Union the Scottish parliament ceased to exist; it was agreed that sixteen Scottish peers (elected by an assembly of peers at Holyrood, at the opening of a new parliament) should sit in the House of Lords, and not less than forty-five Scottish members in the House of Commons. The Irish parliament was an assembly of a more or less provincial character, sitting in two houses. Its legislative independence was conceded, under pressure, in 1782, but it never obtained effective control over the executive (see GRATTAN). By the Act of Union the Irish parliament was taken away; it was agreed that twenty-eight Irish peers (elected for life) should sit in the House of Lords, and 100 Irish members in the House of Commons. Thus the English parliament became the parliament of the United Kingdom. But by the joint effect of the Government of Ireland Act (1920) and the Irish Free State (Agreement) Act (1922), only thirteen Irish members, these representing constituencies in Northern Ireland, now sit in the House of Commons. Twenty-eight peers still sit as formerly in the House of Lords. The Irish Free State and Northern Ireland have each parliaments of their own. That of the Free State is known as Oireachtas, and consists of two houses, a chamber of deputies (Dáil Eireann) of 153 members popularly elected on principles of proportional representation, and a Senate (Seanad Eireann) of 56 members (exclusive of university members), a fourth of whom are popularly elected every three years on principles of proportional representation, from a panel of which two-thirds are nominated by the Dáil and one-third by the Seanad. For the passing of bills the assent of the governor-general as representing the crown is required. Provision is made for the payment of members of both houses. The parliament of Northern Ireland consists also of two houses—a House of Commons of 52 elected members and a Senate of 2 *ex-officio* and 24 elected members. The parliament has power to legislate for its own area except in regard to matters of imperial concern and in certain matters reserved to the imperial parliament. An allowance for expenses is made to members of both houses.

Parliamentary Reform.—Successive Reform acts have widened the democratic basis of the House of Commons: the Act of 1832 gave power into the hands of the middle classes; the Acts of 1867 and 1884, by admitting all householders and £10 lodgers to the franchise, gave a preponderance of voting power to the working-classes; while the Act of 1918 by virtually establishing universal manhood suffrage and by giving the vote to women very greatly enlarged the electorate. Side by side with an extended electorate the House of Commons has increased in size, and with its 615 members may now be considered too large for a deliberative assembly. The colonies and dependencies have no direct representation in either House; but questions of imperial policy occupy no small share of the time of parliament. With the advance of democracy the sphere of legislation has been much extended; large schemes for promoting education, health, insurance, for regulating the control of industry, and for the creation of new executive departments and local authorities are brought forward by all political parties. Each party makes its power felt by pushing its own measures and by dilatory resistance to the measures of its opponents; obstruction has been reduced to an art; the labours of those who lead the House of Commons have become intolerable heavy, and the old rules of debate are found unequal to the strain of political conflict. In 1882 the House adopted new rules of procedure, and these rules were further amended in 1887. A motion for the closure of a debate may now be put at any moment, with the assent of the Speaker or Chairman. But a question for the closure of debate is not decided in the affirmative unless the number voting in the majority be not less than 100. The closure has now been developed so as to give the Cabinet complete control over the business of legislation. A time may be fixed for each stage or part of a bill; when the moment arrives, the 'guillotine' falls and discussion comes to an end. When amendments are put down in embarrassing numbers, the Chairman may be empowered to select those which most require discussion, and the debate leaps, 'kangaroo' fashion, from one selected amendment to another. But though the 'kangaroo' closure, and (to a lesser extent) the guillotine may now be regarded as accepted features of parliamentary procedure, their employment is recognised as being justifiable only on grounds of necessity. Dilatory motions for adjournment have been checked; tedious and irrelevant speakers may now be stopped by the chair; a member 'named' to the House as disregarding the authority of the chair may be suspended for a time from his service.

Officers.—The chief officer of the House of Commons is the Speaker, who is chosen by the members from among their own number, at the opening of a new parliament. The Speaker-elect presents himself at the bar of the Lords for the approval of the crown, which is given in a customary form of words by the Lord Chancellor. The Speaker then lays claim to the ancient privileges of the Commons: on returning to his own House he takes the oath before the other members. Inducted with these forms, the Speaker becomes the president and spokesman of the House, with authority to keep order. Under the Parliament Act he has also important duties of a judicial and interpretative character. He refers all questions of importance to the House; but his own position is one of great influence and dignity; previous to 1919 he was First Commoner in the kingdom ranking next after the peers of the realm, but now he takes precedence after the Lord President of the Council. The Chairman of Committees presides in committee of the whole House; he is also

empowered to act as Deputy-speaker. The Under-clerk of the Parliaments acts as clerk of the House. There are two other clerks; their chief duty is to keep the Journals, which are accepted by all other authorities as evidence of what is done by the House. The Serjeant-at-arms is the executive officer of the Commons.

Summoning Parliament.—When the sovereign is advised to summon a new parliament notice of that intention is given by proclamation. A writ of summons is sent to each lord of parliament; the Scottish peers elect the representative peers. A writ is also sent to the returning officer of each constituency, commanding him to hold an election, and to return the name of the person elected. In counties the sheriff acts as returning-officer; in Scotland he acts also for burghs within his jurisdiction; in English boroughs this duty is commonly performed by the mayor. The lawful charges incurred by the returning-officer, formerly borne by the candidates themselves in such a way as to impede the candidature of the poor, have since 1918, except in the case of university elections, been paid by the state; a candidate has, however, to make a deposit which is not returned to him unless he poll one-eighth of the total votes cast.

Places represented in Parliament.—The places represented in the House of Commons are counties and county divisions, boroughs and wards of boroughs, and universities. By the Representation of the People Act (1918) and by the Redistribution of Seats (Ireland) Act (1918), a new distribution of representation according to population was introduced on the principle of one member for every 70,000 in Great Britain and one for every 43,000 in Ireland; under the Government of Ireland Act (1920), however, the Northern Ireland constituencies are much larger. In both the acts of 1918 the establishment of single-member constituencies was aimed at. By the first act the principle of proportional representation was for the first time introduced into parliamentary elections in Great Britain but only in the case of university constituencies returning two or more members; facilities were indeed provided for a limited extension of the principle to certain other constituencies returning three or more members, provided a scheme to be brought forward by commissioners received the assent of parliament, but this assent, as it proved, was refused. The seats allotted to the universities have long been the cause of controversy. In old times a university was a kind of borough within a borough; Oxford and Cambridge obtained at an early date the privilege of sending burgesses to parliament; and the universities of London and Dublin and the four Scottish universities came also to be represented in parliament. Under the Representation of the People Act (1918) and the Redistribution of Seats (Ireland) Act (1918) the number of university constituencies was increased. Thus the English universities of Durham, Manchester, Liverpool, Leeds, Sheffield, Birmingham, Bristol, the whole forming one constituency, were for the first time enfranchised, as were also the university of Wales, the National University of Ireland, and Queen's University, Belfast. On the establishment of the Irish Free State, Dublin and also the National University ceased to return members to the House of Commons.

Electors.—The voters entitled to take part in the election are those whose names are on the register. Registration was introduced after the Reform Act of 1832; the rules respecting it are now governed by the Representation of the People Act (1918). Lists of voters are prepared by registration officers, and means are provided for proving and testing claims to vote. The lists are prepared twice yearly,

the period necessary for qualification in this way being shortened from one year to six months. The registration list in a university constituency is prepared by the governing body of the university. The persons entitled to be placed on the register are persons of full age (21 years for a man, 30 for a woman) not being peers, though peeresses in their own right may vote, not disqualified by alienage, office, or employment, unsoundness of mind, conviction for crime or corrupt practices, and possessing any of the qualifications required by law (see below). Since 1918 all disqualifications on the ground of receipt of poor relief have been removed. Before 1832 county members were elected in England by the freeholders assembled in the county court; an act of Henry VI. restricted the right of voting to those whose tenements were of the yearly value of forty shillings; in some boroughs the right of election belonged to a limited number of persons having freeholds or burgage tenements within the boroughs; in others the inhabitants paying scot and lot voted; in others, again, the right was restricted to members or officers of the corporation. In Scotland the county qualification was a forty-shilling land of old extent, or land not of old extent rated in valuation books at £400; in Edinburgh the election was by the town council; the member for each group of royal burghs was chosen by delegates appointed by the town-councils. In Galt's novel, *The Provost*, there is a graphic and truthful description of a burgh election under the old system. The Irish borough and county franchises were modelled on the English system; on the passing of the Roman Catholic Emancipation Act in 1829 it was thought prudent to disfranchise freeholders under £10 a year. In England, in the counties, under the Reform Act of 1832 the old forty-shilling freehold qualification was retained, while the franchise was extended to all persons who paid a yearly rent of £50, or were copyholders to the value of £10, and in the boroughs a common franchise was created for all occupiers of premises of the annual value of £10 a year. By the act of 1867 the qualifications required of electors were decidedly lowered, especially of voters in the boroughs; thus in the counties the right to vote was given to all occupiers of property rated at £12 a year, and in the boroughs to all householders who paid rates and to lodgers paying a yearly rental of £10. By the act of 1884 the occupation franchise which had been given to the boroughs in 1867 was extended to the counties, and the qualifications for the suffrage in these two kinds of electoral districts were, with some slight exceptions, made uniform for the first time in parliamentary history. In Scotland and Ireland onwards from 1832, the franchise had, by the passing of corresponding acts, been reformed along similar lines. The position of the franchise law in Great Britain and Northern Ireland is now to be found in the Representation of the People Act (1918), an act in direct succession from the acts of 1832, 1867, and 1884. By this act the county and borough franchises were finally assimilated, and a single statute was substituted for the tangle of legislation in which the franchise law had previously to be sought; the property qualification was altogether abolished, and a common qualification based on local occupation or residence was established; the vote was given to women. Under the act men have the right to vote as parliamentary electors in a constituency provided they have attained the age of 21 years, and provided they have resided in any premises or have occupied any business premises of the yearly value of not less than £10; women have the right to vote provided they have attained the age of 30 years, and provided they are entitled to be registered as local

government electors in respect of the occupation of dwelling-houses (irrespective of value) or of lands or other premises (other than dwelling-houses) of a yearly value of not less than £5, or are the wives of men entitled to be so registered; in Scotland the women's parliamentary franchise is slightly different but substantially the qualifications are the same; in all cases whether of male or female suffrage residence or occupation must be for a qualifying period of six months ending on 15th January or 15th July (in Northern Ireland the latter date alone applies), but residence or occupation during the qualifying period in neighbouring constituencies is as effective as residence or occupation in the constituency itself. As has been indicated above, the Act of 1918 increased the number of the university constituencies; at the same time it also extended generally the university franchise. Formerly women were excluded from that as from other franchises, and the possession of a degree did not in all universities qualify a man for a vote; now the franchise is granted irrespective of sex to all persons who have taken degrees other than honorary degrees. In university, as in ordinary, constituencies, a man to exercise the vote must have attained the age of 21 years, a woman that of 30 years; and in the case of a university which does not admit women to degrees, a woman is none the less eligible to vote if but for the prohibition she would have been entitled to a degree. If qualified, university voters continue as formerly to vote in ordinary constituencies, a double qualification being in this way retained; other double qualifications are also possible under the act, continuance so being given to a method of voting held by many to be inconsistent with democratic principles; while, however, the Act of 1918 did not do away with plural voting, it reduced it to narrow limits, the provisions of the statute making it illegal for anyone to vote at a general election in more than two constituencies. In addition to changes in the franchise already cited, the Act of 1918 also established a new naval and military franchise; under this, soldiers and sailors are entitled to be registered as parliamentary electors provided that but for their service they would have been entitled to be so registered.

Candidates—Conduct of the Election—Election Petitions.—On receiving the writ for an election the returning-officer fixes a day to receive the names of candidates. Any male British subject of full age, not disqualified by peerage, office, conviction, &c., may become a candidate; and by the Parliament (Qualification of Women) Act (1918) women are also eligible for election. Candidates are required to have agents for election expenses, and in promoting their candidatures they are bound to see that no breach of the law is committed, and that the total expenses are kept within the limits prescribed by the Corrupt Practices Act (1883), as amended—the scale of expenses was here reduced—by the Representation of the People Act (1918). If more candidates come forward than there are seats to be filled, a day is fixed for taking a poll of the electors; rooms or booths are fitted up for that purpose; each polling place is supplied with a ballot-box, voting-papers, &c., and presided over by the returning-officer or one of his deputies. The elector votes by placing a cross opposite the name of the candidate of his choice; his paper is folded up by himself and dropped into the box; elaborate rules are made by the Ballot Act, 1872 (amended by the Representation of the People Acts, 1918 to 1920), to protect the secrecy of the vote (see BALLOT). Since 1918 absent voters may in certain circumstances vote by post or by proxy. Under the Representation of the People Act (1918) all polls at a general election, except in university

constituencies, must be taken on the same day. Any material infraction of the law in conducting an election may be made the ground of a petition; the petitioners are required to find security for the costs: the petition is tried by two judges, who decide such questions of law and fact as may be raised, determine whether the person petitioned against has been duly elected or not, and report to the Speaker the result of their inquiry. If there is reason to believe that corrupt practices have extensively prevailed, commissioners may be appointed to make inquiry and report, and persons guilty of criminal offences may be prosecuted. The foregoing rules apply to the conduct of a general election, and also to the conduct of an election to fill a vacancy in the House of Commons caused by death, expulsion, or acceptance of office under the crown. The law does not permit a member of parliament to resign; if it is desired to retire, a member makes application for the stewardship of the Chiltern Hundreds (q.v.), or of the manor of Northstead, and the acceptance of either of these offices has the effect of vacating the seat. On the acceptance of high political office the vacation of a seat is the general rule and presentation for re-election is necessary.

Meeting of Parliament—Acts of Parliament.—When the Lords and Commons assemble at Westminster the Commons are directed to choose a Speaker. This having been done, and the members of both Houses having taken the oath of allegiance, the causes for which parliament has been called together are declared in the King's Speech, which is read by the sovereign in person, or by the Lord Chancellor in the sovereign's presence, or by one of the lords commissioners who represent the sovereign in absence. The two Houses are free to take up matters not laid before them by the crown; business is usually begun in each House by reading a bill *pro forma*, in order to assert the right of free deliberation. Two members are chosen in each House by ministers to move and second an address in answer to the royal speech; in the Commons this motion gives rise to an aimless and discursive debate, in which the whole policy of the government is attacked by the opposition. Such are the forms with which the first session of a new parliament is begun. Each House may adjourn at its own discretion from day to day and for the customary holidays. The session comes to an end when parliament is prorogued by the crown: prorogation puts an end to all sessional orders and to all pending business, except impeachments, writs of error, appeals to the House of Lords, and bills which are being passed under the Parliament Act (1911). The public acts of parliament passed in a session form one statute, which is divided into chapters for convenience of reference. Thus, 'the 30 and 31 Vict. chap. 20' means the 20th chapter of the statute law made in a session which began in the 30th and continued into the 31st year of Queen Victoria's reign—in other words, the session of 1867. Copies of the statutes are engrossed for preservation among the rolls of parliament, and printed copies are sent to judges and magistrates; but no form of publication is required to give validity to a statute; all subjects are bound to take note of and obey the law. In applying the rules of a statute the courts are guided by the intention expressed in the act itself; they will not look at the arguments or assurances addressed to parliament in the course of debate. An act comes into force as soon as it receives the royal assent, unless some other time has been indicated in the act. It is a rule that no bill may be introduced twice in the same session; it has sometimes been found necessary to prorogue parliament in order that a rejected bill may be brought in again without delay.

Divisions—Committees.—A division is taken in either House by the voices of those present, the Lords crying 'Content' or 'Not content,' the Commons 'Aye' or 'No.' If the Speaker's decision as to the result of the vote is challenged, members pass out into the lobbies, and are 'told' or counted by members appointed for that purpose. In case the numbers are equal, in the Lords the question is decided in the negative; in the Commons the Speaker gives a casting vote. Matters which cannot conveniently be dealt with in the House are referred to a committee of the whole House, such as has been already described, or to a select committee. Witnesses may now be examined before committees of both Houses on oath. When a private bill—a bill, that is, furthered by persons outside parliament and devoted to matters of individual, local, or corporate interest—is sent to a committee, the promoters and opponents attend with their counsel and agents; the inquiry partakes of a judicial character. The expense of proceedings before parliamentary committees is very great, and many proposals have been made to alter the existing system. Scottish private bills are dealt with by a different procedure, adopted as an improvement under the Private Legislation Procedure (Scotland) Act (1899). In the House of Commons there were formerly four grand committees—for religion, for grievances, for courts of justice, and for trade. These four were discontinued in 1832; in 1882 two standing committees were appointed for the consideration of bills relating to law and courts of justice and to trade—bills uncontentious in character but needing careful scrutiny in detail. These committees continued to be appointed till 1907, when provision was made for the appointment of four standing committees, a number increased in 1919 to six. One of these committees is appointed for the consideration of all public bills relating exclusively to Scotland; the others deal with any bills that may be referred to them and not as previously only with those relating to law or to trade, and now reference to a standing committee is the rule except in the case of money bills or provisional order bills; great party measures are, of course, also exceptions. The House, if it so desire, may vote not to send a bill to a standing committee. The committees have within their limits undoubtedly forwarded the business of the House.

Prorogation and Dissolution.—When parliament has been prorogued it may be summoned to meet for another session; the new session is opened with a royal speech. When the government determines to 'go to the country'—i.e. to hold a general election—it is customary to put an end to the session by prorogation, and afterwards to issue a proclamation dissolving the parliament and to give directions for the issue of new writs of summons. Dissolution puts an end to the House of Commons for the time being: the members are no longer addressed by the title of M.P., and the Speaker becomes an ordinary commoner. The law directs that not more than three years shall elapse between the dissolution of a parliament and the calling of a new one; but, inasmuch as the Commons will not vote more than an annual supply of money, it is absolutely necessary that there should be at least one session of parliament in each year. No parliament may endure for more than five years from the time when it is first summoned to meet. Triennial parliaments were established by a law of 1641; in the same year the Long Parliament got the king to agree to a bill depriving him of the right to dissolve that parliament without its own consent; the Triennial Act was repealed after the restoration of Charles II., and re-enacted in 1694. The period of seven years was fixed, instead of three years, by the Septennial Act,

passed in 1716, soon after the accession of George I., at a time when the government desired to avoid the changes of popular opinion produced by frequent general elections. Under the Parliament Act (1911) the maximum duration of parliament was reduced to five years.

'Omnipotence' of Parliament.—In foreign countries and in the British colonies the legislature is a limited body, which exercises the powers conferred upon it by a written constitution; its acts are void if they exceed its powers. An act of the congress of the United States, for example, may be set aside by a court of law if it is beyond the constitutional competence of congress. No British court can set aside an act of parliament on any such ground, for parliament defines its own powers and is not bound by any written constitution. In the words of Sir Edward Coke, the power of parliament 'is so transcendental and absolute that it cannot be confined, either for causes or persons, within any bounds.' The other legislative authorities of the empire act within the limits laid down for them by parliament. If a colonial government, for instance, wishes to deal with some matter outside the colony, it must, as a general rule, obtain an act of parliament for the purpose; a colonial legislature has an authority which is plenary as to causes and persons, but limited as to territorial area. The Septennial Act, cited above, illustrates what is meant by the omnipotence of parliament. A parliament elected for three years, under the Act of 1694, concurred in prolonging its own mandate to a period of seven years; in the same way during the Great War a parliament elected in 1910 suspended the clause in the Parliament Act (1911), limiting its life to five years, and by a series of such suspensions continued its existence till 1918; in both cases its action was perfectly legal and constitutional. Whether we should gain or lose by bringing the powers of parliament within legal bounds, it is not easy to decide.

Petitions to Parliament.—Petitions may be addressed to either House of Parliament by British subjects and persons resident in the British dominions; a petition must be presented by a member of the House to which it is addressed, except petitions from the corporation of London, which are presented by the sheriffs of London at the bar. The Lord Mayor of Dublin has also been allowed to present a petition, and the same privilege would probably be conceded to the Lord Provost of Edinburgh. It was formerly not unusual for the member presenting a petition to make a speech, but the standing orders of the Commons now forbid this to be done. There is a committee on public petitions which reports twice a week during the session.

Parliamentary Returns.—Each House may obtain information from the executive departments by asking for returns and papers. In dealing with a subordinate department, or a department created and regulated by statute, either House may order returns; if the department is that of a high officer of state, or if the matter inquired of concerns the sovereign's prerogative, it is usual to move a humble address, praying that the documents required may be furnished. Neither House will order a return regarding the proceedings of the other; but the members of one House have seldom any difficulty in obtaining papers printed for the use of the other. No return may be ordered from private persons and associations, unless under the provisions of an act of parliament. Confidential documents (e.g. cabinet memoranda, or opinions of the law officers of the crown) are never laid on the table in either House, unless for special reasons the government thinks it desirable.

For the history of parliament, see the constitutional histories of Stubbs, Hallam, and May; for its laws and

customs, May's *Parliamentary Practice*, and Anson's *Law and Custom of the Constitution*. The details of electoral law will be found in the works of H. Fraser. See further G. B. Smith's *History of the English Parliament* (2 vols. 1892); Todd's *Parliamentary Government in England* (1892); Redlich's *The Procedure of the House of Commons* (trans. from German, 3 vols. 1908); E. and A. G. Porritt's *The Unreformed House of Commons* (2 vols. 1909); A. L. Lowell's *The Government of England* (1912 ed.); Pollard's *The Evolution of Parliament* (1920); works by MacIlwain (1910) and Ilbert (1911); and popular and descriptive accounts by MacDonagh (1897-1921), and H. Graham (1910). On the parliaments of Scotland and of Ireland there are separate works by Rait (1901 and 1924) and by J. G. Swift MacNeill (1885 and 1917). See also the articles

Parma, a town of Italy, formerly the capital of the duchy of Parma, is situated on the ancient Via Emilia, and on the river Parma, 12½ miles S. from the Po, and by rail 56 miles NW. of Bologna and 79 SE. of Milan. The town is surrounded by walls and has a citadel (1591); the streets are straight and wide. Of the sixty or more churches the chief is the cathedral (1059-74), built mostly in the Lombardo-Romanesque style, with frescoes by Correggio. Other notable edifices are the baptistery, one of the most splendid in Italy, begun in 1196 and completed in 1281; the church of Madonna della Steccata (1521-39), containing 'Moses breaking the Tables of the Law' and other paintings by Parmigiano, and the tombs of the Farnese dukes; the church of St John the Evangelist (1510), with frescoes by Correggio; the ducal palace, containing art galleries (Correggio's works), a great library (with many incunabula and rare works), the archives, &c.; and numerous other palaces, public and private. There are also a university (1599), a music school, a museum of antiquities, &c. The principal industrial products are pianofortes, silks, cast-iron wares, woollens, earthenware, paper, soap, &c. There are cattle, corn, and silk markets. Pop. (1921) 58,469. Founded by the Etruscans, Parma became a Roman colony in 183 B.C. After the fall of the western empire it was known as Chrysopolis (Gold Town). A stout opponent of the emperors, it was besieged and taken by Frederick II. in 1245, and again invested, but without success, in 1248. It then belonged successively to the houses of Correggio, Este, Visconti, and in 1511 to the pope.—The province has an area of 1278 sq. m., and a pop. of 353,000.

Formerly Parma was the name of a sovereign duchy of Italy, lying between the Apennines and the Po, touching Sardinia (Piedmont) on the west and Modena on the east. It comprised the two duchies of Parma and Piacenza, and had an area of 2377 sq. m. (see geography under ITALY). The territories of the cities of Parma and Piacenza fell into the hands of the pope in 1511. Pope Paul III. of the house of Farnese (q.v.) incorporated them (1545) as a duchy for his natural son Pier-Luigi, the grandfather of the celebrated Alessandro Farnese, regent of the Low Countries. On the extinction of the male line of Farnese in 1731 the duchy passed to Don Carlos of Spain, but was transferred to Austria four years later. In 1748 it was restored, along with Guastalla, to the Spanish Bourbons. In 1796 it was seized by the French, in 1802 incorporated with France, and in 1814 was granted to the ex-empress Maria Louisa. On her death in 1847 it passed to the Bourbon Duke of Lucca. From this time until the incorporation with the kingdom of Italy in 1860 the duchy was in a most unsettled condition: the

people were strongly revolutionary in feeling, and desired a union with Sardinia; but the rulers were reactionary and, supported by Austria, successfully beat down all attempts at revolution until after the battle of Magenta, when the Austrian troops withdrew and the regent for the youthful duke fled.

Parmenides, a Greek philosopher of Elea (*Velia*) in Lucania, and in the opinion of the ancients the greatest member of the Eleatic School (q.v.), flourished about the middle of the 5th century B.C. Nothing is known with certainty regarding his life, but Plato tells us he visited Athens in his old age together with his pupil Zeno, and conversed with Socrates, then quite a youth—an anachronism most probably intended to account for the influence which the philosophy of Parmenides undoubtedly exercised on that of Socrates and Plato themselves. Parmenides, like his master Xenophanes of Colophon, sometimes regarded as the first of the Eleatics, expounded his philosophy in verse—his only work being a didactic poem *On Nature*. The extant remains have been rendered into English hexameters by Thomas Davidson (*Journal of Speculative Philosophy*, St Louis, 1870), and paraphrased in English prose by W. L. Courtney (*Studies in Philosophy*, 1882). The leading design of this poem is to demonstrate the reality of Absolute Being, the non-existence of which Parmenides declares to be inconceivable, but the nature of which, on the other hand, he admits to be equally inconceivable, inasmuch as it is dissociated from every limitation under which man thinks. The permanent unity of the universe is thus the ultimate object of knowledge. Parmenides is not a theologian in speculation, seeking rather to identify his Absolute Being with *Thought* than with *Deity*.

The fragments have been edited in Karsten's *Philosophorum Græcorum Reliquiæ* (1835), and by Diels (1897). See also the histories of philosophy of Brandis, Erdmann, Schwegler, Ueberweg, and Zeller.

Parmigiano, or PARMIGIANINO, the nickname of GIROLAMO FRANCESCO MARIA MAZZOLA, painter of the Lombard school, and the most distinguished of those who followed the style of Correggio, was born at Parma, 11th January 1504. He began to paint when little more than fourteen years of age. In 1523 he went to Rome, and was favourably noticed and employed by Clement VII. When that city was stormed by the imperialists under Constable Bourbon in 1527 Parmigiano sat calmly at work on his picture of 'The Vision of St Jerome' (now in the National Gallery, London), and was protected from the soldiers who burst in upon him by their leader. After this event he left Rome for Bologna, where he painted various works, including a celebrated altarpiece, the 'Madonna and Child,' and returned to Parma in 1531. Having engaged to execute a series of frescoes in the church of S. Maria Steccata, and having got payment in advance, he delayed so long with the work that he was thrown into prison for breach of contract, and on being released fled to Casal Maggiore, in the territory of Cremona, where he died on 24th August 1540. His best-known picture is 'Cupid shaping a Bow,' he painted portraits too, as of Charles V., Amerigo Vespucci, and himself.

Parnahyba, a river of Brazil, rises in the Serra Mangabeiras, about 9° S. lat., and throughout its course (650 miles) forms the boundary between the states of Maranhão and Piauí. It enters the Atlantic by six mouths. The stream is swift, but navigable by boats for nearly 350 miles.

Parnassus, a mountain in Phocis, regarded by the ancient Greeks as the central point of the earth. On its southern slope lay Delphi (q.v.), the seat of the famous oracle, and the fountain of

Castalia (q.v.). The highest peak (8036 feet) was the scene of the orgies of the worship of Dionysus, (Bacchus); all the rest of the mountain was sacred to Apollo and the Muses. For the Parnassian poets, see FRANCE (*Literature*), LECONTE DE LISLE; and for Parnassia see GRASS OF PARNASSUS.

Parnell, CHARLES STEWART, Irish politician, was born at Avondale, in County Wicklow, June 28, 1846. His father belonged to an old Cheshire family, which purchased an estate in Ireland under Charles II., and from which had sprung Thomas Parnell the poet and Sir Henry Brooke Parnell, created Baron Congleton in 1841. His great-grandfather was that Sir John Parnell who was long Chancellor of the Irish Exchequer, and an active supporter of Grattan in his struggle against the Union; his grandfather, William Parnell, sat for County Wicklow, and published in 1819 a foolish political novel, anything but Irish in sentiment; his mother, Delia Tudor Stewart, was daughter of Admiral Charles Stewart of the United States navy. He was educated at Yeovil and elsewhere in England under private masters, and was for some time a member of Magdalene College, Cambridge, but took no degree. In 1874 he became High Sheriff of County Wicklow; next year he contested County Dublin without success, but in April 1875 was returned as an avowed Home Ruler for County Meath. He attached himself to Joseph Biggar, the member for Cavan, who was the first to discover the value of deliberate obstruction in parliamentary tactics, and during 1877 and 1878 he gained great popularity in Ireland by his audacity in the use of the new engine. There were many scenes of violence and excitement, and the new horror of all-night sittings became familiar to the House of Commons. Throughout the struggle Parnell showed equal audacity and coolness, and acquired a masterly knowledge of parliamentary forms. Mr Butt, the Irish leader, disapproved of this development of the active or obstructive policy, but his influence quickly gave way before Parnell's, and in May 1879 he died. The year before Parnell had been elected president of the English Home Rule Association. He now threw himself with energy into agrarian agitation, gave it its watchword—'Keep a firm grip of your homesteads'—at Westport in June, and in October was elected president of the Irish National Land League, which had been founded by Michael Davitt. Mr Parnell next visited the United States to raise funds for the cause, was allowed like Lafayette and Kossuth to address congress itself, and carried home £70,000. At the general election of 1880 he was returned for the counties of Meath and Mayo and for the city of Cork, and chose to sit for the last. He was now formally elected chairman of the Irish parliamentary party by twenty-three votes over eighteen for Mr Shaw. Meantime the agrarian agitation grew, and in a speech at Ennis, September 19, 1880, he formulated the method of boycotting as an engine for punishing an unpopular individual. Mr Gladstone's government now came to the conclusion that the objects of the Land League were contrary to the law, and in December put Parnell and several other members of the executive on trial, but the jury finally failed to agree. Next session the government brought in a Coercion Bill, which Mr Parnell opposed vigorously. In the course of the struggle he was ejected from the House, after a stormy scene, together with thirty-four of his followers, February 3, 1881. Mr Gladstone next carried his famous Land Bill, but this Parnell refused to accept as a final settlement until the result of certain test cases before the new Land Court was seen. On the 13th October Mr Gladstone sent him to Kilmainham gaol, and there he lay till released on May 2, 1882,

after some private negotiations with the government conducted through the medium of Captain O'Shea. Mr Forster resigned the Irish secretaryship in consequence of the release, and next followed the terrible tragedy of Phoenix Park, of which Parnell in his place in the House of Commons expressed his detestation. The Crimes Act was now hurried through parliament in spite of the strenuous opposition of the Irish party. Already the Land League had been proclaimed as an illegal association after the issue of the 'No Rent' manifesto, but early in 1884 the Nationalists succeeded in reviving it under the name of the National League, and Mr Parnell was elected its president. The year before the sum of £35,000, mostly raised in America, had been presented to him by his admirers. After an unsuccessful attempt to make terms with the Conservatives, in the course of which he had a famous interview with Lord Carnarvon, the viceroy, Parnell flung his vote—now eighty-six strong since the lowering of the franchise—into the Liberal scale, and so brought about the fall of the short-lived first Salisbury government. Mr Parnell nominated the greater number of Nationalist candidates for the Irish constituencies, and the firm hand with which he controlled his party was seen in the promptitude with which he crushed a revolt of Healy and Biggar against his nomination of Captain O'Shea for Galway.

Mr Gladstone's views on the question of Home Rule had by this time undergone a complete change, and accordingly he introduced a Home Rule Bill, which was defeated owing to the defection of a large number of Liberal members headed by Lord Hartington and Mr Chamberlain. The consequent appeal to the country (July 1886) gave Lord Salisbury a Unionist majority of over a hundred votes, and threw Parnell into a close alliance with Mr Gladstone and the portion of the Liberal party that adhered to him. It was at this period that the *Times* newspaper published its series of articles entitled 'Parnellism and Crime'—a tremendous indictment against the chief Nationalist leaders, the most startling point in which was a series of letters published in fac-simile, one, signed by Parnell, expressing approval of Mr Burke's murder. The public excitement occasioned led to the appointment of a Special Commission to inquire into the whole matter. After an elaborate trial (extending to 128 days, and closing November 22, 1889), the most sensational event in which was the breakdown under cross-examination, and the flight and suicide at Madrid, of Pigott, the wretched Irishman who had imposed upon the *Times* with forgeries, Mr Parnell was formally cleared of the charge of having been personally guilty of organising outrages, but his party were declared to have been guilty of incitements to intimidation, out of which had grown crimes which they had failed to denounce. Parnell now raised an action against the *Times*, which was quickly compromised by a payment of £5000. The 'uncrowned king' of Ireland had now reached the summit of his power—the height of the wave was marked by the presentation of the freedom of Edinburgh, July 30, 1889, and the banquet given him on his forty-fourth birthday. But his fall in public esteem was quickly to follow. A few months later his frequent mysterious absences from his parliamentary duties were explained by his appearance, or rather his non-appearance, as co-respondent in a disgraceful divorce case brought by Captain O'Shea against his wife. After formal evidence was led by the petitioner, the usual decree was granted with costs against Parnell (November 17, 1890). The Gladstonian party in England now demanded his retirement from the leadership of the cause, and Mr Gladstone informed the Irish members

that they must make their choice between Parnell and himself. They met and reappointed Parnell chairman, expecting, as the majority explained later, that after this recognition of his past services he would voluntarily retire at least for a time. But they had not calculated upon the characteristic obstinacy of his nature, and quickly found that their leader had no mind to efface himself for his country's good. After some days of profitless and heated wrangling the majority ended the discussion by leaving the room and electing Justin M'Carthy as their chairman. Parnell, with the shattered remnants of his party, now carried the warfare into Ireland; but his condemnation by the Church and the emphatic defeat of his nominees at by-elections foretold the complete collapse of his party at the general election of 1892, when seventy-two Anti-Parnellites were returned as against but nine who claimed his name and the succession to his policy. For the great discredited and discredited leader had died suddenly at Brighton, 6th October 1891, but five months after his marriage to Mrs O'Shea. Parnell's commanding personality might have made defeat less disastrous, but could hardly have prevailed against the strong conviction forced on Nationalists and English Home Rulers alike, that he had fatally confounded personal ambition with patriotism.

See R. Barry O'Brien's *Life of Charles Stewart Parnell* (2 vols. 1898), McCarthy's *History of Our Own Times* (1897), a memoir by his brother (1916), Katharine O'Shea's *Charles Stewart Parnell* (2 vols. 1914), and St John Ervine's *Parnell* (1925).

Parnell, THOMAS, a minor Queen Anne poet, born in Dublin in 1679, son of a commonwealth's man who at the Restoration left Congleton in Cheshire for Ireland. He had his education at Trinity College, took orders, and in 1705 received the archdeaconry of Clogher, later a prebend from Archbishop King and the vicarage of Finglass. The head of an English family settled in Ireland, with property both in that country and in Cheshire, he spent most of his time in London, where his wit procured him the friendship of Harley, Swift, and Pope, and opened to him the Scriblerus Club. Dr Johnson tells us that his well-timed change of politics coincided with the ejection of the Whigs in the end of Queen Anne's reign. After his wife's death he took to drinking, and died at Chester in October 1718, while on his way to Ireland. Next year Pope published a selection of his poems, mostly translations or adaptations, with the merit at least of being ever smooth and easy in versification. The best known of his poems is the *Hermit*, a polished and harmonious poem, based upon a tale in the *Gesta Romanorum*. Still better as poetry, however, are the two remarkable odes, the *Night-piece* and the *Hymn to Contentment*. See the admirable *Life* by Goldsmith, reprinted in the Globe edition of Goldsmith's works (1881).

Pärnu, the Estonian name of Pernau (q.v.).

Parody, a burlesque and consciously exaggerated imitation of a serious poem, the words of which should strike the ear with the very echo of the original. So to parody a writer is obviously to pay a compliment to his popularity, and at the outset we may admit the truth of Shaftesbury's paradox that 'a subject that will not bear raillery is suspicious,' provided it be not taken to mean that ridicule is to be the test of truth.

The name parody is due to the Greeks, and the first parodist, according to Aristotle, was Hegemon of Thasos, whose parody of the *Gigantomachia* made the Athenians forget for a moment even their disasters in Sicily. Others ascribe its origin to Hipponax, a comic poet, who flourished about 540 B.C. The well-known *Batrachomyomachia*, or

Battle of the Frogs and Mice, is an ancient mock-heroic *epos*; and there is extant, preserved in Athenæus, a fragment of several hundred lines by Matron, on an Attic banquet, in which each dish is introduced with epic solemnity after the manner of Homer. The comedies of Aristophanes contain many subtle touches of sarcastic banter belonging more or less definitely to this order, and we find a further development in the hexameter *Silli* of Timon of Phlius. Among the Romans we first meet this form of literature in the period of decline. The first satire of Persius is interspersed with numerous parodies on the most popular poems of the day, but there seems no adequate evidence for the assertion that the most severe of these were aimed at the verses of Nero. In France the burlesques of Scarron (*Virgile travesti*) and Dassoucy created a taste which Boileau and others strove to counteract, and were imitated in England by Charles Cotton. Of modern English parodies some of the most felicitous examples are to be found in the *Rejected Addresses*, full of clever and genial satire unblemished by vulgarity, of which its authors could say that of the twelve poets imitated 'not one ever betrayed the least soreness or refused to join in the laugh that we had occasioned.' The *Bon Gaultier Ballads*, by Aytoun and Sir T. Martin, contain six admirable imitations professing to be by the unsuccessful candidates for the laureateship on the death of Southey. There are some exquisite examples in the two classical children's books of Lewis Carroll, but few parodies can be compared with those to be found in C. S. Calverley's *Verses and Translations and Fly Leaves*. Among elaborate prose parodies most famous are the *Epistolæ Obscurorum Virorum* (q.v.). Of modern English examples may be mentioned Thackeray's 'Coddingsby' on Disraeli, and 'George de Barnwell' on Lytton; Bret Harte's *Condensed Novels*; and F. C. Burnand's 'New Sandford and Merton,' and 'Strapmore' on a too popular novel by Ouida.

See the article BURLESQUE; Delepierre, *La Parodie chez les Grecs, les Romains, et les Modernes* (Lond. 1871); for a vast collection of English examples, Walter Hamilton's too voluminous *Parodies of the Works of English and American Authors* (6 vols. 1884-89); and *Parodies and Imitations Old and New*, by J. A. Stanley Adam and Bernard C. White (1912).

Parole (Fr., 'word') is the declaration made on honour by an officer, in a case in which there is no more than his sense of honour to restrain him from breaking his word. Thus, a prisoner of war may be released from actual prison on his parole that he will not go beyond certain designated limits; or he may even be allowed to return to his own country on his parole not to fight again, during the existing war, against his captors. To break *parole* is accounted infamous in all civilised nations, and an officer who has so far forgotten his position as a gentleman ceases to have any claim to the treatment of an honourable man, nor can he expect quarter should he again fall into the hands of the enemy he has deceived. For parole evidence see EVIDENCE.

Paronychiaceæ, or ILLECEBRACEÆ are now included in Caryophyllaceæ.

Paropamisus, an ancient name still used for a ridge, less than 1000 feet above the adjacent country, which forms part of the northern edge of the great plateau of Persia and Afghanistan, almost connecting the Hindu Kush (q.v.) on the east with the Elburz Mountains to the west (see ASIA).

Paros, one of the larger islands in the Cyclades; a low pyramid with an area of 64 sq. m. The capital is Paroikia. Wine, figs, and wool are ex-

ported. The quarries of the famous white Parian marble are near the summit of Mount St Elias (ancient *Marpessa*), and are not yet exhausted. Archilochus and Polygnotus, the painter, were born on Paros.

Parotid Gland. See DIGESTION, SALIVA.

Parquetry, a kind of wood mosaic used only for flooring. Parquetry floors are usually of oak, but other and more ornamental woods have also been much used for giving variety and beauty to the pattern. In the more elaborate kinds of parquetry veneers are used, but it is much more generally composed of blocks of wood squared at the sides, and laid down so as to combine and form a geometric pattern.

Parr. See SALMON.

Parr, CATHARINE, the sixth wife of Henry VIII., was the daughter of Sir Thomas Parr, and was born in 1512. Married first to one Edward Borough, possibly Lord Borough, and afterwards to Lord Latimer, she on July 12, 1543, became queen of England by marriage with Henry VIII. She was distinguished for her learning and for her knowledge of religious subjects, her discussion of which with the king had well-nigh brought her to the block, like so many of her predecessors. Her tact, however, saved her; for she made it appear to the king's vanity that she had only engaged him in discourse about the Reformation in order to derive profit from his majesty's conversation. She persuaded Henry to restore the right of succession to his daughters, and interested herself on behalf of the universities. After Henry's death she married (1547) Thomas, Lord Seymour, and died from childbirth at Sudeley Castle, 7th September 1548.

Parr, SAMUEL, a once notable scholar, was born the son of a surgeon at Harrow-on-the-Hill, January 15, 1747. He attended Harrow School, and, after being found unfit for apprenticeship to his father's profession, was sent to Emmanuel College, Cambridge, in 1765. Two years later his father's death obliged him to leave Cambridge and accept an assistant-mastership at Harrow. Here he remained nearly five years, but, disappointed of the head-mastership on Dr Summer's death (1771), started an independent school at Stanmore, and kept it going five years. He was head-master of Colchester grammar-school (1776-78) and of Norwich (1778-86). His clerical preferences were the rectory of Asterby in Lincolnshire, the vicarage of Hatton near Warwick, and a prebendal stall in St Paul's Cathedral. He spent almost the half of his life at Hatton, and here he died, March 6, 1825. The degree of LL.D. was given him by Cambridge in 1781. In 1787 he published an edition of Bellen-den, to which he prefixed his celebrated preface, which is as remarkable for its uncompromising advocacy of Whig principles as for the scrupulous Ciceronianism of its Latinity.

It is almost impossible to understand the reputation which Dr Parr once had. None of his voluminous writings justify it. That he was in some respects an accomplished scholar is undoubted, for he could write Latin of Ciceronian purity and finish; but it is equally undoubted that he never did anything with his boasted scholarship, and has left the world absolutely nothing to keep him in remembrance. Yet his complete works (edited by Dr J. Johnstone in 1828) form eight enormous tomes, and contain 5734 octavo pages, many of them printed in small type. They relate to matters historical, critical, and metaphysical, but in all 'the thread of Parr's verbosity is finer than the staple of his argument.' To his conversational powers alone he owed the fame that he enjoyed during his life. He was an amazing, an overwhelming talker.

Bold, dogmatic, arrogant, with a memory profoundly and minutely retentive, and with a genuine gift of ephemeral epigram, he seemed, at the tables of statesmen, and wits, and divines, to be a man of tremendous talent, capable of any literary feat; but the learning and the repartee have left little trace of their existence, and posterity declines to admire the wonders that it has neither seen nor heard.

See E. H. Barker's ill-arranged *Parriana* (2 vols. 1828-29), De Quincey's essay, and the Lives by Field (1828) and Johnstone (1828).

Parr, THOMAS ('Old Parr'), was born, according to the tradition, in 1483 and died in 1635. See LONGEVITY.

Parra. See JACANA.

Parrakeet, or PARROQUET, a name very commonly given to many of the smaller species of the parrot family. The

Budgerigar
(*Melopsittacus undulatus*).

Warbling Grass-parrakeet (*Melopsittacus undulatus*) or Budgerigar ('good cockatoo'), is a very beautiful little species, often brought to England, and will breed in confinement. In the vast inland plains of Australia this parrakeet is to be seen in flocks of many hundreds feeding on the seeds of the grasses, which afford food also to many other small species. See PARROT.

Parramatta, a town of New South Wales, stands on a stream which runs into the head of Port Jackson (the whole of which inland from

Sydney is generally called the Parramatta River). It is connected with Sydney (14 miles) both by steamer and railway. In the early days of Australian settlement it was the centre of the farming district, and it is the oldest town in Australia outside Sydney. The surrounding district is now devoted to fruit-growing, especially to oranges and table-grapes. In the town itself the manufacture of Australian woollens was first begun. Pop. (1901) 12,560; (1921) 15,050.

Parrhasius, one of the greatest painters of ancient Greece, was at Athens and already distinguished among artists about the year 470 B.C. According to Xenophon, he held a conversation with Socrates, and he was a younger contemporary of Zeuxis. Parrhasius appears to have surpassed all his predecessors in purity of design, accuracy of drawing, force of expression, and what is technically called 'finish.' And it seems that his vanity and pride were equal to his artistic skill.

Parricide (Lat. *paricida*) is rather a popular than a legal term. In the Roman law it comprehended every one who murdered a near relative; but in English the term is usually confined to the murderer of one's father, or of one who is *in loco parentis*. The parricide does not, in any respect, differ in Britain from the murderer of a stranger; in both cases the punishment is death by hanging. In the Roman law a parricide was punished in a much more severe manner, being sewed up in a leather sack, along with a live cock, viper, dog, and ape, and cast into the sea.

Parrish, EDWARD (1822-72), an American pharmacist, member of a family of distinguished physicians, connected for many years with Philadelphia, and best known through 'Parrish's Chemical Food.' This is the popular name for a non-official preparation medicinally known as *Compound Syrup of Phosphate of Iron*, every drachm of which contains 1 grain of phosphate of iron, 2½ of phosphate of lime, besides soda and potash.

Parrot, the type of a large and important group of birds, divided into numerous families and genera. The parrots form an extremely compact group, showing but little structural variation, and offering no 'intermediate forms' to indicate their relationship to other birds. It has been suggested that they come nearest to the birds of prey, but this is at present no more than a suggestion. They are pre-eminently tropical birds, and arboreal in habit; some species, however, range into colder countries—e.g. Patagonia and New Zealand—and some, such as the burrowing Ground Parrot of New Zealand (*Strigops*), now nearly exterminated by the cats run wild which infest the scrub, are not arboreal. They are fruit and seed eating birds, with the exception of the Kea (q.v.), which has, since the colonisation of New Zealand, taken to a carnivorous diet. As a rule the parrots are brightly coloured birds, being often, like other forest-frequenting creatures, green; there are some species, however, which are not brilliantly coloured. There is occasionally a difference of colour in the two sexes, which is best marked in species belonging to the genus *Eclectus*; in these the prevailing colour of the female is red, and of the male green; the differences are so marked that they were actually referred to quite different genera until Dr A. B. Meyer showed conclusively that the red and green forms were merely the two sexes of the same species. The intelligence of parrots has been often commented upon, as also their power of imitating human speech; any one, however, who can endure for a sufficient time that pandemonium of noise, the parrot-house at the Zoological Gardens, will find that the clearness of utterance of the Myna or Indian Starling exceeds that of any parrot. The

great age to which parrots will live has often been exaggerated, but it is at any rate certain that some species will survive for fifty years in confinement, for an individual of the Greater Vasa Parrakeet (*Coracopsis vasa*) lived for more than fifty years at the Zoological Gardens. Parrots make their nests in holes, and lay white eggs, as is commonly the case where the eggs are concealed. Garrod has divided the parrots, on anatomical

The Gray Parrot.

grounds, into two families: (1) Palæornithidæ (including the Cockatoo, q.v., and Lory, q.v., the flightless New Zealand *Strigops*, and the large genus Palæornis) and (2) Psittacidæ (including the Macaws, the African parrots of the genus *Psittacus*, the American *Chrysotis*, the Australian *Platycercus*, and some other forms). The Gray Parrot (*Psittacus erythacus*), which has been a familiar cage-bird in Europe for hundreds of years, is a native of Africa, especially of West Africa. The Great Macaw belongs to the sub-family of Conurinae, found mainly in America, one

genus only (*Palæornis*) occurring in India and Africa. See Dr W. T. Greene's *Parrots in Captivity* (3 vols. 1884).

Parrot-fish, or PARROT-WRASSE (*Scarus*), a genus of fishes of the family Labridæ. The name seems to refer to the frequently bright colours, and partly to the shape of the mouth; for the jaws form a strong and sharp beak, and the teeth are soldered together. Over a hundred species are known, especially from the tropical coral-banks, on which they browse. The most northern species (*S. cretensis*) is the fucus-eating *Scarus*, prized by Greek and Roman epicures.

Parry, SIR CHARLES HUBERT HASTINGS, composer and historian of music, son of Thomas Gambier Parry, of Highnam Court, Gloucester (decorative painter and inventor of the 'spirit-fresco' process; 1816-88), was born at Bourne-mouth, 27th February 1848, and studied at Eton and Oxford. Unsuccessful as an underwriter at Lloyd's, he soon abandoned business. He was strongly influenced by Edward Dannreuther, by whose means many of his compositions were given a hearing, and impressed those who were qualified to judge. His work for the orchestra (four symphonies, symphonic variations, &c.) never gained such wide recognition as his choral compositions—'The Glories of our Blood and State,' 'Blest Pair of Sirens,' 'Judith,' 'Ode on St Cecilia's Day,' 'L'Allegro ed il Penseroso,' 'De Profundis,' Dunbar's 'Ode on the Nativity,' and a number of cantatas, &c. Parry became director of the Royal College of Music in 1894, professor at Oxford in 1899. Important books by him are *The Evolution of the Art of Music*, Vol. III. of *The Oxford History of Music* ('The Seventeenth Century'), *Johann Sebastian Bach, Style in Musical Art*. He died 7th October 1918. His Life has been undertaken by C. L. Graves.

Parry, SIR WILLIAM EDWARD, born at Bath 19th December 1790, entered the navy, and, sent in 1810 to the Arctic regions in command of a ship to protect British whale-fisheries, worked out rules for determining accurately the altitude of the pole by observations of the fixed stars. Parry took command in five expeditions to the Arctic regions: (1) in 1818, under Ross, who set out to find the North-west Passage; (2) in 1819, in chief command of two vessels, he explored Barrow Strait, Prince Regent's Inlet, and Wellington Channel, and wintered in Melville Island, but his attempt in the spring to reach Behring Strait was frustrated by the state of the ice; (3) from May 1821 to November 1823 he was again at the head of an expedition, which, however, achieved little; (4) a fourth voyage in 1824-25 had a like result; (5) his last voyage was an attempt (1827) to reach the North Pole on sledges by way of Spitsbergen—in which he was of course unsuccessful. After his return home from his second expedition he was awarded the £5000 which parliament had offered to the navigator who first crossed 110° W. long. In 1823 he was appointed hydrographer to the navy; in 1829 was knighted, along with Sir John Franklin; and in 1837 was made comptroller of a department of the navy. In 1846 he retired, accepting the post of superintendent of Haslar; in 1852 he was raised to the rank of rear-admiral, and in the following year was appointed governor of Greenwich Hospital, an office which he held till his death, 8th July 1855, at Ems in Germany. A collected edition of his voyages was published in 1833 (Lond. 5 vols.). See *Life* by his son, Rev. Edward Parry (Oxford, 1857).

Parsees (*Parsis*, 'people of Pars or Fars'—i.e. ancient Persia; sometimes called Guebres, q.v.) is the name of the small remnant of the followers of

the ancient Persian religion, as established or reformed by Zoroaster (Zarathustra or Zerdusht). The relation in which Zoroaster stood to the ancient Iranian faith and his date have been much debated; the very fact of his historical existence has even been denied; and accordingly it is difficult to dogmatise on the original principles of the Zoroastrian faith. These questions will be more fully discussed under the heads ZOROASTER and ZEND-AVESTA. It has been alleged that at first the doctrine was a pure Monotheism; that Zoroaster taught the existence of but one deity, the Ahura-Mazdão (Ormuzd), the creator of all things, to whom all good things, spiritual and worldly, belong. The principle of his speculative philosophy, on the other hand, was dualism: there being in Ahura-Mazdão two primeval causes of the real and intellectual world—the Vohu Manô, the Good Mind or Reality (Gaya), and the Akem Manô, or the Naught Mind or Non-reality (Ajyâiti). Certainly, however, the pure idea of Monotheism, if it ever existed, did not long prevail. The two sides of Ahura-Mazdão's being were taken to be two distinct spirits, Ahura-Mazdão and Angrô-Mainyush (Ahriman), who represented Good and Evil—God and Devil. These each took their due places in the Parsee pantheon ere long, and Parsism became a characteristic dualism.

The Zoroastrian creed flourished up to the time of Alexander the Great, throughout ancient Irania, including Upper Tibet, Sogdiana, Bactriana, Media, Persis, &c.; but after Alexander's death it gradually lost ground, rapidly declined under his successors, and under the Arsacidæ was much depressed. On the establishment of the Sassanians (212 A.D.), a native Persian dynasty, by Ardashir (Artaxerxes), the first act of the new king was the general and complete restoration of the partly lost, partly forgotten books of Zerdusht, which he effected, it is related, chiefly through the inspiration of a Magian Sage, chosen out of 40,000 Magi. The sacred volumes were translated out of the original Zend into the vernacular and disseminated among the people at large, and fire-temples were reared throughout the length and breadth of the land. The Magi or priests were all-powerful, and their hatred was directed principally against the Greeks. 'Far too long,' wrote Ardashir, the king, to all the provinces of the Persian empire, 'for more than five hundred years, has the poison of Aristotle spread.' The fanaticism of the priests often also found vent against Christians and Jews. The latter have left us some account of the tyranny and oppression to which they as unbelievers were exposed—such as the prohibition of fire and light in their houses on Persian fast-days, of the slaughter of animals, the baths of purification, and the burial of the dead according to the Jewish rites—prohibitions only to be bought off by heavy bribes. In return the Magi were cordially hated by the Jews; but later we frequently find Jewish sages on terms of friendship and confidence with some of the Sassanian kings. From the period of its re-establishment the Zoroastrian religion flourished uninterruptedly for about 400 years, till in 651 A.D., at the great battle of Nahavand (near Ecbatana), the Persian army under Yezdejird was routed by the khalif Omar. The great mass of the population was converted to the Mohammedan faith; the small remnant fled to the wilderness of Khorasan, but suffered, as might be expected, severe oppression and persecution. Some nine thousand 'Guebres' are still found in Persia, mainly in Yezd, Kerman, and at Teheran. Others, who preferred emigration to the endless tribulations inflicted upon them by the conquering race, found a resting-place along the western coast of India, chiefly at Bombay,

Surat, Ahmedabad, and the vicinity, where they now live under English rule, and are recognised as one of the most respectable and thriving sections of the community, being for the most part merchants and landed proprietors. Parsee traders have also settled at Calcutta, Madras, Aden, Zanzibar, in Burma, and in China. They bear equally with their poorer brethren in Persia the highest character for honesty, industry, and peacefulness, while their benevolence, intelligence, and magnificence outvie that of most of their European fellow-subjects. Their general appearance is to a certain degree prepossessing, and many of their women are strikingly beautiful. In all civil matters they are subject to the laws of the country they inhabit; and its language is also theirs, except in the ritual of their religion, when Zend, the holy language, is used by the priests, who as a rule, however, have no more knowledge of it than the laity. They are forward to embrace the advantages of English education, and not a few have studied law in England. Conspicuous amongst Parsee merchant-princes was Sir Jamsetjee Jejeebhoy (q.v.). In 1921 there were over 100,000 Parsees in India, 85,000 of them in Bombay with its states.

We have spoken of the leading fundamental doctrines as laid down by their prophet. Parsees do not eat anything cooked by a person of another religion; they also object to beef and pork, especially to ham. Marriages can only be contracted with persons of their own caste and creed. Polygamy, except after nine years of sterility and consequent divorce, is forbidden. Fornication and adultery are punishable with death. Their dead are not buried, but exposed on an iron grating in the Dakhma, or Tower of Silence, to the fowls of the air, to the dew, and to the sun, until the flesh has disappeared, and the bleaching bones fall through into a pit beneath, from which they are afterwards removed to a subterranean cavern.

Ahura-Mazdâo being the origin of light, his symbol is the sun, with the moon and the planets, and in default of them the fire. Temples and altars must for ever be fed with the holy fire, brought down, according to tradition, from heaven, and the sully of whose flame is punishable with death. The priests themselves approach it only with a half-mask over the face, and never touch it but with holy instruments. But however great the awe felt by Parsees with respect to fire and light (they are almost the only eastern nation who abstain from smoking), yet they never consider these as anything but emblems of divinity. The fires are of five kinds. There are also five kinds of 'Sacrifice,' which term, however, is rather to be understood in the sense of a sacred action—including the slaughtering of animals; prayer; the sacrifice of expiation, consisting either (a) in flagellation or (b) in gifts to the priest; and, lastly, the sacrifice for the souls of the dead. The purification of physical and moral impurities is effected, in the first place, by cleansing with holy water, earth, &c.; next, by prayers and the recitation of the divine word; but other self-castigations, fasting, celibacy, &c. are considered hateful to the Divinity. The ethical code may be summed up in the three words—purity of thought, of word, and of deed: a religion 'that is for all, and not for any particular nation,' as the Parsees say. Various superstitions have in the course of the tribulations of ages and the intimacy with neighbouring countries defiled the original purity of this creed, and its forms now vary much among the different communities of the present time. There are two main sects amongst them, as well as Conservatives and Liberals in usage.

See PERSIA, ZEND-AVESTA, ZOROASTER (and works there quoted), DEVIL; Haug, *Essays on the Sacred*

Parsley (*Petroselinum*), a genus of plants of the natural order Umbelliferae. The species are annual or biennial, branching, smooth, herbaceous plants, with variously pinnated leaves. Common Parsley (*P. sativum*), which has tripinnate shining leaves, one of our best-known culinary plants, is a native of the south of Europe, growing chiefly on rocks and old walls, and naturalised in some parts of England. The cultivation of parsley is extremely simple, seed requiring to be sown annually in order to keep up a constant supply. A variety with curled leaflets is generally preferred to the common kind with plain leaflets, as finer and more beautiful, being often used as a garnish; it is also safer, as the poisonous Fool's Parsley (q.v.) is sometimes gathered by mistake instead of the other. Hamburg Parsley is a variety with a large white carrot-like root, cultivated for the sake of its root, and much in the same way as the carrot or parsnip. To produce large roots and of delicate flavour a very rich soil is required. The foliage of parsley is not merely of use for flavouring soups, &c., but is nutritious at the same time that it is stimulating, a quality which it seems to derive from an essential oil present in every part of the plant. Parsley contains also a peculiar gelatinous substance called *Apiine*. The bruised leaves of parsley are sometimes employed as a stimulating poultice. The seeds are a deadly poison to many birds, and when powdered they are sometimes used for killing lice.

Parsnip (*Pastinaca*), a genus of plants of the natural order Umbelliferae, having compound umbels with neither general nor partial involucre; yellow flowers, with roundish, involute, sharp-pointed petals; calyx almost without teeth; fruit dorsally compressed and flat, with a broad border, the ridges very fine. The species are annual, biennial, or perennial herbs, with carrot-like, often fleshy roots and pinnate leaves. The Common Parsnip (*P. sativa*) is a native of England, although not of Scotland, and is abundant in some districts, particularly in chalky and gravelly soils. It is also found in many parts of Europe and of the north of Asia. It is a biennial, with angular furrowed stem, 2 to 3 feet high, pinnate leaves with ovate leaflets, rather shining, cut and serrated, and a three-lobed terminal leaflet. The root of the wild plant is white, aromatic, mucilaginous, sweet, but with some acridness; and injurious effects have followed from its use. Cultivation has greatly modified the qualities both of the root and foliage, rendering them much more bland. The parsnip has been cultivated since Roman times, for the sake of its root, which in cultivation has greatly increased in size and become more fleshy. The flavour is disliked by some, as well as the too great sweetness, but highly relished by others; and the root of the parsnip is more nutritious than that of the carrot. The produce is also on many soils of larger quantity; and although the parsnip delights in a very open rich soil, it will succeed in clayey soils far too stiff for the carrot. It is rather remarkable that it has not been extensively cultivated as a field-crop, and for the feeding of cattle, except in the Channel

Islands and in limited districts of continental Europe, more especially as cattle are very fond of it; and not only is the flesh of cattle fed on it of excellent quality, but the butter of dairy-cows fed on parsnips in winter is said by many to be superior to that produced by almost any other kind of winter-feeding. The mode of cultivation of the parsnip scarcely differs from that of the carrot. There are several varieties in cultivation. These may be grouped in three types, viz. the Hollow Crown, the Long, and the Turnip-rooted. The first are the most generally useful and most widely grown. The second require exceptionally deep and free soils, while the last are suitable for shallow or stony ground. The parsnip is used chiefly in winter, whether for the table or for feeding cattle. It is improved rather than injured by frost, but is apt to become *rusty* if allowed to remain too long in the ground, and exhibits acrid qualities after it has begun to grow again in spring. The root of the parsnip is much used in the north of Ireland for making a fermented liquor with yeast and hops, and both in England and Ireland for making *parsnip wine*. A spirit is also obtained from it similar to that of the potato. The Cut-leaved Parsnip or Sekakul (*Malabaila pumila*), having pinnatifid cut leaflets, a native of India, Syria, and Egypt, is cultivated in the Levant, and is very similar in its uses to the common parsnip.

Parson, the incumbent of a benefice in a parish. He is called parson (Lat. *persona*, 'mouthpiece') because he represents the church. See CLERGY, DILAPIDATION, ORDERS, PARISH, RECTOR, VICAR, TITHES, CHURCH-RATES, CHURCHYARD, &c. For the Parson Bird, see HONEY-EATER.

Parsons, SIR CHARLES ALGERNON, born 13th June 1854, fourth son of Lord Rosse (q.v.) the astronomer, was educated at St John's College, Cambridge. He is best known for his Steam-turbine (q.v.).

Parsons, FATHER ROBERT, the chief of the English Jesuits in their golden age, and a man of remarkable talents and achievements, was born of respectable parents in Somersetshire in 1546. When eighteen years of age he passed from the free school at Taunton to St Mary's Hall, Oxford, and after two years migrated to Balliol College, where he took his degrees of bachelor and master, and became a fellow and tutor. Here he twice took the oath abjuring the papal supremacy, but he never received orders in the English Church. His enemies in college brought charges against him which led to his forced retirement from Oxford in 1574. He shortly afterwards became a Roman Catholic, and went to Padua with a view of there studying medicine, but, soon changing his mind, he set out on foot to Rome, and offered himself to the Society of Jesus, which he entered July 1575. He was ordained priest in 1578. When in the following year Dr (afterwards Cardinal) Allen, superior of the Douay seminary, succeeded in persuading the Jesuits to join with the seminary priests in the work of the English mission, Parsons and Campion (q.v.) were selected for the new venture. They left Rome in April 1580, with strict injunctions to meddle neither directly nor indirectly in affairs of state. Parsons landed at Dover, June 11, disguised as a merchant of jewels, in a coat of 'buff laid with gold-lace, with hat and feather.' His activity and success took both Catholics and Protestants by surprise. He employed six printers on a secret press, and by the rapidity of his movements for twelve months baffled all the attempts of the government to catch him. But soon after the apprehension of his companion, Campion, in July 1581, Parsons

found it prudent to escape to the Continent, from which he never again returned to England.

Meanwhile, following the natural bent of his mind, and ignoring or evading his original instructions, he had busied himself with state intrigues, sounded the political dispositions of influential Catholic laymen when treating with them of their consciences, and thought out schemes for the subjection of England to the pope by force of arms. In Normandy, whither he at first retired, he had conferences with the Duke of Guise and with Father Creighton, who had been despatched by the pope into Scotland to negotiate with the Duke of Lennox for the liberation of the Queen of Scots; and a little later, during April and May 1582, he was at Paris conferring with the Provincial of the French Jesuits, the Archbishop of Glasgow, the papal nuncio, and the agent of the king of Spain, concerning a project for the invasion of England. The plan, which was chiefly the offspring of Parsons' brain, was carried by Creighton to the pope, and by Parsons himself to King Philip at Madrid. Now began his intimacy and influence with the Spanish king, and the series of political enterprises which culminated in the Armada of 1588. Affairs of state did not, however, exclusively occupy the Jesuit's active mind. At Rouen in 1582 he had finished his book, the *Christian Directory*, which has found favour with Protestant divines; and, with the aid of the Duke of Guise, he founded at Eu a seminary for youths in preparation for the colleges of Douay and Rome. For a short time in 1588 he was rector of the college at Rome; and after the failure of the Armada he organised seminaries or clerical establishments for his countrymen at Valladolid in 1589, St Lucar in 1591, Seville and Lisbon in 1592, and at St Omer in 1593. In the reaction which followed on the death of Allen (1595) the jealousy and suspicion with which the more loyal section of the clergy had for some time regarded the ambitious schemes of the Jesuits and the Spanish party developed into a scandalous quarrel. Disturbances broke out among the prisoners at Wisbeach and in the English college at Rome. Parsons, who went from Madrid to Rome to again assume the rectorship of the English college, now persuaded the pope to appoint George Blackwell (q.v.), a partisan of the Jesuits, as archpriest over the secular clergy, with the view of keeping the chief direction of affairs, political and ecclesiastical, in his own hands. The appointment was resisted by the leaders of the seculars with an animosity which threatened to create a schism. Parsons, upon whom the odium of the appointment chiefly fell, was accused of deceiving the pope, of tyranny over the clergy, and of continued treason against his country. The stringency of the penal laws against Catholics was laid at his door. An appeal carried to Rome by four delegates of the secular clergy led to a diminution of the Jesuits' power, though Parsons persisted to the end in resisting the endeavours of his opponents to obtain an episcopal government. He died at Rome, as rector of the English college, April 15, 1610.

His industry and power of work were extraordinary. He wrote English forcibly and lucidly, and was a master in the arts of controversy. His domineering spirit and political partisanship created for him bitter enemies, while his mode of prosecuting his ends justly exposed him to charges of double-dealing, equivocation, and reckless slander of his opponents. He was otherwise irreproachable in his private morals. His ambition was for his order and not for himself, and he modestly avoided the cardinal's hat. He knew how on occasions to exercise tact and prudence, and, when it was his purpose to do so, no one could write with more persuasive piety. Among the best known of his

voluminous publications is *The Conference on the next Succession to the Crown*, written with the assistance of Allen and Sir Francis Englefield in favour of the infanta of Spain. He here insists on the right of the people to set aside, on religious grounds, the natural heir to the throne; and advocates principles which afterwards obtained for him the title of the first English Whig. Parliament (35 Eliz.) made it treason to possess a copy of the book, which was reprinted in the interests of Cromwell in 1648. It was again reprinted in 1681, and publicly burned at Oxford in 1683. Another curious work by Parsons, for some time disseminated in manuscript only, was his *Memorial for the Reformation*, in which he lays down rules for the guidance of the government, in the expected event of England's subjection to the pope. The book was read at dinner-time in the English college at Valladolid when Philip was preparing another Armada. The Jesuit's power of invective may be seen in his *Responsio ad Elizabethæ edictum*—a bitter libel on the queen's ministers in reply to the royal proclamation of November 1591. His *Apology* for the government of the archpriest (1601) is historically interesting, while his *Manifestation of the Great Folly and Bad Spirit of Certain in England calling Themselves Secular Priests*, a passionate attack upon the conduct and morals of his clerical brethren, exhibits him on his weakest side.

An impartial biography of this many-sided personality is still a desideratum. A brief sketch of his life and works will be found in Wood's *Athenæ* (i. 83), and from other points of view in Dodd's *Church History* and Oliver's *Collections*. The best estimate of his character as a Jesuit missionary is that by Richard Simpson in his *Life of Campion*, where Parsons' career in England is fully traced. For his political intrigues between 1582 and 1595 the *Letters and Memorials of Cardinal Allen*, published by the Fathers of the Oratory, must be consulted. An account of his quarrels with the secular clergy will be found in the *Conflicts of Jesuits and Seculars in the Reign of Elizabeth*, by Thomas Graves Law; and a number of letters and documents are scattered through Tierney's *Dodd* and Foley's *Records of the English Province of the S. J.* See also Father E. Taunton's *History of the Jesuits in England* (1901).

Parsonstown, or BIRR, a market-town in King's County, Ireland, on the river Brosna, 89 miles by rail W. of Dublin. The castle, anciently the seat of the O'Carrolls, was granted by James I. to Laurence Parsons, ancestor of the Earls of Rosse. Parsonstown is a handsome, well-built town, with a statue of the Duke of Cumberland, the victor of Culloden, and a bronze statue (1876) by Foley of the Earl of Rosse, the astronomer. Pop. 4000.

Parthenogenesis (Gr. *parthenos*, 'a virgin,' and *genesis*, 'production'). See EMBRYOLOGY, GENERATIONS (ALTERNATION OF), INSECTS, SEA-URCHINS.

Parthenon (Gr., 'maiden's-chamber'), the temple of Athena (q.v.) at Athens, probably the most perfect specimen of Greek architecture. It is a great Doric temple, designed under the artistic directorship of Phidias, by the architects Ictinus and Callicrates. Built of Pentelic marble, it has eight pillars in the width and fifteen at each side (not counting those at the corners). The total length is 228 feet; height to top of pediment, 64 feet. The sculptures are, in the orthodox view, held to have been designed by Phidias, and to have been executed in part possibly by himself and in part by assistants under his superintendence; but the theory has also been advanced that except for the celebrated statue of Athena, Phidias had nothing to do with the sculptures. This magnificent relic of Periclean times stood little injured by weather or war until, when it was being used as a Turkish magazine in 1687, a bomb from a Venetian

mortar burst within, and the explosion reduced the building to ruins. Restoration was begun in 1925. Illustrations will be found at GREEK ARCHITECTURE; a view of the ruins at ATHENS; and part of the frieze at ELGIN MARBLES. See Dr A. S. Murray, *The Sculptures of the Parthenon* (1903).

Parthenopean Republic. See NAPLES.

Parthia, anciently a district in what is now northern Persia, lay between Media on the west and Bactria on the east, was separated from the Caspian Sea on the north by the savage land of Hyrcania, and was bordered on the south by the Iranian deserts. The Parthians were of Scythian descent, immigrants and nomads, who eventually adopted the Median dress and a semi-Aryan speech. But in war they clung to their national habits: they always fought on horseback, and both horse and rider were clad throughout in scale armour; their weapons were bows and arrows, which they discharged backwards during pretended flight as well as forwards in direct attack. Their armies were made up principally of slaves, commanded by their masters, the aristocratic nucleus of the Parthian nation. Parthia was subject successively to the Assyrians, the Medes, Persians, Greeks (Alexander the Great and his generals), and the Seleucids of Syria. In or about 250 B.C. a chief named Arsaces founded an independent kingdom in Hyrcania; his brother and successor, Tiridates, established himself in Parthia in 241 B.C. But the early kings of Parthia had much ado to maintain their position against their suzerains, the Seleucid 'great kings,' and it was not until Mithridates I. (171-138) ascended the throne, and had subdued Bactria, Media, and Babylonia, that the Parthian princes shook off completely the Syrian (Greek) yoke and became independent. This king made Parthia supreme in Iran. He greatly strengthened his power by resting it in great part upon the Magi (q.v.) and the ancient creed of Zoroaster. In the reign of his successor the Seleucid king made a determined effort to recover the lost provinces in Iran, but the expedition cost him his life and his army (129 B.C.). No sooner was this enemy disposed of than another and more formidable foe appeared in the east—the Scythians. They defeated and slew (128) Phraates, king of Parthia, levied tribute from his kingdom, and established themselves within its borders. During the first half of the 1st century the Parthian kings, by interfering in the affairs of Armenia, first came into contact with the Romans. The unprovoked invasion of Mesopotamia by Crassus (53 B.C.), his disastrous defeat and his death, make the first act in the drama of real contest that then ensued between Rome and Parthia. The remaining acts were the conquest of Syria and Palestine by Parthia (40-38); the disastrous campaign of Antony in Armenia (36 B.C.); then, after a century and a half of, in Parthia, mostly internal dissensions, the renewal of hostilities by Trajan (115-117 A.D.); the brilliant campaign of Avidius Cassius (164-165); the capture of Ctesiphon by Severus (199) and his repulse before Atrā (201); and the defeat of Macrinus, the Roman emperor, and his ignominious payment of fifty million denarii to his enemy (217-218). During nearly all this period the Euphrates was looked upon by both combatants as the frontier line between their respective empires. The Parthian capital was Ctesiphon, a suburb or twin-capital with Seleucia, all through the duel with Rome. The Parthian empire was overthrown in a battle fought in 224 (or 227) by Artashir, a prince of Persis, a province of ancient Iran, who founded the subsequent dynasty of the Sassanids (see PERSIA). The Parthian kings during the most flourishing period

of their power used Greek as their official language, adopted some of the Greek deities, and in other ways put themselves under the influence of Greek civilisation. But the hold of this civilisation grew weaker as time went on, and Greek ceased to be the official language in the 2d century A.D.

See histories of Parthia by Rawlinson (1873), Schneideworth (Heiligenstadt, 1874), and Spiegel (Leip. 1887).

Partick, from 1852 a police burgh, since 1912 part of Glasgow, prettily situated, chiefly on a rising ground on the Kelvin, immediately above its junction with the Clyde, and 3 miles WNW. of the Cross, has shipbuilding yards, besides flour-mills and brassfoundries, and extensive ranges of handsome villas.

Partinico, a town of Sicily, 32 miles SW. of Palermo by rail. Pop. 21,000.

Partnership is the relation which subsists between persons carrying on business in common with a view to profit. Technically it has no reference to the relation between shareholders and a limited company. The law of partnership for the United Kingdom has been placed on a clear and intelligible footing by the Partnership Act, 1890, 53 and 54 Vict. chap. 39, which does not change the law established by decisions, but states it in an authoritative manner. Joint tenancy, or joint property, or sharing gross returns does not by itself make a man a partner. The receipt of a share of net profits is a strong indication of partnership, but it is not conclusive in such cases as a creditor, a servant or agent, the widow or child of a deceased partner, the vendor of the good-will of a business, receiving payment or remuneration by way of a share in net profits. Where the person carrying on the business becomes bankrupt, however, the creditor or vendor who is paid out of profits is postponed to the other creditors. In Scotland the firm is a legal person distinct from the individual partners, but a partner may be charged on a decree against the firm, and on payment of a firm debt is entitled to relief *pro rata* from the firm and the other partners. In all ordinary transactions each partner, as agent, binds the firm, unless the person dealt with knows that the partner has in fact no authority. The firm is not bound where the partner pledges its credit for a purpose apparently not connected with the business. In England and Ireland the partners are liable jointly, in Scotland severally, for firm debts: in England and Ireland the estate of a deceased partner is subject to prior payment of separate debts. The firm is liable for the misapplication by a partner of property received by the firm, except in the case of property of which the partner is trustee when the other partners have no notice of the trust. Every person who by words or conduct holds himself out as a partner, or permits himself to be so represented by others, is liable to anybody who relied on such representations. But this will not make the executors of a deceased partner liable because the name of the deceased has been used by the firm after his death. The admissions of a partner bind the firm, and notice of any fact to a partner is also notice to the firm, except in the case of a fraud upon the firm. A new partner does not become liable, nor does a retiring partner cease to be liable, to existing creditors. But the consent of creditors to discharge a retiring partner, or to accept the new firm as the only debtor, is easily presumed from a course of commercial dealing. Continuing guarantees or cautionary obligations are revoked as to future transactions by any change in the constitution of the firm which is debtor or creditor in the obligation. Unless the contrary appears, property bought with the money of the firm is held to have been bought on account of the firm. Heritable property

bought for the firm is treated as movable between partners. Unless otherwise agreed, all partners are entitled to share equally in profits and capital, and must contribute equally to losses. The firm must indemnify every partner in respect of proper payments made and liabilities undertaken by him. If a partner advances capital beyond his share, he is entitled to interest at 5 per cent. Every partner may take part in management, but no partner is entitled to remuneration for so doing.

No new partner may be introduced without the consent of all the other partners. The majority of partners cannot expel a partner. Every partner has access to the firm books. If no time has been fixed for the duration of the firm, any partner may at any time dissolve it by notice to his copartners. If the partners go on trading after the time fixed for dissolution they are presumed to do so under their former agreement so far as that may be applied to a partnership at will. Every partner must account to the firm for any benefit derived by him from any partnership transaction, or any use of partnership property or business connection. The same rule applies if without consent a partner carries on a separate business competing with the firm. An assignment by a partner to his creditor of a share in the business does not entitle the creditor to inspect books, or to require accounts, or to interfere in management, but merely to receive share of profits, or to receive the value of the share when realised on dissolution. Apart from agreement, partnership is dissolved by the death or bankruptcy of any partner, or by the business becoming unlawful. Further, the court may decree a dissolution (1) where partner is of permanently unsound mind; (2) when partner becomes permanently incapable of performing his duties; (3) when partner's conduct prejudicially affects the carrying on business; (4) when partner persistently breaks the agreement, or so conducts himself that it is not reasonably practicable for the other partners to act with him; (5) when the business can only be carried on at a loss. A person dealing with a firm after change in its constitution is entitled to treat all *apparent* members of the firm as still partners until he receives notice of the change. A retiring partner, not known to be a partner, is not liable for debts contracted after his retirement. After dissolution the authority of partners to bind the firm continues so far as necessary for a proper winding up—viz. in having the property of the partnership applied to payment of the debts and liabilities of the firm, and the surplus assets applied in payment of what is due to the partners after deducting what is due by the partners to the firm. If after a partner's death or retirement the other partners carry on business without any settlement of accounts, they must account for share of profits or pay interest at 5 per cent. in the option of the outgoing partner or the representatives of deceased partner. An option to purchase, however, is generally given by the contract in such cases.

In Scotland, as already stated, the firm is a distinct *persona*. Therefore in actions by or against the firm the individual partners need not be named, though in practice one or two of them generally are named. Each partner may also sue the firm; and the firm may be sequestrated without any of the partners being sequestrated.

By the Limited Partnerships Act, 1907, 7 Edw. VII. chap. 24, a system of limited liability in partnership was introduced, resembling the 'commandite' partnership (see *COMMANDITE*), which had been in operation for many years in Europe and in the United States. This act permits the formation of partnerships consisting of one or more *general* partners, liable for all the debts and obligations of the firm, and one or more *limited* partners,

liable only up to the amount contributed by them to the firm capital, subject to the fulfilment of the requirements of the act as to registration.

The law of the United States is based on English common law, but many of the states of the Union have their own special legislation.

See Lord Lindley's *Treatise on the Law of Partnership* (9th ed. 1924), the great authority; Sir F. Pollock's *Digest of the Law of Partnership* (11th ed. 1920); and, for the United States, besides Kent's *Commentaries* (14th ed. 1896) and Story's *Law of Partnership* (1841), works by T. Parsons (4th ed. 1893), Bates (1888), and Burdick (2d ed. 1906). See also the articles COMPANY, CORPORATION.

Partridge (*Perdix*), a genus of gallinaceous birds, of the family Phasianidæ, having a short, strong bill, naked at the base; the upper mandible convex, bent down at the tip; the wings and tail short; the tarsi as well as the toes naked, the tarsi not spurred. The Common Partridge or Gray Partridge (*P. cinerea*) is the most plentiful of all game-birds in Britain, and becomes increasingly plentiful as cultivation is extended, whilst the range of the moorfowl is restricted. Hence it has

a, Common Partridge (*Perdix cinerea*); b, Red-legged Partridge (*P. rufa*).

greatly increased during the 19th century in Britain, and, though not preserved to the same extent as are pheasants, it affords considerable sport. It is not found in the Outer Hebrides. On the continent of Europe it is abundant in almost all districts suitable to its habits, from Scandinavia to the Mediterranean, and is found also in the north of Africa, and in some parts of the west of Asia. It varies considerably in size, those found in rich arable lands being generally the largest, and about 12½ inches in entire length, whilst those which inhabit poorer and more upland districts, or where heather abounds, are rather smaller. The female is rather smaller than the male. The upper parts of both are ash-gray, finely varied with brown and black; the male has a deep chestnut crescent-shaped spot on the breast, which is almost or altogether wanting in the female. A variety called the Mountain Partridge has the plumage brown. The Partridge is seldom found far from cultivated land: It feeds on grain and other seeds, insects and their larvæ and pupæ; and the pupæ of ants are generally the food sought at first for the young. The nest is usually on the ground, among brushwood and long grass, or in fields of clover or corn, and generally contains from twelve to twenty eggs. The young run as soon as they are hatched. Both parents show a very strong attachment to their young, and great courage in repelling assailants; they have also recourse, like many other birds, to stratagem to draw off the most powerful and dangerous enemies, such as dogs, in another direction, fluttering close before them as if broken-winged, whilst the brood escape. Until the end

of autumn the parent birds and their brood keep together in a *covey*; late in the season several coveys often unite into a *pack*, when it becomes much more difficult for the sportsman to approach them. The flight of the partridge is strong and rapid for a short distance, but it does not seem to be capable of a long-sustained flight. The eggs of partridges are often hatched, and the young birds reared, by the domestic hen, the chief requisite being a plentiful supply of ants when the birds are very young. Partridges thus reared become very tame, but they seldom breed in the aviary.

The Red-legged Partridge (*P. rufa* or *Caccabis rufa*, the genus or sub-genus *Caccabis* being distinguished by a rudimentary blunt spur on the tarsi) is a native of the south of Europe and of the Channel Islands, often called the French Partridge. It is now also plentiful in some parts of England, particularly Norfolk and Suffolk, into which it has been introduced, and whence it has largely driven out the common breed. It is said to have been brought to England from Guernsey during the reign of Charles II.; and the French Revolution of 1789, with its sudden abolition of the game-laws, is said by Carlyle to have caused 'two signs—emigrant flights of French seigneurs, emigrant winged flights of French game.' The red-leg is rather larger than the common partridge, stronger on the wing, and less easily approached by the sportsman, whilst it is also less esteemed for the table. The upper parts are of a reddish-ash colour; the throat and cheeks white, bounded by a collar of black, which expands in black spots on the breast; and the sides exhibit bars of black. The plumage is smooth. Two other species, nearly allied to this, are found in some of the southern parts of Europe, and one of them is found as far east as India. In Africa there is the Barbary Partridge (*P. petrosa*). The habits of all the species much resemble those of the common partridge, but the *P. rufa* prefers heavy clay land and heaths, in which respect it greatly differs from the gray partridge.—The name is loosely used for a North American Grouse (q.v.), the Virginian Quail (q.v.), the Tinamou (q.v.), and other birds. See H. A. Macpherson, *The Partridge* (1893).

Partridge Berry. See GAULTHERIA.

Partridge-wood, a very pretty hardwood from the West Indies and Brazil; the product of the leguminous tree *Andira inermis*. See ANDIRA.

Pasadena, a pretty country town in southern California, 10 miles by rail E. of Los Angeles; pop. 45,000. There are two important observatories on neighbouring mountains.

Pasargadæ, one of the most ancient cities of the Persians, containing a palace and great treasures, was in the province of Persis, and stood in a plain surrounded by mountains, on the river Cyrus. It is identified with ruins near the modern Murghab, north-east of ancient Persepolis, and 70 miles north-east of the modern Shiraz.

Pascagoula, a navigable river in the south-eastern part of Mississippi, formed by the junction of the Leaf and Chickasawha. It flows 85 miles south to a small bay of the same name on the Gulf of Mexico.

Pascal, BLAISE, one of the best writers and profoundest thinkers France has produced, was born of a good legal family, at Clermont-Ferrand in Auvergne, 19th June 1623. His father, Etienne Pascal, was a president of the Court of Aids there, and was himself a man of high character and capacity; his two surviving sisters, Gilberte and Jacqueline, grew up beautiful and accomplished women, with something of their brother's intellect and all his spiritual elevation of character. The

elder of the two, Gilberte (born 1620), married her cousin M. Périér in 1641, penned a tender and touching sketch of her brother's life, as well as her sister's, and had her own history written by her gifted and austere daughter Marguerite (1646-1733). Jacqueline (born 1625) wrote verses as a child, and in maturer life remarkable letters and *Thoughts* on the 'Mystery of the Death of Christ.' After a troubled spiritual experience she became one of the sisters of Port Royal in 1652, but failed to find all the happiness she sought for, and died nine years later, immediately after having been persuaded into subscribing against her conscience the formula required from the Port-Royalists, which she had vehemently resisted as a treasonable betrayal of the cause. Her brother, at first willing to submit, now offered the strongest opposition to any further concessions, and, at an interview with Arnauld, Nicole, and Sainte-Marthe, argued the point with such vehemence that he fell fainting to the ground.

Their mother died in 1626 or 1628, and in 1630 their father went to live in Paris amongst the men of science of his time. He trained his gifted son with the greatest care, and Madame Périér has told us of the child's astonishing precocity, how he refused to rest without knowing the reason for everything, and how, when purposely kept from mathematical books, he worked out for himself at twelve the propositions of Euclid as far as the thirty-second in the first book. Still more, at sixteen he wrote a treatise on conic sections which called forth the mingled incredulity and astonishment of Descartes, and indeed founded the modern treatment of the subject, though not published for more than a century. Leibniz saw it, and Pascal himself gave a résumé of it in his *Essai pour les Coniques* (1640). His father's protest against one of Richelieu's financial measures brought him into trouble, and indeed drove him awhile into hiding, but the cardinal's anger was abated by the intercessions of Jacqueline and her charming acting in a representation by young girls of Scudéry's *L'Amour Tyrannique*. Richelieu sent him as Intendant to Rouen in 1641, and here about 1646 an accident brought him into contact with the Jansenists, and turned into a new current the destinies of his children. Here the boy gave himself to study with unbroken devotion, despite wretched health and almost incessant sufferings from nervous prostration. To this period belongs his first conversion, and we find him in the intemperate zeal of a first love testifying to the earnestness of his convictions by denouncing to the archbishop the errors in the teaching of a Capuchin monk at Rouen. In 1647 he published his *Nouvelles Expériences sur le Vide*, and next year occurred his famous Puy de Dôme experiments on atmospheric pressure, which may be said to have completed the work of Galileo and Torricelli. The reputation he gained earned him the jealousy of Descartes, and the attacks of the Jesuit fathers of Montferrand and Paris.

His calculating machine was a brilliant achievement of the first years at Rouen; the later scientific labours of his life were contributions to the infinitesimal calculus, to the theory of the equilibrium of fluids, the mathematical theory of probability, and the properties of the cycloid. In the very last months of his life we find him busily engaged in a scheme for running omnibuses on the streets of Paris.

In the autumn of 1647 he returned to Paris, and we find him frequently accompanying Jacqueline in her visits to the church of Port Royal. Next year their father returned to Paris as Councillor of State, and took the pair to Clermont for nearly two years. In September 1651 he died, and Jacqueline, now free to carry out her desire, joined Port

Royal in the January of 1652. From some of her exaggerated phrases Pascal has been needlessly supposed to have lived a worldly life with the Duc de Roannez and other friends, and his *Discours sur les Passions de l'Amour* has been interpreted as inspired by a hopeless passion for Charlotte Gouffier de Roannez, the duke's sister, then about sixteen years old. Certain it breathes a genuine passion throughout, and there can be little doubt that it was written out of some real experience. If Pascal did love her, it is most probable that he never told his love, for he continued to the close the warm friend and correspondent of herself and her brother alike. She vacillated awhile between the cloister and the world, passed through her novitiate at Port Royal, then married the Duc de la Feuillade, saw her children die and her own health decay, and early sank into the grave.

In the autumn of 1654 Pascal's second conversion occurred, and from this period date those severe and gloomy austerities which darkened his life and doubtless hastened him to the grave. The immediate occasion may have been a narrow escape from death through his horses running away when driving to Neuilly, but the moment that remained ever sacred in his memory was that of a remarkable vision or ecstasy, November 23, 1654, commemorated in a few broken sentences of impassioned and mystical devotion in his Profession of Faith, or Amulet, as Condorcet called it, which was found after his death, copied in his own handwriting both on paper and parchment, and sewn into his doublet, being apparently stitched anew into every change of clothes. (See, but only for its facts, Lélut's *L'Amulette de Pascal*, 1846.) From this time a complete change passed over his life; he subjected himself to the most rigid mortifications, complete denial of self, boundless charity, and absolute obedience to his spiritual director, and ever wore around his body a girdle of iron, the sharp points of which he would press into his flesh when he felt in danger from worldly temptations or wandering thoughts. For a time he lived in Port Royal, and henceforth he threw himself with a passionate devotion into its cause. Arnauld was condemned by the Sorbonne in 1655, not merely for doubting whether the famous Five Propositions condemned were actually contained in the work of Jansen, but also for asserting the identity of the Augustinian and Jansenist doctrines of *gratia efficax*, and for declaring that the arguments used against the *Augustinus* were themselves erroneous or falsified; and his friends now thought the time had come for the public to be informed about the whole question at issue.

In a happy hour Pascal was induced to lend his pen to the cause, and on the 23d January 1656, in the interval between the first and second judgment of the Sorbonne on Arnauld, appeared *A Letter written to a Provincial by one of his Friends*. A second was issued a few days later, and as its successors followed he assumed the pseudonym of 'Louis de Montalte.' These 'little letters'—the greatest tracts for the times that were ever issued—flew from hand to hand, and the rage and fury of the Jesuits knew no bounds. Never before had been seen in the whole range of controversy such delicate yet scathing irony, such lightness of touch yet keenness of thrust, such Socratic directness and point, such mastery of incisive argument wedded to perfect grace and felicity of phrase and rare distinction of style. 'The best comedies of Molière have not more wit than the first Provincial Letters,' says Voltaire, and he adds, 'Bossuet has nothing more sublime than the concluding ones.' Voltaire tells us that Bossuet himself confessed that had he not written his own, he would rather have written them than any other book he knew; even Madame

de Sévigné bowed her head before their sovereign delicacy and perfection of style; Boileau owned them unsurpassed in ancient or modern times; Perrault places them above Plato for wit, Lucian for delicate and artful railery, and Cicero's orations for strength and ingenuity of reasoning; and Gibbon tells us that almost every year he perused them with fresh pleasure, and from them learned 'to manage the weapon of grave and temperate irony, even on subjects of ecclesiastical solemnity.' There are altogether eighteen Letters from the pen of Pascal himself, a brief fragment of a nineteenth ascribed to him, and a twentieth on the Inquisition from the pen of M. Le Maitre. The first two deal with the special question between Arnauld and the Sorbonne; the third and two concluding letters are closely connected with these; the intervening thirteen (4-16) open up the whole subject of the moral theology of the Jesuits, and form the most formidable attack ever made upon the order. The fabric of the moral theology or casuistry of the Jesuits, with all its subtle equivocations and refinements for the extenuation of sin, appalled the austere soul of Pascal as he read into it; and by the end of the tenth letter, after completing his exposition of their theology, he turns to address the Jesuit fathers directly, and breaks into language of eloquent and indeed sublime denunciation. The eleventh defends the application of the method of railery to serious subjects; the twelfth and thirteenth rise to an eloquence equalled only in Demosthenes; the sixteenth is that the length of which he excuses because he had not had time to make it shorter. In the composition of his Letters Pascal owed much to the materials collected in the Port Royal work, *La Théologie Morale des Jésuites* (1644). His quotations were confessedly often furnished for him from the wider reading of friends like Nicole and Arnauld, but he tells us that he himself read Escobar's seven volumes twice through, and never made use of a single passage supplied to him without having specially examined it and its context. It has been charged against him that he sometimes quotes inexactly, and that he is unfair in taking quotations out of their setting, but the real grievance of his adversaries is nothing more than this, that he turns their flank by taking their own positions and developing them practically to their natural conclusions. And if it be said that he treated with too great seriousness the statements and arguments of inferior writers, it must be remembered that all these books were issued under the *imprimatur* of the order. At anyrate the Jesuits were much readier with denial and denunciation than counter-arguments and proof; the replies of Piro (1657), Daniel (1694), and Dumas (1700) were pitiful failures, and hardly more can be said of the onslaught of Joseph de Maistre (in *De l'Eglise Gallicane*, 1821) and of the Abbé Maynard's edition of the Letters with a professed refutation (1851). Pascal's own final judgment of his work was expressed in these solemn words: 'Though my Letters be condemned at Rome, what I condemn in them is condemned in Heaven. Ad tuum, Domine Jesu, tribunal appello.'

Between his conversion and the beginning of his great controversy Pascal seems to have lived chiefly at Port Royal under the spiritual guidance of M. de Saci, but he never took up his abode as a regular inmate there. His Letters occupied him till the spring of 1657, and during the following year he busied himself in a scheme for a great Apology of religion, his faith meanwhile being quickened by his belief in the famous Miracle of the Holy Thorn, according to which his niece, Marguerite Périer, a pupil at Port Royal, had been miraculously cured of an obstinate *fistula lacrymalis* by a touch of a fragment of the crown of Christ. But his

health gave way during 1658, and thenceforward to the close he bore the burden of constant suffering with more than saintly patience and resignation. Indeed he laboured to deaden every sensation of pleasure in life, in his food, his studies, and even the affections of his friends. Meanwhile his weakness grew upon him, study and composition became possible only in brief intervals, and on 19th August 1662 he sank to rest under his sister's roof at Paris, his own house having been given up to a poor family one of whose children had been seized with smallpox.

Seven years later (1669) appeared his *Pensées*, with a preface by Madame Périer's son—the result of the editorial labours on his fragmentary papers of a committee of influential Jansenists. Unhappily these perplexing fragments were garbled to a great extent in the interests of orthodoxy and ecclesiastical policy by exaggerated prudence and misdirected zeal, just as they were in 1776 by Condorcet in the interests of heterodoxy. The Abbé Bossut's edition in 1779 was long accepted as authoritative; but in 1842 Cousin first showed the real state of the case in his celebrated Report to the French Academy, and startled the world by declaring that Pascal was a complete sceptic in philosophy, and a Christian only through external influences entirely unconnected with logic or reason. To M. Prosper Faugère belongs the honour of first giving (1844; Eng. trans. by Pearce, 1850) a complete and authentic text, although all readers will not accept his supposed discovery of the indications of an interior arrangement. Havet (1852), thought it hopeless to discover the true order, and therefore returned to Bossut's arbitrary but familiar arrangement. Victor Rocher, again (1873), adopted an elaborate arrangement, professedly founded on Pascal's original plan, and maintained that everything falls naturally into it. A standard edition is that of Molinier (1877-79), an independent arrangement mainly on the lines of Faugère's, admirably translated into English by C. Kegan Paul (1885). Another is that of Brunschvicg (1897).

Pascal's *Pensées* are detached thoughts dashed rapidly off, intended as materials to be shaped into his projected Apology for the Christian faith. They are thrilled through and through with passionate emotion and ever-present personality, and they contain some of the most profound, suggestive, and startling thoughts that have ever been expressed on the greatest mysteries within the range of human speculation. From one point of view it is easy to construct from them, as Cousin did, a theory that their author was a pessimist and sceptic of a far deeper dye than Montaigne, but profounder study proves this view but a shallow paradox at best. The conversation with De Saci (first published in 1728 by Des Molets) offers the best key to Pascal's philosophy of life. Here he takes Montaigne and Epictetus as his representatives, the first of the Pyrrhonist, Epicurean, and sceptic, who mocks man's aspirations after spiritual truth, and insists upon his weakness, his ignorance, and doubt; the second, of the Stoic, who looks at man only on his lofty side, insists on his freedom and moral dignity, and points out in his moral nature the image and likeness of God. Pascal regards these two opposites as united in the gospel of Christ, the overwhelming certainty of which arises out of its alone affording a key to the tormenting anomalies and contradictions of nature, at once to the moral law as revealed by conscience within and to all the disorder of the world as discovered by conscious experience—to man's greatness and man's degradation, and the reason for both the one and the other. Man's spiritual capacity alone enables him to realise his intrinsic greatness, which was revealed to him once for all when for his sake the Highest was joined to the lowest, in the incarnate union of Divine Power and Love with human degradation and pain. This is a mystery beyond man's power of demonstration, and a deeper ground for certainty must be sought in its essential

correspondence, not with the intellect alone, but with the whole complex nature of man. Yet with all this there exist in the *Pensées* startling fragments deeply tinged with scepticism, although many of these may be interpreted with Sainte-Beuve as a kind of shorthand notes to fix ideas that flashed across his mind of difficulties to be afterwards considered. Of these none is more famous than the wager essay, in which, as has been said, and with truth, Pascal plays at pitch and toss with the existence of God and the immortality of the soul. Such a passage as this is a product, says Tulloch, of one of those 'moments of terrible doubt, when the soul is so borne away on the surge of the sceptical wave that rises from the depth of all human speculation that it can only cling to the Divine by an effort of will, and with something of the gamester's thought that this is the winning side.' The *Pensées* owe much to Montaigne and Charron, and, as Molinier has shown, to the 13th-century Spanish writer Raymond Martin.

More or less complete editions of Pascal's works are those of Bossut (1779), Lahure (1858), Faugère and Brunschvicg (1886-1904). Of the *Provincial Letters*, besides the Abbé Maynard's edition (1851) already mentioned, and Lesieur's reprint of the original quarto (1867), there are editions by Villemain (1829), De Sacy (1877), De Soyres (Lond. 1880), L. Derome (1885 *et seq.*), and Molinier (2 vols. 1891). The famous Latin translation by Wendrock [Nicole], for which he read his Terence thrice over, appeared at Cologne as early as 1658. There are English translations by Royston (1657), Pearce (1849), and Dr Mc'Crie (1846). Of the *Pensées* there are editions by Frantin (1835), Faugère (1844, containing what seems to be the most authentic portrait), Havet, with an admirable commentary (1852; 3d ed. 1881), Lahure (1858), Louandre (1854), Rocher (1873), and Molinier (1877-79). English translations are those by Walker (1688), Craig (1825), Pearce (1850), and Kegan Paul (1885). For Jacqueline Pascal's Life, see the works by Cousin (1845) and Sophy Winthrop Weizel, *Sister and Saint* (New York, 1880). Her miscellaneous writings, letters, and poems, together with those of Madame Périer and Marguerite Périer, were edited by Faugère (Paris, 1845).

See vols. ii. and iii. of Sainte-Beuve's *Port Royal* (1842-48), and Charles Beard's *Port Royal* (1861); the studies by Reuchlin (Stutt. 1840), Vinet (1856), Cousin (1857), H. Weingarten (Leip. 1863), Dreydorff (admirable, Leip. 1870), Tulloch (1878), Joseph Bertrand (1891), and Boutroux (1901). Admirable articles on Pascal are those in the *Edinburgh Review* for January 1847 (by Henry Rogers), the *Quarterly Review* for October 1879 and April 1906, the *British Quarterly Review* for October 1884 (by C. Kegan Paul). See also the articles ARNAULD, JANSEN, and PORT ROYAL in this work; and Madame Duclaux, *The French Ideal; Pascal, Fénelon, and other Essays* (1911).

Paschal. See PASSOVER, EASTER, HOLY WEEK.

Pasco. See CERRO DE PASCO.

Pascoli, GIOVANNI (1855-1912), Italian poet and critic, born in Romagna, was educated at Bologna, became a teacher of Latin and Greek, professor of Latin Literature at Messina and Pisa, and of Italian Literature at Bologna. As a follower of Carducci he produced several volumes of poetry from 1891 on, as well as a study of Dante and other prose works. See a book by Croce (1920).

Pas-de-Calais (Fr. for Strait of Dover), a department in the north of France, formed out of Artois and Picardy, and bounded on the W. by the Strait of Dover and the English Channel. Area, 2550 sq. m.; pop. (1861) 724,338; (1911) 1,068,155; (1921) 989,967. The surface is level, with the exception of a low ridge running to the north-west, and ending in Cape Gris-nez (q.v.). The soil is fertile, mostly under cultivation, and watered by numerous short rivers, the majority of which are

navigable and connected by canals. The coast-line is 80 miles in length, and the shores are in certain parts low and sandy. The climate is exceedingly inconstant. Fishing is actively carried on, particularly in the neighbourhood of Boulogne. Coal, iron, and other minerals are raised and worked, and considerable quantities of turf are cut. The industrial establishments are numerous and important, as iron-foundries, beet-root sugar factories, glass-works, potteries, tanneries, and others. Boulogne and Calais are the principal harbours. There are six arrondissements—Arras, Béthune, St Omer, St Pol, Boulogne, and Montreuil. The capital is Arras.

Paseng. See GOAT.

Pasewalk, a town of Prussia, 26 miles by rail WNW. of Stettin, has varied industries. It was plundered and burned three times by the Imperialists in the Thirty Years' War, by the Poles in 1657, and by the Russians in 1713, and passed from Sweden to Prussia in 1720. Pop. 11,000.

Pasha' (spelt also *pacha* and *bashaw*), a title applied to Turkish military commanders of high rank. The title was limited in the early period of the Ottoman empire to the princes of the blood, but was subsequently extended to great officers of the empire. The three grades of pashas used to be distinguished by the number of the horse-tails—three, two, or one—borne before them as their standards. This antique system was abolished by Mahmud II.

Pashto, PUSHTU, or PUKHTU, the language of the Afghans proper (see AFGHANISTAN), is, according to Darmesteter, not intermediate between the Iranic and Indic branches of the Indo-Germanic stock, but is directly derived from the Zend, with Persian, Hindustani, and Arabic admixture. See Darmesteter's *Chants Populaires des Afghans* (1890).

Pašić, or PASHICH, NIKOLA, Serbian 'Old Radical' leader, born in 1846 at Zaječar, studied at Zürich polytechnic, and became an engineer. A member of the Skupština from 1878, leader of the radicals from 1881, he was condemned to death in 1883 and to five years' imprisonment in 1899, and was prime minister in 1891-92, 1904-5, 1906-8, 1912-18, and (of Yugoslavia) from 1921.

Paskevich, IVAN FEODOROVICH, Count of Erivan and Prince of Warsaw, a Russian field-marshal, was born at Poltava, 19th May 1782. He was educated in the school of pages, entered the army, served against the French in the campaign in 1805 which was ended by the defeat of Austerlitz, and afterwards against the Turks. Then he took a prominent part in the campaigns of 1812-14, especially in the battles of Smolensk, Borodino, Leipzig, and in the capture of Paris. In 1826 he was appointed commander-in-chief against the Persians, whom he completely defeated, conquering Persian Armenia, taking Erivan, and ending the war by a peace (1828) exceedingly favourable to Russia. In recompense for these services he was created Count of Erivan, and received a grant of £100,000. In 1828 and 1829 he made two campaigns against the Turks in Asia, took Kars, Erzerüm, and other fortresses, and terminated the war by the treaty of Adrianople in 1829. In 1831 he suppressed the rising in Poland by capturing Warsaw, and was made governor of the reconquered country. Under his rule Poland was (1832) definitively incorporated as Russian territory. When the Hungarians took up arms in 1848 Paskevitch was sent to the assistance of Austria, and, after defeating the Hungarians in several battles, compelled Görgei to surrender at Vilagos (1849). In 1854 he took command of the Russian army on the Danube; but fortune, which had

hitherto invariably smiled upon him, deserted him at Silistria, where he was wounded. Thereupon he resigned the command, retired to Warsaw, and died 1st February 1856.

Paspalum, a large genus of grasses, chiefly tropical, with some in temperate America. Many are cultivated for grain or fodder. See MILLET.

Pasque Flower. See ANEMONE.

Pasquinade, an anonymous or pseudonymous publication of small size, sometimes printed, sometimes only posted up or circulated in manuscript, having for its object the defamation of a character, or at least the turning of a person to ridicule. The name is derived from *Pasquino*, a tailor remarkable for his wit and sarcastic humour, who lived in Rome towards the close of the 15th century, and attracted many to his shop by his sharp and lively sayings. Some time after his death a mutilated fragment of an ancient statue, considered to represent Menelaus supporting the dead body of Patroclus, was dug up opposite his shop, and placed at the end of the Braschi Palace, near the Piazza Navoni. It was named after the defunct tailor, and the practice originated of affixing to its placards containing satires and jests relative to the affairs of the day—the pope and the cardinals being favourite victims of the invisible satirists. See a French monograph by Mary Lafon (2d ed. 1877).

Passacaglia (Ital. from Span. *pasacalle*; *pasar*, 'to pass,' *calle*, 'street'), in music, a slow dance-form in triple time, similar to the chaconne, constructed over a ground-bass. It occurs in suites and by itself.

Passaic, a city of New Jersey, on the Passaic River, 11 miles by rail NW. of Jersey City. Besides foundries and print-works, it has manufactories of woollens and shoddy, whips, india-rubber, chemicals, &c. Pop. (1890) 13,028; (1920) 63,824.

Passamaquoddy Bay, in North America, opens out of the Bay of Fundy, at the mouth of the St Croix River, between Maine and New Brunswick. It is 15 miles long by 10 wide, and shut in by a cluster of islands so as to form an excellent harbour.

Passarowitz, or more correctly POŽAREVAC, a town of Serbia, 9 miles S. of the Danube and 40 ESE. of Belgrade. Pop. 15,500. Here was signed, 21st July 1718, the treaty between Venice and the emperor, on the one side, and the Porte on the other, by which a truce of twenty-five years was established, and the Banat of Temesvar, the western portion of Wallachia and Serbia, Belgrade, and part of Bosnia were secured to Austria.

Passau, a town of Bavaria, stands on a rocky tongue of land, on the right bank of the Danube, beside the influx of the Inn, and opposite the confluence of the Ilz with the Danube, close to the frontier of Austria, and 72 miles by rail SE. of Ratisbon. The city proper is connected with its suburbs on the other side of the Inn and the Danube by means of iron bridges; and picturesque hills encircle the whole town. The cathedral was rebuilt after a fire in 1680; the bishop's palace is now in part converted into public offices. The Passau Agreement between the Roman Catholic and Protestant estates of the empire was signed here on 29th July and 15th August 1552. Passau was long an important fortified post, being looked upon as the key of the Danube in that part of its course. There were two strong citadels, one dating from 737, the other from 1215–19, besides other fortified works. The town grew up around an old Roman camp, and in 739 was made the seat of a bishopric founded by St Boniface. The town came into the hands of Bavaria in 1803. It has important manufactures of leather, porcelain, paper, and parquet-floors, besides boats, metal-ware, and mirrors, and consider-

able trade in salt, timber, corn, graphite, and Passautes (made at Oberzell). Pop. 20,500.

Passenger Pigeon (*Ectopistes migratorius*), a kind of arboreal pigeon, once abundant in eastern North America, but now apparently extinct. It was the only species of the genus. The head was small, the bill short, the tail very long and wedge-shaped. The wings were long and pointed and the flight was very rapid. The male was about 16½ inches in length of body, or 25 inches including the tail. The colour was grayish blue above, reddish brown on the breast and sides, white on the rest of the ventral surface. The female was smaller and duller in colour. The birds were famous for their huge numbers, for their great flights in search of food, and for their crowded, noisy roosts. In 1878 a roost at Petosky in Michigan was described as extending for 28 miles in length by 3 or 4 in breadth. Somewhat peculiar were the sharp call-note and the single egg. As late as 1888 flocks of millions used to be seen, and the rapidity of the extermination (by shooting and netting and otherwise) is puzzling. In 1912 there was an old female alive in the custody of the Zoological Society of Cincinnati, but the species seems now to be extinct. See Rothschild's *Extinct Birds* (1907).

Passenger Pigeon
(*Ectopistes migratorius*).

Passe-pied, in music, a dance-form in triple time, resembling a quick minuet, said to have been derived from the dancing of Breton sailors through the streets. It was often introduced in suites.

Passeriformes, the huge order of perching birds, including all British songsters and many more. See BIRD.

Passifloraceæ, a family of dicotyledons mostly included in the genus *Passiflora* (see PASSIONFLOWER).

Passionflower (*Passiflora*), a genus of plants for the most part natives of the warm parts of America, and belonging to the family Passifloraceæ. The flowers are hermaphrodite, with a coloured calyx, generally of five segments; the corolla also of five segments or wanting; always having a more or less conspicuous crown of filaments springing from the throat of the tube formed by the base of the calyx and corolla. The stamens are five, inserted in the tube of the calyx, united in a tube to near the apex, where they divide, and are surmounted by the much-reflexed anthers. The ovary is one-celled, elevated on a stalk, surmounted by three thick styles with thick clove-like stigmas. The fruit is fleshy. This genus has received its name from fanciful persons among the first Spanish settlers in America imagining that they saw in its flower the emblems of Christ's passion; the filamentous processes being taken to represent the crown of thorns, the nail-shaped styles the nails of the cross, and the five anthers the marks of the wounds. The species are mostly half-shrubby evergreen or stove climbers, of rapid

growth; and most of them have lobed leaves, with from two to seven lobes. The flowers of many

Passionflower (*Passiflora caerulea*).

are large and beautiful, on which account they are often cultivated in hot-houses. Some of the species

are also cultivated in tropical countries for their fruit, particularly those whose fruit is known by the name Granadilla. The apple-fruited Granadilla or Sweet Calabash of the West Indies, *P. maliformis*, has a fruit about two inches in diameter, containing within a hard stringy shell an agreeable gelatinous pale yellow pulp. *P. quadrangularis* is the common Granadilla, a native of Jamaica and South America, but is cultivated in all parts of tropical South America, and occasionally in hot-houses in Britain for the sake of its fruit. The fruit is oblong in shape, often six inches in diameter transversely. The skin when ripe is greenish yellow in colour, thin, but tough and leathery, and contains a very succulent pulp of a purple colour which is sweet and slightly acid. It is generally eaten with wine and sugar. The root of the plant is poisonous, owing to the presence of an active principle called *passiflorine*, the properties of which are similar to morphine. The laurel-leaved Granadilla is *P. laurifolia*, the fruit of which is named *Water-lemon* by the English and *Pomme de Liane* by the French in the West India Islands. It grows to about the size of a hen's egg, becomes yellow, dotted over with white when ripe, and contains within the tough thin rind a whitish sweet watery pulp, delicately aromatic and slightly acid. It quenches thirst, allays heat, and induces appetite. *P. incarnata*, a species with herbaceous stems, a native of the warm parts of South America, produces an edible orange-coloured fruit about the size of an ordinary apple. The fruit of *P. edulis* is about two inches long and slightly less in diameter, assuming a livid purple colour when ripe, and contains an orange-coloured pulp with the flavour of a somewhat acid orange. The fruit of some species of passionflower, however, is not only uneatable, but fetid; and the roots, leaves, and flowers of some have medicinal properties, narcotic, emmenagogue, anthelmintic, febrifugal, &c. The hardest species, the Blue Passionflower (*P. caerulea*), grows well enough in some parts of France, and even in the south of England.

Passionists, a religious congregation of priests of the Roman Catholic Church, the object of whose institute, indicated by their name, is to preach 'Jesus Christ and him crucified.' The founder, St Paul of the Cross, was born in 1694 near Genoa, obtained the sanction of Benedict XIV. in 1741, and died at the mother-house of the society on the Cœlian Hill at Rome in 1775. The cross appears everywhere as their emblem, and a large crucifix forms part of their very striking costume. They practise many personal austerities, and their ministerial work consists chiefly in holding what are called 'missions' wherever they are invited by

the local clergy, in which sermons on the passion of Christ, on sin, and on repentance, together with the hearing of confessions, hold the principal places. For a time the congregation remained in obscurity; but in the first half of the 19th century it rose into notice. In 1842 it secured a footing in England, whose conversion had been the founder's special aim.

Passion Music. See ORATORIO, BACH.

Passion Play. See MYSTERIES.

Passion-Week, the name commonly given in England to the week immediately preceding Easter, and otherwise called Holy Week (q.v.). But, by the proper rubrical usage, Passion-Week is that which precedes Holy Week, commencing on Passion Sunday, the fifth Sunday of Lent. In the Roman Catholic Church, with this Sunday begins the more solemn part of Lent, and during the succeeding fortnight the *Gloria Patri* is omitted at the Introit, and all pictures, crucifixes, statues, and other sacred representations are veiled.

Passive Obedience. See DIVINE RIGHT, BODIN, FILMER.

Passover, a well-known feast of the Jews. The English word *passover* is a translation of the Hebrew *pesach*, which in Aramaic with the post-positive article becomes *pascha*; whence the Greek, Latin, and various Romance forms of the word. The original meaning of the verb may perhaps be traced in 1 Kings, xviii. 26, where it is rendered 'leap' or (revised version margin) 'limp,' and suggests a religious dance. The Passover is one of the oldest recurrent sacrifices of the Hebrews; an account of its origin is given in Exod. xii.; famous celebrations of it are described in 2 Chron. xxx., xxxv., and Ezra vi.; and the laws and regulations relating to it will be found in Exod. xii. 1-51, xiii. 3-10, xxiii. 14-19, xxxiv. 18-26, Lev. xxiii. 4-14, Numb. ix. 1-14, xxviii. 16-25, Deut. xvi. 1-8. These laws were formerly held to be all practically contemporary pieces of legislation; but they are now known to be of very various dates and to relate to widely-different religious and social conditions (see PENTATEUCH). In all of them the Passover is intimately associated with the Feast of Unleavened Bread; but the latter is essentially an agricultural festival, and the earliest origin of the Passover must doubtless be sought in the times when the Israelites were still a purely nomadic and pastoral people, and gave religious expression to their thankfulness for the annual increase of their flocks and herds by sacrifices 'of the firstlings of the flock and the fatlings thereof' (Gen. iv. 4). The recollection of such an annual festival, which would naturally be held in spring, survives in the Jehovistic narrative of the events preceding the exodus, which largely turned on the refusal of Pharaoh to allow the people to go out into the wilderness to sacrifice. It was, we infer, a nocturnal lunar feast, held at the spring full moon, and this character it retained throughout; it consisted of the firstlings of the flock and of the herd, and even as late as the close of the 7th century B.C. the victim was not necessarily a lamb (Deut. xvi. 2; cf. 2 Chron. xxxv. 7: 'lamb, kids, bullocks'). With the settlement of the Israelites as an agricultural people in Canaan, the agricultural festivals, marking the various stages of harvest and ingathering, naturally gained in prominence, and the pastoral Passover came to be more and more closely associated with a harvest feast which also fell in spring—that of unleavened bread—when after the presentation of the first sheaf before Jehovah the people entered at once upon the enjoyment of the new corn, without waiting for the tedious process of leavening their dough. The usages of the various local and domestic sanctuaries in the land were made uniform (Deut. xvi. 1-16)

by the promulgation of the law of one exclusive place of worship. Of subsequent modifications made on the Deuteronomic code by the Priestly legislation the most interesting perhaps are the stricter definition of the kind of victim, the substitution of roasting for 'boiling' (see Deut. xvi. 7, Revised Version margin), and the interpolation of an additional day into the accompanying feast (Deut. xvi. including the Passover in the seven days of unleavened bread, while Numbers xxviii. counts the seven days from the 15th, not the 14th, of the month).

The celebration of the Passover in later times had public and official aspects which were invested occasionally at least with great pomp and ceremony, as may be gathered from the descriptions already referred to in Chronicles and Ezra; but, just like great ecclesiastical functions in our own day, it also had its private and domestic side. From Talmudic sources we gather a good deal that is of interest as to Passover customs in connection with the life of Jesus and the last supper. The company for a single lamb varied from ten to twenty; first the cup of consecration, over which the master of the house had pronounced a blessing, was drunk; then hands were washed and the meal served, consisting of bitter herbs, cakes of unleavened bread, a sauce called *haroseth*, made from dates, raisins, and vinegar, the paschal lamb, and the flesh of subsidiary (Deuteronomic) sacrifices. The master of the house dipped a morsel of unleavened bread into the *haroseth*, and ate it, and a similar 'sop' was given to every one present. Afterwards the paschal lamb was eaten, and three other cups of wine were drunk at intervals with thanksgivings and singing of the Hallel (Psalms cxiii.-cxviii.). To the Jews of the Dispersion the Passover, together with the Feast of Unleavened Bread, has always had great importance, though the lamb, not being slain at the Temple, is not regarded as strictly the paschal lamb of the law.

That the paschal lamb typified Christ is taught by Paul (1 Cor. v. 7), and also by the author of the fourth gospel (John, xix. 36), who, as is well known, represents the crucifixion as having taken place at the time of the Passover, and attaches importance to the fact.

For the history of the Passover in its bearings on Old Testament criticism, see Wellhausen's *Prolegomena to the History of Israel* (1885), Dr W. H. Green's *Hebrew Feasts* (New York, 1885), and the commentaries on the principal passages mentioned above. See also G. B. Gray's *Sacrifice* (1925), chaps. xxiii. sqq.

Passow, FRANZ, scholar, born at Ludwigslust in Mecklenburg, 20th September 1786, was educated at Gotha and Leipzig, and in 1815 became professor of Archaeology at Breslau, in 1829 director also of the museum of art there. He died 11th March 1833. His *Handwörterbuch der griechischen Sprache* (1819-25; 5th ed. 1841-57) is the work that preserves his memory, and formed the basis of Liddell and Scott's *Greek Lexicon*. See his *Life* by Wachler (Bresl. 1839).

Passport, a warrant of protection and permission to travel, granted by the proper authority, to persons moving from place to place. Passports proceed from the authorities of the state to which the traveller belongs, and ought to bear the *visa* or countersignature of the minister or consul of the country which he is about to visit. The system of issuing passports had been dropped in most European countries before the Great War, but since then it has been revived. Within the United Kingdom no passports are required; but for a British subject travelling in some parts of the Continent they are still requisite. The passport most used by British subjects is that of the British Secretary of State for Foreign Affairs, which

is now granted to any British subject for a fee of seven shillings and sixpence, and is good for five years. If the applicant be not personally known to the Secretary of State, he must either be recommended to him by some person who is known to him, or produce an application in his favour by some banking firm established in London or elsewhere in the United Kingdom, or a certificate of identity signed by a mayor, magistrate, justice of the peace, minister of religion, physician, surgeon, solicitor, or notary resident in the United Kingdom. In certain cases the production of a certificate of birth may be required. If the applicant be a naturalised British subject his certificate of naturalisation must be forwarded to the Foreign Office.

In time of war passports or safe-conducts may be granted in special cases by neutral powers, to protect persons and property from belligerents, and by a belligerent to protect from interference by its own ships or forces.

Passy, a western suburb of Paris (q.v.).

Pasta, GIUDITTA (JUDITH), opera singer, was born of Jewish parents, Negri by name, at Comon near Milan, 9th April 1798, and received her musical education at Como and in the conservatoire at Milan. She married a singer called Pasta before 1816, and was at first a failure on the stage. Her first great triumph was achieved at Verona in 1822, seven years after she began to sing. The year following she was engaged at the Paris Italian Opera, where her singing excited great admiration. From 1825 to 1833 was the period of her most splendid triumphs, which were won principally in London and Paris. She withdrew from the stage in the following year, and resided on the banks of Lake Como till she died on 1st April 1865. She had a magnificent voice, which passed easily from the highest soprano notes to the gravest contralto tones. In addition she possessed fine dramatic power. Her principal rôles were Medea, Desdemona, Semiramide, La Sonnambula (the opera of this name was written for her by Bellini), Nina, Camilla, and Giulia in *Romeo e Giulia*.

Pasteboard. See CARDBOARD, MILLBOARD, STRAWBOARD.

Pastel, chalk mixed with other materials and various colours, and formed into Pencils or Crayons (q.v.). Drawings with such dry, coloured crayons may be made on paper or parchment, and have been especially used in portraiture—Pastel is also a name for Woad (q.v.).

Pastes. See GEM.

Pasteur, LOUIS, distinguished for his researches in chemistry and pathology, and more precisely for many discoveries in regard to bacteria, was born on 27th December 1822, at Dôle in the department of Jura. From the college of Arbois he passed to Besançon, and thence to the École Normale and the Sorbonne in Paris. After the completion of his preparatory studies he held various academic positions at Strasburg, Lille, and Paris, where in 1867 he became professor of Chemistry at the Sorbonne. From 1886 onwards the centre of his work was at the Pasteur Institute in Paris. His work was at first chemical. Following up well-known researches by Arago, Biot, and Mitscherlich, Pasteur discovered the facets on tartrate crystals and what are called left-handed tartrates. He also propounded the theory that 'molecular dissymmetry'—supposed to be expressed in the power which solutions of some organic substances have of causing a beam of polarised light to rotate—was characteristic of living matter and its products.

It is said that a German manufacturer of chemicals noticed that impure tartrate of lime fermented

when dissolved and exposed in the sun, and that this prompted Pasteur to an investigation, the result of which was the discovery of a living ferment—a micro-organism comparable in its powers to the yeast-plant which Cagniard-Latour and Schwann had discovered in alcoholic fermentation. Pasteur was further able to show that the little organism would, in a solution of paratartrate of ammonia, select for food the 'right-handed' tartrates alone, leaving the 'left-handed,' although the difference between these is merely physical not chemical. Having got hold of a clue, Pasteur went on to show that other fermentations—lactic, butyric, acetic—are essentially due to organisms. He was naturally led to corroborate and extend Schwann's researches on putrefaction, which is also due to micro-organisms, and this path of investigation enabled him to make important practical suggestions in regard to the making of vinegar and the prevention of wine disease, as also to correct insufficiently careful experiments which were leading many to believe that spontaneous generation was demonstrable.

Prompted by his illustrious master Dumas, Pasteur next (1865) directed his inquiries to those diseases of silkworms by which the silk industry in France had been almost ruined. It is said that he had never before even seen a silkworm, though he knew the supposed disease-germs which had been demonstrated by previous investigations in the insect's blood. These he traced from egg to larva, from chrysalis to moth; and, as the pébrine disease is distinctly manifest in the adults, though it may be hidden in the young, the practical conclusion was plain that unhealthy moths should be rejected, and that all precautions should be taken to prevent infection. But Pasteur's work on the diseases of silkworms overstrained him, and in 1868 he was laid aside by paralysis. Soon, however, he was at work again, investigating beer as he had investigated wine, detecting the intruders which sometimes interfere with the life of the yeast-plant and spoil the brew. His researches began to come yet closer to human life, for he attacked the problem of splenic fever, the bacillus of which had been discovered by Davaine (1863), and skilfully traced from stage to stage by Koch (1876). Of Pasteur's investigations in this connection, that by which he showed that birds were not liable to fall victims to splenic fever, because the temperature of their blood is too high for the prosperity of the germ, may serve as a characteristic illustration. Passing from splenic fever to fowl cholera, Pasteur showed that it was possible to attenuate the virulence of injurious micro-organisms by exposure to air, by variety of culture, or by transmission through various animals. He thus 'tamed' the bacillus of splenic fever, and demonstrated by a memorable experiment that sheep and cows 'vaccinated' with the attenuated bacilli were protected from the evil results of a subsequent inoculation with the virulent virus. Pasteur's subsequent researches in regard to hydrophobia (q.v.) are discussed in that article, originally contributed to this work by himself. He wrote books on most of the special researches and discoveries by which he enriched science and benefited humanity. He died 28th September 1895, and was transferred from a temporary resting-place to a tomb in the Pasteur Institute on 26th December 1896.

See Lives of Pasteur (who was a devout Catholic) by his son-in-law (trans. 1885), Bournand (1896), Vallery-Radot (trans. 1919), and Duclaux (trans. 1920); and an English Life by Percy and Grace Frankland (1898). For his scientific career, see L. Descour, *Pasteur and his Work* (trans. 1922).

Pastille, usually an aromatic paste or mixture, such as *fumigating pastilles*, which are burned

either as incense or as a means of diffusing an agreeable odour. They are composed of charcoal powder, with such aromatic gums as benzoin, ladanum, &c., and powders of sweet-scented woods and barks, as sandalwood, cinnamon, and especially cascarilla barks. Essential oils are also added, and the whole are worked into a paste with a little gum-mucilage, and formed into small sharp-pointed cones about an inch and a half high, and half an inch broad at the base. When perfectly dry they are used by lighting at the point, and as they burn down an agreeable odour is given out with the smoke. Another kind of pastille, usually in the form of a small pill covered with gold or silver leaf, is used for perfuming the breath; it is made of similar ingredients, excepting the charcoal.

Pastinaca. See PARSNIP.

Pasto, a town in the south-west of Colombia, in a fertile valley 8350 feet above sea-level. Above it rises the volcano of Pasto (14,000 feet above the sea); and in 1827 the town was destroyed by an earthquake. Pop. 30,000.

Paston Letters, a collection of over a thousand letters and papers, mostly written by or to particular members of the Norfolk family of Paston, and covering almost the whole 15th century (1422-1509). They are of especial value as giving a glimpse into the life of England during the Wars of the Roses. The family took its name from the village of Paston, near the sea, about 20 miles N. of Norwich, and gradually grew upwards out of the condition of the smaller gentry of Norfolk. Its most famous members were William Paston, Justice of Common Pleas under Henry VI.; his son John, executor to the famous Sir John Fastolf; Clement Paston, a brave sailor under Henry VIII.; Sir Robert Paston, created under Charles II. first Viscount, then Earl, of Yarmouth. His son William married Lady Charlotte Boyle, an illegitimate daughter of Charles II., but with him the main line and the title became extinct. It was due to the extravagance of the last that the letters were sold to Peter Le Neve, from whom they passed into the hands of 'honest' Tom Martin of Palgrave, and eventually of Sir John Fenn, who edited a selection in two quartos in 1787. The editor presented the originals of these to the king, and was knighted, but the originals strangely disappeared till discovered in 1889 at Orwell Park in Suffolk. Volumes iii. and iv. followed in 1789; vol. v. posthumously, edited by Mr Serjeant Frere, in 1823. The originals of vol. v. were discovered at Mr Serjeant Frere's house at Dungate, Cambridgeshire, in 1865; those of iii. and iv. were long missing, but the whole 220 were discovered in 1875 at the family mansion of the Freres at Roydon Hall near Diss, together with 95 unpublished letters of the same period, included in Mr Gairdner's third edition. 311 of these letters (the others missing) were offered for sale in 1888 and bought for 500 guineas; since 1896 they have been in the British Museum.

There are admirable editions of the Paston Letters by James Gairdner (3 vols. 1872-75; new ed. 1901; complete library edition, 6 vols. 1904). These contain twice as many letters as Fenn's, and the letters were for the first time arranged in chronological order. Mr Gairdner's answer (*Fort. Review*, No. 11) to Herman Merivale's attack on the authenticity of the Paston Letters (*Fort. Review*, No. 8) was completely satisfactory.

Pastor (*Pastor roseus*), a beautiful bird in the starling family, often called the rose-coloured starling. The back, shoulders, breast, and belly are rose-pink, the rest glossy-black with a violet or greenish sheen. With headquarters in Asia, it is a common migrant in Europe and a straggler in

Britain. It devours insects, e.g. locusts, and

Pastor (*Pastor roseus*).

sometimes grain. The name may refer to its habit of following sheep.

Pastoral is an artificial form of literature, in verse or prose, narrative or drama, in which a pastoral background is given to the treatment of a subject, a rustic scene being chosen and the characters appearing as shepherds and shepherdesses. In the 16th and early 17th century pastoral attained a great height of popularity. The pastoral poems of our modern literatures are essentially a humanistic revival of the Greek *idyl* of Theocritus, Bion, and Moschus, and the Latin *eclogue* of Virgil, and first made their appearance in Tuscany in the 16th century. The earliest dramatic pastoral is the *Favola di Orfeo* of Politian, performed at the court of Mantua in 1472, but the first complete pastoral was Agostino Beccari's comedy, *Il Sacrificio*, played at Ferrara in 1554. Its finest and most famous successors were the *Aminta* of Tasso, represented at the court of Ferrara in 1573, and Guarini's *Pastor Fido*. The earliest non-dramatic pastoral was G. Sannazaro's *Arcadia* (1504), which through Sidney's famous romance with the same title exercised a great influence upon English literature. In Spain the pastoral flourished during the 16th century, some of the most notable names being Gil Vicente, Jorge de Montemayor (*Diana*, 1524), and Cervantes (*Galatea*, a pastoral romance, 1584). In France we already find Remy Belleau's miscellany, *La Bergerie* (1565), and the writing of pastorals was practised long after even by the great Richelieu. After Honoré d'Urfé's *Astrée* (1610), came a long succession of lengthy pastoral romances by Mdlle. de Scudéry, La Calprenède, and Gomberville. Henryson's *Robin and Makyns* has been reckoned the first pastoral in English (i.e. Scots). In any case England had already had Alexander Barclay's translations of Baptist Mantuan, and Barnabe Googe's *Eglogs*, *Epytaphes*, and *Sonnettes* (1563), before the twelve charming eclogues composing Spenser's *Shepherd's Calendar* (1579) formed once for all a faultless model for posterity. The poem is appropriately dedicated to Sir Philip Sidney, whose pastoral romance of *Arcadia* outstrips in point of literary beauty all other fictions of that class. Its successors were Robert Greene's *Morando* (1584) and *Menaphon* (1589), Lyly's *Gallathea* (1584), Peele's *Arraignment of Paris* (1584), and, most famous of all, Lodge's *Rosalynde* (1590). Spenser's poetical idealisation of pastoral life, again, gave rich inspiration to Drayton, Daniel, Barnfield, Marlowe, Nicholas Breton, Wither, William Browne, Herrick, Ben Jonson (*Sad Shepherd*), and Fletcher (*Faithful Shepherdess*, 1610, the finest of all pastoral plays). Shakespeare employed the pastoral form in *As You*

Like It, and Milton in *Lycidas* and in *Comus*. An 18th-century revival gave us the highly conventional pastorals of Ambrose Philips and of Pope; Gay's *Shepherd's Week* was much better than either. Allan Ramsay also achieved a success in his *Gentle Shepherd*, which is almost as good as Gay, though far behind Spenser. In later times Shelley (*Adonais*), and Arnold (*Thyrsis*) produced elegies in the pastoral tradition, and in the work of Cowper, Burns, Tennyson, and others the influence of the pastoral is to be seen. See E. K. Chambers, *English Pastorals* (1895); W. W. Greg, *Pastoral Poetry and the Pastoral Drama* (1906).

Pastoral Epistles. See TIMOTHY, TITUS.

Pastorales. See BASQUES.

Pastoral Letter, a letter addressed, either at certain stated times or on the occurrence of some notable occasion, by a 'pastor,' but especially by a bishop, to the clergy under his jurisdiction, to the laity of his flock, or to both.

Pastoral Staff, or Crosier (q.v.), one of the insignia of a bishop, sometimes also borne by an abbot. It is a tall staff of metal, or of wood ornamented with metal, having, at least in the Western Church, the head curved in the form of a shepherd's crook, as a symbol of the pastoral office. From an early time the pastoral staff was connected with the actual possession of the jurisdiction which it symbolises. The giving of it was one of the ceremonies of investiture; its withdrawal was part of the form of deprivation; its voluntary abandonment accompanied the act of resignation; its being broken was the most solemn form of degradation. We annex as a specimen of the highest art the pastoral staff of William of Wykeham, now preserved in his foundation, New College, Oxford. A very early form of the pastoral staff is represented at FILLAN (St).

Pastoral Staff.

Pastoral Theology, that branch of theological science which regards the duties and obligations of pastors in relation to the care of souls.

Pasture. A pasture may be defined as a crop of mixed grasses and clovers, or other leguminous plants, intended for purposes of grazing. Such a crop often occupies the land for many years, and is then called permanent pasture. The chief benefit accruing to the farmer is that the mixed plants occupy the land more completely than the same constituents grown in separate plots. The various species of the mixture overlap and foster one another; thus produce is increased, and quality of herbage improved. From this point of view, a pasture is an agricultural device for increasing the amount of land at disposal, since from a single acre of mixed crop as much produce may be obtained as from, say, 1½ acre laid down under pure sowings.

The chief plants used in Britain for forming pasture may be classified thus:

(A) *Top Grasses*.—Cock's-foot (*Dactylis glomerata*), Meadow Fescue (*Festuca pratensis*), Meadow Fox-tail (*Alopecurus pratensis*), Timothy (*Phleum pratense*), Italian Ryegrass (*Lolium italicum*).

(B) *Bottom Grasses*.—Crested Dog's-tail (*Cynosurus cristatus*), Fiorin (*Agrostis stolonifera*),

Hard Fescue (*Festuca duriuscula*), Rough-stalked Meadow Grass (*Poa trivialis*), Smooth-stalked Meadow Grass (*Poa pratensis*), Wood Meadow Grass (*Poa nemoralis*), Sweet Vernal (*Anthoxanthum odoratum*), Yellow Oat-grass (*Trisetum flavescens*), Perennial Ryegrass (*Lolium perenne*).

(C) Clovers and Leguminous Plants.—Alsike Clover (*Trifolium hybridum*), Red Clover (*Trifolium pratense*), White Clover (*Trifolium repens*), Trefoil (*Medicago Lupulina*), Bird's-foot Trefoil (*Lotus corniculatus*).

This list includes several species which are not permanent, but of short duration, as Timothy, Italian and perennial ryegrass, red and Alsike clover, and trefoil. Timothy lasts from four to six years, and at times even longer. Perennial ryegrass has a very misleading name, inasmuch as it may die out in three or four years; in other cases, where seeding is prevented, the ryegrass may become, to all intents and purposes, a perennial plant. The reasons for including short-lived constituents in permanent pasture are obvious. They not only give increased produce during the first years of the lea, when the permanent species are slow in coming forward, but hold possession of land which would otherwise be bare, and thus keep out worthless plants. Place is made for the expanding perennials by the short-lived species which gradually die out. This must be carefully borne in mind when fixing the proportion of short-lived plants in a mixture.

The following are the leading principles according to which the various constituents of a mixture are proportioned: (1) To obtain maximum produce, the land must be filled with roots as thoroughly and completely as possible. This is accomplished by incorporating deep-rooted and shallow-rooted plants in due proportions. If, for example, a soil is 3 feet deep, and the roots occupy merely 1 foot of this depth, two-thirds of the land is, evidently, lying idle and unutilised, not for one year, as when under an ordinary crop, but for a long series of years in the case of a permanent pasture.

(2) The nutritive value of the mixed herbage depends upon the relative proportion of grass and clover: the albuminoid ratio increases with the amount of clover. For a permanent pasture good proportions are clovers, 25 to 30 per cent. of total area; grasses, 70 to 80 per cent.

(3) As many species as possible should be represented in the mixture. If one is injuriously affected by drought, another, which revels in drought, is ready to take its place; if one is late, another is early; if one is not relished by the browsing animal, another is, and so on.

(4) Those species which are best and most suitable for the soil should be most largely represented.

(5) Certain species liable to overrun the pasture, or to destroy other good plants, ought to be represented in extremely small proportions. This applies more particularly to ryegrasses (especially Italian), crested dog's-tail, and smooth-stalked meadow grass.

(6) The short-lived components should not cover more than one-third of the whole land.

According to these principles, a mixture suitable for a wet clay might be proportioned as follows:

Area of the land to be covered by clovers, 20 per cent:

Red clover.....5 per cent.	White clover.....5 per cent.
Alsike clover.....5 "	Bird's-foot trefoil...5 "

Area to be covered by short-lived grasses, 20 per cent:

Timothy.....15 per cent.	Perennial ryegrass....5 per cent.
--------------------------	-----------------------------------

Area to be covered by permanent grasses, 60 per cent:

Cock's-foot.....20 per cent.	Rough-stalked meadow
Meadow fescue.....15 "	grass.....10 per cent.
Meadow fox-tail....10 "	Smooth-stalked do. 5 "

The percentage area of land to be occupied by

each component being determined and known, the percentage numbers have to be translated into pounds of seed per acre. To get the number of pounds corresponding to these areas the covering power of each kind of seed used must be known. We assume, as a basis for calculation, that the seed is perfect in quality—i.e. the percentage of purity is 100, and the percentage of germination also 100. According to Stibler, one acre of land is covered by the following amounts of perfectly pure and germinating seeds:

	Lbs. of Seed per acre.		Lbs. of Seed per acre.
Cock's-foot.....	28	Hard fescue.....	19
Meadow fescue.....	56	Sweet vernal.....	12
Meadow fox-tail.....	10	Yellow oat-grass.....	7
Timothy.....	21	Perennial ryegrass.....	58
Italian ryegrass.....	49	Alsike clover.....	14
Crested dog's-tail.....	20	Red ".....	24
Florin.....	11	White ".....	12
Rough-stalked meadow grass.....	13	Trefoil.....	23
Smooth-stalked ".....	13	Bird's-foot trefoil.....	7

In using these numbers as a basis for calculating mixtures, allowance must be made for seeds which cannot germinate on account of imperfect tillage, and also for the overlapping of the plants when grown in mixture. An allowance of 50 per cent. is found, in ordinary cases, to meet these requirements. The amount of seed per acre actually used in mixtures is, accordingly, the amount calculated for an acre and a half.

The mixture already given for a wet clay soil when translated into pounds of perfect seed per acre (making an allowance of 50 per cent.) is:

Red clover.....	1·8	Cock's-foot.....	8·4
Alsike clover.....	1·0	Meadow fescue.....	12·6
White ".....	9	Meadow fox-tail.....	1·5
Bird's-foot trefoil.....	5	Rough-stalked meadow	
Timothy.....	4·6	grass.....	1·9
Perennial ryegrass.....	4·3	Smooth-stalked ditto.....	9

By simple proportion pounds of perfect seed can be immediately converted into pounds of commercial seed of any given quality.

Patagonia, the southern region of the South American continent, extending from about S. lat. 39° southwards; area about 400,000 sq. m., including the islands to west and south. Like the rest of the continent, Patagonia is divided by the Andes into two very unequal and dissimilar territories. Since 1881 nearly the whole country east of the watershed has been formally recognised as part of the Argentine Republic; while Chile, which previously claimed a considerable share of that area, has contented herself with the country to the west and a strip along the southern coast.

Western or Chilean Patagonia is rugged and mountainous. Along the coast are numerous islands with precipitous shores, the principal between Chiloé and Tierra del Fuego being the Chonos Archipelago (q.v.), Wellington Island, the Archipelago of Madre de Dios, Queen Adelaide's Archipelago, and Desolation Island. These islands, together with several peninsulas, notably Taytao, form a coast almost as rugged as that of Norway; but in none of them do the mountains rise to the snow-line. Even in the Cordilleras proper the summits are less lofty towards the south; but the following are worthy of note—the volcanoes of Minchinmavida and Corcovado (respectively 8000 and 7510 feet high), Monte San Valentín (12,697), Chalten or Fitzroy volcano (7120), Mount Agassiz (10,597), and Mount Stokes. From the Andes to the Pacific the strip of shore is so narrow that the longest river of this district has its origin only about 13 miles from the coast. In the island of Chiloé (q.v.), to the north of Western Patagonia, the mean temperature of winter is about 40°F., that of summer rather above 50°; while at Port Famine, 800 miles nearer antarctic latitudes, the mean temperature is in winter about 33°, and

in summer about 50°. This unusually small difference in the mean temperature of the extremes of Western Patagonia is due to the great dampness of the atmosphere all along the coast. The prevailing winds blow from the west; heavily charged with moisture from the Pacific Ocean, they strike against the Andes and cause almost perpetual precipitation from Chiloé to the Strait of Magellan. South of 47° S. lat. hardly a day passes without rain, snow, or sleet. This continual dampness has produced forests of almost tropical luxuriance, which yield valuable timber. Coal is mined in the neighbourhood of Punta Arenas (Sandy Point).

Eastern or Argentine Patagonia consists mainly of high undulating plains or plateaus rising in successive terraces, and frequently intersected by valleys and ravines. These plateaus are occasionally covered with coarse grass, but more frequently with a sparse vegetation of stunted bushes and herbs; elsewhere the surface is strewn with huge boulders, and again rugged with heaps or ridges of bare, sharp-edged rocks. Keen and often piercing blasts sweep chiefly from the west; and as this wind has already parted with its moisture on the other side of the mountains, hardly any rain falls in Argentine Patagonia during seven or eight months of the year. The soil in many places is strongly impregnated with saltpetre, and salt-lakes and lagoons are numerous. North of the Río Chico, and towards the seacoast, there is a wild, weird, desolate region called by the Indians 'The Devil's Country.' Several wastes of this kind fringe the Atlantic, and formerly induced the belief that Patagonia was a barren and waterless desert; but the interior, though not fertile, really abounds in lagoons, springs, and streams, and the banks of the rivers are capable of cultivation. Along the eastern base of the Andes, also, there is a great tract of territory which is astonishingly picturesque and fertile, with great forests to which the Indians retire for shelter from the freezing winds of winter. Eastern Patagonia has probably been raised above the sea-level in the Tertiary period, and its most characteristic geological feature is its boundless expanses of shingle. The flora is in consequence exceptionally poor, and appears to be mainly derived from the lower slopes of the Andes. Herds of horses and, in the more favoured regions, cattle are bred; pumas and foxes, armadillos, skunks, and tucotucos (a peculiar rodent) are met with; and among the birds are condors, hawks, partridges, and flamingoes, ducks, and other water-fowl. But by far the most important animals are the guanaco or Huanaco (q.v.), sometimes in herds of two hundred or more, and two species of Rhea (q.v.).

Inhabitants.—The population of Western Patagonia, with Tierra del Fuego and other islands, numbers 106,000, including some small indigenous nomadic tribes of Araucanian stock who live by fishing and hunting, and the settlers at Punta Arenas or Magellan's Colony and elsewhere, mainly immigrants from other parts of Chile. In Eastern Patagonia the Argentine herdsmen are beginning to pasture their cattle in the northern valleys, and Chilean immigrants are moving eastwards. The Patagonians proper or Tehuelche Indians, who are confined to Eastern Patagonia, are perhaps about 100 strong. Of their two divisions, which speak the same language, but are distinguishable by difference of accent, the northern range chiefly over the district between the Cordilleras and the Atlantic, from the Río Negro to the Chubut, and even the Santa Cruz River. The southern, who appear to be on an average taller and finer, and are more expert hunters, occupy the rest of Patagonia as far south as the Strait of Magellan. The two divisions are much intermixed. Magellan

described the Patagonians as 'so tall that the tallest of us came up only to their waists;' and, though such extravagant statements have led others to deny the claim of the Patagonians to be considered exceptional, there is no doubt that they are one of the tallest races on the globe. The average height of the male members of Musters's party was rather over 5 feet 10 inches; two others, measured at Santa Cruz, stood 6 feet 4 inches each; Pikechoche, who was in Berlin in 1879, was 5 feet 9 inches high, and stretched 5 feet 11 inches with his arms. The muscular development of the arms and chest is extraordinary, and in general the body is well proportioned. The Patagonians are splendid swimmers, can walk great distances and for two and even three days on end without being tired. Their cranial characteristics are somewhat disguised by the fact that the hinder part of the skull is artificially flattened, the custom being to strap the child's head back to a board to prevent it 'wagging' when carried about the country on horseback. This process, however, appears only to exaggerate a natural tendency; and it is asserted by the most scientific investigators that the Patagonian skull is, next to that of the Lapps, the shortest in the world. The jaws are powerful, though with no trace of prognathism. The expression of their face is ordinarily good-humoured though serious; their eyes are dark brown, bright and intelligent, their noses aquiline and well-formed, their foreheads open and prominent. The complexion of the men, when cleansed from paint, is a reddish or rather yellowish brown. Thick flowing masses of long coarse, black, glossy hair cover their heads. The scanty natural growth of beard, moustaches, and even eyebrows, is carefully eradicated. The young women are frequently good-looking, displaying healthy, ruddy cheeks when not disguised with paint. The dress of the men consists of an under-garment round the loins, a long mantle of hide with the fur inside, and boots or buskins of skin. The dress of the women is very similar. Both sexes are fond of ornaments. Besides mantles of guanaco hide, their only manufactures are saddles, bridles, stirrups, and lassos, which often evince wonderful ingenuity and nicety of execution.

History.—Magellan, before passing through the strait, had in 1520 sailed along the whole of the Patagonian coast; and it is commonly believed that it was from the large footsteps (*patagones*) observed near his winter-quarters at S. Julián that the country derived its name. Another suggested etymology is the Quichua word *patacuna*, 'terraces,' the rule of the Incas having extended hither. The great plain was traversed by Rodrigo de Isla in 1535. Sarmiento de Gambo (commemorated by the mountain in Tierra del Fuego) added greatly to the knowledge of the west and south (1579–80), and founded Spanish settlements, doomed to early extinction, at Nombre de Dios and San Felipe (Port Famine). English interest in the country, aroused by Drake's voyage in 1577, was kept up by Davis, Narborough, Byron, Wallis, and the Jesuit Falkner, and at last the beginning of a real scientific acquaintance with the interior was made by King, Fitzroy, Darwin, and Musters. Since 1870 careful explorations have been carried out by Argentine travellers. For Welsh settlements, see CHUBUT.

English works on Patagonia are by Falkner (1774), Snow (1857), Musters (1871), Beerbohm (1878), Lady F. Dixie (1880), Coan (1880), Prichard (1902), and Skottsberg (1911); and see Fossarieu (French, 1884), Burnmeister (Spanish, 1891), and Fouck (Spanish, 1896).

Patan, a walled town of India, in Baroda, 64 miles NW. from Ahmadabad, stands on a tributary of the Banas, and manufactures swords, spears,

pottery, and silk and cotton goods; the capital of native dynasties from the 8th century to the present day, it has many ruins; population, 27,000. —Patan is also a town of Nepal, 1½ mile SE. of Khatmandu (q.v.); pop. about 30,000.

Patanjali is the name of two celebrated authors of ancient India, the one the author of the system of philosophy called Yoga (see SANSKRIT LITERATURE), the other the critic of Pāṇini (q.v.), circa 140 B.C. They are identified by late Indian tradition, but they differ in their philosophical views, and the philosopher may have lived as late as c. 300 A.D.

Patches. During the whole of the 17th and beginning of the 18th century these fantastic ornaments were commonly worn by women and sometimes by men. In *Jack Drum's Entertainment, or the Comedie of Pasquil and Katherine* (1601; 2d ed. 1616), they are thus mentioned: 'For even as blacke patches are worne, some for pride, some to stay the Rheume, and some to hide the scab,' &c.; and in the *Artificial Changeling* (1650) there is a woodcut showing the lady of fashion, with a coach, coachman, two horses, and postillions gummied on to her forehead, and the rest of her face ornamented with a star, two crescents, and a large round spot. In the same year (1650) a Bill against 'painting, black patches, and immodest dresses' was read for the first time, but got no further. In vain were sermons preached; in vain did *Morbus Satanicus, or The Sin of Pride*, in 1666 reach the 15th edition; in vain did satirists assail the *Metamorphosis of Fair Faces into Foul Visages* (temp. James I.); the senseless custom was still rife when (1712) Pope described among the treasures of Belinda's toilet-table 'Puffs, Powders, Patches, Bibles, Billet-doux' (*Rape of the Lock*, i. 138). Attempts have been made to revive the fashion, but without success. See Fairholt's *History of Dress and Costume in England* (2d ed. 1860).

Patchouli, a perfume derived from the dried branches of *Pogostemon Heyneanus* (family Labiatae), first introduced into Britain as an article of merchandise in 1844. The name is from the Tamil *patchei*, 'gum,' and *elei*, 'leaf.' The plant, a low shrub 2½ or 3 feet high, is a native of Silhet, the Malay coast, Ceylon, Java, the neighbourhood of Bombay, and probably also of China; but, owing to the fondness of Asiatics for the perfume which it yields, it is difficult to say where it is native or cultivated. Every part of the plant is odoriferous, but the younger portions of the branches with the leaves are chosen; they are usually about a foot long. The odour is peculiar and difficult to define, but it has a slight resemblance to sandalwood; it is very powerful, and to many persons is extremely disagreeable. The odour of patchouli was known in Europe before the material itself was introduced, in consequence of its use in Kashmir to scent the shawls with a view of keeping out moths, which are averse to it; hence the genuine Kashmir shawls were known by their scent, until the French found the secret, and imported the herb for use in the same way. In India it is used as an ingredient in fancy tobaccos and as a perfume for the hair. It is also much prized for keeping insects from linen and woollen articles. The essence of patchouli is a peculiar heavy brown oil, with a disagreeably powerful odour; it is obtained by distillation, and requires extreme dilution for perfumery purposes. A cwt. of the plant yields about 28 oz. of the oil. The Arabs believe it to be efficacious in preventing contagion and prolonging life.

Patella. See KNEE, and LIMPET.

Paten (Lat. *patina*, 'a dish'), a small circular plate employed for the wafers or bread in the

eucharistic service. It is always of the same material as the chalice, often richly chased or carved, and studded with precious stones.

Patent Medicines, in popular language, include not only patent medicines strictly so called, but also all proprietary medicines and all medicines liable to stamp-duty. A preparation to be liable to stamp-duty must be one which is to be 'used or applied externally or internally as a medicine or medicament for the prevention, cure, or relief of a disorder or complaint incident to or in any wise affecting the human body.' Then it must also be brought under one of the following six causes, which constitute liability to duty: (1) the seller must have or claim to have a secret art or for making or preparing; or (2) an exclusive right or title to making or preparing; or (3) it must have been patented; or (4) it must be, or have been, recommended to the public as a nostrum (Lat. 'our') or proprietary medicine, or (5) as a specific, or (6) as beneficial for the prevention, cure, or relief of any disease. Any one of these entails liability to stamp-duty independently of the others. All other medicines are exempt from stamp-duty; that is to say, drugs the 'denominations, properties, qualities, virtues, and efficacies' of which are known and admitted in medicine, and in the making or preparing of which no secret art or exclusive right is claimed by any person.

Patents. In the widest sense of the term, a patent is a royal grant made by letters-patent (*litteræ patentes*) or open letters, 'so called because they are not sealed up, but exposed to open view, with the Great Seal' (or a lawful substitute for the Great Seal) 'pendant at the bottom; and are usually addressed by the sovereign to all the subjects of the realm' (Blackstone). The principal grants made by letters-patent are titles of honour, such as peerages and baronetcies, appointments to judicial and administrative offices, charters of incorporation, and monopolies of the right to make, use, exercise, and vend new inventions. Of these grants it is here proposed to consider the last mentioned alone, to which the term patent is in common parlance restricted. It may, however, be observed in passing that the procedure connected with royal grants other than patents for inventions is still intricate and technical, resembling that which was in use for patents of invention before the Patent Law Amendment Act of 1852, and that such grants are enrolled on the Patent Rolls, and may be seen at the Record Office or, in the case of recent grants, at the Chancery Enrolment Office, London.

From a very early period in our history the sovereign has enjoyed and exercised the prerogative of securing to inventors, for a limited term, 'the sole right of making, using, and vending' new and useful inventions. Thus, it is stated that Edward III., on the representation of some alchemists, granted a commission to two friars and two aldermen to inquire whether a philosopher's stone might be made, and, on their reporting that the project was feasible, granted to the two aldermen a patent of privilege that they and their assignees should have the sole making of the philosopher's stone. Upon the royal prerogative, however, of which this case offers an early, though in all probability by no means the earliest, illustration, the common law placed certain definite and well-understood restrictions. (1) The sovereign could not grant the sole right to sell articles in common use. Thus, letters-patent granting to one John Pechey the sole importation of sweet wines into London were, at a parliament held in the fiftieth year of the reign of Edward III., declared to be void. (2) A grant of the sole right to exercise a known occupation was bad. This was decided as to the manufacture and

importation of playing-cards in the leading case of *Darcy v. Allin*. (3) The grantee was required to have been at least the *introducer* of the invention within the realm. (4) The term of the grant must be for some limited period, such as might be sufficient for the instruction of others. (5) The subject-matter must be such as, in the result, led to a new trade or manufacture. (6) The patented invention must possess the incidents of utility and novelty, and must not be prejudicial or inconvenient to trade (1 Webster Patent Cases, 7. n.).

In the reign of Elizabeth, however, and still more emphatically in the reign of James I., the old common-law monopoly changed its character. The number of *bona-fide* inventions or discoveries was small. But the financial and political difficulties of the sovereign were great. The royal prerogative of granting limited monopolies 'for the good of the realm and the furtherance of trade' came, with many other doubtful expedients, to the sovereign's assistance. The common-law limitations were ignored. Currants, salt, iron, powder, cards, calfskin, paper, tin, sulphur, and a hundred other commodities in common use were appropriated to monopolists for practically unlimited periods. The patentees were enabled to charge extortionate prices for inferior articles, to enter (at least under the saltpetre patents) private houses and ransack stables and cellars for infringing articles, and to have infringers brought before the council and punished for contempt of the royal authority. After a protracted struggle, in the course of which Queen Elizabeth recalled most of her obnoxious grants, and James published a counterblast against monopolies, which influenced his subsequent conduct very slightly, the famous Statute of Monopolies was passed in 1624. The purview of the measure has often been misrepresented. It did not, as we have seen, *create* the royal prerogative to grant letters-patent for inventions. But it declared that all such monopolies as the sovereign had latterly been granting were contrary to law and void. It then excepted from this sweeping prohibition (*inter alia*) 'grants of privilege for the term of fourteen years or under, thereafter to be made, of the sole working or making of any manner of new manufactures within the realm, to the true or first inventor or inventors, which others, at the time of making such letters-patent and grants, shall not use, so as also they be not contrary to the law, nor mischievous to the state, by raising prices of commodities at home, or to the hurt of trade, or generally inconvenient.'

This saving clause in the Statute of Monopolies is the foundation of the modern English patent system. It preserves, and at the same time limits, the royal prerogative to grant monopolies of inventions, and it gives a most succinct, and yet a complete, statement of the characteristics of a valid patent-grant. The *term* of the grant is to be fourteen years *or under*; and patents were in fact always granted for a term of fourteen years till the period was raised to sixteen years by the Patents and Designs Act, 1919. The *grantee* is to be 'the true and first inventor'—words which a series of judicial decisions has interpreted as including the first importer from abroad—of the patented invention. The *privilege* conferred is the sole and exclusive right to work or make the invention; and the *subject-matter* of a valid grant is 'any manner of new manufacture within the realm' which is (a) not in use at the date of the grant, (b) not contrary to law or mischievous to the state, (c) not to the hurt of trade, or (d) not generally inconvenient. The next important measure in the history of our patent law is Lord Brougham's Act, 1835. At common law, letters-patent were wholly void for

any defect in part, not being a mere clerical error which the Master of the Rolls could correct; and a patentee was liable to be deprived of his patent from the failure of some condition, such as *want* of novelty in a very trifling part of the invention. The Act of 1835 enabled a patentee to enter with the clerk of patents, by permission of the crown, signified by the *fiat* of the law officer, a *disclaimer* of any part of the title or a memorandum of any alteration therein, which upon being filed by the clerk of patents, and enrolled with the description of the patent, was deemed and taken to be part of the letters-patent in all courts whatever. A still more important change was introduced by the Patent Law Amendment Act, 1852. The policy of granting patents is not only to reward inventors, but to induce them to disclose their inventions to the public. Different means of attaining the latter object have been adopted at different stages in the history of our patent law. The earliest practice was to insert in the grant a proviso requiring the inventor and his assignee to take apprentices during the last seven years of the term, and to teach them 'the knowledge and mystery' of his invention. In the reign of Queen Anne the patentee was required within a certain period (usually six months) after obtaining his patent to enrol at one of the public record offices a *specification* or description of his invention, upon the accuracy and sufficiency of which the validity of his grant in great measure depended. This practice had several grave disadvantages. There were three offices in which specifications might be enrolled—the Enrolment Office, the Rolls Chapel, and the Petty Bag Office; in each of these offices a laborious search might have to be made before a particular specification could be discovered and inspected. Again, the interval of time which elapsed between the grant of a patent and the enrolment of the specification enabled a patentee first to obtain protection for what might be merely a crude idea, and then to work out its details, altering and modifying them at will, during the protected interval. The Patent Law Amendment Act of 1852, adopting a practice which was in force in several continental countries, and which was strongly recommended by most of the witnesses who gave evidence before the committees of 1829 and 1851, provided that a petition for the grant of letters-patent should be accompanied by a statement in writing, describing the nature of the invention which it was sought to patent; this statement was called the *provisional specification*. The effect was that a patentee might use his invention for six months without prejudice to his patent by that user. The patentee was thereby protected against the consequences of his own publication, and enabled to employ workmen and obtain machinery without the risk of being betrayed.

The existing law, including the various Patents, Designs, and Trade-marks Acts, 1833-1902, was repealed, but in substance re-enacted with alterations by the measure introduced by Mr Lloyd George in 1907, which came into force in 1908, and which has, in turn, been amended by the Patents and Designs Act, 1919. The present procedure to obtain a patent is as follows: An application signed by the inventor himself, and accompanied by a 'provisional specification,' in which the nature of his invention is briefly and generally described, is lodged at the Patent Office. The application and specification are then referred by the comptroller-general, who is the official head of the department, to an examiner who ascertains and reports to him whether (1) the nature of the invention has been fairly described, (2) the application, specification, and drawings, if any, have been prepared in the prescribed manner,

(3) the title selected by the applicant sufficiently indicates the subject-matter of the invention, and (4) the specification does not describe more than one invention. Provision is made for an official examination of the Patent Office records (limited to fifty years) to find out if the proposed new patent had been in any way forestalled. If the examiner report against the applicant on any of the grounds mentioned above, the comptroller may require the application, specification, or drawings to be amended before he proceeds. Against this decision the applicant may appeal to the law officer, whose judgment is final. The comptroller may also refuse to grant a patent for any invention of which the use would, in his opinion, be contrary to law or morality, and from such refusal no appeal can be taken. If, however, the examiner report in the affirmative upon each of the issues submitted to him, the application is accepted. If the provisional specification is found satisfactory, within a period of six months (formerly nine months) from the date of his application the applicant must deposit at the Patent Office a *complete specification*, particularly describing the nature of the invention and the best method of carrying it out. If the examiner report that the complete specification (1) does not fairly describe the invention, (2) does not terminate with a distinct claim or claims, (3) claims more than one invention, or (4) varies materially from the provisional, the comptroller may refuse to accept it unless and until it has been amended to his satisfaction. From such a refusal the applicant may appeal as before to the law officer, whose decision is final. When the complete specification has been accepted it is printed and published, and the details of the applicant's invention are then for the first time thrown open to public inspection. The comptroller-general causes the fact of the acceptance to be advertised in the official journal of the Patent Office, and the patent is not granted until after the expiration of two months from the date of such advertisement. At any time within that period any person may oppose the grant on any one or more of the following grounds: (1) that the applicant had obtained the invention from the opponent or from some person of whom the opponent is the legal representative; (2) that the invention had been patented in this country on an application of prior date; (3) that the complete specification describes or claims an invention other than that described in the provisional, and that such other invention forms the subject of an application made by the opponent between the leaving of the provisional and of the complete specifications. At any time after the sealing of a patent it may be indorsed by the comptroller, at the request of the applicant, with the words 'licences of right.' The effect of this indorsement is to entitle any person as of right to a licence under the patent on such terms as, in default of agreement, may be settled by the comptroller. Where, at any time after the expiration of four years from the date of a patent, the comptroller is satisfied, on the application of any interested person, that there has been an abuse of the monopoly rights, either by the non-working, or inadequate working of the invention within the United Kingdom, or the refusal of, or conditions attached to the grant of licences, he may order (a) the patent to be indorsed 'licences of right;' or (b) the grant of a licence, exclusive or otherwise, to the applicant; or (c) the revocation of the patent. Every such order is subject to an appeal to the court. Prior to 1835 the term of a patent could only be extended by a special act of parliament. But the frequency of applications for statutory assistance suggested the propriety of framing some general measure for the extension or

prolongation of letters-patent, and Lord Brougham's Act was passed with that view. Other enactments, of which the interest is now chiefly historic, followed; and section 25 of the act of 1883 empowered the Judicial Committee of the Privy-council to extend for a further period of seven, or in exceptional cases of fourteen, years the term of a patent which, although highly meritorious and useful, had not adequately remunerated the patentee, from circumstances beyond his control, during the original term. Under the acts of 1907 and 1919 petitions for prolongation of the patent beyond the statutory term of sixteen years are decided by the High Court (instead of the Judicial Committee of the Privy-council, as formerly), and the expense, which was often prohibitive, is thus kept within reasonable bounds. The term for which an extension may be granted is now five, or, in exceptional cases, ten years. Conditions more favourable to the patentee were granted in respect of a single patent for cognate inventions, 'patents of addition,' and the revival of lapsed patents.

The infringement of a patent may be restrained by injunction, and punished by damages awarded in an action at law. A patent will be *revoked*—or, as it is termed in Scotland, *reduced*—if it is proved to the satisfaction of the proper court to have been obtained by fraud or false suggestion on the part of the patentee, or to lack the essential requisites of novelty and utility. The procedure in Scotland under the Patent Act, 1907, is regulated by an Act of Sederunt, dated 16th July 1910.

A patentee is not compelled to mark articles made according to his invention as 'patented.' But any person who represents that an article sold by him is patented, when in fact no patent has been granted for the same, is liable on summary conviction to a fine not exceeding £5.

Patent Agents.—Before the Patent Law Amendment Act, 1852, only about 500 patents were taken out annually in England. The patent business of the country would not, therefore, support a separate profession; and the parliamentary reports of 1829 and 1851 throw a somewhat painful light on the proceedings of many of those persons who carried on the work of patent agents in connection with other callings. Under the act of 1852, however, the number of patents annually obtained greatly increased; foreigners and British subjects abroad desired to patent their inventions more frequently than before, and consequently the work of the patent agent became a distinct profession. On the 12th of August 1882 an Institute of Patent Agents was incorporated under the Companies Acts, 1862 to 1880. The Patents Act, 1888 (sect. 1), created a Register of Patent Agents, on which (see sect. 18 of the act of 1919) every person who assumes the name of 'patent agent' must be enrolled under a penalty not exceeding £20. The *Register of Patent Agents Rules*, issued by the Board of Trade, came into operation on 12th June 1889, and gave to the Institute of Patent Agents (which received a royal charter in 1891) practically complete control over the whole profession. A communication to a patent agent is not privileged from disclosure in a court of law though he be a solicitor.

The Patent Office.—All the formal, and much of the judicial, work connected with the grant of letters-patent for inventions is done at the Patent Office in Southampton Buildings, Chancery Lane, London. At the head of the whole department is an officer called the comptroller-general, who is appointed by, and responsible to, the Board of Trade, and is assisted by a staff of examiners, clerks, &c. In addition to his formal and judicial duties relating to applications, the comptroller attends to the Register of Patents, in which the

names of patentees and notifications of all assignments and licenses must be entered, and prepares an annual report as to the work of the Patent Office, which is laid before both Houses of Parliament. The Patent Office contains a valuable free public reference library and reading-room, in which all the publications of the Patent Office—specifications, reports of cases, illustrated official journals, &c.—may be consulted.

Patents in the United States.—Before the Declaration of Independence patents were occasionally issued by the colonial governments; and the constitution of the United States expressly vested in congress powers 'to promote the progress of science and useful arts by securing for limited times to authors and inventors the exclusive right to their respective writings and discoveries.' The congress of 1790 passed an act regulating the issue of patents for inventions, requiring the would-be patentee to petition the Secretary of State, the Secretary of War, or the Attorney-general; with the approval of any two of these the description of the patent was certified by the Attorney-general, and the president directed the issuing of the patent. The patent was recorded in the office of the Secretary of State, and delivered to the patentee under the great seal of the United States. Under this law, which remained practically unchanged till 1836, patents were granted with little examination, and the responsibility of deciding whether the patentee had made out his case was left wholly to the courts—a system found to be inconvenient and unsatisfactory for the interests of the public. On occasion of a fire at the Patent Office, when many of the documents were destroyed, congress repealed former acts and established a new system, which remains in force till now. The general principles of the law are the same as in Britain, but the term for which patents are granted is seventeen years—longer than elsewhere. The Patent Office is attached to the department of the Secretary of the Interior. The commissioner, assistant-commissioner, and examiners-in-chief are appointed by the president, with the consent of the senate. The chief clerk, a staff of examiners (principal, first assistants, second assistants, third assistants), draughtsmen, copyists, attendants, &c. are nominated by the commissioner of patents and approved by the Secretary of the Interior. The office publishes pamphlets on *The Patent Laws and Laws relating to the Registration of Trade-marks and Labels*, and *The Rules of Practice in the United States Patent Office*, which may be had on application. But inventors are recommended to secure the assistance of 'patent lawyers,' who are a distinct branch of the legal profession. The minimum expense may be stated at \$60; but difficulties and references to various authorities may greatly increase the outlay. An act of 1897, among other minor alterations, provides that the proprietor of a foreign patent, wishing to patent his invention in the United States, must do so within two years of the date of his original patent, instead of any time during its existence, as formerly.

The International Convention.—It had long been the desire of inventors and legislators to bring about an assimilation of the patent laws of the world. As early as 1851 a society called the 'Association of Patentees' included in their list of proposed reforms in the patent law 'international arrangements for a mutual recognition of the rights of inventors.' Adopting in substance the views of Sir H. Bessemer, Sir William Armstrong, and Mr C. W. Siemens, the Select Committee of 1872 recommended that 'Her Majesty's government be requested to inquire of foreign and colonial governments how far they are ready to concur in international arrangements' in relation

to the proposed international patent law. In accordance with this recommendation Earl Kimberley, then Colonial Secretary, directed the governors of the British colonies to ascertain the state of colonial opinion upon the subject. At the same time our representatives abroad were required by Lord Granville to prepare succinct reports upon the patent laws of the countries to which they were severally accredited, and these reports were published and laid before parliament in 1873 (C—741). The inquiries thus held showed that colonial and foreign official opinion was in the main favourable to the proposed change, and also that, all divergencies notwithstanding, there existed in the patent laws of the world ample materials out of which an international patent system might eventually be created. The International Congress at Vienna in 1873 and the Paris Congress, organised during the Exhibition of 1878, carried the movement forward; and on 20th March 1883 an 'International Convention for the Protection of Industrial Property' was signed at Paris. The plenipotentiaries of the contracting parties exchanged ratifications on 6th June 1884, and the convention came into effective operation a month later. The original signatories were Belgium, Brazil, Spain, France, Guatemala, Italy, Holland, Portugal, Salvador, Serbia, and Switzerland. The accession of Great Britain was delayed until special statutory power had been given to the crown to allow the *ante-dating* of patents granted under the convention, but subsequently took place. The United States, Cuba, Honduras, Uruguay, Tunis, Mexico, Denmark, Dominican Republic, Japan, Rumania, Bulgaria, Finland, Luxemburg, and Germany have subsequently joined the International Union. Among the Colonies, arrangements have been made with the Commonwealth of Australia, Ceylon, New Zealand, Trinidad, and Tobago. The principal changes introduced into our patent system by this important treaty are these: (1) Formerly a patentee could not import into some of the states now comprised in the union articles manufactured according to his patent in this and other countries without forfeiture of his rights. Free importation of such articles without the penalty of forfeiture is now allowed. (2) An applicant for a patent in any one of the contracting states may obtain protection for the same invention here at any time within seven months (by act of 1901 altered to twelve months) from the date of his foreign application. The subsequent application is *ante-dated* to the date of the first application, and is consequently not defeated by prior publication or user in the protected interval. This may be explained by an illustration. A, a French inventor, applies for a patent in Paris on 1st June 1890. At any time within twelve months from that date he may apply to the English Patent Office to protect the same invention which he is patenting in France, and the *English application, and the patent granted thereunder, are dated back to the 1st of June*. The result is that A may, for almost twelve months after his French application, use his invention in England with perfect safety. No one can say that the patent subsequently granted to him is bad for want of novelty, because the patent ultimately bears the date of the 1st of June, and thus protects the period during which he was using the invention in England. The rights conferred on a person who has applied for protection of an invention in a foreign state extend to his legal representatives and assignees (Patents and Designs Act, 1914).

In connection with the international Convention an international office or bureau has been established at Berne in Switzerland. Its expenses are defrayed by the governments of all the contracting

states, and it publishes a monthly periodical entitled *La Propriété Industrielle*, which is devoted to the interests of the union. The convention provides for conferences being held successively in one of the contracting states by delegates from the said states with a view to perfect the system of the union. The first meeting took place at Rome in April and May 1886.

In Britain, in 1924, there were 31,370 applications for patents, and 16,839 were granted. In the United States the numbers were 76,855 and 42,594. At the Imperial Economic Conference held in London at the end of 1923, proposals were made and considered for an 'empire patent,' valid throughout the British empire, but they have not yet materialised.

In some countries, such as the United States of America, Germany, and Austria, the Patent Office inquires strictly into the novelty and utility of every invention submitted to it for protection. A limited form of preliminary examination into novelty has now, as above explained, been established in England by recent legislation. In others, such as France and Turkey, there is no preliminary examination as to novelty or utility. Indeed, in France the patentee, if he refers to his title at all, is obliged to add the words *sans garantie du gouvernement* or their initial letters, S.G.D.G. In most European states a patentee is compelled to 'work' his invention within a certain time prescribed by law or limited in the grant; but this regulation or *exploitation* law, as it is called, is usually enforced in cases of voluntary and unjustifiable inaction alone.

See Carpmas, *Patent Laws of the World* (2d ed. 1889 *et seq.*); Edmunds, *Law of Patents* (2d ed. 1897); books by Robinson (1890), Fulton (1905), Terrell (1906), and for America, by Walker (1895), Phillips, Curtis, and others; the Reports of the Parliamentary Committees (1829-87); the Reports of the Commissioners of Patents (1852-84), and by the Comptroller-general since 1884. See also COPYRIGHT, MONOPOLY, TRADE-MARKS.

Pater, JEAN BAPTISTE JOSEPH (1695-1736), genre-painter, born at Valenciennes, was not only the pupil but the disciple of Watteau, and rivalled his master in grace and colour, though he was a less skilful draughtsman.

Pater, WALTER, was born in London, August 4, 1839, and educated at King's School, Canterbury, and at Queen's College, Oxford, taking a classical second-class in 1862. He was elected to an open fellowship at Brasenose; has travelled in Italy, France, and Germany; and, both by his subtle critical insight and the exquisite finish of his style, secured a rank among the best prose-writers of his time. With a wise reticence he husbanded his gift; hence all his work maintains the same high level of excellence. His books are *Studies in the History of the Renaissance* (1873), a series of essays on art and letters, on such men as Leonardo, Botticelli, Joachim du Bellay, and others, written in exquisitely modulated prose, with faint traces of a conscious daintiness, from which he soon shook himself free; *Marius the Epicurean: his Sensations and Ideas* (2 vols. 1885), an imaginary biography of a young man brought up in Roman paganism, who passes through varied spiritual experiences, meets Marcus Aurelius himself, and at last, shortly before his unexpected death, makes acquaintance with the mysterious new Eastern religion, yet without being profoundly influenced by it; *Imaginary Portraits* (1887) of Watteau, Denys l'Auxerrois, and others; *Appreciations* (1889) of Charles Lamb, Wordsworth, Coleridge, Rossetti, Sir Thomas Browne, Blake, and of Style itself; *Greek Studies* (1895); *Miscellaneous Studies* (1895) on Raphael, Pascal, North

Italian art, French cathedrals, with romantic tales; and *Gaston de Latour: An Unfinished Romance* (1896). From 1885 on Pater had divided his time between Oxford and London. He died 30th July.

See Gosse's *Critical Kit-Kats* (1896), a book by Greenslet (1904), and that by A. C. Benson ('Men of Letters,' 1906).

Paterculus, MARCUS VELLEIUS, lived from about 19 B.C. to 31 A.D., and served as legate in Germany. His *Historiæ Romanæ* is a compendium of universal, but more particularly of Roman history, in two books. The work, as we have it, is not complete, the beginning, and a portion following the 8th chapter, being wanting. The work is slovenly and superficial, marred moreover by inflated rhetoric as well as by ignorant errors, and by fulsome flatteries of Cæsar, Augustus, and Tiberius. The *editio princeps* appeared at Basel in 1520. Good editions are those of J. C. Orelli (1835), F. Kritz (1840-48), and C. Halm (1876).

Pateretors were small pieces of ordnance, now obsolete, worked on swivels; most commonly used on board ships, where they were mounted on the gunwale, and discharged showers of old nails, &c. into hostile boats.

Paterno, a town of Sicily, 11 miles NW. of Catania, at the southern base of Mount Etna. Pop. 15,230.

Pater-Noster (Lat., 'Our Father'), called also THE LORD'S PRAYER, a short form of prayer suggested or prescribed by our Lord to his disciples (Matt. vi. 9-13; Luke, xi. 2-4) as the model according to which, in contrast with the prayers of the Pharisees, their petitions ought to be framed. The Pater-Noster has been accepted as, by excellence, the form of Christian prayer. It formed part of all the ancient liturgies, usually introduced with a preface, and said between the consecration of the elements and the communion, except the so-called Clementine liturgy, in which it does not appear at all, and the Abyssinian, in which it is said, as in the English, after the communion. St Gregory finally settled its place in the Roman Mass, immediately after the Canon and before the fraction. Whereas in the East it was said by both priest and people, in the Roman use it was recited by the priest alone. The Catechism of the Council of Trent contains a detailed exposition and commentary on it, and in all the services, not only of the Roman Missal, Breviary, Ritual, Processional, and Ordinal, but in all the occasional services prescribed from time to time, it is invariably introduced. In the Mass it is said aloud, but in the Breviary secretly, or with at most the first and concluding words said audibly. In the Rosary of the Virgin Mary it is combined with the Hail Mary (whence the larger beads of the 'Rosary' are sometimes called *Pater-Nosters*), and perhaps the most usual of the shorter devotions among Roman Catholics is the recitation of the 'Pater,' with one or more 'Ave Marias,' concluding with the Doxology. The Pater-Noster as commonly used by Protestants concludes with the clause, 'for Thine is the kingdom, the power, and the glory for ever [or, for ever and ever]. Amen,' but this is wanting in the most ancient authorities. This embolism or intercalated prayer occurs in all the liturgies, Roman, Mozarabic, Gallican, Greek, Coptic, and Armenian. Of the two gospels—that of Matthew and that of Luke—in which the prayer is contained, that of Luke has not this clause; and even in the gospel of Matthew it is found only in the later MSS., in which it cannot be doubted that it is a modern interpolation. It was retained, however, in Luther's German translation, in the Prayer-book (original) version, and in the English authorised version. In the revised version it is

omitted both in Matthew and Luke; in Luke, 'which art in heaven,' the whole of the third petition, and 'deliver us from evil' are relegated to the margin; and in Matthew, 'deliver us from evil' is properly rendered 'deliver us from the evil one.'

Many polyglot collections of the Pater-Noster have been published from the 16th century downwards, the most remarkable of which are those of John Chamberlayne in 150 languages (1715), of Conrad Gesner in 200 (1748), and that of Padre Hervaz in 307 (1787). There are expositions of the Lord's Prayer by Origen, Chrysostom, Gregory Nyssa, Cyprian, Luther, Leighton, and Tholuck. See Moses Margoliouth, *The Lord's Prayer no Adaptation of existing Jewish Petitions* (Lond. 1876).

Paterson, capital of Passaic county, New Jersey, is on the Passaic River (which here has a perpendicular fall of 50 feet), and on the Morris Canal (connecting it with the Delaware River), 15 miles NW. of New York City. It contains several locomotive-works, dye-works, numerous factories of cotton, paper, and linen and woollen goods, &c.; but chiefly it is famous for its silk-factories, which have made Paterson 'the Lyons of America.' Pop. (1870) 33,579; (1890) 78,347; (1920) 135,875.

Paterson, ROBERT (1715-1801), 'Old Mortality,' was born near Hawick, and served his apprenticeship as a stone-mason to an elder brother near Lochmaben. He married soon after 1740, and, renting a quarry for himself, took to carrying gravestones into Galloway. From about 1758 he neglected to return to his wife and five children, and for upwards of forty years devoted himself to the task of repairing or erecting headstones to Covenanting martyrs, wherever such had been buried. So Joseph Train wrote to Scott, who tells how about 1800 he himself met 'Old Mortality' at Dunnottar, engaged 'in the usual business of his pilgrimage.' From the old man's son, however, Train got a different story, without a hint of Cameronian zeal.

See the Introduction (1830) to *Old Mortality*, and Dr Crawford Tait *Ramage's Drumlarnrig Castle and the Douglasses* (Dumfries, 1876).

Paterson, WILLIAM, the greatest commercial schemer of the 17th century, was, like Law, a Scotsman, and was born at Skipmire farm in Tinswald parish, Dumfriesshire, in April 1658. His early career is obscure, but it appears that he carried a pack through England, settled some time at Bristol, next lived in the Bahamas, whether as preacher or buccaneer, and there matured his famous Darien Scheme. Returning to Europe, he promoted his scheme in London, Hamburg, Amsterdam, and Berlin, made a fortune by commerce in London, founded the Hampstead Water Company in 1690, and projected the Bank of England, and was one of its first directors in 1694. Paterson next went to Edinburgh, and soon talked the whole nation into his Darien Scheme. He sailed with the expedition in a private capacity, shared all its troubles, and returned with its survivors a broken man, in December 1699. But his energy remained unabated. When in 1701 William resolved to carry the contest with Louis XIV. into the heart of Spanish America, Paterson was taken into the king's confidence, and but for his death might have seen his dreams of Darien realised. He had a considerable share in promoting the union of Scotland with England, and was elected to the first united parliament by the Dumfries burghs. By a special act of parliament in 1715, he was awarded £18,241 as indemnity for his losses by the Darien Scheme; but he did not live long to enjoy it, for he died on 22d January 1719. Paterson was no mere dreamer, but a far-seeing financier, and a free-trader before free-trade times.

See **DARIEN SCHEME**; the Life by S. Bannister (1858), editor of his *Works* (3 vols. 1859); Pagan's *Birthplace*

and *Parentage of W. Paterson* (1865); Barbour, *History of William Paterson and the Darien Company* (1907).

Pathans. See **AFGHANISTAN**.

Pathology (from Gr. *pathos*, 'disease,' and *logos*, a 'discourse') is that department of medicine which treats of the doctrine of diseases, their nature, causes, symptoms, and progress. General pathology deals with disease or morbid processes in general, and special pathology with particular diseases. Pathology is also divided into internal and external, and into medical and surgical. Pathology may be treated as falling into the departments of nosology, ætiology, morbid anatomy or pathological anatomy, symptomatology, and therapeutics. Humoral pathology was based on the theory that all diseases were due to the disordered condition of the humours and fluids of the body. Cellular pathology, associated with the name of Virchow, gives prominence to the action of cells in the healthy and diseased functions of the body. See **ANATOMY**, **DISEASE**, **MEDICINE**, **PHYSIOLOGY**, and the articles on the several diseases in this work.

Patiala, an Indian state in the Punjab, partly amongst the hills; area, about 5400 sq. m.; pop. 1,500,000. The capital, also called Patiala, has a pop. of 47,500, including 7500 Sikhs.

Patkul. See **CHARLES XII**.

Patmore, COVENTRY KERSEY DIGHTON, poet, was born at Woodford, Essex, July 23, 1823, the son of P. G. Patmore, author of *My Friends and Acquaintances*. He published a volume of *Poems* in 1844, and three years later joined the staff of librarians in the British Museum, where he remained till 1868, when he purchased a small estate in Sussex. Soon after he settled at Hastings, where he built a large Catholic church. His second volume of poems, *Tamerton Church-tower*, &c. (1853), prepared the way for his greatest work, *The Angel in the House*, an elaborate, exquisite, and sincere poem of love from the domestic side, which has had a great popularity, but not beyond its deserts. It consists of four parts, all included under the general title for the first time in the edition of 1866: *The Betrothal* (1854) *The Espousals* (1856), *Faithful for Ever* (1860), and *The Victories of Love* (1863). A carefully revised edition of this poem was issued in his collected poems (1878 and 1886), with an essay on *English Metrical Law*, and including *The Unknown Eros*, a mystical poem first published in 1877. *The Rod, the Root, and the Flower* (1895) contains religious poems. Patmore edited the anthology entitled *The Children's Garland* (1862), the *Autobiography* of Barry Cornwall (1877), and the poems of his son Henry (1884). *Florilegium Amantis* was a selection from his poems (ed. Garnett, 1888); another was *Poems of Pathos and Delight* (ed. Meynell, 1895). *Courage in Politics and other Essays* appeared in 1921. He died 26th November 1896. See *Lives* by Champneys (1900), and Gosse (1905).

Patmos, a rocky island in the Ægean Sea, one of the Sporades, lies to the south of Samos; area, 16 sq. m. In a cave here, it is said, the exiled apostle John saw the visions of the Book of Revelation. The famous monastery of 'John the Divine' was built in 1088. The island is under Italian rule, but is inhabited by about 2500 Greeks, mostly sponge-fishers.

Patna, called also **AZIMABAD**, the capital of Bihar and Orissa, 140 miles E. of Benares by rail, extends 9 miles along the Ganges and 2 miles back from the river; but the streets are narrow and crooked, and the houses mostly mean in appearance. Apart from the Gola or government granary (1786), the government opium-factories, Patna

College, the shrine of Shah Arzani, the mosque of Sher Shah, a Roman Catholic church, and a Mohammedan college, there are no buildings of moment. A university was founded in 1917. Its railway communication, and its central position at the junction of three great rivers, the Son, the Gandak, and the Ganges, avenues for the traffic of the United Provinces of Agra and Oudh, render Patna of great importance as a commercial centre. The chief imports are cotton goods, oil-seeds, salt, sugar, wheat, and other cereals. The exports are principally oil-seeds and salt, with cotton, spices, English piece-goods, coconuts, and tobacco. Patna, under its early name of *Pataliputra*, is supposed to have been founded about 600 B.C. It was visited by Megasthenes, the Greek historian, about 300 B.C., and called *Palibothra* by him. In modern times Patna is notable as the scene of a massacre of British prisoners by Mir Kasim in 1763, which led to war and annexation, and for the mutiny at Dinapur, the military station of Patna, in 1857. Pop. (1891) 165,192; (1911) 136,153; (1921) 129,429.

Patna, an Indian state of Bihar and Orissa, formerly of the Central Provinces; area, 2399 sq. m.; pop. about 500,000. It has been under the management of a British political agent since 1871. Bolangir is the chief town.

Patois, the French term for dialects of a language spoken especially by the uneducated. See DIALECT.

Paton, JOHN GIBSON, missionary to the New Hebrides, the son of a stocking-maker, was born in the parish of Kirkmahoe, Dumfriesshire, 24th May 1824. He offered his services as a missionary to the Reformed Presbyterian Church, and settled down in 1858 amongst the cannibal natives of Tanna. Forced to leave in 1862 owing to the hostility of the natives, he worked for twenty years on the neighbouring island of Aniwa, the whole population of which became Christian. Both by voice and pen he afterwards attracted public attention and sympathy towards this field of mission labour; and his brother published and edited his graphic and thrilling missionary narrative, 1st and 2d series (1890). He died in January 1907.

Paton, SIR JOSEPH NOEL, painter, was born in Dunfermline, 13th December 1821, and studied for a time at the Royal Academy, London. His cartoon sketch, 'The Spirit of Religion,' gained one of the three premiums at the Westminster Hall competition in 1845. Two years thereafter his oil-picture of 'Christ bearing the Cross' and his 'Reconciliation of Oberon and Titania' jointly gained the prize of £300. The latter and its companion-picture, the 'Quarrel of Oberon and Titania,' are now in the National Gallery at Edinburgh. 'Dante Meditating the Episode of Francesca' was exhibited in Edinburgh in 1852; the 'Dead Lady' in 1854; and 'The Pursuit of Pleasure' in 1855. Scenes from fairyland and from ancient legend, and religious and mystical allegory, painted with grace, tenderness, and something of over-refinement, have made his work familiar, and have been often engraved. Among his other pictures are 'Home from the Crimea'; 'In Memoriam,' a scene from the Indian Mutiny; a series of six picture-illustrations of the 'Dowie Dens o' Yarrow'; 'Luther at Erfurt'; 'The Fairy Raid'; 'Faith and Reason'; 'Gethsemane'; 'Christ and Mary at the Sepulchre'; 'The Man of Sorrows'; 'Mors Janna Vitæ'; 'The Spirit of Twilight'; 'Thy Will be Done' (1879); 'Beati Mundo Corde' (1891), &c. He illustrated Aytoun's *Lays of the Scottish Cavaliers*, and in 1864 he executed twenty illustrations of the *Ancient Mariner*. He published two volumes of poems. R.S.A., Queen's Limner for Scotland (1865), he died 26th December 1901.

Patras, or *PATRÆ*, a fortified seaport town and the most important in the west of Greece, climbs up a hillside and spreads out at its foot on the eastern shore of the Gulf of Patras, by rail 81 miles W. by N. of Corinth and 137 W. by N. of Athens. It is a handsome city, almost entirely rebuilt after the ravages of the war of liberation (1821). It is defended by a citadel, is the seat of an archbishop, and has a spacious harbour (1880) protected by a mole. It ships great quantities of currants, chiefly to Great Britain and France. Olive-oil, wine, valonia, &c. are also exported. Pop. 52,000. *Patra* is the only one of the 'twelve cities' of Achaia which still exists as a town; but most of its relics have been swept away by earthquake (551, 1820) and siege (by the Spaniards in 1532 and 1595, by the Knights of St John in 1603, and by the Greeks, 1822-28). It was an early seat of Christianity, having an archbishop before 347.

Patria Potestas. See FAMILY, PARENT AND CHILD.

Patriarch (Gr. *patriarchēs*, 'the head of a tribe') is the name given to the heads of the families in the antediluvian period of Old Testament narrative, and is still more familiar as the designation of the three progenitors of the Jewish people, Abraham, Isaac, and Jacob. In the later history of the Jews, too, after the destruction of Jerusalem, the Greek name was used to designate the heads of the college which was regarded as a continuation of the old Sanhedrin; one of whom, the patriarch of the west, resided at Tiberias, in Galilee, and the other, the patriarch of the Eastern Jews, at Babylon. The patriarch of Tiberias was also regarded by the Roman imperial government as municipal head of the Jews of Palestine. The most familiar use of the word, however, is in the history of the Christian church. It is the name given to the bishops of certain great metropolitan sees, who not only held rank beyond other metropolitans, but also enjoyed a jurisdiction over all the metropolitans included in their district almost identical with that of the metropolitan in his own province. It is certain that the name and the office were both recognised before the Council of Nice, at which time, as we learn from the sixth canon, the patriarchal sees, acknowledged by 'ancient custom,' were three in number, Rome, Antioch, and Alexandria. After the translation of the seat of empire to Byzantium, thenceforward called Constantinople, that see, originally subject to the metropolitan of Heraclea, obtained metropolitan and afterwards patriarchal rank, and eventually established a precedence over the patriarchs of Antioch and Alexandria, being second only to Rome. The contests between the patriarchs of Rome and Constantinople were among the chief causes of the Greek Schism. To these four patriarchates was added a fifth in the year 451, that of Jerusalem, which was formed out of the ancient patriarchate of Antioch. The limits of these five patriarchates can only be loosely assigned. After the Greek Schism, and particularly after the establishment of the Latin Kingdom of Jerusalem, Latin prelates were appointed with the title and rank of patriarch in the four great Eastern sees resident at Rome; in 1847 the Latin patriarch took up his residence in Jerusalem. The Catholic Church also recognises Maronite, Melchite, and Syrian patriarchs of Antioch, an Armenian patriarch of Cilicia, and a Chaldaic patriarch of Babylon. There are also minor patriarchs of Venice, of Lisbon, of the West and of the East Indies. For the patriarchs of the Eastern Church, see GREEK CHURCH. And see TWELVE PATRIARCHS.

Patrician (Lat. *patricius*, from *pater*, 'father'), a name given to the members of Roman *gentes* of whom the *populus Romanus* originally consisted, and to their descendants by blood and adoption. On the establishment of the plebeians as a distinct order, sharing certain rights with the patricians, the patriciate became an aristocracy of birth, in the exclusive possession of a number of important privileges. A long struggle between the two orders ended in the attainment by the plebeians of a political equality, and the establishment of a new aristocracy of *nobiles* based on wealth and office (see **NOBILITY, ROME**). Under Constantine the dignity of *patricius* became a personal title; not hereditary, but conferring very high honour and certain privileges. The popes in after times conferred the same title on eminent persons and princes; and elsewhere also the title of patrician was bestowed on distinguished subjects.

Patrick, St., a missionary of the 5th century, commonly known as the Apostle of Ireland. We have no certainty as to the place or date of his birth; and of late the scope of his labours has been much limited and his successful apostolate denied. Ussher put his birth in 372; Zimmer calculates it at 386. From his own Confession we learn that his father was a magistrate and had a small farm near 'Bannavem Taberniæ' (perhaps for *Bannaventa Berniæ*, or for *Bannaventa Haverniæ*, 'on Severn'). Arguing on these and all the other data, most modern authorities refer Patrick's birthplace to South Wales (perhaps one of three places now called *Baneven* in Glamorgan), not to Daventry (which was called *Bannaventa*) or the north of France, or Kilpatrick near Dumbarton. His father was a deacon named Calpornius, and his grandfather, Potitus, a priest. That his father was a *decurio* and a deacon seems conclusive against Dumbartonshire, which was neither Christianised nor in any way Romanised at the date in question. Patrick's original British name was Succat, Patricius (Hibernicised as *Cothrige*) being his Latin designation. In his sixteenth year he was seized, at his father's farm, by a band of pirates, and with a number of others was carried to Ireland and sold to a petty chief, in whose service he remained for six years. This chief's name was Miluic or Milchu. He lived in the valley of the Braid near Slémish Mountain, just outside the town of Broughshane, in the centre of the County Antrim, where a town-land called Bally-lig-patrick ('the town of Patrick's hollow') still preserves the memory of his residence. This district of Antrim was then famous for its piratical expeditions into Britain, as the vast finds of Roman coins all along the Antrim coast as far as Coleraine amply prove. After six years Patrick succeeded in effecting his escape, and, probably after a second captivity, went to France, where he became a monk, first at Tours, and afterwards in the celebrated monastery of Lérins, which was then the residence of John Cassian, the admirer of Egyptian monasticism, and of vast numbers of Egyptian monks; hence the numerous points of contact with Egyptian customs which have been noticed in the ancient Irish Church. He seems to have been ordained by an unknown Gallic bishop named Matorix or Amatorix, or else by Germanus of Auxerre. In the year 432, it is thought, he went as a missionary to Ireland; Palladius, who had been sent by Pope Celestine as missionary to that country a short time before, having died.

The leading facts of Patrick's life in Ireland as they are collected out of the various documents are these. He sailed from France to Wales or Ireland. The Welsh claim that he landed in Wales before he went to Ireland (see Giraldu Cambrensis, iii. 379, Rolls series). The communication, however, between Wales and the east coast of Ireland has

been very frequent from the earliest ages. He first landed as a missionary in Ireland at the town of Wicklow at the mouth of the river Vartry; thence he sailed north to convert his old master Milchu, who destroyed himself at his approach. Milchu was a chief of Northern Dalriada, a district which extended from the middle of Antrim to Newry. In the County Down, in the south of the same Dalriada, he converted another chief named Dichu, who bestowed upon him the first Christian church that St Patrick possessed. It was called Sabhall (Saul) or 'the barn,' and it is still a church called by exactly the same name. St Patrick then set out to Tara in the County Meath, which was at that period the central point of meeting for all the tribes of Ireland. There he preached to the king of Tara, Laoghaire, or Leary (as the name should be pronounced), where Patrick is said to have used the shamrock to illustrate the doctrine of the Trinity; this is, however, a mere modern legend. Thence he proceeded to Connaught, as far as Croagh-Patrick in Mayo, to Ulster, and as far as Cashel in the south. We can trace his footsteps in all these directions by the topography of the country as well as by the documents which are extant. His mission was eminently successful. He adopted the expedient of addressing himself first to the chiefs, and of improving, as far as possible, the spirit of clanship and other existing usages of the Irish for the furtherance of his preaching; nor can it be doubted that he had much success in Christianising the ancient Irish system of belief and of practice. According to the accounts of his Irish biographers, he founded 365 churches and baptised with his own hand 12,000 persons. He is said also to have consecrated 450 bishops, ordained a vast number of priests, and to have blessed very many monks and nuns. After he had been some twenty years engaged in his missionary enterprise, he is said to have fixed his see at Armagh about the year 454, where he held probably more than one synod, the decrees of which have been a subject of much controversy. He died at Saul, the spot which Dichu had given him on his first arrival, and was buried at Downpatrick, where his relics were preserved down to the period of the Reformation. The place is still venerated by the people. The date of his death is much disputed, the Bollandists placing it in 460, while Ussher holds it to have been 493. Dr Todd inclines strongly to the latter opinion, in which case Patrick's age would have been quite 120. The only certainly authentic literary remains of St Patrick are his 'Confession' and a letter, both of very rude Latinity, but of much historical interest. The letter is addressed to Coroticus, possibly Ceretic, the Welsh king of Strathclyde, who had made a descent on the Irish coast and slain or carried off some Irish neophytes. These are included in Wilkins's *Concilia*, and in Haddan and Stubbs's *Councils* (vol. ii. 1873).

The first good biography of St Patrick was that by Dr J. H. Todd (1863), which carefully gathered the materials; as did Dr Whitley Stokes in his edition of the *Tripartite Life of St Patrick* (Rolls Series, 2 vols. 1887). The great Celtic scholar, Professor Zimmer, in a contribution to the 4th edition of Herzog's *Real-encyklopädie* (separately translated as *The Celtic Church in Britain and Ireland*, 1902), has dealt somewhat trenchantly with the traditional story. By a brilliant piece of critical reconstruction, he has sought to prove that Patrick (unknown to Bede) was only another name for Palladius, the Briton who was sent to Ireland by Pope Celestine in 431 (see *IRELAND*, p. 212); that his mission was not well received in Ireland, and that he wrote his Confession to defend himself and explain his failure. Zimmer further argues that the legend of his having been a great apostle came up first in the 7th century, after the southern Irish had agreed to accept the Roman tonsure and the Roman Easter, and were trying to induce their northern brethren, and especially the Church of Armagh,

to come into the *Unitas Catholica*. Professor J. B. Bury, in his *Life of St Patrick* (1905), has endeavoured to rehabilitate the traditional view.

Patrick, SIMON, a learned English divine, born at Gainsborough in Lincolnshire, 8th September 1626, was educated at Queen's College, Cambridge, and was successively rector of St Paul's, Covent Garden (1662), where he laboured heroically through the horrors of the Great Plague, Dean of Peterborough (1678), Bishop of Chichester (1689) and of Ely (1691). He died 31st May 1707. A theologian no less devout than erudite, an ecclesiastic of wide sympathies and large sagacity, he established a solid reputation by his excellent sermons, his admirable if sometimes prolix devotional and expository treatises, and his paraphrases and commentaries on the historical and poetical books from Genesis to Canticles (10 vols. 1695-1710). His *Autobiography* was first printed at Oxford in 1839, and is included in the complete edition of his works, ed. Taylor (9 vols. 1858).

Patrick, THE MOST ILLUSTRIOUS ORDER OF ST., a national order of knighthood for Ireland, established by George III. in 1783, and enlarged

in 1833. The *Collar* (of gold) is composed of roses alternating with harps, tied together with a knot of gold, the roses enamelled alternately white within red, and red within white; and in the centre is an imperial crown surmounting a harp of gold, from which the badge is suspended. The *Badge or Jewel* is of gold, and oval; surrounding it is a wreath of shamrock proper on a gold field; within this is a band of sky-blue enamel charged with the motto of the order, *QUIS SEPARABIT* MDCCLXXXIII, in

Order of St Patrick.

gold letters; and within this band a saltire gules (the cross of St Patrick), surmounted by a shamrock or trefoil slipped vert, having on each of its leaves an imperial crown or. The field of the cross is either argent or pierced and left open. A sky-blue *Ribbon*, worn over the right shoulder, sustains the badge when the collar is not worn. The *Star*, worn on the left side, differs from the badge only in being circular in place of oval, and in substituting for the exterior wreath of shamrocks eight rays of silver, four of which are larger than the other four. The order is indicated by the initials K.P.

Patripassians (Lat. *pater*, 'father,' and *passus*, 'suffered'), a name given to one of the earliest classes of anti-Trinitarian sectaries (2d century), who, in maintaining the oneness of the Godhead, were said by their enemies to believe that, as it was true to say that Jesus, in whom dwelt the Logos, or the Son, suffered, therefore it would be true to say that the Father suffered. Their principles are in the main the same with those of the Sabellians (q.v.).

Patristic Literature. See FATHERS OF THE CHURCH, and separate articles.

Patroclus. See ACHILLES.

Patron (Lat. *patronus*, from *pater*, 'father'), among the Romans originally signified a citizen who had dependents, who were called *clients*, attached to him. Before the time of the Laws of the Twelve Tables, the most frequent use of the term *patronus* was in opposition to *libertus*, these two words being used to signify persons who stood to one another in the relation of master and manumitted slave. The original idea of a patron apart from the manumitter of slaves continued to exist. A Roman citizen, desirous of a protector, might attach himself to a patron, whose client he thenceforward became; the patron was the guardian of his client's interest, public and private; as his legal adviser he vindicated his rights before the courts of law. The client was bound on various occasions to assist the patron with money, as by paying the costs of his suits, contributing to the marriage portions of his daughters, and defraying in part the expenses incurred in the discharge of public functions (see ROME). As the patron was in the habit of appearing in support of his clients in courts of justice, the word *patronus* acquired in course of time the signification of advocate or legal adviser and defender, the client being the party defended. *Patron* in after times became a common designation of every protector or powerful promoter of the interests of another; and the saints who were believed to watch over the interests of particular persons, places, trades, &c. acquired in the middle ages the designation of their patron saints.

The term *Patron* has also been applied to those who endowed or supported churches and convents. The question of ecclesiastical patronage, or the right of the patron to present to livings, is dealt with in ADVOWSON, FREE CHURCH, INVESTITURE, SCOTLAND (CHURCH OF), STATE CHURCH.

Patterson-Bonaparte. See BONAPARTE.

Patteson, JOHN COLERIDGE, was born in London on 1st April 1827, the son of Sir John Patteson, judge in the King's Bench, and of a niece of Coleridge the poet. Educated at Eton and Balliol, he sailed in 1855 with Bishop Selwyn of New Zealand. The next sixteen years he spent in the New Hebrides, Banks, Solomon, and Loyalty Islands; and in 1861 he was consecrated Bishop of Melanesia. Greatly beloved by the islanders, whom he protected to his utmost against white kidnappers, he was killed by the natives of Nukapu, one of the Santa Cruz group, on 20th September 1871, it is believed in revenge for kidnapped relatives. See *Life* by Miss Yonge (2 vols. 1874).

Patti, ADELINA, prima-donna, was born at Madrid, 19th February 1843, the daughter of a Sicilian tenor and the 'Signora Barilli.' At seven she sang 'Casta Diva' in Tripler Hall, New York; and in the same city she made her operatic debut as 'Lucia' in 1859. In London she first appeared in 1861 as 'Amina' in *La Sonnambula*, when her success was as splendid as it had been in America, and as it was wherever she sang. Her voice was an unusually high soprano, reaching to F in alt, of rich bell-like tone and remarkable evenness; to these qualities she added purity of style and the highest artistic finish. Equally at home in the tenderness of deep passion and the sprightly vivacity of comedy, she also sang splendidly in oratorio. She married in 1866 the Marquis de Caux (divorced in 1885), in 1886 the tenor Ernesto Nicolini (who died in 1898), and in 1899 the Baron Rolf Cederström. She lived at Craig-y-Nos Castle, near Swansea, and was naturalised in 1898. She

died 27th September 1919. See *Life* by Klein (1920).—Her elder sister, CARLOTTA, born at Florence in 1840, was likewise a very fine vocalist, though a slight lameness prevented her from appearing much in opera. She made her début at New York as a concert-singer in 1861, married in 1879 the 'cellist Ernst de Munck, and died at Paris, 28th June 1889.

Pattison, MARK, scholar, was born in 1813 at Hornby in Yorkshire, but brought up mostly at Hauxwell, of which parish his father had become rector. The eldest of twelve children, of whom ten were daughters, he grew up amid the Yorkshire moors, with a close knowledge of nature and a love for field-sports, which in the one form of fishing lingered with him till the last. He was educated at home until he entered Oriel College at Oxford in 1832. A shy and awkward lad, diffident and hesitating, without the wholesome discipline of public school life, he suffered much in his first years as an undergraduate, but his sufferings were the fruit of his own lack of self-reliance, his morbid self-consciousness, and hyper-sensitiveness of temperament. He took his bachelor's degree in 1836 with a second-class in classics, and was elected Fellow of Lincoln College in 1839. Under the dominant influence of Newman he gave himself first to the study of theology, twice (1841-42) carried off the Denyer prize, wrote two *Lives of the Saints*, translated for the 'Library of the Fathers' the Matthew in the *Catena Aurea* of Aquinas, and almost followed his master into the fold of Rome, being saved only, as he himself explains, by his habits of study and a constitutional slowness to act. Fortunately we have his own account of his spiritual growth, out of the Puritanism of his home into the wider atmosphere of Anglicanism, and how that in its turn fell from him as the larger horizon of the Catholic Church opened itself up before his eyes, only to disappear before 'the highest development, when all religions appear in their historical light as efforts of the human spirit to come to an understanding with that Unseen Power whose presence it feels, but whose motives are a riddle.' His reaction from Newmanism reawakened within him all his zeal for pure scholarship, and, no less lofty in his ideal of the teacher than the student, he soon became a tutor of altogether exceptional devotion and influence, and acting head of the college as sub-rector, under the aged Dr Radford. On the death of the latter in 1851 Pattison was kept out of the headship which was his right by a discreditable obscurantist intrigue, which gave an almost paralysing blow to his sensitive nature. A further unsuccessful attempt was made to deprive him of his fellowship on the technical plea that he had not proceeded in time to the degree of B.D., and the result of his disappointment was that for ten years he took little real interest in the life of Oxford, while his ideas of university reform henceforth grew rather towards an increase of the professorial than the tutorial system. But his educational sympathies soon extended far beyond mere college life; he published an article on education in the *Oxford Essays*, acted as assistant-commissioner on the Duke of Newcastle's Commission of Inquiry into Elementary Education in Germany, rambled in the long vacations through England, Scotland, and Germany, visiting most of the universities of the latter country, and served for three months of 1858 as *Times* correspondent at Berlin. Meanwhile he gave himself with rare devotion to severe and unbroken study, and scholars soon came to recognise his Roman hand in the columns of the *Quarterly*, the *Westminster*, and the *Saturday Review*. His luminous and thoughtful *Report on Elementary Education in Protestant*

Germany appeared in 1859; his equally learned and temperate paper on 'Tendencies of Religious Thought in England, 1688-1750,' in *Essays and Reviews* (1860). At length in 1861 he was elected Rector, but, though he made an exemplary head, the spring and elasticity of earlier days were gone. In 1862 he married the accomplished Emilia Frances Strong, afterwards Lady Dilke, who helped him to make Lincoln a social and intellectual centre for a world much wider than the walls of Oxford. Down to his last illness and his death at Harrogate, 30th July 1884, he lived wholly for study, maintaining a mediæval rather than modern ideal of the life of the scholar as a sufficient end in itself.

Everything Mark Pattison wrote was characteristic; nowhere else among contemporaries could be found such fullness of knowledge and earnestness of thought, shaped ever into terse and vigorous English. Yet his standard of perfection was so high that his actual achievement is far more suggestive than demonstrative of his powers, and the greatest project of his life—the study of Scaliger—remains a fragment, printed by Professor Nettleship in vol. i. of Pattison's collected *Essays* (1889).

Besides the books already named he published *Suggestions on Academical Organisation* (1868); admirably annotated editions of Pope's *Essay on Man* (1869) and *Satires and Epistles* (1872); *Isaac Casaubon, 1559-1614* (1875), which grew out of his Scaliger studies; *Milton*, almost the best book in the 'English Men of Letters' series (1879); the *Sonnets of Milton* (1883); and *Sermons* (1885). His posthumous *Memoirs* (1885) was a strikingly frank judgment of himself and others—even his own father—and a remarkable revelation of a singular moral and intellectual personality, describing, 'without restraint, the whole current of his thoughts and feelings from 1832 to 1860.'

DORA WYNDLOW PATTISON, his sister, was born at Hauxwell, January 16, 1832, the youngest but one of her father's family. She grew up amid her native Yorkshire moors a handsome and healthy girl of remarkable humour, spirit, and vigour, and had her young enthusiasm kindled by the heroic devotion of Florence Nightingale. In October 1861, against the advice of all her family, she started a life of labour for others as schoolmistress at Little Woolston, near Bletchley, and in the autumn of 1864 joined the sisterhood of the Good Samaritans at Coatham, near Redcar. Here 'Sister Dora' underwent severe discipline, but found solace in devoted labours as a nurse, first at North Ormesby, near Middlesborough, and in 1865 at Walsall. Ere long she gave herself entirely to hospital work, and her absolute self-forgetfulness, patience, gentleness, and skill quickly brought her the adoration of the saint from the rough men and women for whom she spent her strength. In 1874 she left the Good Samaritan Community, and in 1877 took charge of the municipal epidemic hospital at Walsall, where the cases were mainly of smallpox. She also found time for exertions on behalf of unfortunate women, and did much for her poor neighbours in every way. But even her strength at last gave way, and she died a true martyr for Christ's sake at Walsall, December 24, 1878. The whole population of the town followed her body to the grave, and the working-men erected a monument to her memory in 1886.

See *Sister Dora: A Biography*, by Margaret Lonsdale (1880)—which Mark Pattison, with a characteristic touch, terms 'Miss Lonsdale's romance'; Tollemache's *Recollections of Pattison* (1895).

Pau, the chief town of the French department of Basses-Pyrénées, on the right bank of the Gave-de-Pau, 66 miles by rail ESE. of Bayonne and 143 SSE. of Bordeaux. It occupies a rocky height,

623 feet above sea-level, and commands towards the south most magnificent views of the serrated Pyrenees; indeed, for mountain scenery its situation is surpassed by no other town in France. The ancient capital of the kingdom of Béarn and French Navarre, it has a noble five-towered castle, rising to a height of 110 feet. Rebuilt about 1363 by Gaston Phoebus, Comte de Foix, and restored by Louis-Philippe and Napoleon III., this castle was the birthplace of Henri IV., as also of his mother Jeanne d'Albret; and Abd-el-Kader was a prisoner here in 1848. Bernadotte was likewise a native of Pau, which, beyond a statue of King Henri (1843), has nothing else calling for notice. Linen and chocolate are its chief manufactures; and in the vicinity Jurançon wine (good but strong) is grown, and many swine are fed, whose pork supplies the famous 'Jambons de Bayonne.' Pau is a great English resort, especially during the winter season (October to May), and is famous for its golf-links. Pop. (1872) 25,607; (1886) 28,864; (1921) 35,665.

Pauillac, a port on the left bank of the estuary of the Gironde in France, 30 miles N. by W. of Bordeaux, ships the best brands of Médoc (claret) to Bordeaux. Pop. 6000.

Paul, a Cornish town, 2½ miles SSW. of Penzance. Its ancient church is recorded as having been burnt by the Spaniards in 1595. Pop. 5400.

Paul. It is probable that no man ever swayed the religious opinions and destinies of mankind so powerfully as Paul of Tarsus, the Apostle of the Gentiles. He was greater than some of the greatest servants of Christ in many single capacities; a greater preacher than Chrysostom, a greater missionary than St Francis Xavier, a greater theologian than St Thomas of Aquinum, a greater reformer than Luther, a greater organiser than St Gregory the Great. Collectively he exercised over the world a mightier influence not only than all of these put together, but even than his fellow apostles St Peter and St John. The secrets of his unparalleled success were—regarded on their human side—the secrets of all success in the field of religious effort—burning zeal, absolute self-sacrifice, undaunted courage, and a strong conviction that he was fulfilling a ministry to which he had received a special call from God.

Our chief and all but exclusive authorities for his life are the Acts of the Apostles and his own epistles. The few particulars added by Christian tradition are highly dubious, and the calumnious inventions of Talmudic malice and Ebionite heresy may be dismissed with silent contempt. Paley in his *Horæ Paulinæ* has shown with wonderful skill and originality how remarkably the credibility of St Luke's history is supported by authentic touches of autobiography, even in cases where there is a seeming and superficial discrepancy. He shows us that even the undesigned coincidences can be counted by scores. From combination of the two sources we are able to arrive at a true picture and estimate, though both are entirely fragmentary. The life of St Paul is like a manuscript of which the beginning and end are irrecoverably lost. All that we really know of his life lies in the thirty years between 36 A.D. and 66 A.D., which form its central period. We can only form slight and uncertain conjectures respecting Paul's childhood, youth, and early manhood, and respecting all that befell him after St Luke drops the curtain upon his first Roman imprisonment with the words, 'teaching with all boldness unmolestedly. But even in this central period the records are quite fragmentary. In 2 Cor. xi. 24-33, written about 57 A.D., some ten years before his death, St Paul briefly alludes to the strange and severe diversity of his trials; and yet of those which he mentions

no less than eleven specific trials are not so much as alluded to in the Acts. St Luke does not mention one of the five scourgings with Jewish thongs; only one of the three flagellations with Roman rods; not one of the three shipwrecks, though he minutely describes a fourth. He makes no allusion to the 'night and day in the deep,' and only mentions two of what Clement of Rome tells us were seven imprisonments. Nor, again, does St Luke refer to any one of the perils of watercourses, perils of robbers, perils in the wilderness, perils among false brethren, hunger, thirst, fasting, cold, and nakedness, for which we can only find places in the travels of the apostle by reproducing in imagination the character of the countries through which he made his long and toilsome journeys.

St Jerome, perhaps following a true but confused and anachronistic tradition, says that St Paul was born at Giscala in Galilee, and taken by his parents to Tarsus of Cilicia in early infancy. The conjectural date of his birth is about 3 A.D. Tarsus was at that time 'no mean city.' It was beautifully situated on the river Cydnus, and was a centre not only of political power and commercial enterprise, but also of learning and philosophy. He grew up in the midst of paganism, but was trained 'a Hebrew of the Hebrews,' in profound acquaintance with the Jewish Scriptures, and with some slight knowledge of classical literature. Being of the tribe of Benjamin, he received the famous tribal name of Saul. Tarsus was only an *urbs libera*, but in some unknown way St Paul was a Roman citizen, and it has been conjectured that his father may have been one of the Tarsians carried by Cassius to Rome, and may there have obtained the *civitas*. He was sent, probably as a boy, to relatives at Jerusalem, where in after days he seems to have had a married sister. He there became an illustrious and learned Pharisee of the famous school of the Rabban Gamaliel (q.v.), a grandson of the sweet and noble Hillel. At the feet of this eminent doctor he sat for many years, endeavouring to attain to the legal blamelessness which was the ideal of Pharisaic virtue, but which could give little satisfaction to his deepest yearnings. It was hardly wonderful that he should have imbibed the spirit of fanatical hatred against that new and immeasurable force of the gospel, which to a Pharisee seemed to involve the overthrow of all his most cherished idols and formalities. If, as he seems to imply, he had a vote in the Sanhedrin (Acts, xxvi. 10), he must have been married; and from the context of 1 Cor. vii. 8 it has been inferred that he was a widower, and remained a widower by choice (1 Cor. ix. 5). Gamaliel approved of the wise policy of toleration; but Saul, less wise herein than his teacher, was hurried by what he himself afterwards and remorsefully described as a spirit of frenzied rage (Acts, xxvi. 11) into the attitude of a most violent persecutor. He haled men and even women to prison, hunted them out for punishment through every synagogue, scourged them (Acts, xxii. 4), voted for their execution, and did his best to make them blasphemers. The persecution culminated in the martyrdom of St Stephen by stoning, and on this occasion the executioners laid their garments at the feet of Saul. Fanaticism enabled him to witness that horrible death, but he was haunted long years afterwards by the memory of the angel face (Acts, vi. 15), the light of which he had seen quenched in blood (Acts, vii. 58-60, xxii. 20; 1 Cor. xv. 9; Gal. i. 13).

When he had finished his bad work as an inquisitor at Jerusalem, and had, as he hoped, extirpated the odious sect of Nazarenes, he obtained letters of authorisation from the high-priest, and went as

commissioner of the Sanhedrin to root them out from Damascus. On his journey he met the crisis of his fate. He was, as he regarded it, arrested—apprehended by Christ, dashed to the ground, taken captive, led in triumph, branded as a slave with the stigmata of the Lord Jesus, when the dazzling vision, which outshone the Syrian noon, wrapped him as in a blinding sheet of flame, and filled him with the unalterable conviction that he had both seen and heard his risen Lord. From that moment he was a changed man. He felt that the fire of God had melted the iron sinews, and the hammer of God had shattered the stony heart. What is certain is that from that time forth the proud man became utterly humble, and the fierce persecutor a tender-hearted evangelist. The hard and self-sufficient Rabbi, abandoning for ever his national arrogance, his rabbinic wisdom, his legal scrupulosity, became thenceforth the suffering and despised preacher of an execrated faith.

It is needless to follow in detail the further narrative of the Acts or the personal indications of the epistles. Healed by Ananias of his temporary blindness, he retired for about three years to Arabia, and then returning to Damascus began powerfully to preach the gospel which he had heretofore toiled to destroy. Driven from Damascus by Jewish animosity, he contrived to escape down the city wall in a basket, and made his way to Jerusalem, where, as was natural, he was received with coldness and suspicion, until Barnabas generously intervened to remove the prejudices of the brethren. After a trance and vision in the temple, in which his future destiny was foreshadowed to him, he was driven to Tarsus by a plot to murder him, and there he stayed with his family, waiting and preparing for his work. Meanwhile the capital of Christianity was being gradually transferred from Jerusalem to Antioch, and Barnabas, realising the importance of the vast sphere of labour which was there opening before him, set out to seek Paul as his fellow-labourer. At Antioch he laboured for a year with ever-widening influence, and went to Jerusalem with Barnabas in the year 44 to carry contributions to the necessitous mother-church. Soon after his return began the first stirring of the missionary spirit, and Barnabas and Saul were set apart by divine consecration to preach Christ to the Jew first and afterwards to the Gentile. They set forth accompanied by Mark, who was the cousin (Col. iv. 10) of Barnabas, and sailed to Cyprus, where they converted the proconsul Sergius Paulus, and confounded the false prophet Elymas, by whom he had been duped. From that time Saul assumes the Gentile name of Paul. Thence they sailed to Perga, and travelled through the passes of the Taurus to the Pisidian Antioch. Driven from thence, and afterwards from Iconium, by the jealous fury of the Jews at the success of their preaching among the Gentiles, they went to Lystra, where, healing a cripple, they were at first taken for gods; but a revulsion of feeling against them was again caused by the Jews, and Paul was stoned and left for dead. It is probable that he carried with him to the grave the marks of this cruel martyrdom; but at Lystra he had the happiness of winning a young convert named Timotheus, the beloved son and companion of many later trials and travels, even to the end of his life. From Lystra they fled secretly to Derbe, and thence retraced their steps to Antioch, appointing in each place elders over the infant churches. Such was the first flight of the eagle, the first journey of Christian missionaries. It confirmed Paul in his destined work as the Apostle of the Gentiles.

Shortly after their return to the Syrian Antioch the church began to be troubled by the Pharisaic

converts, who wished to reduce Christianity to the level of a local faction by forcing on Gentile converts the crushing yoke of Jewish circumcision. It is difficult after the lapse of ages to estimate the daring courage and originality which it then required to pronounce obsolete and abrogated, and to characterise as 'weak and beggarly elements,' what all Jews regarded as the infinitely sacred and eternally inspired institutions of that Mosaic ceremonialism which had covered religion with the scurf of petty obligations indefinitely multiplied by tradition and the oral law. But Paul took this part boldly and decisively from the first and at all costs—willingly facing the obloquy heaped upon him as a renegade and a seducer of the people—he carried out to the end the indignant battle which saved Christianity from being degraded into a narrow sect and made it the universal religion of spiritual freedom. It was necessary for Paul and Barnabas to visit Jerusalem to obtain from the first church synod the decision of this great question, and the victory gained in that synod, mainly by the genius of St Paul aided by the manly convictions of St Peter, is the most momentous in the history of early Christianity. It was indeed only a partial victory in the form of a local decision; but it practically conceded the main point of issue, and enabled St Paul to enforce on reluctant Judaists the emancipation of their Gentile brethren from a host of worrying restrictions, which, if unabolished, would have been justly fatal to the spread of Christianity. How strained were the relations between the two divisions of the church we see from the fact that shortly afterwards at Antioch Paul had to rebuke even the chief of the apostles publicly for something like tergiversation, into which he had been led for a moment by fear of his Jewish co-religionists. This was never forgotten, and we see from the Pseudo-Clementine writings that perhaps a century later there were Judaising heretics who because of it dared to indulge in malignant calumnies against St Paul.

It was shortly after this memorable scene that St Paul's missionary ardour led him to propose to Barnabas another evangelistic journey. The wish of Barnabas to take with him his cousin Mark, and Paul's disinclination to admit the companionship of one who in his judgment had put his hand to the plough and looked back in the first journey, led to a sad disagreement between the two friends. This ended in a life-long separation, though much later Paul desired the presence of Mark at Rome because he found him profitable for the ministry. Paul, with Silas as his companion, went through the Cilician Gates to Derbe and Lystra. At Lystra he circumcised and ordained Timothy, who continued to be his dearest companion for many years. Thence they went through Phrygia and Galatia, preaching and founding churches. In Galatia Paul had a severe illness, in which he was cheered by the bright enthusiasm of his Galatian converts. Thence, by providential intimation, they were led to Troas, and there St Paul was joined by St Luke, and saw the vision of the 'man of Macedonia,' which led to the momentous decision to carry the gospel into Europe. They sailed to Neapolis, and were received at Philippi by the generous hospitality of Lydia. The church here founded was the most beloved by St Paul of all his infant communities. The healing of the girl with 'a spirit of divination' led to an uproar, in which Paul and Silas were unjustly and illegally scourged and imprisoned. An earthquake in the night alarmed the Philippian prætors, and the two prisoners, who had converted their gaoler, were honourably dismissed. They went to Thessalonica, and founded another church, where Paul, who was

generally able to support himself by his trade of tent-maker, was aided by the generous Philippians. Another riot, stirred up by Jewish jealousy, compelled their flight to Beroea, from which St Paul was again driven by Jewish machinations, and made his way to Athens. He preached on the Areopagus amid the jeers of Stoics and Epicureans, but won some important converts, and proceeded to Corinth. There, with the aid of his fellow tent-makers, Aquila and Priscilla, he founded an important church; but another riot arose in which both Jews and Greeks were involved, which was treated with disdainful indifference by the proconsul Gallio, the brother of Seneca.

After a stay of some months at Corinth, he revisited Jerusalem (his fourth visit), touching at Ephesus on the way. After saluting the church at Jerusalem he went back to Antioch, whence, after a period of rest, he started on his third great missionary journey. He confirmed the churches of Galatia and Phrygia, and then went to Ephesus, where he made a full convert of the eloquent Apollos, and stayed for two years. The immense success of his preaching led to the riot of the silver-smiths in the theatre. Compelled to fly, he made his way to Troas and retraced his steps through Macedonia as far as Illyricum, and thence to Corinth. It was during this period that he wrote his most important group of epistles. He was greatly occupied also in raising a contribution for the perennial destitution of the mother-church at Jerusalem, which was taken thither by chosen delegates of the contributing churches. A sudden plot of the Jews to murder him compelled him to return through Macedonia. He spent the Passover with Luke at Philippi, sailed to Troas, where he raised Eutychus from death, and then among the isles of Greece to Miletus, where he had an affecting parting with the elders of the Ephesian Church. A voyage past Coos, Rhodes, and Patara brought him to Tyre, where he was warmly welcomed by the church, and parted from them in prayer on the seashore. At Cæsarea he stayed in the house of Philip the Evangelist, and thence, in spite of the warnings of the prophet Agabus, went up to Jerusalem for his fifth visit. He was the guest of Mnason of Cyprus, and was received by James, the Lord's brother, and the elders, to whom he handed over the Gentile contributions, in accordance with the old instructions of the synod of Jerusalem, 'to be mindful of the poor.' Afraid that his presence in the Holy City might arouse tumults among the Jewish fanatics, St James suggested to him that he should take a share in the expenses of a Nazarite vow. The suggestion turned out unfortunately. He was recognised in the Court of the Women, and charged with having taken Trophimus, a Gentile Ephesian, into the temple. He was rescued from the brutal fury of the mob by the chief captain Lysias, who, taking him for an impostor, was on the point of having him scourged, when he discovered that he was a Roman citizen. Under the protection of the Romans he was tried before the Sanhedrin, but threw the assembly into a tumult by taking advantage of the rivalry between the Pharisees and Sadducees. Amid these perils a vision assured him that he should yet preach the word in Rome. Discovering that forty Jews had bound themselves under a curse to assassinate Paul, Lysias sent him to the procurator Felix at Cæsarea. He was tried before Felix, and made a deep impression; but, as he had no money to bribe the avaricious governor, he was left two years in prison. He was then tried afresh by the fair and energetic Festus, who also gave him an opportunity of pleading his cause before King Agrippa II. and Berenice. Weary, however, with the long and unjust detention, he had appealed to Cæsar, and

Festus sent him, in charge of the centurion Julius, to Rome. St Luke, who, with Aristarchus, was his companion, gives us a minute account of the voyage to Myra, and thence in an Alexandrian wheat-ship to Crete, where they lay windbound at Fair Havens. Continuing the voyage in spite of Paul's warning, the crew were caught in a cyclone called Euro-aquilo, and the ship, in spite of undergirding and every other precaution, became a complete wreck. Amid the despair and misery of all on board, St Paul, comforted by a vision, assured them of their safety, and though the vessel finally became a total wreck at Ras el Koura, in Malta, every life was saved. At Malta he waited three months for another ship. He was held in great honour by the barbarous natives because he had shaken a viper off his hand unhurt, and healed the father of Publius, the Protos of Malta. The prisoners were taken to Italy on board the *Castor and Pollux*, and landed at Puteoli, proceeding by land to Rome. Paul was met by Christian brethren at Appii Forum and the Three Taverns, and went along the Appian Road to the capital, where he was handed over to the *observatio* of Afranius Burrus, the prætorian prefect. For two years he continued a prisoner at Rome, and, as the Jews refused to accept his preaching, he did what he could to make the gospel known to the Gentiles, gaining converts even among the prætorian soldiers and the slaves of Cæsar's household, and being suffered to live in his own hired apartment, under the supervision of the soldiers. From the pastoral epistles we securely infer that his trial ended in a complete acquittal. His next movements are uncertain, but we find traces of his probable visits to Colossæ, Crete, and Nicopolis, and of his final arrest in the house of Carpus at Troas. He seems to have been tried and imprisoned at Ephesus, and again sent to Rome. Meanwhile the Neronian persecution had broken out, and his second imprisonment, in which nearly all deserted him, was far more imperilled and miserable than the first.

At his first trial—perhaps before Nero in person—he seems to have been remanded; but at a second trial we learn from unanimous Christian tradition that he was condemned to martyrdom, probably, as he was a Roman citizen, by decapitation. His 'trophy,' or martyr's memorial, was a familiar object in Rome in the 2d century, but his death was so lonely and unrecorded that not even tradition has preserved a single trustworthy detail respecting it. All that we can see from his last writings is that he remained heroic, indomitable, cheerful, faithful to the end, never doubting, amid an apparent failure which the world might well have regarded as absolute, that the hundredfold harvest of eternity would spring up from the grain which he had sown in tears. Yet it is unlikely that even he, on this side the grave, was at all able to estimate the far-reaching grandeur and many-sidedness of the work which it had been given him to do. He had set an example of lifelong zeal and devotion in the willing endurance of numberless perils and privations, such as has never been equalled, much less surpassed; and he had done this with a mind acutely sensitive to the blasts of hatred which came to him from every region of the Jewish and Gentile world, and with a body weakened by chronic disease. He had formulated the language and systematised the doctrines of theology. He had saved the gospel from dwindling into a Pharisaic Judaism, and had established for ever its freedom from the yoke of priestly and ceremonial bondage. He had carried the faith over a vast extent of Asia from Jerusalem to Antioch, to Ephesus, to Macedonia, to Athens and Corinth, to Rome, and perhaps even 'to the farthest limit of the west.' He had been the founder

of many flourishing churches. He had written epistles of various orders, of which even the most casual is 'weighty and powerful,' and which constitute him one of the greatest moral and spiritual teachers whom the human race has ever seen.

It only remains to glance at these epistles. They are thirteen in number, and fall into four well-marked chronological and doctrinal groups. The first group (1, 2 Thess., written 52-53 A.D., during the second missionary journey) are mainly eschatological, and represent St Paul's earliest stage of thought. The second group, written during the third missionary journey, may be called broadly epistles of Judaic controversy. 1 Corinthians (written at Ephesus in 57) is mainly polemical and ecclesiastical. 2 Corinthians (written at Philippi in 58?) is the apostle's *Apologia pro Vita Sud.* Galatians and Romans (written at Corinth in 58) are mainly doctrinal and soteriological. The third group are the epistles written during St Paul's first imprisonment at Rome. Philippians (62) is personal and ethical. Colossians and Ephesians (63) are Christological, Ephesians being especially the epistle of the ascension. Philemon is an exquisite personal epistle, the first charter of emancipation, and was written (63) as a sort of annex to the Epistle to the Colossians. The fourth group contains the pastoral epistles of St Paul's closing years. 1 Timothy and Titus may have been written in Macedonia about 66, 2 Tim. about 67 in Rome.

They may also be classified according to their forms, as (1) Circular letters to the churches (Eph. and Romans), which are rather treatises than letters; (2) Letters to special churches, or little groups of churches (1 and 2 Thess., 1 and 2 Cor., Philippians, Col., and Gal.); (3) Letters to friends (Philemon, Titus, 1 and 2 Tim.).

The genuineness of some of these epistles has been fiercely contested. Four (1 and 2 Cor., Gal., and Romans) are absolute *homologoumena*, of which not even the school of Tübingen questioned the genuineness; but they regarded 1 and 2 Thess., Philippians, Ephesians, Colossians, and Philemon as *antilegomena*, of uncertain authenticity, and the three pastoral epistles as spurious. The Christian church has amply met the arguments against the authenticity of all the epistles, and even Renan only rejects the pastoral epistles, and that mainly on historic and chronological grounds, because with many others he holds that St Paul perished in the Neronian persecution in 64 A.D.

The mission of St Paul was fourfold. Had he done nothing more than set the world an example of saintly self-sacrifice, his work would have been sufficiently memorable to make him immortal; but besides this he was a missionary, a moralist, a reformer, and a theologian.

(1) Of his missionary work we have spoken, and have shown that to him pre-eminently belongs the honour of having made known the gospel to the civilised world around the basin of the Mediterranean; so that before his death the Christians had grown from a little community of 120 Galileans in an upper room at Jerusalem into a number of flourishing Asiatic and European churches, and even in that early day Christ had His followers in the Prætorian camp at Rome, and in Cæsar's household.

(2) As a moralist St Paul laid down, with incomparable clearness, the relations of ethics to the gospel, and the secret of the loftiest moral standard as rendered possible by the new life. No moralist before him had more distinctly illustrated the eternal principles taught by Christ, by showing their bearing on the simplest concrete duties of life. To take but one example—no moralist ever dealt with the duty of purity, so universally

ignored in the ancient civilisations, with such unrivalled delicacy yet with such absolute precision. By insisting on the new truth, 'Know ye not that your bodies are the temples of the Holy Ghost, who dwelleth in you?' he placed chastity on a wholly new basis, and contributed indefinite force and meaning to Christ's elucidation of the duties implied in the seventh commandment as extending even to the thoughts of the heart.

(3) As a reformer St Paul not only relieved the world from that yoke of petty Levitic observances which even St Peter pronounced to have been intolerable, but he emancipated all true religion from the burden of external Pharisaic restrictions, from all oral laws and traditions of the elders, and ecclesiastical tyrannies of ceremonialism, and all terror of humanly-invented sins. He was the divinely-appointed champion of the principle 'Ye shall know the truth, and the truth shall make you free.' This is the keynote of one of his most important epistles—that to the Galatians—in which he alludes no less than eleven times to the privilege and duty of 'standing fast in the liberty wherewith Christ hath made us free' (Gal. ii. 4; iii. 28; iv. 22, 23, 26, 30, 31; v. 1, 13). Hence this epistle powerfully swayed Wyclif, Huss, Savonarola, Luther, Tyndale, Wesley, and all great religious reformers. The truths which Luther learned from it became in his hands the instrument for the deliverance of the church from the tyranny of Rome. 'The Epistle to the Galatians,' he said, 'is my epistle. I have betrothed myself to it. It is my wife.' Bengel calls this epistle 'the sum and marrow of Christianity,' and says of v. 1-6 'in these stands all Christianity.'

(4) In the Epistle to the Galatians we also find the germ of that great doctrinal system which makes St Paul the chief founder of Christian theology. In the doctrinal section of the epistle (iii. 1-iv. 30) he had proved the doctrine of our justification by faith. He had shown that justification is not attainable by outward ordinances. His proofs had been drawn from the Christian consciousness (iii. 1-5), from the Old Testament (iii. 6-18), and by establishing the secondary position of the law both objectively (iii. 19-29) and subjectively (iv. 1-18). In the Epistle to the Romans, which was probably a circular treatise, sent round with different appendices of personal greetings to various churches, the theme of justification is more systematically worked out. The keynote of that epistle is the recurrent word *all*, as illustrative of the spiritual universality of the gospel to meet the universality of man's need for the gospel. In this epistle the four main positions are (1) all are guilty before God; (2) all need a saviour; (3) Christ died for all; (4) we are all one body in Him. In Adam all are equally guilty (i. 18-iii. 20), in Christ all are equally redeemed (iii. 21-30). The grand fundamental theme of the epistle is given in Rom. i. 16, 17. It is stated not as a *doctrine* of sin, or a *theory* of imputations, or a theological shibboleth, but as a momentous practical truth. The elements of that great summary are (1) justification; the righteousness of God imputed to man; (2) faith; man's belief, rising first to self-surrender, then to mystic union with Christ, which becomes the germ of a new life in the heart; (3) this plan of salvation by free grace is offered gratuitously to all; (4) the object of this faith is Jesus Christ, whose life and death are for man a ransom and a propitiation; (5) Christ's sacrifice was necessary as a vindication of God's righteousness in the premission of past sins; (6) the end to be obtained was that God might justify every man whose root of life is faith in Christ.

St Paul dwelt therefore on three cardinal points—the Grace of God, the Redemption of Christ,

the Faith of Man. Luther rediscovered this truth theoretically by reading the epistles to the Romans and Galatians in the library of his monastery at Erfurt, experimentally by the facts of his own religious life. Wesley learned it, partly from the Moravians, and partly from Luther's commentary on the Galatians, after his return from Georgia. But this cardinal doctrine of justification by faith is ignorantly misunderstood and perilously misinterpreted when faith is confused with mere belief. Hooker (*Eccles. Pol.* I. xi. 6) long ago corrected this error; and of recent critics, both Baur (*Paul*, ii. 149) and Pfeiderer (*Paulinismus*, sect. 5) have given the true meaning of St Paul. Baur shows how faith, beginning in hearing, and becoming faith in *Christ* (Gal. ii. 16, iii. 26), and more especially in *Christ's blood* (i.e. the communication to man of His essential life, Rom. iii. 24-27), becomes more intense as it narrows from stage to stage, and passes from theoretic consent to dominant conviction. Pfeiderer shows that there are ascending degrees and qualities of faith, passing from *dead* faith, which produces no works, and theoretic persuasion, then into faithfulness and moral surrender, and then into *mystic union with Christ*, which does not remain receptive, but becomes the spirit of life—a living power and impulse (1 Cor. vi. 17), so that, in its true sense, as Luther says, 'Faith is a divine work in us, which changes us and creates us anew in God.' The modern sense of faith as a body of doctrines (the faith) may, in this connection, be left out of sight altogether, since the word is only thus used in the Pastoral Epistles.

(5) But complete as is St Paul's statement of this central doctrine, which he characterised as *his* gospel (Rom. ii. 16, xvi. 25; Gal. i. 7, ii. 2; 2 Tim. ii. 8)—complete, that is, so far as we can give such a title to truths which touch, on every side, upon insoluble mysteries—we are thankful that the same essential truths are represented in a less controversial and more directly spiritual form in the epistles of the captivity—those especially to the Ephesians and Colossians. The mind of St Paul—as we see at once when we read his epistles in chronological order—was not only intensely susceptible to surrounding conditions of life and controversy, but was also one which was constantly in a state of growth and progress. The theodicy which he had been led to formulate in the 'storm and stress' of Judaic controversy assumed larger, richer, less rigid and antagonistic forms when he had to wean the infant church from the dangerous glamour of incipient Gnostic heresies. Olshausen calls the epistles to the Romans and Galatians soteriological—i.e. they contain, so to speak, the philosophy of the plan of salvation; and the epistles to the Colossians and Ephesians Christological—i.e. they insist on the immediate relation of the soul and of the church to Christ. The epistles are closely connected, though that to the Colossians is less exquisite and gracious than that to the Ephesians, which may well be called the Epistle of the Ascension, the Epistle of 'the heavenlies.' The idea of the Epistle to the Colossians is 'Christ all in all,' and its moral is summed up in the words 'Walk in Him, in Him alone.' The idea of the Epistle to the Ephesians is Christ in the universal church. In the Epistle to the Romans the doctrine of salvation is set forth psychologically. It is built on the moral facts of the universality of sin, the insufficiency of man, the justification of the believer by union with Christ. In the later epistles the statement of the doctrine is theologic. Christ is set forth as the central being of the universe, and we see God's eternal plans realised by the unity of redeemed humanity in Christ with the family of heaven in the heavenlies.

Round these central truths all the other views of St Paul are crystallised. The fierce disputes in which rival dogmatists—St Augustine and Pelagius, the Jesuits and Jansenists, the Calvinists and Arminians, and many others—have combated over his opinions arise from the futile attempt to systematise exorbitant inferences drawn from isolated phrases, to build upon their apexes inverted pyramids of argument, to obscure the whole heaven of Christianity with smoke made to issue 'from the narrow aperture of single texts.' Such attempts must always fail. St Paul's letters were *écrits de circonstance*; they were fragmentary; they were the outcome of the special conditions with which they immediately dealt. St Paul 'never recoils before a paradox; he never cares to remove an apparent contradiction; he knew that truths which apparently contradict others are often complementary truths; he leaves side by side the apparent antinomies which arise from the contact of finite reason with infinite truth. He was well aware that when reason steps beyond the limits of experience it comes into collision with mysteries not only insoluble, but apparently opposite to each other.'

The preceding statement represents the orthodox Protestant view.

The literature bearing on St Paul is vast in extent; the following are merely the names of some of the more important books: (1) LIFE.—K. Schrader, *Der Apostel Paulus* (1830-36); Neander, *Gesch. der Pflanzung u. Leitung der christl. Kirche durch die Apostel* (vol. i. 1832; Eng. trans. 1851); F. C. Baur, *Paulus der Apostel Jesu Christi* (1845; 2d ed. by Zeller, 1866; Eng. trans. 1873-75); A. Hausrath, *Der Apostel Paulus* (1865; 2d ed. 1872); Ch. F. Trip, *Paulus nach der Apostelgeschichte* (1866); Renan, *Les Apôtres* (1866) and *Saint Paul* (1869); F. Bunge, *S. Paul, sa Vie, son Œuvre, ses Épîtres* (1867); M. Krenkel, *Paulus, der Apostel der Heiden* (1869); W. J. Conybeare and J. S. Howson, *The Life and Epistles of St Paul* (1852); F. W. Farrar, *The Life and Work of St Paul* (1879); Lewin, *The Life and Epistles of St Paul* (1851; new ed. 1874); and works by Stalker, Sir W. M. Ramsay, Bousset, Weinel, Wrede, Wernle, Cone (1898), Clemen (1904).

(2) THEOLOGY.—Ritschl, *Die Entstehung der altkatholischen Kirche* (2d ed. 1857); A. Sabatier, *L'Apôtre Paul* (1870; 2d ed. 1881); K. Holsten, *Zum Evangelium des Paulus u. Petrus* (1868), and *Das Evangelium des Paulus dargestellt* (1880 et seq.); R. Schmidt, *Die Paulinische Christologie* (1870); O. Pfeiderer, *Der Paulinismus* (1873; 2d ed. 1890; Eng. trans. 1877), and *Hibbert Lectures* (1885); Ernesti, *Die Ethik des Apostels Paulus* (1868; 3d ed. 1880); J. H. Scholten, *Das Paulinische Evangelium* (1881); A. B. Bruce, *St Paul's Conception of Christianity* (1894); G. B. Stevens, *The Pauline Theology* (1892); Garvie, *Studies of St Paul and his Gospel* (1912); W. Morgan, *The Religion and Theology of Paul* (1918); T. R. Glover, *Paul of Tarsus* (1925); also the general works on the theology of the New Testament by Schmid, Baur, Weiss, Oosterzee, and others.

The Tübingen theory of the sharp difference between the Pauline and Petrine parties was maintained by Baur (q.v.), Holsten, Zeller, and Scholten. Many modern expositors lay great stress on the apostle's confident (eschatological) expectations of the immediate second coming of Christ; Prof. Percy Gardner (*The Religious Experiences of St Paul*, 1911), and Prof. Kirsopp Lake (*The Earlier Epistles of St Paul*, 1911) are more concerned with the influence of the Greek mysteries on St Paul's doctrine of sacraments, and on St Paul's disciples.

At the beginning of the Christian era, the deities, whose worship was a power amongst the middle and lower classes of the empire were not the official gods of Rome or of Greek poetry, but those of the 'mystery' religions of Eastern origin now wide spread in the empire, deities like Mithras, Cybele, and Isis. The mystery religions widely differing in detail, agreed in holding out the offer of happiness in this world and salvation in the next to all who by initiation into their sacraments joined in the risen life of a Redeemer God, and thus secured a knowledge of the great secret which would guard the initiated when he passed through the gate of death, and bring him safe to the eternal life on which his faith was fixed.

Paul's Greek hearers would from his doctrine of the significance of Christ's death inevitably equate the Lord he preached with the Redeemer Gods of the mystery religions. Albert Schweitzer in *Paul and his Interpreters* denies *in toto* Pfleiderer's contention that Pauline teaching was a blend of the Old Testament with Hellenism: there is, he says, no Hellenism in Paul. He knew Greek and used the Septuagint, but cared nothing for the phraseology, the problems, the ethics of Hellenism. Schweitzer dismisses with great disrespect the views of Loman, Steck, and Van Manen, who refuse to acknowledge the Pauline authorship of any single epistle in the New Testament, because of the Hellenism that mark them. Schweitzer denies with equal energy the influence of the 'mystery-religions' on Paul; in the form in which we know them they are later than his time. There is a large element of mysticism in Paul, but it comes from Judaism, and in the shape it took before it became Rabbinitism and before it had been deeply affected, as it ultimately was, by the Oriental religions. Paul was the child of Jewish apocalyptic; his teaching is in line with the Jewish Son of Man Messiah. Paul's eschatology, like that of the Apocalypses of Ezra and Baruch, seems to represent a movement of Rabbinitism of which otherwise we have no record. Deissmann's *St Paul* (1912) insists that Paul should be treated as a religious, not as a theological genius, and that a key-note of his teaching is mysticism centred in Christ (the phrase 'in Christ' occurring 174 times in Paul's epistles). See also the relevant parts of the *Introductions* of Bleek, Weiss, S. Davidson, Salmon, Holtzmann, &c.; and especially the works devoted to the *Acts*; also McGiffert, *The Apostolic Age* (1897), and Weizsäcker, *Das apostol. Zeitalter der christl. Kirche* (1886). See also the countless Commentaries on the individual epistles of St Paul, the names of which will be found under the special articles thereon. Of these may here merely be mentioned, as masterpieces in their kind, those of Godet on *Romans* and *Corinthians*, and Lightfoot on *Philippians*, *Galatians*, *Colossians*, and *Philemon*.

Noteworthy articles on St Paul are those in the Hauck-Herzog *Realencyklopädie*, the *Encyclopædia Biblica*; Hastings's *Dictionary of the Bible*, and *Dictionary of Christ and the Gospels*; the *Encyclopædia Britannica*; the *Catholic Encyclopædia*; and (for contrast) the *Jewish Encyclopædia*. See the article CHRISTIANITY in the present work, and the several articles on the epistles of St Paul and those credited to him; as also BIBLE, JESUS, LORD'S SUPPER.

Paul was the name of five popes. PAUL I. (757-767) and PAUL II. (1464-71) were unimportant. PAUL III., Alessandro Farnese, reigned from 1534 to 1549, during a very critical period for the papacy. He was born at Carino in Tuscany in 1468, and was created cardinal-deacon in 1493 by Alexander VI., who had illicit relations with his sister. He showed great powers of diplomacy, and on the death of Clement VII. in 1534 was elected pope. One of his first acts was to give cardinals' hats to two of his boy-grandsons, and throughout his reign he laboured to advance his sons; but his ambitious schemes to secure Parma and Piacenza to the debauched Pietro Luigi were at length frustrated. Yet in other respects he was a wise pontiff, and he had the prudence to surround his throne with good cardinals like Contarini, Pole, and Sadolet. He convoked a general council to meet at Mantua in 1542, but it did not actually assemble (in Trent) until 1545. The bull of excommunication and deposition which he issued in 1538 against Henry VIII. of England is a late example of the exercise of the temporal power claimed by the mediæval popes. The bull instituting the order of the Jesuits (1540) is important as marking the beginning of the Roman counter-reformation. In the contest of Charles V. with the Protestant League in Germany Paul sent a large force to support the emperor, and he opposed the pacification proposed by him upon the basis of the Interim. And in the struggle between the emperor and Francis I. he tried to trim in order to save the peace of Italy and the interests of his bastards. He died suddenly, November 10, 1549.

PAUL IV., named Giovanni Pietro Caraffa, a member of the noble family of that name, was born in Naples in 1476. His early career was distinguished for ascetic rigour. He was appointed Bishop of Chieti, in which see he laboured most earnestly for the reformation of abuses, and for the revival of religion and morality. With this view he established, in conjunction with several congenial reformers, the congregation of secular clergy called Theatines, and was himself the first superior. He showed himself the most rigorous enemy of heresy, and it was under his influence that Paul III. organised the tribunal of the Inquisition in Rome. On the death of Marcellus II. in 1555, although in his seventy-ninth year, he was elected to succeed. He enforced vigorously upon the clergy the observance of all the clerical duties, and enacted laws for the maintenance of public morality. He established a censorship, was the first to issue a full official *Index librorum prohibitorum*, and completed the organisation of the Roman Inquisition; he took measures for the alleviation of the burdens of the poorer classes, and for the better administration of justice, not sparing even his own nephews, whom he banished from Rome on account of their corrupt conduct and profligate life. His foreign relations, too, involved him in much labour and perplexity. He was embroiled with the Emperor Ferdinand, with Philip II. of Spain, with Cosmo, grand-duke of Tuscany. Under the weight of so many cares his strength gave way, and he died, August 18, 1559. His severity had been hateful to the Roman citizens, who hailed the news of his death with delight.

PAUL V., originally named Camillo Borghese, was born in Rome in 1552. In his early life he was a distinguished canonist and theologian; and, after the ordinary prelatical career at Rome, he rose first to the post of nuncio at the Spanish court, and afterwards to the cardinalate under Clement VIII. On the death of Leo XI. in 1605 Cardinal Borghese was elected to succeed him. His pontificate is rendered memorable by the celebrated conflict with the republic of Venice, into which he was plunged at the very outset of his reign. The original ground of dispute was the question of the immunity from the jurisdiction of civil tribunals conceded to the clergy, who claimed to be tried by ecclesiastical tribunals alone. This claim the senate resisted; and further causes of dispute were added by a mortmain law, and a law prohibiting the establishment of new religious orders or associations unless with the sanction of the senate. Each party remaining inflexible in its determination, Paul issued a brief, directing a sentence of excommunication against the doge and senate, and placing the republic under an interdict, unless submission should be made within twenty-four days. The senate persisted, and an animated conflict, as well of acts as of writings, ensued, in the latter of which the celebrated Fra Paolo Sarpi, on the side of the republic, and on the papal side Bellarmine and Baronius were the leaders. By the intervention of Henry IV. of France the dispute was accommodated in 1607, but not until the pope had been compelled to abandon his claims. Paul's administration was vigorous on behalf of orthodoxy, and he did a great deal for the promotion of useful public works, for the embellishment of the city, the restoration and preservation of antiquities, the improvement of the museums and libraries, and, above all, for the pious and charitable institutions of Rome. Paul died January 28, 1621, and was succeeded by Gregory XV. See T. A. Trollope's *Paul the Pope*, and *Paul the Friar* (1860).

Paul, emperor of Russia, the second son of the unfortunate Peter III. and the Empress Catharine II., was born October 2, 1754, became

heir-apparent on the death of his elder brother in 1763, and succeeded his mother on the imperial throne in 1796. The tragical death of his father when he was still a child, and his mother's neglect, exerted a baneful influence on the character of Paul, who was kept in seclusion while Catharine and her favourites governed. His earliest measures were the exile of his father's murderers, and the pardon of Polish prisoners, including Kosciusko. But he soon revealed his capricious and violent temper, as well as his lack of capacity, and irritated all classes of his subjects by vexatious and imperious regulations. Not less unhappy and variable was his foreign policy. After beginning with an attitude of neutrality in the war between France and the rest of Europe, he suddenly declared in favour of the allied powers, and sent an army of 56,000 men under Suvorov into Italy. Encouraged by his success, he despatched a second army of equal strength to co-operate with the Austrians, but its defeat in 1799 induced him to recall Suvorov; whereupon he retired from the allied coalition without giving any reason, quarrelled with England, and entered into a close alliance with the First Consul Bonaparte. Paul now concluded a convention with Sweden and Denmark for the purpose of opposing the right insisted on by England of searching neutral vessels, with the result that the English government sent a fleet into the Baltic under Nelson to dissolve the coalition, at the close of March 1801. He was about to help the Danes, when a conspiracy was formed against him at St Petersburg. Among the conspirators were Count Pahlen, General Bennigsen, and other distinguished officers, and their aim was originally only to compel Paul to abdicate; but a scuffle arose in which the emperor was strangled, 24th March 1801. See life by Waliszewski (trans. 1913).

Paul, CANONS OF ST. See BARNABITES.

Paul OF SAMOSATA, the Socinus of the 3d century, was born at Samosata on the Euphrates, capital of a district of Syria, and in 260 became bishop or patriarch of Antioch, the most important see of the East. Antioch then belonged to the Palmyrene kingdom, and Paul was practically the vicegerent of Queen Zenobia, from whom he received support in the maintenance of his heresy. This was monarchianism—the doctrine that Father, Son, and Holy Ghost are the one God, and that the Father has from all eternity produced the Logos, who is his Son, but is rather an attribute than a person. Antioch being recaptured by Aurelian in 272, Paul's enemies procured his deposition by the heathen emperor; but his doctrines survived, and he had followers, Paulianists or Samosatenians, till the 4th century.

Paul, VINCENT DE. See VINCENT DE PAUL.

Paula. See FRANCESCO DI PAULA.

Paulding, JAMES KIRKE, an American author, was born in Dutchess county, New York, August 22, 1779. Self-educated, he early showed a tendency to literature, and, being a friend of Washington Irving, wrote a portion of *Salmagundi*. During the war of 1812 he published the *Diverting History of John Bull and Brother Jonathan*; and in 1814 a more serious work, *The United States and England*, a defence against articles in the *Quarterly Review*. This gained him an appointment on the Board of Naval Commissioners. He still continued to write minor satires and humorous sketches, and in 1831 published the very successful novel, *The Dutchman's Fireside*, and in 1832 *Westward Ho!* which attained to a similar popularity. These were followed by a popularly written *Life of Washington* (1835), and *Slavery in the United States* (1836), in which the institution is defended on social, economical, and physiological grounds. In 1837

Van Buren appointed him Secretary of the Navy. Four years later he retired to a country residence at Hyde Park, New York state, where he died, April 6, 1860. The well-known patter lines, 'Peter Piper picked a peck of pickled peppers,' &c., occur in his satirical novel *Koningsmarke* (1823). Four vols. of his *Select Works* were edited by his son (New York, 1867-68).

Pauli, REINHOLD, a no less learned than genial historian of England, was born in Berlin, 25th May 1823, studied at Bonn, next paid a long visit for purposes of study to England and Scotland, spent the year 1848 at Oxford, and acted from 1849 till 1852 as private secretary to Bunsen. In 1855 he returned to Germany and habilitated at Bonn, whence he was called to a chair at Rostock in 1857. He obeyed a call to Tübingen in 1859, but during the war of 1866 he was punished by being sent to the little seminar at Schönthal for an article on the policy of Württemberg in the *Preussische Jahrbücher*. But he soon left this place, and was appointed to a chair at Marburg in 1867, at Göttingen in 1870. He died at Bremen, 3d June 1882. Pauli's life-long studies were devoted to English history. His excellent book on Alfred (1851; Eng. trans. 1852) induced Lappenberg to commit to him the task of continuing the *Geschichte von England* in the great series of Heeren and Uckert. Pauli's part (vols. 3-5, Gotha, 1853-58) begins with Henry II., and comes down to the accession of Henry VIII., and remains one of the best histories of mediæval England.

Paulicians, a heretical Eastern sect, who owe their name to their peculiar reverence for the apostle Paul and his writings; but they called themselves 'Christians' only. Their founder was Constantine of Mananalis, near Samosata, who founded his first congregation at Cibossa in Armenia about 660. He was put to death by the emperor's order in 687, his successor, Titus, in 690; whereupon the adherents of the sect fled to Episcari under the Armenian Paul as leader. Later heads were Sergius, who carried them from the persecutions of Leo the Armenian to Argæum in Saracen Armenia; Karbeas, who built the cities of Amara and Tephrica for the remnant saved from the Empress Theodora's merciless severity, and Chrysocheres, on whose defeat by an army of the Emperor Basil they were utterly crushed. In 970 some of their remnants were transferred by the Emperor John Tzimiskes to Philippopolis in Thrace; a century later great efforts were made for the conversion of these, and the new city of Alexiopolis was built opposite for the converts. The sect, called *Popelicans* by Villehardouin, continued to exist in Thrace into the 13th century. And it has been affirmed that remnants survived at Philippopolis and in Bulgaria into the 19th century. The Cathari (q.v.) and Bogomili (q.v.) were similar or related sects.

The only Scriptures which they accepted were the four Gospels, fourteen Epistles of Paul, the three Epistles of John, James, Jude, and an Epistle to the Laodiceans. They rejected the title of *Theotokos*, refusing all worship to the Virgin, as well as any reverence to the symbol of the cross, and even the outward administration of the Lord's Supper and baptism. Photius, Petrus Siculus, and others identified them erroneously as a branch of the Manichæans; and the statement heretofore accepted that they maintained, like the Manichæans, a dualistic system (the Evil Spirit being the ruler of the visible universe) is denied by Conybeare, who affirms them to have been simply Unitarians, holding Christ to have been one with the Holy Ghost, and a creature. Gieseler and Neander connected them with the Gnostic Marcionites.

See the Church Histories of Gieseler and Neander F. Schmidt, *Hist. Paulic. Orientalium* (Copen. 1836); Lombard, *Pauliciens, Bulgares, et Bons-hommes* (Geneva, 1879); Ter-Mikrttschian, *Die Paulicianer* (Leip. 1893); and F. C. Conybeare's translation of *The Key of Truth: the Manual of the Paulician Church of Armenia* (1898).

Paulinus, missionary to Northumbria, counted as first Archbishop of York, was a native of Rome. He was sent on his mission by Gregory in 601, and first laboured under Augustine in the evangelisation of Kent. By the third of Augustine's successors, Justin, fourth Archbishop of Canterbury, he was consecrated bishop in 625, when he accompanied Ethelburga on her marriage to the still heathen Edwin, king of Northumbria. For a long time he made no progress in his mission beyond baptising the infant princess; but at length a great gathering was held at Goodmanham, near York, to consider the matter, and in consequence Edwin and his court submitted to baptism at York, in a wooden chapel dedicated to St Peter, the foundation of the Minster, Easter Sunday 627. Paulinus now carried the gospel over Northumbria, but after six years' constant labour the death of Edwin in battle at Hatfield put a sudden end to his work. He did not wait for the honour of martyrdom, but went back with the widowed queen to Kent. In the year 634 he received the *pallium* as Archbishop of York from Rome, but he never returned, dying in 644. See Hunt's *English Church*, vol. i. (1899), and Plummer's *Bede* (1896).

Paulinus, St, of Nola (353-431), born at Bordeaux, was *consul suffectus* there, was baptised in 389, and, settling at Nola, lived an ascetic life, becoming bishop in 409. He left epistles, *Carmina*, and other poems.

Paulownia, a genus of trees belonging to the Scrophulariaceæ, natives of China and Formosa, *P. tomentosa*, naturalised in Italy, &c., and cultivated in Europe, America, and Japan, has large panicles of purplish flowers. It is the badge of the imperial family of Japan. See ORDERS OF KNIGHTHOOD.

Paul's, St. See LONDON, and for the school ST PAUL'S.

Paulsen, FRIEDRICH (1849-1908), born at Langenhorn in Sleswick, became in 1878 professor at Berlin. He accepted and developed the psychophysik of Fechner, and wrote largely on the theory and history of education, on the development of the Kantian system, as well as an introduction to philosophy and an excellent manual of ethics.

Paulus, ÆMILIUS. See ÆMILIUS, GREECE.

Paulus, HEINRICH EBERHARD GOTTLÖB, one of the pioneers of German rationalism, was born at Leonberg near Stuttgart in 1761, studied at Tübingen, travelled in England, Holland, and France, and was called in 1789 to the chair of Oriental Languages at Jena, which he exchanged in 1793 for that of Theology. There he produced his laborious but little read *Philologisch-kritischer und historischer Commentar über das Neue Testament* (4 vols. 1800-4); *Clavis über die Psalmen* (1791); *Clavis über den Jesaias* (1793). In 1803 he accepted the chair of Theology at Würzburg, next filled scholastic offices at Bamberg, Nürnberg, and Ansbach, and in 1811 the chair of Church History at Heidelberg. There he died, 10th August 1851. Of his numerous works the most important were his *Leben Jesu, als Grundlage einer reinen Geschichte des Urchristenthums* (2 vols. 1828), and *Exegetisches Handbuch über die drei ersten Evangelien* (3 vols. 1830-33). His chief critical principle is an assertion of the impossibility of the supernatural, and the miracles of Christ he therefore explained as due to a variety of mistaken opinions and errors in narration. Paulus lived long enough to see his own rationalistic theory of Scripture give place to the more

scientific mythical theory of Strauss, and that in its turn shaken to its foundations on the one hand by the Tübingen school, on the other by Neander and his school.

See his own autobiographical *Skizzen* (1839), Reichlin-Meldeg's *Paulus* (1853), Pfeiderer's *Theology since Kant* (1890), and the article in Herzog-Hauck.

Paulus Ægineta, a celebrated Greek physician, was born in the island of Ægina, and flourished most probably during the conquests of the calif Omar in the 7th century. Of his life we know almost nothing more than that he pursued his medical studies first at Alexandria, and afterwards in Greece and other countries. He had much knowledge and skill in surgery and obstetrics, and his *Synopsis of the Medical Art* has gone through many editions both in its original Greek and in Latin, English, and other translations.

Paulus Diaconus, the greatest of the Lombard historians, was born at Friuli about 720. He instructed Adelperga, daughter of King Desiderius, and most probably resided at the court of her husband, Arichis, Duke of Beneventum. He became a monk, probably of Monte Cassino, about 774, but seems later to have spent some years at the court of Charles. He died before the coronation of Charles as emperor, therefore not later than 800. Of his works the earliest is the *Historia Romana*, an epitome of events based on Eutropius, with additions compiled from Orosius, Jerome, and Jordanes. This work was again extended with interpolations by Landolf the Wise (c. 1000), and the whole compilation has been known as the *Historia Miscella*; there are editions by Eyssenhardt (1869) and Droysen in *Mon. Germ. Hist., Auct. Ant. ii.* The *Historia Langobardorum* comes down to the death of King Liutprand (744), and is largely compiled from Gregory of Tours, the *Origo Gentis Langobardorum*, the short history (*De Gestis Langobardorum*) by Abbat Secundus of Trent (died 612), and other sources. His other works are a *Life of Gregory the Great*, compiled from Gregory's own writings and from Bede; *Gesta Episcoporum Mettensium*, written at the request of Bishop Angilram, containing an interesting account of the rise of the Carolingian house, the founder of which was Arnulf, Bishop of Metz (ed. in Pertz, *S.S. ii.*); an *Epitome*, or extracts from the *De Significatione Verborum* of Sextus Pompeius Festus (ed. by K. O. Müller); a *Book of Homilies*, consisting of 298 sermons selected from Ambrose, Augustine, Chrysostom, Gregory, Jerome, and Leo; *Poems*, in honour of St Benedict, in praise of the Lake of Como, &c. (ed. by Dümmler in the *Monumenta Germ. Historica, Poetarum Latinorum Medii Ævi*, i.); and *Letters*, to Adelperga, Adelhard, Charles, and others.

Pausanias, a famous Spartan regent and general, the son of Cleombrotus, and nephew of Leonidas. He commanded the confederate Greeks in the important battle of Platea (479 B.C.), in which the Persians were totally routed, and their leader, Mardonius, slain. He then marched his troops against Thebes, and compelled the inhabitants to give up the chiefs of the Persian party to him for punishment. Elated by this victory, however, he became in an extreme degree haughty and vainglorious, took all the credit to himself, and allowed none to the Athenian generals, Aristides and Cimon, who commanded under him, and treated all the other Greeks as if the Spartans were their lords. Nevertheless, he still continued his conquests, capturing Cyprus and Byzantium. It was he

first began to play false to Greece. He entered into secret negotiations with Xerxes, with the view of becoming ruler, under the Persian monarch, of the whole country, and, in his journey through Thrace, even adopted the dress and luxurious habits of a Persian satrap, and surrounded himself with a body-guard of Persians and Egyptians. He was recalled, on account of these things, by the Spartans, but his former services procured him acquittal. He then returned to Byzantium, where he renewed his traitorous intrigues, was expelled from the city for a criminal assault upon a Byzantine lady, withdrew to the Troad, and there continued his treachery. He was a second time called to account by the Spartan ephors, but again escaped, though with greater difficulty. Yet his passion for the sovereignty of Greece, even though at the expense of the national liberties, once more drove him to play the traitor. He tried to stir up the Helots, but was taken in his own net. A Helot betrayed him. When Pausanias found his position desperate he took sanctuary in a temple of Athena. Hereupon the people blocked up the gate of the temple with heaps of stones, and left him to die of hunger, his own mother depositing the first stone.

Pausanias, one of the most eminent of Greek geographers and historians, was probably a native of Lydia in Asia Minor, and flourished under Hadrian, Antoninus Pius, and Aurelius. He travelled through almost all Greece, Macedonia, and Italy, and also through part of Asia and Africa, and composed from his observations and researches an *Itinerary* of Greece (*Hellados Periēgēsis*) in ten books, describing the different parts of that country, and giving a particular account of the monuments of art and of the legends connected with them. His style is unpretentious and easy, although devoid of any special literary grace, but his *Itinerary* possesses the rare merit of being the work of an honest and accurate eye-witness. Pausanias was a man of marvellous industry, and is one of the earliest examples of the antiquary in the full modern sense of that word. Even in his treatment of works of art he is ever the antiquary rather than the critic, and his observations seldom rise out of the prosaic atmosphere proper to the catalogue. But he has the saving grace of accuracy, and his work, bare and meagre as it is, remains one of the most precious records of antiquity that we possess. He has not grasped the distinction between legend and history; or, more correctly, dominated by the instinct of the collector, he has recorded everything that he learned, historical fact and local legend alike. Hence his work is a mine of wealth to the student of mythology and folklore, no less than to the archæologist proper.

There are editions by Siebelis (5 vols. 1822-28), by Schubart and Walz (3 vols. 1838-40; reprinted in Teubner's series, 2 vols. 1862), Spiro (1903), and Hitzig and Bluemner (1896 *et seq.*); translations by A. R. Shilleto (1880) and J. G. Frazer (1898). See also Kalkmann, *Pausanias der Perieget* (1886); Margaret Verrall, *Mythology and Monuments of Ancient Athens* (1890); Frazer, *Pausanias and Other Sketches* (1900); and Robert, *Pausanias als Schriftsteller* (1909).

Pavan, in music, a very slow, stately dance-form in 4-4 time, much in vogue in the 16th century.

Pavement, flat stones or 'flags,' seldom exceeding 4 inches in thickness, used for covering footpaths, courtyards, kitchens, &c. (see FLAG-STONES). The name is also given to the stone covering of the carriage-way of streets. The Romans paved both their streets and their highways with stones in a most substantial manner, but until the 12th century mediæval cities were almost all unpaved. At Pompeii the stone pavement of the narrow streets remains as it was before the city was destroyed, and shows the ruts

made by the bigæ or carriages. It is formed of polygonal blocks of stone, like cyclopean masonry, the largest pieces being about 3 feet across the face. This kind of ancient Roman pavement, the remains of which are found at other places in Italy, is laid on a carefully prepared basis or foundation, sometimes in several layers.

Streets are still largely paved with hard stones of various kinds, roughly dressed into oblong blocks, say 12 in. by 4 in. and 6 in. deep, and smaller sizes. These are generally laid on a foundation of sand or very fine gravel, sand or pitch being used for filling up the joints. Granite and some varieties of Basalt (q.v.) are extensively quarried for these paving-stones.

Wooden pavement consists of pieces of wood (in northern Europe usually that of *Pinus sylvestris*) about the size of paving-stones, laid end up on boards, with asphalt or concrete below them, and with the joints of the wood blocks pitched. Vehicles make least noise on this kind of pavement, but it is expensive to maintain under heavy traffic. Asphalt (q.v.) is now very much used both for foot and carriage ways. Both this and wood pavement are apt to be slippery in wet, and the latter in frosty, weather.

For foot-pavement a Portland cement concrete has been much employed. Small stones, such as granite, crushed into small chips like beans, or not much larger, are mixed with the cement, which is laid on a bed of broken whinstone or 'road-metal.'

Pavia, a city of Northern Italy, on the left bank of the Ticino, 2 miles above its confluence with the Po, and 21 miles by rail S. of Milan. A covered brick bridge (1353) connects the city with the suburb of Ticino, on the right bank of the river. Pavia is still in great part surrounded by walls, and has an imposing appearance; in former times it was called the 'city of a hundred towers.' Its oldest church is the Lombard basilica of San Michele, which, although the date of its foundation is uncertain, is mentioned as early as 661. The early 'kings of Italy' were crowned within its walls; in 1863 it was granted the title of 'royal basilica,' and was restored 1863-76. The cathedral, containing some good paintings, was commenced in 1488, but was never finished. It shelters the tomb of Boëtius (brought from St Peter's) and Roland's lance; and in a beautiful chapel attached to it are the ashes of St Augustine, in a Gothic sarcophagus ornamented with a great number of bas-reliefs and figures. The Certosa, which lies 5 miles north of the city, is described in a separate article. The castle of the Visconti (begun in 1360), a massive square arcaded structure, once contained valuable collections of MSS., armour, and curiosities, but they were carried away by the French in 1500. The university is said to have been founded by Charlemagne, and was a famous seat of learning during the middle ages; but it was not formally constituted a university until 1361. Attached to it are two colleges—Borromeo (1563) and Ghislieri (1569)—for poor students, and a great library (1772), anatomical and natural history museums, a botanic garden, a school of the fine arts, &c. There is neither much industry nor much trade. Pop. (1881) 29,836; (1921) 42,043.

Pavia, the ancient *Ticinum* (afterwards *Papia*, whence the modern name), was founded by Gallic tribes, and was sacked by Attila (452) and by Odoacer (476); Theodoric selected it as his capital after 489. Later on the Lombards made it their capital, and then it became the chief city of the kingdom of Italy. Through jealousy of Milan it sided with the emperors (1056-1356); it was then conquered by the Visconti, and subsequently shared the fate of Milan. It was sacked by the French in 1500. Here in 1525 the French were defeated

by the imperialists, and Francis I. (q.v.) taken prisoner; but in 1527, and again in the following year, the city was taken and laid waste by the French. It was stormed and pillaged by Napoleon in 1796, and came into the possession of Austria by the peace of 1814. Since 1859 it has been included within the kingdom of Italy. Lanfranc and Pope John XIV. were natives.—The province of Pavia (1312 sq. m.) has a pop. (1921) of 492,520.

Paviland Cave, 11 miles SW. of Swansea, was excavated by Buckland about 1823 and yielded important human remains, notably the so-called Red Lady of Paviland, a male skeleton (thought at first to be female), covered with red ochre, now assigned to the Cro-Magnon race. See Sollas in *Jour. Roy. Anthropol. Inst.*, xliii. (1913).

Paving. See PAVEMENT.

Pavlograd, a town of Ukraine, 45 miles by rail ENE. of Ekaterinoslav, on an affluent of the Dnieper, was founded in 1780 by Zaporogian Cossacks. Pop. 20,000.

Pavlov, IVAN PETROVICH, a distinguished Russian physiologist, the son of a village priest, was born in 1849 near Riazan. After preliminary training at St Petersburg, where he graduated M.D. in 1883, he undertook research at Breslau and Leipzig, and thereafter became head of the physiological department of the new Institute of Experimental Medicine in St Petersburg, of which institute he became director in 1913. He was also a professor in the Military Medical Academy. Pavlov carried out exacting research chiefly into the physiology of the circulation and digestion. His *Work of the Digestive Glands* appeared in English in 1902. He was awarded the Nobel Prize in 1904 and the Copley Medal in 1915. He died in February 1916.

Pavlova, ANNA, Russian danseuse, was born in 1885 at St Petersburg, where, after training, she appeared in the Marianski Theatre and the Imperial Opera House. In 1910, at the Palace Theatre, London, she took part with great success in *Le Cygne*, *Les Papillons*, &c., appearing later in Paris in *Les Sylphides*, and in New York in *Coppélia*. A favourite the world over, Pavlova has danced regularly in London at the Palace Theatre, Drury Lane, Queen's Hall, and in 1923 with her own company at Covent Garden.

Pavonidae. See PEACOCK.

Pawnbroking. Pawn is a contract whereby the owner of a thing delivers it to a creditor as security for a debt contracted by himself or by a third party. This contract is of great antiquity, as may be seen on referring to the story of Judah and Tamar (Gen. xxxviii.) and the provisions of the Mosaic law (Exod. xxii.). In modern times the superior class of money-lenders have often advanced money on pledges of plate, &c.; this was the business carried on by the Lombard traders, from whom Lombard Street in London takes its name; and it is said that the three golden balls which figure over every pawnshop were taken from the armorial bearings of the Medici family. Property of considerable value is sometimes pawned with bankers and others; and an equitable Mortgage (q.v.) may be described as a kind of pawn. Among the poorer classes, clothes, tools, &c. are frequently pledged when money runs short; like other small money-lenders, the pawnbroker is regarded by his customers as an extortioner, though the profits of the trade are not particularly high. On the Continent efforts have been made to supersede the pawnshop by establishing what are called Monts de Piété. In England a quasi-charitable institution of the same kind was started in 1708, but it came to a disastrous end in 1731; another

scheme, started during the bubble mania of 1824–25, was equally unfortunate. In Ireland there were, in 1841, as many as eight Monts de Piété, but they had all disappeared by 1853. On comparing the rules and charges of the Mont de Piété (q.v.) at Paris (the largest establishment of the kind in the world) with those of English pawnbrokers, it does not appear that there is any striking superiority in the French system. It is understood that the Paris establishment is superior to the London pawnshop in two points—it charges a lower rate of interest, and it gives greater facilities for recovering stolen goods. On the other hand, it is said that officialism, which must prevail where a large staff is employed, makes it more difficult for the poor to obtain advances.

The rules of English common law which apply to a contract of pawn are founded in part upon the Roman law. The pawnbroker acquires what is sometimes called a special property in the goods deposited; he has a right to retain them, and, if the debt be not paid within the stipulated time, he has a right to sell; if the sale produces more than the amount of the debt, he must account for the surplus. The pawner has a right to redeem at any time before sale; interest is not due unless there is an express or implied contract to pay. These rules are considerably modified by the Pawnbrokers Act, 1872, which applies to all persons who make a business of taking chattels in pawn, including the keeping of what in England are called dolly-shops, and what in Scotland used to be called 'wee brokers.' Every pawnbroker is required to take out a license; unless in business before 1872 he must obtain a certificate of fitness from a magistrate or a petty sessions court before taking out a license. Pawnbrokers are required to keep books in a prescribed form; their shops are made liable to be searched under a magistrate's warrant. A ticket must be given on receiving goods in pawn; the pawnbroker may charge one halfpenny per month on each 2s. advanced; and there is also a small charge for the ticket. These charges are high, or rather would be high if the pawnbroker were in the same position as an ordinary money-lender; but it must be remembered that the risks of this business are considerable, and also that the borrower obtains a larger advance by reason of the high interest. Pledges are to be redeemable within twelve months and seven days; if a pledge over 10s. in value is sold for more than the loan and profit due, the pawnbroker must account for the surplus on demand. These rules apply to any loan not above £10; but in the case of a loan of more than £2 the rules of the act may be excluded by special contract. The act extends to Scotland. Special enactments have been made in regard to persons pawning or receiving in pawn property belonging to public authorities. A pawnbroker may not take in pawn a firearm or ammunition from any person.

The law of the United States is the English law, as altered by the legislation of each state; but the law of Louisiana, which is French in its origin, approximates more closely to the Roman, and is free from the peculiarities of the English system.

Pawnees, a tribe of American Indians (q.v.), who formerly lived in Nebraska, with branches extending into Kansas and Texas. They surrendered their lands south of the Platte by treaty in 1833; suffered much thereafter at the hands of their hereditary enemies, the Sioux; and in 1876 removed, only 2026 strong, to reservation of 283,020 acres in Oklahoma. Their numbers have shrunk.

Pawtucket, a city of Rhode Island, on the Pawtucket River, 4 miles by rail N. of Providence.

A fall of nearly 50 feet on the river, and its proximity to the sea, caused it to be selected by Samuel Slater, in 1790, as the site of the first cotton-factory in the United States. It now contains numerous large mills for cottons, woollens, and thread, besides bleach-works and dye-works, &c. Pawtucket was settled about 1655, and became a city in 1886. Pop. (1870) 6619; (1890) 27,633; (1920) 64,248.

Pax. See KISS.

Paxo, one of the Ionian Islands, lies south-east of Corfu, has with the smaller island of Antipaxo (1 sq. m.) an area of 8½ sq. m. and produces wine, olives and olive-oil, almonds, oranges, lemons, &c. Capital, Gaion, the seat of a bishop.

Paxton, SIR JOSEPH, English architect and horticulturist, was born at Milton-Bryant, near Woburn, Bedfordshire, on 3d August 1801. He began life as a working-gardener in the service of the Duke of Devonshire, at Chiswick, and was thence transferred to Chatsworth; there he was put in charge of the gardens, and entirely remodelled them, and was made manager of the duke's Derbyshire estates. The experience he obtained in designing capacious glass conservatories at Chatsworth (q.v.) found wider scope in his proposal for a palace of glass and iron for the Great Exhibition (q.v.) of 1851. It was the first time these materials had been employed on so extensive a scale, and visitors found an inexhaustible theme of admiration in a fairy palace so novel, beautiful, and magnificent. His design obtained for him the honour of knighthood. He then designed the Crystal Palace at Sydenham (q.v.), and superintended its construction from the materials of the exhibition in Hyde Park. He also laid out the terraces, and planned the gardens, with their fountains, cascades, &c. Besides publishing a very popular *Cottage Calendar*, he edited the *Botanical Magazine*, *Paxton's Flower-Garden*, *Pocket Botanical Dictionary*, and other works. He died at Sydenham, 8th June 1865, having represented Coventry since 1854.

Paymaster-general, an officer of the British ministry, but not of the cabinet, who is charged with superintending the issue of all moneys voted by parliament, but has no control over the sums issued, paying merely on the order of the department concerned. He is always either a peer or a member of the House of Commons, and changes with the ministry.

Paymasters. See ARMY (*Army Pay Department*).

The naval paymaster is for a ship what the military paymaster was for a regiment; but in addition he has charge of the provisions, clothing, and miscellaneous stores, and the cooking and breadmaking staff. Paymasters (till 1844 called *pursers*) are commissioned officers, ranking according to service with lieutenants, commanders, and captains. The paymaster is responsible for all the accountant and victualling duties of the ship, and under the authority of the captain makes now all disbursements for the naval service, the captain being held responsible that all accounts are sent in by the paymaster regularly, and that the balance of cash is correct.

Payn, JAMES, was born at Cheltenham in 1830, and educated at Eton, Woolwich Academy, and Trinity College, Cambridge. In 1855 he published a volume of poems, in 1858-74 was editor of *Chambers's Journal*, and in 1882 succeeded Leslie Stephen as editor of the *Cornhill*. Of his hundred novels may here be named *Lost Sir Massingberd* (1864), *A Woman's Vengeance*, *Carlyon's Year*, *Not Wooded but Won*, *By Proxy*, *Thicker than Water*, *The Talk of the Town*, *A Perfect Treasure*,

The Heir of the Ages, *Driffell*, and *Another's Burden* (1897). Some critics preferred his shorter stories, essays, and criticisms to his novels. See *Some Private Views* (1882), *Some Literary Recollections* (1884), *Gleanings of Memory, with Some Reflections* (1894). He died 25th March 1898.

Payne, EDWARD JOHN (1844-1904), born at High Wycombe, studied architecture and music, and at Oxford became a fellow of University College. He edited Ruskin's select works and the Elizabethan voyagers, wrote on the colonies and two volumes of a great history of America, and contributed to Grove's *Dictionary of Music* and to the *Cambridge Modern History*. A volume of essays with biographical introduction was edited by W. P. Ker in 1900.

Payne, JOHN HOWARD, born in New York 9th June 1791, had for thirty years a successful career as actor and author of plays, chiefly adaptations; *Clari* contains the song *Home, Sweet Home* (the music being by Sir Henry Bishop). Payne was appointed American consul at Tunis in 1841, and died there 10th April 1852. His remains were taken to Washington in 1883. See *Lives* by Harrison (1875) and Brainard (1885).

Payne, PETER (c. 1380-1455), English Hussite, was the son of a French father and an English mother, and was born near Grantham and educated at Oxford. He became principal of St Edmund Hall in 1410; but adopting Wycliffite opinions, he sought safety from persecution in flight to Bohemia. There he procured court favour, and in 1433 was sent as a Bohemian delegate to the Council of Basel, where his unconciliatory temper contributed to prevent the Bohemians from coming to terms with the council. During the civil war in Bohemia (see HUSS) he took the Taborite side, and after their collapse was persecuted and imprisoned. He wrote much, and at least six MSS. by 'Petrus Anglicus' are extant at Vienna, Prague, and elsewhere. See Baker's *A Forgotten Great Englishman* (1894), based on Palacky.

Payne, ROGER (1739-97), born at Windsor, became famous, after 1766, as the most artistic bookbinder in London.

Payne-Smith, ROBERT (1819-95), educated at Oxford, as sub-librarian of the Bodleian began his great *Thesaurus Syriacus* (1870-93). Sermons on *Isaiah* (1862) led to his appointment as regius professor of theology at Oxford (1865-70), whence he removed to the deanery of Canterbury. He gave the Bampton Lectures on Prophecy (1869), and published books on Daniel, Jeremiah, Samuel, and Genesis.

Paysandú, the chief town of an Uruguayan department (5000 sq. m.; 87,000 inhabitants), is built upon a hill gently sloping from the Uruguay River, 280 miles NW. of Montevideo. From its busy port tinned meat is exported. Pop. 26,000.

Paz, LA. See LA PAZ.

Pazardjik. See BAZARDJIK.

Pea (*Pisum*), a genus of plants of the family Leguminosæ, sub-family Papilionaceæ. Two species are very extensively cultivated for their seeds (peas)—the Common Pea or Garden Pea (*P. sativum*) in gardens, and the Field Pea (*P. arvense*) in fields; both of them climbing annuals, with pinnate leaves, ovate leaflets, and branching tendrils in place of a terminal leaflet; the garden pea distinguished by having two or several flowers on each flower-stalk, the flowers either red or white, more generally white, and the seeds subglobular; the field pea having one flower on each flower-stalk, the flowers always red, and the seeds angular from crowding and compression

in the pod. But it is not improbable that they are truly one species. Peas have been found in Swiss lake dwellings of the Bronze period, and are cultivated from warm climates, as India, to very cold latitudes, the plant being of rapid growth and short life. The seeds of the garden pea are used for culinary purposes both in a green and in a ripe state, as are also the green succulent pods of some varieties, known as Sugar Peas or Wyker Peas, in which the membrane lining the inside of the pod—parchment-like in most kinds—is much attenuated. Field peas are used both for feeding cattle and for human food; deprived of the membrane which covers them, in a kind of mill, they are sold as *Split Peas* as used for making *Pea Soup*. They are also ground into meal. Some of the kinds of garden peas—products of horticultural art—have long stems, and require for their support stakes 6 or 8 feet in height; others are of humbler growth; and certain dwarf kinds succeed very well without stakes. In Britain garden peas are sown at different times from January to the end of June in order to secure a supply of green peas in summer and autumn; in the south they are also sown in the end of autumn, a very little protection being sufficient for them during the winter. *Early Peas*, formerly preferred for the first sowings, have been supplanted by more productive, larger, and better-flavoured sorts, which combine the desirable quality of extreme earliness with the size and tenderness of the *wrinkled marrow* kinds. Chalky and other calcareous soils are particularly suitable for peas. Supplies received from France in May are inferior in quality to the English. Peas as a field-crop are best adapted to those districts in which the climate is least moist. The haulm or straw of peas is used for feeding cattle; and for its sake field peas are often reaped before they are quite ripe, great care being taken in stacking the straw to provide for ventilation, so that it may not *heat*. Pea haulm, when cut and dried green, is more nitrogenous and more nutritious than hay. Dried peas are largely imported into Britain. The chemical constituents of peas will be found in the table at DIET; and the high dietetic value is discussed at FOOD. Tinned peas have little of the delightful flavour of the fresh vegetable.

The Sea Pea (*Lathyrus maritimus*), the Sweet Pea, the Wood or Heath Pea (*L. montanus*), and the Everlasting Pea are species of *Lathyrus* (q.v.). The Chick Pea (q.v.) is a species of *Cicer*.—The pods of peas are often injured by the Pea-beetle (*Bruchus pisi*), a small coleopterous insect; by the Pea-maggot, the caterpillar of a moth (*Tortrix pisi*); and by the Pea-weevils (*Sitona crinita* and *S. lineata*), small coleopterous insects.

Peabody, GEORGE, philanthropist, born at South Danvers, Mass. (see PEABODY), 18th February 1795, of Leicestershire stock, became a partner in a Baltimore dry-goods store in 1829. He established himself in London in 1837 as a merchant and banker, and in his lifetime gave away a million and a half for philanthropic purposes, including \$500,000 towards building industrial homes in London. He refused a baronetcy. He died in London, 4th November 1869. See *Lives by Hanaford* (1882) and *Curry* (1898).

Peabody, a town of Massachusetts, 16 miles NNE. of Boston (formerly South Danvers), was so named in 1868 in honour of George Peabody (q.v.), who was born there; pop. 20,000.

Peace and International Arbitration.

Several times in the course of our era permanent peace has been a direct object of practical statesmanship. Thus the idea of the 'grand design' of Henry IV. of France (1603), as set out in the memoirs of his great

minister, Sully, was by diplomatic combination and negotiation 'to divide up all Europe proportionately among a certain number of States who would have nothing to envy each other as regards equality and nothing to fear as regards their equilibrium.' The number of states was to be reduced to fifteen, which were to be of three kinds—viz. six great hereditary monarchies, five elective monarchies, and four sovereign republics. The six hereditary monarchies were to be France, Spain, England, Denmark, Sweden, and Lombardy; the five elective monarchies were to be the Empire, Papacy, Poland, Hungary, and Bohemia; the four republics, Venice, Italy, Switzerland, and Belgium. The affairs of this community of states were to be administered by a senate composed of four representatives of each of the Great Powers and two of each of the smaller states—i.e. seventy persons in all, elected every three years (see *Memoirs of Duc de Sully*, vi. p. 129 *et seq.*). Thus also the Treaties of Ratisbon (15th August 1684) provided, after settlement of certain disputed points, for a suspension of warfare between Louis XIV. and the emperor on the one hand and King Charles of Spain on the other for twenty years. Territorial details were to be settled by commissioners, and certain differences, if they arose, by arbitration.

The Holy Alliance (September 1815) was another attempt to secure more or less permanent peace. It proclaimed the fraternity of nations in the spirit of Christianity, and bound the parties to respect each other's just rights and assist each other in maintaining them. Most of the sovereigns of Europe joined it, including the British Prince Regent, in so far as a constitutional sovereign could join in a personal undertaking by sovereigns.

Alongside these practical efforts to ensure durable peace, writers have elaborated many schemes for the same end. Among these the most notable have been William Penn (1693), the Abbé St Pierre (c. 1700), Jeremy Bentham (1786–89), Kant (1796), and in more recent times John Stuart Mill, Professor Seeley, Professor Bluntschli, David Dudley Field, Professor Leone Levi, Sir Edmund Hornby. But it was not till 1893 that statecraft came again to the front with a proposal to promote the world's peace by a deliberate effort. In his rescript of 24th August 1898 the Tsar Nicholas II., to whom the initiative of the movement was due, stated that he regarded the time as 'very favourable for seeking, by means of international discussion, the most effectual means of assuring to all peoples the benefits of a real and durable peace.' The financial charges necessitated by armaments were constantly increasing and paralysing economic prosperity at its source. The accumulation of war material was transforming armed peace into a crushing burden which peoples had more and more difficulty in bearing. The tsar, therefore, proposed that a diplomatic conference should meet and discuss whether an understanding could not be achieved under which the contracting states would agree not to increase for a fixed period the then military and naval effectives. Other objects were added, including the organisation of 'good offices,' 'mediation,' and 'arbitration,' as a means of settling international disputes. The first conference sat at The Hague from 18th May to 29th July 1899. The conference, however, confined itself to the pious expression of a wish for the restriction of military budgets and a recommendation to governments 'to examine the possibility of an understanding concerning the limitation of military and naval armaments and war budgets.' On the other hand, three conventions relating to the 'peaceful settlement of international disputes,' to the 'laws and customs of war on land,' and to the 'adaptation to maritime warfare of the principles of the Geneva Convention

of 22d August 1864,' and declarations prohibiting the use of asphyxiating projectiles and expanding bullets and the dropping of projectiles and explosives from balloons, were adopted. Although the main object was not achieved, this result was of the greatest importance to the development of law and order in the intercourse of states. Till then the only legislation enacted by international agreement had been the Declaration of Paris (q.v.).

The conference of 1899 also created an international Court of Arbitration, with a procedure for its use, for the purpose of trying cases between nations in the same way as cases between individuals are tried in national courts. Three years, however, elapsed before any state had the courage to put the new Hague court to the test of experience. The United States and Mexico were the first to submit a case to it. This was the Pious Fund case (decision 14th October 1902). Down to the beginning of the Great War eleven cases had been tried—the Preferential Treatment case: Germany, Great Britain, and Italy *v.* Venezuela, the United States of America, Belgium, France, Mexico, Netherlands, Sweden, and Norway (decision 22d February 1904); the Japanese House Tax case: France, Germany, and Great Britain *v.* Japan (decision 22d May 1905); the Muscat Dhows case: France *v.* Great Britain (decision 8th August 1905); the Casablanca case: Germany *v.* France (decision 2d May 1909); the Maritime Boundary case: Norway *v.* Sweden (decision 22d October 1909); the North Atlantic Fisheries case: Great Britain *v.* United States (decision 6th September 1910); the Orinoco Steamship Company case: United States *v.* Venezuela (decision 6th September 1910); the Savarkar case: France *v.* Great Britain (decision 24th February 1911); the Canevaro case: Italy *v.* Peru (decision 3d May 1912); claim for unpaid interest: Russia *v.* Turkey (decision 11th November 1912); and claims for illegal seizure of the *Carthage* and *Manouba*: France *v.* Italy (decision 6th May 1913).

Under the impulsion of the United States government the holding of a second conference to continue the work of that of 1899 became the subject of diplomatic negotiations, which ultimately led to the Russian government again issuing an invitation to a conference which was held at The Hague in 1907. The conference of 1899 had been attended by twenty-six states; at that of 1907 forty-four were represented—i.e. the whole world except Costa Rica, Honduras, and Abyssinia. The second conference sat from 15th June to 18th October. The conventions adopted dealt with international law on a much wider basis than that of 1899, embracing not only revised editions of the three adopted in 1899, but the following further subjects: limitation of the employment of force for the recovery of contract debts; the commencement of hostilities; the rights and duties of neutral powers and persons in war on land; the status of merchant ships at the outbreak of hostilities; the conversion of merchant into war ships; the laying of automatic submarine contact mines; bombardment by naval forces in time of war; restrictions on the right of capture in maritime war; the establishment of an international Prize Court; the rights and duties of neutral powers in maritime war; and a declaration forbidding the discharge of projectiles, &c., from balloons.

The British government took an active part in promoting the adoption of the proposed international Prize Court, and as there was no universally admitted international law of prize, it called a conference to establish such a law. The work of the conference, which sat from 4th December 1908 to 26th February 1909, is known as the Declaration of London. Though the

declaration was not ratified by any state, it was declared applicable in practice by Italy, Turkey, and Russia during the Turco-Italian war, and was frequently appealed to and 'tortured' to satisfy belligerent requirements in the Great War, a testimony to the usefulness of even an imperfect codification of international law. Again, at the conference of 1907 the question of the restriction of armaments and of military and naval budgets was eliminated by a pious wish; but the other work of the conference in the codification of international law was an immense further stride in the direction of establishing a uniform public law of Europe, a means in itself of diminishing the possibilities of international friction.

From 1899 to July 1914 the number of arbitration treaties concluded was some 170, of which about 140 since the first of the new series on which most of them are based—viz. the Anglo-French Convention of 14th October 1903. Nearly all these treaties except cases involving 'national honour' and 'vital interests' from their operation. The few cases in which the exception has not been inserted are between states which, generally speaking, are not likely to be exposed to difficulties arising out of bad faith or deliberate aggression, which seem to be the cases disguised under the name of 'national honour' and 'vital interests.' To the United States falls the merit of having entered into treaties with Great Britain and France dealing with all cases without any exception, though reserving matters of extreme gravity for a joint commission of the parties. If carried out in good faith, they would be a monument to the memory of the statesmen who devised such ingenious means for giving peace every possible chance of preservation. Though public opinion in all civilised countries seemed to be growing more pacific, international amity becoming in an ever higher degree a positive object of statesmanship, and 'pacificism' ceasing to be regarded as anti-patriotic among the influential classes, the Great War broke out like a volcanic eruption, or rather like an inundation sweeping all pacific methods before it. The only suggestion of arbitration came from Serbia on one of the points of the Austro-Hungarian ultimatum. Germany and England made feeble attempts to get mediation accepted, but when armed forces are mobilised the time for negotiation is passed. Following the war, however, the desire for permanent peace became more intense than ever before.

The terrible experience of the Great War and the awakening conscience of modern democracies may focus the many agencies now at work in different ways for the promotion of a better understanding of the true interests of the productive classes throughout the world. The *League of Nations* (q.v.) created by the victorious belligerents obviously can only be regarded as an effective instrument of peace when the United States and Russia have joined or been admitted to it, but its potentialities are great. The creation of a Permanent Court of International Justice, under Art. 14 of the Covenant of the League, had provided a useful agency for dealing with matters of right and wrong judicially as distinguished from settlement by arbitration.

If the United States stood aloof from the League of Nations their government has not been inactive in the cause of peace. In February 1922 under its auspices a conference was held at Washington for the reduction of naval armaments, and the protection of the lives of neutrals and non-combatants at sea in time of war, and to prevent the use in war of noxious gases and chemicals. On the first subject a treaty between the following powers, the United States of America, the British Empire, France, Italy,

and Japan, was signed at Washington on the 6th February 1922, and was duly ratified by the powers concerned. This convention provided for the limitation of naval armament in fixed proportions, according to the requirements of naval defence, and regulates the procedure of destruction of ships beyond such proportion and its upkeep. The other convention forbade the employment of submarines as commerce destroyers, and the use in war of asphyxiating, poisonous, and other gases, and all analogous liquids, materials, or devices. This also was ratified by the contracting powers except France. The naval convention has come into force, and its provisions have been or are being complied with.

Peace River, a large river of Canada (1100 miles), rises in two branches in the Rocky Mountains, in British Columbia, and flows north-east to the outlet of Lake Athabaska, where it joins the Slave River by five widely separate mouths. The delta thus formed is very fertile and rich in minerals, and is part of the province of Alberta (q.v.).

Peach (*Prunus Persica*, now believed to be of Chinese origin) belongs to the order of Rosaceae, and is of the drupaceous subdivision. This, the most delicious fruit that ripens in the open air of Britain, is nearly akin to the almond, resembling it closely in wood, leaves, and blossom, but differing widely in the character of the fruit. In the peach the stone is covered not with a brittle husk but a fleshy substance, juicy, melting, and of the finest flavour when matured and mellowed. The peach-tree is of moderate height, more or less spreading, deciduous (though some are called evergreen), and, when left to itself, deep-rooted. The leaves (which contain some prussic acid) are lanceolate, on short footstalks, differ much in size, have their edges serrate or crenate, and have glands near the stalk, or are glandless. The serrate leaves, as a rule, are glandless; the crenate have globular or reniform glands. Mildew (both of fruit and leaf) attacks the varieties with glandless leaves, while the glandulose have immunity. The many varieties of the peach pass into divisions and subdivisions, according to the point regarded. There is first the decisive difference in the clothing, flesh, and flavour of the fruit, which has established the broad distinction between peach and nectarine. A very close observer is the man who can pronounce in winter, unless the trees happen to be his own, which of twain is nectarine, and which is peach. In summer there is a certain difference, perceptible, but not easily described, in the tint and cast of foliage; while the fruit on the other hand leaves no doubt, even from its first appearance, as to its proper title. Peaches and nectarines, while distinguished as above, pass alike into the other three divisions which have been established concerning them—to wit: (a) those which have large and those which have small blossoms; (b) those which have glandless leaves and those whose leaves are glandular; (c) those that have fruit which adheres

to the stone and those whose fruit parts freely. Neither of these points affects the other two, and hence arise cross-divisions.

(a) As to size of bloom, it is hard to say why, but all known peaches and nectarines have blossom either very conspicuous or almost insignificant. Other fruit trees have blossom larger or middle-sized, or small, according to variety. Some gardeners fancy that the smaller bloom suffers less from the attacks of frost; the larger petals certainly show the nips more sadly, but the internal injury is received in either case. The colour of the blossom ranges from snowy-white to pink and rose (the latter being the most usual tint), and even to bright carmine.

(b) The leaves of the peach and nectarine, being as above described, furnish another classification according to the absence or presence of glands, and the form of glands when present. The gland is a small accretion or concretion upon the petiole, or at the base of the leaf itself; sometimes there is one gland at either edge, sometimes two, and at times even three. In form the glands vary from round to reniform; or even lenticular; but their function, if any, is not yet understood. Probably they take no active part, but are merely the tokens of a constitution adverse to fungoid overtures. However that may be, they afford one more division of the peach and nectarine, according as they are glandless or glandulose, the latter subdivided into those which have round and those which are gifted with long glands.

(c) Again, the peach and nectarine are palpably divided (according to the inner construction of the fruit) into *clingstones* (or *Pavies*) and *freestones*.

Fruit of the *clingstone* (a) and *freestone* (b) varieties, cut across to show the seed.

In the former the stone seems to radiate, as it were by tentacles, into the flesh, and the eatable part will not quit hold without great loss of the delicious juice. These peaches are therefore only fit to be sucked, for to quarter them fairly is impossible. And it is a sad indictment against the peaches of America that they belong mainly to the non-seccable section. But the freestones, chiefly grown in Europe, part from the stone with little rupture of tissue, and melt in the mouth instead of gushing on the plate. All the above being cross-divisions, the classes of the peach grow manifold; but the cultivation is the same with all. When grown on its own roots or on peach-stock the tree is short-lived, and being treated thus in America is worn out in some twenty-five years. In France it is worked upon the almond or the plum; in England the mussel-stock is the most approved; and upon this it attains the greatest age. But grow it as we may, it is impatient of the knife, and must receive its orders at a very early date. In the southern parts of England both nectarines and peaches ripen well upon the open wall, or even on dwarf standards in fine summers, and fruit so ripened is the best of all.

Though many good varieties have been added lately by the skill of nurserymen, the older kinds are not yet obsolete; and the chief gain, if any, is in the lengthening of the period when ripe

peaches of some sort can be gathered out of doors.

[In the United States peaches are grown profitably as far north as 40° N. lat. at least; enormous quantities are sent to the markets, and the fruit, in some form, is brought easily within the reach of all classes. The principal peach-growing states are Delaware, Maryland, Virginia, Pennsylvania, and New Jersey, in this order; but the fruit is also largely cultivated in Georgia, Florida, and Texas for the early market, from near the great lakes all down the Mississippi valley, and in California and Oregon. The canning of peaches is an important industry.]

For description of varieties, see André Leroy's *Dictionnaire de Pomologie*; R.H.S. *Catalogue of Fruits*, edited by Thompson; Dr Hogg's *Fruit Manual*; *The Orchardist*, by John Scott; *The Growth of Fruit under Glass*, by Thomson; the treatises of Thomas Rivers; and *The Book of the Peach*, by H. W. Ward (1903).

Peach, BENJAMIN NEEVE, geologist, born at Gorran Haven, Cornwall, in 1842, was educated at Peterhead and Wick Academies and the Royal School of Mines, London. On the Geological Survey he worked with Dr Horne on the elucidation of the very intricate geology of the north-west Highlands. He is author of *The Silurian Rocks of Scotland* (with Dr Horne, 1899) and *The Geological Structure of the North-west Highlands* (1907).

Peacham, EDMUND. See BACON (FRANCIS).

Peacock (*Pavo*), a genus allied to pheasants and other game-birds, including at least two species—the Indian and Singhalese *P. cristatus*, domesticated in Britain and other countries, and the Malayan *P. muticus*, inhabiting Java, Borneo, and similar regions. The Indian peafowls live in flocks, especially in mountainous and wooded districts, and are often accompanied by the tiger; though whether the tiger derives benefit from the wariness or flesh of the birds is uncertain. The birds roost in trees, and eat omnivorously—worms, insects, small snakes, seeds, &c. At the pairing season rival males display the well-known beauty of their tail-coverts before their desired mates, and strut about after the fashion of many game-birds. They sometimes fight fiercely with their rivals, and the females sometimes pay court to the males. Polygamy prevails, but there seems no truth in the old stories about the cruelty of the males to their mates. The usual cry is a shrill *Pao*, and strange noises are made by rattling the quills. The females lay, according to the climatic conditions, from April to October; the eggs, of a brownish colour, are numerous (eight to ten), and are laid without a nest in some concealed part of the jungle. At first both sexes are alike in plumage, but after a year or so the males gradually acquire their gorgeous feathers, which are perfected about the third year. It is not necessary to describe these colours, so delightfully familiar to all, but it may be noted that they are for the most part of a physical nature, being due not so much to pigment as to external markings, which produce iridescence. As to the evolution of the eye-like markings, which occur in varying degrees of perfection, we have on the one hand to recognise with Darwin that the more beautifully decorated males are selected by their mates, and on the other hand that we do not know to what precise conditions of feather-growth the marvellous beauty is due. The Javan peafowl is said to be even handsomer than the familiar species. Its 'crest, head, and neck are rich green, the breast bluish green margined with gold, the back bright copper-colour barred with green and light brown, and the upper tail-coverts rich green with gold and copper-colour reflections.' White or pied peacocks occasionally occur

as sports, and yet more remarkable is the 'jappanned' breed, which seems to have arisen quite abruptly.

The peacock seems to have been well known in Greece after Alexander's Indian expedition, but it was known in Judæa even in the time of Solomon. From Greece it spread to Rome and gradually westwards. In many ways it has touched human life and fancy: it was the bird of Hera or Juno to the Greeks and Romans, and emblematic of a glorified body to the early Christians; its feathers have adorned many a throne and shrine, and the perverted luxury of the later Roman empire made an entrée of the tongues or brains. The eggs and the young are edible, but domesticated peacocks are now kept almost solely for their beauty's sake, and that at some cost, for they are apt to do mischief both in garden and poultry-yard.

Peacock, THOMAS LOVE, satirist, was born at Weymouth on 18th October 1785, the only child of a London merchant, who died three years afterwards. His boyhood was passed at Chertsey, and for six and a half years he was sent to a private school on Englefield Green, but from thirteen he was self-educated, growing up an accomplished scholar. The chief events of his uneventful life were the loss of his first love (1808); his under-secretaryship to Sir Home Popham on a warship at Flushing (1808-9); his close friendship with Shelley, whom he first met in Wales in 1812, during one of his many walking tours; his employment from 1819 to 1856 in the office of the East India Company, as clerk, correspondent, and chief examiner; his marriage in 1820 to the 'Beauty of Carnarvonshire,' who bore him one son and three daughters, and died in 1852 after twenty-six years of ill-health; and the important part he bore in the introduction of iron steamships to Eastern waters (1832-40). In 1823 he had taken a cottage for his mother at Halliford on the Thames, and here he died, aged eighty, on 23d January 1866.

Peacock's literary activity extended over more than half a century. Of his half-dozen booklets of verse, published between 1804 and 1837, the best, *Rhododaphne*, offers nothing so good as some of the gay lyrics scattered throughout his seven 'novels'—*Headlong Hall* (1816), *Melincourt* (1817), *Nightmare Abbey* (1818; its hero is Shelley), *Maid Marian* (1822), *The Misfortunes of Elphin* (1829), *Crotchet Castle* (1831), and *Gryll Grange* (1860). And these 'novels' are interesting chiefly as a study of character—the author's own. A Rabelaisian pagan of the 18th century, egoistic, protean, such was Thomas Love Peacock, and in Thomas Love Peacock we have the Alpha and Omega of his writings. They mirror his likings (for nature, music, the classics, madeira, and good living generally), and his stronger, if exaggerated, dislikes (for field-sports, reviewers, political economy, all things Scotch and American, and, above all, Lord Brougham). They leave on one the impression that the little he did not know was to his mind not worth knowing, that because, for example, he had not been at a university and was not religious, therefore Oxbridge and heaven were beyond his microcosm. The steely wit and erudition of their dialogues still find admirers in the cultured few. The three plays by him first published in 1910—*The Dilettanti*, *The Circle of Loda*, and *The Three Doctors*—have much in common with the novels; especially the author's favourite plan of 'philosophical debate or conversation strung haphazard on a thread of irrelevant action.'

See editions by Sir H. Cole, with preface by Lord Houghton and memoir by his granddaughter (1875); by Dr Garnett (10 vols. 1891-92); and by Brett-Smith and Jones (1924 *et seq.*); his Plays (ed. A.B. Young, 1910); the Life by Carl Van Doren (1911); and the 'Critical Study' by A. Martin Freeman (1911).

Peacock-stone, the name under which the dry cartilaginous ligaments of some large lamelli-branchiate molluscs, as the pearl-oyster, have been sold by jewellers.

Peak, the hilly district of north-west Derbyshire, having Castleton for its capital, 10 miles N.E. of Buxton. Measuring some 30 by 22 miles, it is watered by the Dove, Derwent, and Wye, and culminates in Kinderscout (2082 feet), other eminences being Axe Edge (1810 feet), and Mam Tor (1710). The Peak Cavern or Devil's Hole near Castleton penetrates 750 yards; and crowning a rock above the village is Peveril Castle, so named from its first lord, a bastard of William the Conqueror's. The wonders of the Peak were celebrated early by Thomas Hobbes (1666) and Charles Cotton (1683).

Pea-nut. See GROUND-NUT.

Pear. The pear (*Pyrus communis*), a member of the Pomaceæ, a sub-order of Rosaceæ, is a tree very largely cultivated for the sake of its fruit, which contests with that of the peach the first place in the list of the British Pomona, and vastly exceeds it in endurance. The pear is a native of Europe and the more temperate parts of Asia, and is still found wild in Britain, but in that state is of lesser girth and stature, with thorny branches and small harsh fruit, and jagged and sometimes pinnate leaves. Under cultivation the tree attains a height of 40 to 60 feet, with a trunk of a yard or even more in diameter, while the thorns disappear, though in some kinds they linger for years after grafting; the leaves are simple, ovate, serrate, or crenate, and sometimes almost entire, glabrous on the upper surface, sometimes tomentose on the under side while young; the flowers are in corymbs of five to eight or nine or even more, each bloom having five petals, generally white, though in some varieties touched or striped with pink, differing also in size and curve according to variety. The stamens are numerous, and the styles distinct, generally five in number and enclosed within the calyx-tube. With the growth of the fruit the ovaries become united, and form what is called the core, consisting usually of five cells, and each cell has one or two seeds or pips, which in many of the best kinds are imperfect. The fleshy mass which is formed around these constitutes what we call the fruit, differing greatly in form, size, and substance, according to variety, health, climate, and other influences. But the normal form of the pear, when we use the word as one of description, is long and tapering to the stalk from the part just above the eye, where the diameter is the greatest.

The pear-tree is grown upon divers stocks, as well as in many shapes and manners, by English gardeners. (1) As to stock—which partly governs other treatment—gardeners use either pear or quince, (a) the pear (which is called the free stock) being raised for that purpose from seed or otherwise, and grafted when strong enough, or budded, with the sort required. This is the way to obtain large trees, lusty and enduring, but loth to give fruit until they have found long experience. *Infœcunda quidem, sed læta et fortia surgunt.* Whence the old distich—‘The man who plants pears is a-planting for his heirs.’ This has told much against the liberal stock, but in common with the race of proverbs is exaggerative. (b) The quince-stock, shallow-rooted, less vigorous in habit, and of briefer date. Upon this stock the pear, when congenial to it, begins to fruit even in the second year from working, gives larger, more beautiful, and sometimes better produce than it could afford upon its closer kindred, but does not grow to the bulk or stature which nature intended for it. It is a mistake, however, to suppose that the tree so wrought is cut short of life, unless of a

nature that spurns the union, as some of the finest pears have always done. Other pears, indeed the great majority, thrive upon the quince for from ten to twenty years; and some kinds there are which show every sign as yet of a life as long and almost as large as they could have attained without transmigration. (c) Other stocks whereupon the pear will grow are the hawthorn, the Sorbus, the *Cydonia japonica*, and several other members of the pyric race. Some kinds of pear will do well on some of these. But in spite of all local and paradoxical flourish, the stern fact remains that the success is fitful, comparatively brief, and scarcely worth the trouble.

(2) The shape and manner of growth are also manifold. In the northern parts of Great Britain and the bleaker portions of the south the pear—unless it be of an early kind—will not ripen well without the aid of glass or the shelter and warmth of a garden-wall. It is not largely grown under glass as yet, and for many good reasons, though very fine specimens are thus obtained. But as a wall-tree it is to be found in almost all fruit-gardens, and much of the finest fruit is thus produced. There are four modes of training now chiefly in vogue—viz. the old horizontal, the fan-shaped, the rectangular fork (with from two to twenty prongs), and the cordon, diagonal or horizontal, single, double, or treble, &c., and sometimes tortured into spirals. But, wherever the pear will ripen without the absorbed and reflected heat of a wall, the simplest and cheapest form of growth is that which our nurserymen call the dwarf pyramidal—more correctly termed the conical—or, with some few varieties which spurn that form, the less compact outline of the bush. Some diligence is needed at least twice a year to keep any of these in discipline.

(3) The varieties of pears are almost countless, as are those of apples, and nine-tenths are unworthy of the census. If this was so in the time of Virgil, we must not be surprised at the catalogue now. No year, however barren, lacks new kinds on paper, which are to supersede all previous issue. But the historical fact survives that pears were as well worth eating in the days of our ancestors as they are now.

Pear, PRICKLY. See PRICKLY PEAR,

Pearl, a peculiar product of certain marine and fresh-water molluscs. Most shell-bearing molluscs are provided with a secretion with which they line their shells, and give to the otherwise harsh granular material of which the shell is formed a beautifully smooth surface, which prevents any unpleasant friction upon the tender body of the animal. This secretion is laid in extremely thin semi-transparent films, which, in consequence of such an arrangement, have generally a beautiful Iridescence (q.v.), and form in some species a sufficient thickness to be cut into useful and ornamental articles. The material itself in its hardened condition is called *nacre* by zoologists, and by dealers mother of pearl. Besides the pearl lining of the shells, detached and generally spherical or rounded portions of the nacre are often found on opening the shells. In general, a pearl may be said to consist of concentric layers of nacre of extreme tenuity laid down around a centre. This centre may be an irritant sand-grain, which never results in more than an inferior pearl; or a minute spherule of nacre artificially introduced between the shell and the skin; or a microscopic parasite as in the mussel (*Mytilus*), where pearls are formed around a larval Trematode. It is believed by some authorities, but not proved, that ‘fine pearls’ in the Ceylon pearl-oyster are due to the larva of a tapeworm (*Tetrarhynchus unionifactor*). Others

maintain that a foreign nucleus is rather exceptional, and that the normal centre of a pearl is a variety of shell-substance which arises when the normal rhythm of secretion is disturbed.

Those who believe in the diffusion of culture from ancient Egypt over the world attach great importance to the search for pearls as 'givers of life' (see MAGIC). 'It went by sea,' says Mr Perry, 'from pearl-bed to pearl-bed, until it reached America, and there, again, it spread over the widespread pearl-beds of the American continent.'

The most famous pearls are those of the East; the ancients obtained theirs mainly from Ceylon (Taprobane) and the Persian Gulf, whence many of the best pearls still come. Other pearl-fisheries are in the Sulu Archipelago, off New Guinea, off some parts of the Australian coast, and amongst some of the Polynesian islands. In the Persian Gulf the most important pearl-yielding mollusc is the *Avicula* (*Meleagrina*) *fuscata*. It is specially fished for pearls, and yields them in greatest number and of the finest kinds. It has a much smaller shell than the species which has been long known as the pearl-oyster, *Avicula* (*Meleagrina*) *margaritifera*. This last and another species (*A. macroptera*) are also extensively fished for in the gulf; but, though pearls are found in both, they are much more valuable for their shells. Like *A. margaritifera*, *A. macroptera* has also a large shell. All three species are chiefly fished about Bahrein. The centre of the trade is the port of Lingah, but all the pearls that come thence are called Bombay pearls.

Of the Ceylon pearl-fishery, which, like the Indian ones on the Madras side of the Strait of Manaar, is under government supervision, and is only allowed at intervals, some account is given in the article CEYLON. The method of fishing may be thus described. The season of the fishery, when permitted, lasts from four to six weeks. For each diver there is provided a diving-stone, weighing about 40 lb., which is fastened to the end of a rope long enough to reach the bottom, and having a loop made for the man's foot. To each boat there is usually allotted a crew of thirteen men and ten divers, five of whom are descending whilst the others are resting. This work is done very rapidly; for, notwithstanding the stories of divers who can remain below for four minutes (see DIVING), the best divers cannot, as a rule, remain longer than eighty seconds below, and sixty is more usual. The greatest depth they descend is thirteen fathoms, and the usual depth about nine fathoms. When the diver gives the signal by pulling the rope he is quickly hauled up with his net and its contents. The oysters are allowed to putrefy, in order that the pearls may be easily found. The pearl-fishery in the Mergui Archipelago has become very important since 1890.

The pearls vary much in size; those as large as a pea, and of good colour and form, are the best, though unusually large specimens have the value of rarity—such as the extraordinary one in the Beresford Hope collection, which measures two inches in length, and four in circumference, and weighs 1800 grains. The smaller ones are sorted into sizes, the very smallest being called seed-pearls. A considerable quantity of these last are sent to China, where they are said to be calcined and used in Chinese pharmacy. Amongst the Romans the pearl was a great favourite, and enormous prices were paid for fine ones. The single pearl which Cleopatra is said to have dissolved and swallowed was valued at £80,729; and one of the same value was cut into two pieces for earrings for the statue of Venus in the Pantheon at Rome.

The finest pearls are found within the mantle of the mollusc, close to the lips of the shell, or in the

soft part of the oyster near the hinge of the shell; the worst pearls are those found within the close, coarse fibres of the adductor muscle. At intervals they are found loose in the shell outside the body of the oyster, and may when large get washed out of the shell and thus be lost. Lastly, pearls are often found embedded more or less deeply in the shell, having in some cases escaped from the soft tissues. It is notable that the adherent pearls occur almost invariably in the flat or lower valve; occasionally, it is true, they are found embedded in the rounded or upper valve, but in such cases it is observed that the shell has been found lying at the bottom in the reverse position. The pearls found embedded in or under the 'muscular impression' are always small, irregular, and worthless, similar to those found embedded in the adductor muscle itself. Pearls are found in infinite variety of form, and the consecutive layers vary in brightness, colour, and perfection. The most highly prized pearls are quite spherical, and it is evident from their shape that these must have been formed free in the mantle or in the soft tissues of the mollusc, and not cemented to the shell. Some pearls show defects caused apparently by the contact of new foreign substances, organic or inorganic, such as a grit or film of weed: and in some cases it requires a number of layers completely to hide these defects. Thus every new layer secreted changes the value of the pearl. When a pearl that has been cut from the shell presents a hemispherical surface, it is sometimes called a 'perle bouton'; such a pearl is flat on one side and rounded or convex on the other. If a solid pearl has an irregular shape, having grown over a rough object, it is known as a baroque pearl. Sometimes warty pearls are hollow, and pass under the name of 'coq de perle.'

Pearl-oysters are in the habit of burying such intruders as they cannot otherwise dispose of. Stones, mud, small shells, wood, and especially layers of weed are found thus embedded in shells forming unnatural excrescences on the surface. These protuberances are gradually removed by the oyster secreting thinner layers of nacre on the top of them than on the base until the surface becomes again level. Slowly, but steadily, the exterior surface of the shell decays and disappears, until the foreign substance, of whatever nature it may be, comes within the reach of advancing dissolution, and thus the oyster literally passes a stone or other intruder through its shell. The Chinese carefully slip little figures of the Buddha below the mantle of the oyster or mussel, and the process of deposition covers them with nacre. By such means the Japanese produced the earlier *Culture-pearls*. A bead of mother-of-pearl inserted between the body of the oyster and the shell became in the course of four years or so the centre of a more or less hemispherical 'blister' or excrescence on the shell, suitable for cheap jewellery. The problem of getting free spherical culture pearls was taken up by men of science. English and German zoologists proved that the presence of an irritating body was not enough to produce a pearl within the tissues. There must be present also a closed sac of that same shell-secreting epidermis which lines the shell. Such a sac, not continuous with that of the surface, may be introduced, or it may be produced by the irritation or by some unknown cause. Professor Mikimoto's method is to wrap up beads of mother of pearl in pieces of epidermis from another oyster and insert them in the sub-epidermal tissues. The oysters operated on are returned to the sea, and in some seven years the grafted sacs have secreted pearls big enough for the market.

The value of a pearl depends upon its size, shape, colour, brightness, and freedom from defects. The most valuable pearls at the present time are those

which are perfectly round; the button-shaped ranks next, and then comes the drop or pear-shaped pearl. Perfectly round pearls over 25 grains in weight are extremely scarce, and secure high prices. They are greatly sought after to form the centre of necklaces, and large pearls of this character are safe and very profitable investments. The varying tints and colours of pearls are less difficult to understand than some of their eccentricities of growth. The changing condition of the sea, both as regards purity and temperature, the health of the oyster, accidents, such as the discharge of the inky fluid of the cuttle-fish in the neighbourhood of the oyster, all will probably affect the colours of the successive growth-periods of the pearl. Pearls, when of extraordinary beauty, size, and brilliancy, will sell for sums which appear extravagant.

The chemical composition of the pearl is carbonate of lime associated with a small proportion of organic matter. It is easily affected by acids and fetid gases, and may be calcined by exposure to heat. Its sp. gr. is 2.5 to 2.7. Three varieties of pearls examined, British, Australian, and Singhalese, were found to have an identical composition, and consisted of water, organic matter, and calcium carbonate without any magnesia.

The most important marine pearl-fishery (for black pearls) on the American continent is that of Lower California, the central point being at La Paz. In Australian waters fisheries are carried on along the West Australian coast north of lat. 25° S., and in Queensland round about Torres Strait. In the Shark Bay district of Western Australia, which is outside the tropics, *A. imbricata* is the species fished.

River-pearls are produced by fresh-water mussels in Scotland, Wales, Ireland, various parts of Russia, Germany, Canada, and the United States. British pearls are spoken of by Tacitus and Pliny; and in the end of the 17th century the Scottish pearl-industry was of some importance. The Spey, Tay, South Esk, Doon, Dee, Don, Ythan, Forth, and other rivers yield pearls, and a little fishing is still done. In the United States the chief river-pearl fishery is in the Mississippi and its tributaries. China is the headquarters of the trade in river-pearls.

False Pearls are made by blowing very thin beads or bulbs of glass, and pouring into them a mixture of liquid ammonia and the white matter from the scales of the bleak, and sometimes of the roach and dace. The scales of the lower part of the fish are very carefully washed and put to soak in water, when the pearly film falls off and forms a sediment at the bottom of the vessel, which is removed and placed in liquid ammonia for future use. This pearl mixture is injected into the glass beads, so as to coat them thinly inside; afterwards the better kinds have melted white wax or mucilage of gum-arabic poured in, which renders them much more durable. In this way are produced imitations of the finest oriental pearls, such as only the practised eye can detect. The art of giving the irregular forms of large pearls to the glass bulbs increases the resemblance; and the glassy appearance caused by the exterior glass coating is removed by exposing it for a short period to the action of the vapour of hydrofluoric acid. *Roman pearls* are lighter, as they have the coating of pearly matter on the outside.

See Streeter's *Pearls and Pearling Life* (1886), Kunz's *Gems and Precious Stones of North America* (1890), and Herdman's Reports on Ceylon pearl-fisheries.

MOTHER OF PEARL. The shells of several species of molluscos animals are popularly known as mother of pearl, those, for instance, of *Avicula macroptera* and of some species of *Haliotis*. To the shells, however, of *Avicula* (*Meleagrina*) *margar-*

tifera the term mother of pearl is properly applied. This species has a wide distribution in tropical seas. Macassar mother of pearl, from white-edged shells, is the most highly prized; the Manila yellow-edged shells are not much inferior; and the shells from some parts of Australia are also of a high quality, but those from Auckland are generally of a gray texture. The poorest shells come from Panamá. By far the greatest supply of mother of pearl is now got from the north and north-west of Australia, but large quantities also are obtained from the Straits Settlements, the Persian Gulf, and the islands of the Pacific. In Britain and the Continent thousands of persons work it for inlaid-work, fans, buttons, cutlery handles, trays, &c. The shell of the large pearl-oyster is thick, of slow growth, and sometimes measures nearly a foot across. For its play of colour, see IRIDESCENCE.

Pearl Powder. See BISMUTH.

Pearson, CHARLES HENRY (1830-94), born at Islington, and educated at Rugby, King's College, London, and Oriel and Exeter Colleges, Oxford, was successively professor or lecturer on Modern History at King's College, London (1855-65), Trinity College, Cambridge (1869-71), and Melbourne University (1874). He went into the colonial parliament in 1878, and in 1886-90 was Minister of Education. He died in London. His chief work was *National Life and Character* (1893). Earlier was a *History of England in the Early and Middle Ages* (1867). See Sketch by Strong, prefixed to a volume of his articles (1896), and the final *Life* by Stebbing (1900).

Pearson, JOHN, a learned English divine, was born 28th February 1612, in the same year as Jeremy Taylor, at Great Snoring, Norfolk, the son of the rector of that parish and Archdeacon of Suffolk. He was educated at Eton and at Queen's and King's Colleges, Cambridge, and became Fellow of the last in 1634. Five years later he took orders, and was collated to a prebend in Salisbury Cathedral. In 1640 he was appointed chaplain to the lord-keeper Finch, and soon after was presented to the rectory of Thorington in Suffolk. In 1650 he was appointed preacher at St Clement's, Eastcheap, London, and here in 1659 he published his admirably learned and judicial *Exposition of the Creed*. It was dedicated to his flock, to whom the substance of it had been preached some years before in a series of discourses, and it is still esteemed one of the very ablest works produced in the greatest age of English theology. During the same year (1659) Pearson edited the *Golden Remains of the Ever Memorable Mr John Hales of Eton*, with an admirable preface; and next he had a share in editing the *Critici Sacri* (1660). At the Restoration honours and emoluments were lavishly showered upon him, and he was successively Master of Jesus and Master of Trinity, Cambridge, and in 1673 Bishop of Chester. He died 16th July 1686. Other works were on the epistles of Ignatius, Cyprian, and sacred chronology, besides sermons and *Determinationes Theologicæ*.

Pearson, KARL, born in London in 1857, studied at University College School, London, King's College, Cambridge (where he became fellow), Heidelberg, and Berlin, and in 1895 became professor of applied mathematics and mechanics, and afterwards of eugenics, in London. He has written *The Ethics of Free-thought*, *The Grammar of Science*, *The Chances of Death*, and on elasticity and strength of materials, evolution, eugenics, and edited *Biometrika* (1902-24). His *Life and Letters of Francis Galton* (1915 et seq.) is a new kind of biography, in which the head of the Eugenics

Laboratory applies the principles of his science to the study of its founder.

Peary, ROBERT EDWIN (1856-1920), admiral (1911), born at Cresson Springs, Pennsylvania, entered the U.S. Navy in 1881, and worked as engineer at the Nicaragua Ship Canal surveys and elsewhere. But he is known to the world by his many adventurous and successful Arctic journeys (1886-1909), in which he proved Greenland an island, outlined the NE. corner, and brought back Ross's meteorite (1818). In his sixth voyage (1905-6) he left his ship, the *Roosevelt*, in 82° 27' N. lat., and went north in sledges, reaching 87° 6'. On his final journey he wintered at Cape Sheridan, and on 1st March 1909 left the coast of Grant Land with sledges, reaching the North Pole on 6th April.

Peasant Proprietorship is a system of cultivation of small holdings of land by occupiers who own the land, or hold it on some secure or permanent tenure. Perhaps there are few questions on which there is a greater diversity of opinion. On the one hand the small cultivator is held up as a pattern of industry, thrift, and prosperity, and on the other as an example of unceasing toil and miserable failure.

Arthur Young (q.v.) held that the best system of agriculture was that which secured the largest amount of produce from the land. It is evident, however, that account must be taken of the numbers, quality, and condition of those engaged in tilling the soil. Even if it could be proved that vast areas of land could be cultivated at the greatest money profit, by means of machinery and a handful of labourers, yet such a method of cultivation would probably be adverse to the real interests of the nation as a whole.

There is substantial evidence, however, that small holdings of land are more productive in proportion than large farms for certain kinds of food. It has been calculated that the small holdings of countries like Belgium and Denmark show greater gross receipts per acre than do the large farms of Great Britain, and that in Great Britain itself the amount of stock per acre carried on small holdings is larger—with the exception of sheep—than that carried on a similar area of land in large farms. But the system of peasant proprietorship in its strict sense is much more characteristic of continental agriculture than of British. In France especially peasant owners have long been a numerous class. In Germany agrarian reforms were inaugurated by Stein and Hardenberg early in the 19th century. In that country to-day, of 5½ million separate holdings, 5¼ million are owned by the occupiers. The vast majority of holdings in the Netherlands are in the hands of cultivating owners, and the small and medium-sized farms are generally the best cultivated and managed. The great prosperity of agriculture in Denmark, and the large and increasing exports of butter, eggs, cattle, and pigs, are due to the fact that the great bulk of the land is cultivated by owners, mainly by peasant proprietors. The majority of the agricultural labourers in Denmark possess a cottage with a small piece of land. Belgium is rather a country of small cultivators than of peasant proprietors, but yet is a striking example of the advantages of *la petite culture*. In England and Wales, on the other hand, although the majority of agricultural holdings are under 300 acres in extent, over 80 per cent. of them are farmed by tenants; thus the peasant proprietor class is all but negligible.

Britain depends more and more on foreign countries for a supply of the smaller articles of food, such as dairy produce, fruit, vegetables, honey, &c. The system of farming which obtains in

Britain is not adapted to the supply of these articles. The large farmer who raises corn and cattle cannot successfully compete with the small grower who is accustomed to minute and intensive cultivation, whilst the tenant farmer, unless he feels himself absolutely secure, cannot be induced to take an owner's interest in the land which he cultivates. Peasant proprietorship is a business requiring close personal attention, hard work, and the strictest frugality. As owner of his little holding, the peasant proprietor has no restrictions as to cropping or methods of cultivation, no doubts about compensation for unexhausted manures and improvements, and no uncertainty as to tenure. The great secret of success of peasant proprietorship is summed up by Adam Smith in a striking passage in his *Wealth of Nations*: 'A small proprietor who knows every part of his little territory, who views it with all the affection which property, especially small property, naturally inspires, and who upon that account takes pleasure not only in cultivating but in adorning it, is generally of all improvers the most industrious, the most intelligent, and the most successful.' The two great drawbacks of peasant proprietorship are excessive subdivision and the unlimited power of mortgage. The land-hunger—especially in France—is so great that the proprietor of a few acres will submit to any privation to save money, and will borrow at any rate, in order to acquire more land. The money-lender on the Continent, like the 'gombeen' man in Ireland, has been a cause of trouble and difficulty to the small cultivator. The establishment of various forms of agricultural co-operative societies, however, has done much to better the position of the peasant proprietor (see CO-OPERATION).

Towards the end of the 19th century the creation of a peasant proprietorship in Great Britain began to be seriously entertained as a practical question. In 1889 a Select Committee on Small Holdings declared that the extension of small ownerships was a matter of national importance both in the interests of the rural population, and also as adding to the security of property generally. The Small Holdings Act, passed in 1892, empowered County Councils to purchase land and resell it on accommodating terms in small holdings, not exceeding fifty acres, to suitable persons who would themselves cultivate it. In 1907 a further Small Holdings Act was passed, the chief object of which was the creation of tenants rather than proprietors; whilst in 1908 the various acts relating to small holdings and allotments were consolidated in one measure known as the Small Holdings and Allotments Act, 1908. This measure, however, which empowered County Councils to acquire land and let it out to small holders, has not been as successful as was anticipated. These acts, together with those of 1919 and 1923, are discussed at ALLOTMENTS and LANDLORD AND TENANT. The Irish Land Acts of 1903 and 1909 practically provide for the establishment of peasant proprietorship in Ireland. See articles above mentioned, also that on CROFTERS.

See Laveleye's works on the rural economy of Belgium and the Netherlands (1864-75); Laveleye, *Économie Rurale de la France* (4th ed. 1877); Thornton, *Peasants for Peasant Proprietors* (new ed. 1874); Collings, *Land Reform* (1906); Turnor, *The Land and its Problems* (1921); and Fordham, *The Rebuilding of Rural England* (1924).

Peasant War (*Bauernkrieg*), a great insurrection of the German peasantry which broke out in the beginning of the year 1525. The oppression of the peasants had gradually increased in severity as the nobility became more extravagant and the clergy more sensual and degenerate. The example of Switzerland encouraged the hope of success, and

from 1431 to 1517 there were risings amongst the peasants of the south and west of Germany. A peasant rebellion took place in the Rhine countries in 1502, and another in Württemberg in 1514, both of which were put down without any abatement of grievances. The Reformation, by stirring up the desire of freedom, must be reckoned amongst the causes of the great insurrection itself; although Luther, Melancthon, and the other leading reformers, whilst urging the nobles to justice and humanity, strongly reprobated the violent proceedings of the peasants. The Anabaptists, however, encouraged them, and peasant insurrections, quickly suppressed, took place in 1522 and 1523. In January 1525 the peasantry of the abbacy of Kempten suddenly assailed and plundered the convent. This proved the signal for a rising of the peasants throughout the south of Germany. Many of the princes and nobles at first regarded the insurrection with complacency, because it was directed in the first instance chiefly against the ecclesiastical lords; some, too, because it seemed to set bounds to the increase of Austrian power. But the Archduke Ferdinand hastened to raise an army, and entrusted the command of it to Von Waldburg, a man of stern and unscrupulous character. Von Waldburg defeated and destroyed some large bodies of peasants, but was himself defeated by them on the 22d of April. Meanwhile the insurrection extended, and a number of towns took part in it, as Heilbronn, Mühlhausen, Fulda, Frankfurt, &c., but there was a total want of organisation and co-operation. On 25th March 1525 there appeared in Upper Swabia a manifesto, in which the insurgents demanded the free election of their parish clergy; the appropriation of the tithes, after maintenance of the parish clergy, to the support of the poor; the abolition of serfdom; the restoration to the community of forests, fields, and meadows which the secular and ecclesiastical lords had appropriated; release from arbitrary augmentation and multiplication of services, duties, and rents; the equal administration of justice; and the abolition of some of the most odious exactions of the clergy. The conduct of the insurgents was not, however, in accordance with the moderation of their demands. Their many separate bands destroyed convents and castles (more than 1000 in all), murdered, pillaged, and were guilty of the greatest excesses. A number of princes and knights concluded treaties with the peasants, conceding their principal demands. The siege of Marienberg, near Würzburg, gave time to their enemies to strengthen their forces: Götz von Berlichingen (q.v.) was one of the captains of the besieging peasants, who, he afterwards maintained, had forced him to lead them. In May and June 1525 the peasants sustained a number of severe defeats; and the Landgrave Philip of Hesse, the Saxon Dukes, the electors of the Palatinate and Treves, and Frundsberg were successful farther north. The peasants were everywhere treated with terrible cruelty; more than 130,000 were killed in Upper Germany alone. Multitudes were hanged in the streets, and many were put to death with the greatest tortures. Würzburg and other towns which had joined them suffered the terrible revenge of the victors. It is supposed that more than 150,000 persons lost their lives in the Peasant War. Flourishing and populous districts were desolated. The lot of the defeated insurgents became harder than ever, and many burdens of the peasantry originated at this period. The cause of the Reformation and of German national life also was very injuriously affected. Similar peasant insurrections in other countries are treated of under TYLER, CADE, KETT, JACQUERIE, SPARTACUS.

Peastone, or **PISOLITE**, a coarse Oolite (q.v.).

Peat, a substance formed by the decomposition of plants amidst much moisture, as in marshes and morasses. The remains are often so well preserved in it that the species can be easily distinguished. Reeds, rushes, and other aquatic plants may usually be traced in peat, and stems of heath are often abundant in it; but it chiefly consists in the northern parts of the world of different species of *Sphagnum* or Bog-moss (see BOG-PLANTS). These mosses grow in very wet situations, and throw out new shoots in their upper parts whilst their lower parts are decaying and being converted into peat; so that shallow pools are gradually changed into bogs. Stools and trunks of trees often occur under peat in the British Islands and in north-western Europe generally. And not only so, but similar stools and trunks are frequently met with in a middle position—i.e. resting on peat and covered by a variable thickness of the same accumulation. It cannot be doubted that the overturning of trees, whether by natural causes or by man's hand, would in many cases impede surface drainage, and so eventually give rise to the formation of bogs. But there is reason to suspect that the succession of 'buried forests' and peat so frequently seen in the bogs of north-western Europe points to climatic changes (see POST-GLACIAL SYSTEM). Peat passes by insensible degrees into Lignite (q.v.). The less perfectly decomposed peat is generally of a brown colour; the more perfectly decomposed is often nearly black. Moist peat possesses a decided and powerful antiseptic property, which is attributed to the presence of gallic acid and tannin, and is manifested in the perfect preservation not only of ancient trees and of leaves, fruits, &c., but sometimes even of animal bodies. Thus in some instances human bodies have been found perfectly preserved in peat after the lapse of centuries.

The formation of peat takes place mainly in the colder parts of the world. In warmer regions decay is too rapid. The surface covered by peat in England is considerable; it is greater in Scotland, and very great in Ireland. Some large peat-bogs occur in the south of Europe, even near the sea, and farther north they are still more extensive; they occur also in the northern United States, but more extensively in Canada and Newfoundland. For their physical characters and reclamation, see BOG, WASTE LANDS.

Mere peat is not a good soil, even when sufficiently drained, but by the application of lime, marl, &c., it is soon converted into valuable land, yielding excellent crops. A mixture of peat is often of benefit to soils otherwise poor; and for many shrubs, as rhododendrons, kalmias, whortleberries, &c., no soil is so suitable as one largely composed of peat. Bacterised peat is peat used as a medium for application of nitrogen-fixing bacteria to land. It is peat treated with a mixed culture of *Bacillus radriicola* and *Azotobacter chroococcum*. See NITROGEN-FIXATION.

Peat is a fuel, of great future importance. Up to now, however, the vast amount of energy stored up in the world's peat-bogs has hardly been touched, owing to the fact that even a well-drained peat-bog contains some 80 to 90 per cent. of water, which may be reduced by 'air-drying' to about 15 to 25 per cent. The calorific value of *air-dried* peat averages about 3000 K.C.U.s. per kilogram (5400 B.Th.U.s. per lb.), which is less than half that of a good bituminous coal. Dry ashless peat contains 50 to 65 per cent. of carbon, 4.5 to 6.8 per cent. of hydrogen, 30 to 45 per cent. of oxygen, 0.5 to 2.5 per cent. of nitrogen, together with a

very small amount of sulphur. Its calorific value is between 5000 and 5500 K.C.U.s. per kilogram (9000 to 9900 B.Th.U.s. per lb.).

A great deal of inventive skill has been brought to bear on the problem of devising some method whereby the moisture in natural peat can be got rid of without resorting to 'air drying,' but as yet no complete solution has been disclosed, although promising attempts have been made along the lines of a combination of moderate heat and compression in specially designed presses.

In 1909 the late Dr Ekenberg published proposals for eliminating the water from peat-pulp by a so-called process of 'wet carbonisation,' whereby the pulp is forced at 200 to 300 lb. per square inch pressure through a series of tubes heated externally to 200° C., and subsequently dehydrated under mechanical pressure (*Journal of the Iron and Steel Institute*, 1909, vol. i. p. 313).

Inasmuch as peat containing up to 60 per cent. moisture can be gasified in gas-producers under ammonia recovery conditions, it is a valuable potential source of ammonia, owing to its usually large nitrogen content compared with other natural fuels. Also, on carbonisation it yields a valuable charcoal. That prepared from uncompressed peat is unsurpassed as regards its antiseptic and deodorising properties; whilst that made from compressed peat is denser than wood charcoal, and, on account of its low sulphur content, is highly valued in connection with the making and tempering of the finer kinds of cutlery steel. Other valuable products of the carbonisation of compressed peat are ammonia, pyroligneous acid, acetone, methyl alcohol, &c., the commercial recovery of which is still to a large extent an unsolved problem.

Pebble (probably allied to *bubble*, from the sound of water running among stones), a small, round, water-worn stone of any kind; but with jewellers sometimes an agate—agate being often found as loose pebbles in streams, and those of Scotland in particular being popularly designated *Scotch Pebbles*. Hence the name has come even to be extended to rock-crystal when not in the crystalline form. Deposits of pebbles (in the sense of water-worn stones) occur among the rocks of all periods, but the pebbles are seldom loose; they are generally cemented together by iron, lime, or silica, forming a pudding-stone of greater or less hardness (see CONGLOMERATE). Single pebbles are sometimes found in deposits which have been formed in perfectly still water, as in chalk and fine silt. They must have been floated to their places entangled in roots.—**BRAZILIAN PEBBLES** (so called from Brazil having been long famous for the purity of its rock-crystal) are very pure pieces of Rock-crystal (q.v.) used for lens-making.

Pebrine, the formidable silkworm disease, due to a Protozoon parasite, *Glugea* or *Nosema bombycis*, one of the Myxosporidia. See PASTEUR, SILK.

Peć (Turk. *Ipek*), a town of Yugoslavia, 73 m. ENE. of Scutari, contains the monastery founded by Archbishop Arsenius in the 13th century, which is the seat of the Patriarchs of the Serbian Church, and contains the famous marble throne on which they are crowned. There is a church dating from the 16th century.

Pecan. See HICKORY.

Peccary (*Dicotyles*), a genus of the family Suidæ, containing at least two species. They have fewer teeth (thirty-eight) than the ordinary swine (forty-four), and a very short tail. The name *Dicotyles* is derived from a gland upon the back, almost corresponding in position to the navel below. *D. torquatus* is found from Arkansas to Patagonia, and is about 3 feet long; but the larger and fiercer *D. labiatus* only ranges from

Central America to southern Brazil. The latter is exceptionally pugnacious, and, as it goes about commonly in herds, it is extremely dangerous to

Peccary (*Dicotyles labiatus*).

meet with. Even the jaguar is said to retire before several of these animals when banded together. The two species freely breed together.

Pe-chi-li, GULF OF, a land-locked extension of the Yellow Sea (q.v.), between the base of the Korean peninsula and the Chinese province of Shantung, into which the Pei-ho (q.v.) discharges.

Peck, a measure of capacity for dry goods, such as grain, fruit, &c., used in Britain, and equivalent to two imperial gallons, or 554.548 cubic inches. It is thus the fourth part of a Bushel (q.v.). The old Scots peck, the sixteenth part of a boll, when of wheat was slightly less than the imperial peck, but when of barley was equal to about 1.456 of it.

Pecock, REGINALD, prose-writer, was most probably born in Wales, about 1395; was a Fellow of Oriel College, Oxford, in 1417; and was ordained acolyte and sub-deacon in 1420, proceeding to deacon's and priest's orders in the two following years. His preferments were the mastership of Whittington College, London; the bishopric of St Asaph's, from Duke Humphrey of Gloucester in 1444, when he also received his degree of Doctor of Divinity, and of Chichester, through the patronage of the ill-fated William de la Pole, Duke of Suffolk, in 1450. A student of great learning and industry, he plunged eagerly into controversy, and compiled many treatises, including the *Reule of Crysten Religioyn* (unprinted; Morgan Library, New York), the *Donet* (ed. Miss Hitchcock, E.E.T.S., 1921), on the main truths of Christianity, the *Folwer* (sequel) to the *Donet* (ed. Miss Hitchcock, E.E.T.S., 1924), and his practical *Book of Feith* (c. 1456; ed. Morison, 1909), written for the Lollards. He gives up infallible authority in the church, makes faith a matter of probability rather than of knowledge, lays a broad foundation for a really rational piety, and makes a noble approximation to the doctrine of religious toleration. His *Repressor of Over Much Blaming of the Clergy* (c. 1455) seeks to promote the peace of the church by plain arguments against Lollardy, written in the mother-tongue. He maintained that bishops had higher duties than mere preaching, and strove with great patience and clear logic to demonstrate the reasonableness of those doctrines and ordinances of the church which the Lollards rejected as not founded on Scripture. Of a liberal and tolerant spirit far before his time, Pecock indicated with much point and originality the teaching of natural religion about man's moral duties, asserting that the judgment of reason must not be overruled and twisted into conformity with Scripture, which rather confirms than serves as the authority for the light of nature. In his argument that Scripture pre-supposes a knowledge of the moral virtues, and that its special object is

to make known those truths which reason could not have discovered, he is distinctly the forerunner of the great Hooker. His attack on the Donation of Constantine is an admirable piece of reasoning, and his argument that experience shows that there is no subject on which men are more likely to err than the interpretation of Scripture deals a deadly blow to the bibliolatriy of Lollardy and Protestantism. Peacock's philosophic breadth and independence of judgment brought upon him the suspicions of the church, and especially of the friars, whom he had stigmatised as 'pulpit bawlers.' The storm of opposition that had long been gathering burst upon his head at a council held at Westminster in 1457. He was hotly denounced for having written in English, and for making reason paramount even to the authority of the old doctors, while many slanderous and baseless charges besides were heaped upon his head. He was summoned before Archbishop Bouchier at Lambeth, where his writings were subjected to examination by twenty-four doctors. In the end he was condemned by the archbishop as a heretic whose doctrines were contrary to St Augustine, St Jerome, and St Gregory, and the cruel alternative was put before him, to abjure his errors or be burned. He elected to abjure, made confession of many errors and heresies of which he had never been guilty, and with his own hands delivered to the executioner his three folios and eleven quartos for the flames. Against the further sentence that he should be deprived of his see he appealed to Rome, and the pope indeed commanded him to be reinstated, but he was prevailed upon to resign his bishopric into the hands of the king. The rest of his days he spent in the abbey of Thorney in Cambridgeshire. Forty pounds a year was allowed for his maintenance; he was to have the service of an attendant, somewhat liberal diet, and a private chamber with a chimney and a passage leading from it which gave a sight of an altar and allowed him to hear mass. He was denied writing materials, and his books were but five—a breviary, a mass-book, a psalter, a legendary, and a Bible. He died about 1460.

See LOLLARDS; also James Gairdner's *Studies in English History* (1881); his monograph (1911) on *The Revue of Crysten Religoun* (1924); Churchill Babington's *Introduction to the Repressor in the Rolls series* (2 vols. 1860); the *Life* by John Lewis (1774; reprinted, Oxford, 1820); F. Schmidt, *Studies in the Language of Peacock* (Uppsala, 1900).

Pecos, a river of New Mexico and Texas, flows some 800 miles SSE. to the Rio Grande.

Pecten. See SCALLOP.

Pectic Acid, Pectin, Pectose. See FRUIT (*Chemical Composition*).

Peculiar. See BENEFICE, DEAN.

Peculiar People, a sect of Faith-healers founded in London in 1838. They reject medical aid in cases of disease, although not in surgical cases, and rely on anointing with oil by the elders, and on unceasing prayer, with patient nursing. They have their own collection of hymns, usually select their preachers from among the elders, and baptise their children when they are considered old enough to understand the ceremony and to express consent. Their communities are not numerous, and the members are nearly all very poor working-folk; but they bear a high character for morality, honesty, and Christian charity.

Pedaliaceæ, a family of 17 genera and 50 species, ranging over tropical Africa, Asia, Australia, and sub-tropical South Africa. It is closely allied to Bignoniaceæ, and distinguished by the peculiar fruits provided with strong and very acute spines or grappels, which are savagely developed on the Grapple-plant (q.v.). See SESAME.

Pedestrianism. See ATHLETIC SPORTS.

Pedicellariæ, very remarkable minute structures on the skin of sea-urchins and starfish, having the form of a stalk with a three-bladed or two-bladed snapping forceps at the summit. Some are poisonous; others keep the surface clear; others catch hold of small organisms.

Pedicularis, a genus of herbs of the Scrophulariaceæ, over 400 species, some with rather large and finely-coloured flowers. Two species *P. palustris* and *P. sylvatica*, are natives of Britain, common in wet grounds. Both have received the name of Lousewort. the English equivalent of 'Pedicularis,' from their supposed influence in producing the lousy disease in sheep—an influence purely imaginary. Their acridity renders them obnoxious to sheep; but cattle, goats, and swine eat them. Continental Europe and the northern parts of Asia produce many other species, and some are found in North America and elsewhere. *P. Sceptrum-Carolinum*, or King Charles's Sceptre, is one of the principal ornaments of marshy grounds in the most northerly countries of Europe.

Lousewort
(*Pedicularis palustris*).

Pedigree (possibly from *pied de grue*, 'crane's foot,' from the slender lines used in drawing pedigrees), a tabular view of the members of a particular family, with the relations in which they stand to each other, accompanied or unaccompanied by a notice of the chief events in the life of each, with their dates, and the evidence of the facts stated. Pedigrees are indispensable aids to the student of history. The materials to be used in the formation of a pedigree are notes of the facts to be set forth, and a recognised series of signs and abbreviations. These notes comprise the name of every person who is to appear in the pedigree, with such dates and circumstances as it may be considered desirable to record. Among the commonest abbreviations are *dau.*, for daughter of; *s. and h.*, son and heir of; *coh.*, coheir of; *w.*, wife of; *s. p.* (*sine prole*), without issue; *v. p.* (*vita patris*), in his father's lifetime; *b.*, born; *d.*, died; *dep.*, deposed; *K.*, king; *E.*, earl, &c. The sign = placed between two names indicates that they were husband and wife; † indicates that they had children; ↓ under a name signifies that the person had children. Men are frequently indicated by small squares, women by circles or lozenges. All persons of the same generation are to be kept in the same horizontal line; and the main line of descent is, wherever possible, to be indicated by keeping the successive names in a vertical column. Continuous lines indicate the succession of the different generations. The members of the same family are generally arranged in their order of birth in two groups—the sons first, and then the daughters; but where the same father or mother has children by more than one marriage, the children of each marriage ought to form distinct groups. The actual arrange-

ment, however, of a pedigree must always depend on the leading object which it is intended to illustrate. Specimens may be seen in the articles **BONAPARTE** and **BOURBON**.

Tabular genealogies, generally brief, and meant to illustrate some particular claim of right, are found among the records, public and private, of the early middle ages; but after the incorporation of the English Heralds' College far more attention was devoted to the compilation of pedigrees of families, more particularly with reference to their claims to dignities and heraldic insignia. In the course of the 16th century the heralds obtained copies of all such accounts of the English families of any distinction as could be supplied to them, and entered them in the books which contain the records of their official proceedings. Royal commissions were issued till 1704 to the two provincial kings-of-arms, empowering them to visit in turn the several counties of England, in order to collect from the principal persons of each county an account of the changes which had taken place in their respective families in the interval since the last preceding visitation, and to inquire what account could be given of themselves by families who had stepped into the rank of gentry, or had become settled in the county since that period. The register-books kept by the heralds and their assistants contain the pedigrees and arms collected in the course of the visitations, with the signatures of the heads of the families. See the article **HERALDRY**.

In Scotland, in the absence of the regular system of visitations which prevailed in England, there is a great deal of evidence regarding the pedigrees of the historical families of the country scattered here and there in public and private collections, including the Scottish National Library and the Lyon Office. A register of genealogies exists in the Lyon Office, in which the pedigrees of applicants, after being proved to the satisfaction of the heraldic authorities, are inserted with the accompanying evidence; and the Register of Arms contains much valuable information. To what extent the register of genealogies in the Lyon Office may be admitted as a probative document, conclusive of the facts which it sets forth, has not been ascertained by actual decision; but there can be no doubt that, in questions both as to property and honours, it would be regarded as a most important adminicle of proof.

The construction of pedigrees has proved scientifically valuable for the study of the kinship systems of primitive peoples, and for problems of heredity and Eugenics (q.v.).

See the works of Sir Bernard Burke (q.v.) and Sir Harris Nicolas (q.v.); Doyle, *Official Baronage* (1886); Foster, *Peerage, Baronetage, and Knightage* (1883), and *Collectanea Genealogica* (1882); Marshall, *The Genealogist's Guide* (1879; 2d ed. 1885); Roberts, *Calendarium Genealogicum* (1865); G. Burnett, *Popular Genealogist* (Edin. 1865); Rye, *Records and Record Searching* (1888); Whitmore, *The American Genealogist* (1862; 2d ed. 1875); Durrie, *Bibliographia Genealogica Americana* (1863); Douglas's *Scots Peerage* (1764; re-ed. Sir J. Balfour Paul, 1904-11); E. Round, *Peerage and Pedigree* (1910).

Pediment, the triangular space over the portico at the ends of the roof of classic buildings. It may be called the gable of classic buildings, and is frequently enriched with sculpture, for which it forms a fine setting. See **GREEK ARCHITECTURE**.

Pedlars. See **HAWKERS**.

Pedometer, an instrument for measuring walking distances. It has a dial which records revolutions of the mechanism; and the mechanism is generally actuated by the relative movement of a comparatively heavy suspended mass attendant on each step, though in some forms it is driven by

a cord connected with the foot. In all cases the thing measured is the number of steps rather than the distance walked; and the user must find the true meaning of the readings of the apparatus as applied to his own walking.—An instrument attached to the wheel of a carriage so as to mark the number of revolutions of the wheel and so the distance traversed is called *hodometer* or *odometer* (Gr. *hodos*, 'way,' and *metron*, 'measure'). This is usually a train of wheelwork attached to the axle of the carriage, and communicating motion to an index on a dial. A similar instrument, called a *cyclometer*, is attached to bicycles and tricycles. The name *odometer* is also given to a wheel used by surveyors, which records the distances in miles or rods.

Pedrell, FELIPE, Spanish composer, was born in 1841 at Tortosa. His knowledge of music was acquired mainly without a teacher. He became a member of the Spanish Academy in 1895, was professor in the Madrid Royal Conservatory and lecturer at the Ateneo; he removed to Barcelona in 1903, and died there in 1922. His works include a series of operas *El Último Abencerraje* (1874), *Barcelona*, *Quasimodo* (1875), *Cleopatra* (1881), a trilogy *Pineros* (1902), besides choral works, symphonic poems, and songs. Pedrell wrote on music and folk-lore, and edited, among other things, the *Hispanica Schola Musica Sacra*.

Pedro I. (1798-1834), emperor of Brazil (1822-31), second son of John VI. of Portugal, fled to Brazil with his parents on Napoleon's invasion of Portugal, and became prince-regent of Brazil on his father's return to Portugal. For the proclamation of Brazilian independence and subsequent history, see **BRAZIL**.—**PEDRO II.**, his son, born 2d December 1825, became king in 1831 on his father's abdication, was declared of age in 1840, and, distinguished by his love of learning and simple scholarly tastes, reigned over Brazil in peace until the sudden revolution of November 15, 1889, compelled him to withdraw to Europe, where he lived, mainly in France, Brazil becoming a republic under the name of 'United States of Brazil.' He died at Paris, 5th December 1891. See *Life* by Mossé (1889).

Pedro the Cruel, king of Castile and Leon, was the only legitimate son of Alfonso XI., and was born at Burgos, 30th August 1334. On his father's death (1350) Pedro succeeded to the throne without opposition, but left the whole exercise of power to his mother, Donna Maria of Portugal, and Albuquerque, his father's prime-minister and chancellor. But by the instigation of his mistress (afterwards his queen), Marie de Padilla, Pedro emancipated himself in 1353 from the guidance of the queen-mother. He now obtained exceeding popularity; but the strict justice with which he decided all causes between the rich and poor, the clergy and the laity, combined with a haughty and imperious carriage towards them, alienated from him the nobles and clergy. The plottings of Albuquerque, who had fled to Portugal, having culminated (1354) in a revolt in Estremadura, Pedro marched against the rebels, but was betrayed by his brother Henry and taken prisoner. Escaping, he found himself speedily at the head of a powerful army, with which, despite the excommunication of the pope, he speedily reduced his opponents to submission. But having been betrayed by his relatives, and even by his mother, he became suspicious of every one; and the rest of his reign was devoted to the destruction of the power of the great vassals, the establishment of his own authority on the ruins of their feudal tyranny, and long-continued and bloody wars with the kingdoms of Aragon and Granada. He owes the epithet Cruel mainly to the murder

of his brother Don Fadrique in 1358. But he is still often called in Spain 'the Justiciary,' from remembrance of his better qualities. The people were in general well and justly governed, but the heavy taxes imposed to maintain the cost of his long wars with Aragon and Granada dissipated his popularity. Henry, who had fled to France, now seizing the favourable opportunity, returned (1366) at the head of a body of exiles, backed by Bertrand du Guesclin (q.v.) with an army of mercenaries, and aided by Aragon, France, and the pope. Pedro, however, by great promises of territory and money, prevailed upon Edward the Black Prince to espouse his cause. Edward invaded Castile in the spring of 1367, totally defeated Henry and Du Guesclin at Navarrete (13th April), taking the latter prisoner. But the king disgusted his chivalrous ally by his cruelty to the vanquished, and paid no heed to his remonstrances; Edward accordingly repassed the Pyrenees, and left the misguided monarch to his fate. The whole kingdom groaned under his cruelties; rebellions broke out everywhere; and, in autumn 1367, Henry returned with 400 lances, the people immediately flocking to his standard. Pedro's scanty and ill-disciplined forces, including many Saracens, were routed at Montiel (14th March 1369). Captured by Du Guesclin, he was carried to a tent, where a single combat took place between him and Henry, in which Pedro, on the intervention of a follower of Henry's, was slain, 23rd March 1369. See Prosper Mérimée's book (1848; 2d ed. 1865; Eng. trans. 1849), and Storer's (1910).

Peduncle. See FLOWER.

Peeblesshire, or **TWEEDDALE**, a southern county of Scotland, bounded by Edinburgh, Selkirk, Dumfries, and Lanark shires. Irregular in outline, it has a maximum length and breadth of 29 and 21 miles, and an area of 347 sq. miles or 222,240 acres. The Tweed, rising in the extreme south, winds 40 miles north-north-eastward and eastward, descending therein from 1500 to 450 feet; and from it the surface rises into big, round, grassy hills—Windiestraw Law (2161 feet), Minchmoor (1856), Hartfell (2651), Broad Law (2754), &c. Among the Tweed's numberless affluents are Talla, Biggar, Lyne, Manor, Eddleston, Leithen, and Quair Waters, of which the Talla supplies Edinburgh with water. About one-eighth of the entire area is arable; but nearly 200,000 sheep graze on the hillsides. The antiquities include over fifty hill-forts, the 'Romano terraces,' a Roman camp at Lyne, the ruined castles of Neidpath and Drochil, and the old mansion of Traquair; whilst 4 miles SW. of Peebles is the cottage of Davie Ritchie, the 'Black Dwarf' (1740-1811). Peebles and Innerleithen are the only towns. The county unites with South Midlothian to return one member. Pop. (1801) 8735; (1841) 10,499; (1881) 13,822; (1921) 15,330.

PEEBLES, the pleasant county town, stands on the left bank of the Tweed, 22 miles S. of Edinburgh. It has a parish church (1887) and other modern churches; the Chambers Institution (1859-1912), with library, museum, &c., in the old house of the Yester and Queensberry families; a hydro-pathic; a cross; a public park (1887); tweed manufactures; the tower of St Andrew's Church (1196), restored in 1882 by Dr William Chambers (q.v.), who rests beneath its shadow; remains of the Cross Church, and of the town wall. Mungo Park was a surgeon here. Peebles was made a royal burgh in 1367, and till 1832 returned one member. Pop. (1861) 2045; (1881) 3495; (1921) 5537.

See Dr A. Pennicuik's *Description of Tweeddale* (3d ed. 1875), Dr John Brown's *Minchmoor* (1864), and *Charters of Peebles* (1873); and the histories of Dr W. Chambers (1864), Sir G. Douglas (1899), and John Buchan (1925).

Peel, a coast town of the Isle of Man, 11½ miles by rail NW. of Douglas. On Peel Hill (450 feet) is a tower called Corrin's Folly; and on an island sheltering the harbour stand the beautiful ruins of Peel Castle, celebrated by both Scott and Wordsworth. It dates from the 12th century, but was mainly rebuilt by the fourth Earl of Derby in 1593. St German's Cathedral, a cruciform ruin, with a crypt and low central tower, is included in its area. Fishing is Peel's chief industry, but as a watering-place attracts yearly more and more visitors. Pop. 2500.

Peel, **SIR ROBERT**, statesman, was born on 5th February 1788, near Bury in Lancashire. His father, Sir Robert Peel (1750-1830, created a baronet in 1800), was a wealthy cotton-spinner, from whom he inherited a great fortune. He was educated at Harrow, and at Christ Church, Oxford, where he took a double first in 1808, and entered the House of Commons in 1809 as member for Cashel, adopting the strong Tory politics of his father. Perceval was then prime-minister. Peel set quietly about the business-work of the House, feeling his way with that steady prudence and persevering diligence that were the conspicuous features of his character. In 1811 he was appointed Under-secretary for the Colonies; and from 1812 to 1818 he held the office of Secretary for Ireland. In this capacity he displayed a strong anti-Catholic spirit (whence the witty Irish gave him the nickname of 'Orange-Peel'), and was in consequence so fiercely attacked by O'Connell that even the cool and cautious Secretary was stung into sending the agitator a challenge. The police, however, prevented the duel from taking place. From 1818 till 1822 Peel remained out of office, but not out of parliament, where he sat for the university of Oxford. He now began to acquire a reputation as a financier and economist, and in 1819 was appointed chairman of the Bank Committee, and moved the resolutions which led to the resumption of cash-payments. He was still as averse as ever to anything like religious or political reform. No member of the Liverpool-Castlereagh cabinet could have been to appearance more resolute; he even vehemently defended the 'Peterloo Massacre' of 1819. In 1822 he re-entered the ministry as Home Secretary—Canning shortly after becoming Foreign Secretary, on the suicide of Lord Castlereagh. The two worked together pretty well for some time, as Peel devoted himself chiefly to financial matters, and especially to the currency; but 'Roman Catholic emancipation' was a question on which Canning was considerably in advance of his brother-secretary; and when the former was called upon by the king, after the resignation of Lord Liverpool, to form a sort of Whig-Tory ministry, Peel, along with the Duke of Wellington and others, withdrew from office. Yet it is singularly characteristic of this most honest statesman that even when he seceded (1827) his opinions were veering round to the liberal and generous view of the claims of Roman Catholics; and when the death of Canning, shortly after, led to the formation of the Wellington-Peel government, its great measure—actually introduced by 'Orange-Peel' himself—was the ever-memorable one for the 'relief' of the Roman Catholics (1829). As Home Secretary he also signalled himself by a reorganisation of the London police force (since popularly called 'Peelers' and 'Bobbies'), and by the introduction of several other important measures.

Meanwhile, the university of Oxford had rejected its apostate representative, and chosen in his stead Sir Harry Inglis. And now came on the great question of parliamentary reform, which Peel firmly but temperately opposed. In 1830 the Wellington-Peel ministry fell, and was succeeded

by a Whig ministry under Earl Grey, which, in 1832, carried the Reform Bill. Peel (now, by the death of his father, Sir Robert Peel), when he saw that reform was inevitable, accepted defeat and its results with great equanimity. He shrank from anything like factious opposition to the measure, and contented himself with presenting as forcibly as he could the political *per contra*. After it was passed he became the leader of the 'Conservative' opposition; and, as we have said, accepting reform itself as a *fait accompli* and irreversible, he only sought by a keen and vigilant criticism of Whig measures to retard the too rapid strides of liberalism. In 1833, when the first reformed parliament assembled, Peel took his seat as member for Tamworth, which he represented till the close of his life. On the retirement of the Melbourne ministry in November 1834 he accepted the office of prime-minister, but could not succeed in giving stability to his administration; he was compelled again to give place to Viscount Melbourne in April 1835, and resumed his place as leader of the opposition. Peel's conduct in opposition was always eminently patriotic. The Whigs, who were being pressed on the one side by the new Radical party and the Anti-corn-law League, and on the other by O'Connell and the Irish repealers, gradually lost ground, and, being all but defeated in 1841 on a motion of want of confidence, dissolved parliament. The general election that ensued was virtually a contest between Free Trade and Protection. Protection won; and, when the new parliament met, a vote of no confidence was carried by a majority of ninety-one.

The Conservative party, headed by Peel, now came into office. The great feature of the new government was the attitude it adopted on the corn-law question. The Whigs, while in office, and even after their expulsion, were bent upon a fixed but moderate duty on foreign corn; the Anti-corn-law League would hear of nothing short of an entire repeal, while Sir Robert was in favour of a modification of the sliding-scale of duty which had existed since 1828. He introduced and carried (1842), in spite of strong opposition, a measure based upon this principle. The deficit in the revenue, which had become quite alarming under the Melbourne administration, next engaged his attention, and led him to bring in a bill (1842) for the imposition of an 'income-tax' of 7d. in the pound, to be levied for three years. To alleviate the new burden Peel commenced a revision of the general tariff, and either abolished or lowered the duties on several very important articles of commerce, such as drugs, dye-woods, cattle, sheep, pigs, salted meat, butter, eggs, cheese, and lard. He also showed himself resolute in the repression of the malcontents of Ireland. O'Connell (q.v.) was tried for conspiracy, and, though the judgment against him was set aside on appeal to the House of Lords, the influence of the 'agitator' was broken. The first half of 1845 was marked by the allowance to Maynooth being increased and changed into a permanent endowment instead of an annual grant, and by the foundation of the Irish unsectarian colleges, and other important measures. But the potato-rot in Ireland during the autumn, followed by a frightful famine, rendered 'cheap corn' a necessity, if millions were not to starve. Cobden and the League redoubled their exertions. Lord John Russell announced the views of the Whig party on the crisis, and Peel again yielded. He told his ministerial colleagues that the corn laws were doomed, and that their repeal was inevitable. Some of them refusing to go along with him, he resigned, but after a few days was recalled, and resumed office. Lord Stanley (afterwards Earl of Derby) seceded, and,

with Lord George Bentinck, Disraeli (whose savage attacks goaded Peel into sending him a challenge), and others, formed a 'no-surrender' Tory party; but the Duke of Wellington, Graham, Aberdeen, Gladstone, and other eminent Conservatives stood by him, and the measure for the repeal was carried. He was, however, immediately afterwards defeated on an Irish Protection of Life Bill. Not so much upon this account as because he felt that the course which he had pursued had produced a dissolution of the old ties of party, and that he could not expect for some time to find himself at the head of a strong government, Peel retired from office in June 1846, giving place to a Whig administration under Lord John Russell, to which he gave an independent but general support as the leader of a middle party rather Whig than Tory. In the critical times of 1847-48 he was one of the most important props of the government, whose free-trade principles he had now completely accepted. His ecclesiastical policy had also undergone a remarkable change, and he now frankly supported the Whigs in the efforts to carry an act for the repeal of the Jewish disabilities. He was himself regarded by the working and middle classes generally with much grateful respect. He had a keen English interest in sport, and a cultivated taste in matters literary and artistic. An accident put an end to his career. On the 28th of June 1850 he had delivered a great speech against Lord Palmerston in the Don Pacifico matter; but on the following day he was thrown from his horse near Hyde Park Corner, and was so much injured that he died on the night of the 2d of July. He was buried in the church of Drayton Bassett, his Staffordshire home. Peel left five sons, the eldest of whom, SIR ROBERT (1822-95), and the second, SIR FREDERICK (1823-1906), held office as ministers; whilst ARTHUR WELLESLEY, the youngest (1829-1912), was Speaker of the House of Commons from 1884 to 1895, when he was created Viscount Peel.

See *Sir Robert Peel from his Private Papers*, ed. C. S. Parker (3 vols. 1891-99), his *Memoirs* (2 vols. 1857), his *Speeches* (5 vols. 1835-1853), his *Private Letters* (ed. G. Peel, 1920); monographs by Guizot (1851), Laurence Peel, Lord Dalling, Barnett Smith, F. C. Montague (1888), Justin McCarthy (1891), J. R. Thursfield (1891), Lord Rosebery (1899), Shaw Lefevre, *Peel and O'Connell* (1887); Greville's *Memoirs*; Beaconsfield's *Bentinck*; Morley's *Cobden*; Froude's *Beaconsfield* (1890); Croker's *Memoirs* (1884); also CORN LAWS, CATHOLIC EMANCIPATION.

Peel, or PEEL-TOWER, the name given to fortified towers or small castles of the type common on the Scottish border. Originally 'peel' denoted the earthen works, surmounted by palisades, which surrounded and defended the courtyard and tower; but later on the name was applied to the tower itself. See BORDERS, CASTLE; and a monograph by G. Neilson (1896).

Peele, GEORGE, an Elizabethan dramatist, was son of James Peele, Clerk of Christ's Hospital, and was born most probably about 1558. He had his education there, and went up to Oxford in 1571. Next year his name is found on the list of members of Broadgates Hall, now Pembroke College, and from December 1574 to 1579 he was a student of Christ Church. He took his bachelor's degree in 1577, his master's in 1579. He seems to have had a reputation at the university as a poet and arranger of dramatic pageants, but by 1581 he had removed to London, where for seventeen years he lived a roystering Bohemian life as actor, poet, and playwright, dying a discreditable death in 1598. 'As Anacreon died by the pot, so George Peele by the pox,' writes Meres. We know that he married in 1583, and was one of those warned to repentance by the miserable Greene in his *Groatsworth of Wit bought with a Million of Repentance*

(1592), Little confidence need be put in *The Merry Jest* of George Peele (1607), which are mostly ancient and borrowed witticisms, representing Peele as a shifty and disreputable trickster and vagabond haunter of taverns. His best work, *The Arraignment of Paris*, a dramatic pastoral containing some exquisite verse and ingenious flatteries of Elizabeth, was published anonymously in 1584. Another pastoral play, *The Hunting of Cupid* (1591), is lost. In 1585 he was employed to write the Lord Mayor Dixi's Pageant, and in 1591 he prepared another for the mayoralty of Sir William Webbe. His fine and spirited *Farewell* to Sir John Norris in his expedition to Portugal in 1589 (eked out by *A Tale of Troy*); his *Eclogue Gratulatory* (1589) to the Earl of Essex on his return; his *Polyhymnia* (1590), on the retirement of Sir Henry Lee from the office of queen's champion (closing with the exquisite song 'His golden locks time hath to silver turn'd,' quoted in *The Newcomes*); his *Speeches* for the reception of Queen Elizabeth on her visit (1591) to Burghley at Theobalds; and his *Honour of the Garter*, written on the occasion of the investiture of the Earls of Northumberland and Worcester (1593), are other examples of the occasional poems that flowed from his fluent pen, and helped him to make a shifty living.

The historical play of *Edward I.* (1593) has descended in a very corrupt text, and is grievously marred by its baseless slanders against the stainless Queen Eleanor, due to the anti-Spanish prejudice of the time. His bombastic and ranting play, *The Battle of Alcazar*, was published anonymously in 1594, and was followed by another now lost, which in the *Merry Jest* is named *The Turkish Mahomet and Hiren the Fair Greek*. It is doubtless this play that is alluded to in Pistol's 'Have we not Hiren here?' His charming play, *The Old Wives' Tale* (1595), which most probably gave Milton the subject for his *Comus*, is well defended by Mr Bullen from the contemptuous criticisms of Symonds and Saintsbury. The latter, however, finds much higher poetic merit in *David and Bethsabe* (1599) than either Mr Bullen or Charles Lamb. The last work assigned to Peele is *Sir Clyomon and Sir Clamyes* (1599), but its authorship is more than doubtful.

Peele's works were first collected by Dyce (2 vols. 1828; 2d ed. 1829; a supplementary 3d volume in 1839). A carefully revised re-issue was published, together with Greene, in 1861. The best edition is that by A. H. Bullen (2 vols. 1888). See Ward's *English Dramatic Literature* (1875), and J. A. Symonds' *Shakespeare's Predecessors* (1884).

Peep o' Day Boys, an Ulster Protestant association (1780-95).

Peepul, or **PIPAL** (*Ficus religiosa*), also known as the **SACRED FIG** of India, and in Ceylon called the **BO-TREE**, a species of Fig (q.v.), somewhat resembling the Banyan, but the branches not rooting like those of that tree, and the leaves heart-shaped with long attenuated points. The tree is held sacred by the Hindus, because Vishnu is said to have been born under it. It is generally planted near temples, and religious devotees spend their lives under its shade. It is also held sacred by the Buddhists of Ceylon (see **BO-TREE**). It attains a great size and age. The peepul is often planted near houses, and by the sides of walks, for the sake of its grateful shade. The juice contains a kind of caoutchouc, and is used by women as bandoline. Lac-insects feed upon this tree, and much lac is obtained from it. The fruit is not much larger than a grape, and although eatable is not valued.

Peerage. See **NOBILITY**, **PARLIAMENT**.

Peewit. See **LAPWING**.

Pegasus, in Greek Mythology, a winged horse which arose with Chrysaor from the blood of the Gorgon Medusa, when she was slain by Perseus. He is said to have received his name because he first made his appearance beside the springs (*pégai*) of Oceanus. He afterwards ascended to heaven to carry the thunder and lightning of Zeus. Some later authors make him the horse of Eos. Bellerophon had in vain sought to catch Pegasus for his combat with the Chimæra, but at length was advised by the seer Polydus of Corinth to sleep in the temple of Minerva. The goddess appeared to him in his sleep, and gave him a golden bridle with which he caught him, and by his aid overcame the Chimæra. Modern writers ignorant of mythology make Pegasus the horse of the Muses, with whom, however, he had nothing to do beyond having by a kick of his hoof made spring up the inspiring fountain of Hippocrene.

Pégasus, a genus of small bony fishes, related to the Sea-horses, remarkable for the prolongation

Sea-dragon (*Pegasus draconis*).

of the snout beyond the toothless mouth, the covering of bony plates arranged in rings, and the spinose character of the five anterior rays of the pectoral fins. The members of the genus and the allied *Parapegasus* are found on the coasts of China, Japan, Arabia, the Malay Archipelago, and Australia.

Pegmatite, a variety of Granite (q.v.).

Pegu, a town, division, and river of Lower Burma. The town stands on the river Pegu, 46 miles NE. of Rangoon. The old city was founded in 573 and was made the capital of a powerful independent kingdom. European travellers in the 16th century speak of its great size and magnificence. It was destroyed in the middle of the 18th century by Alompra; but was rebuilt. A celebrated pagoda still stands within part of the old walls. The place was handed over to the British by the inhabitants both in the first and the second Burmese war. Pop. 19,000.—The division has an area of 13,707 sq. m., and a pop. of 1,258,000.—The river rises in the Pegu Yoma Mountains, and flows generally south for 180 miles, joining the Rangoon or Hlaing River.

Péguy, **CHARLES-PIERRE**, French author and publisher, was born of peasant stock on 7th February 1873, at Orleans, and educated there and at Paris University. He intended to take up teaching as a profession, but devoted himself instead to social questions. For a time manager of a socialist publishing concern in Paris, he afterwards established a similar business of his own. In 1897 and 1898 he published several books and a drama *Jeanne d'Arc*. The *Cahiers de la Quinzaine* began to appear in 1900. In the course of his writings Péguy revealed himself as something of a mystic, animated by a profound love of country and humanity, and veneration for the saints. In 1905 appeared *Notre Patrie*, and in 1910 his *Mystère de la Charité de Jeanne d'Arc*. Other works of his are both religious and polemical: the *Mystère des Saints Innocents* (1912), *La Tapisserie de Sainte Geneviève et de Jeanne d'Arc* (1913), *Notre Jeunesse* (1910), &c. He was killed in action at Plessis-

l'Évêque on the 5th September 1914. See Daniel Halévy, *Charles Péguy et les Cahiers de la Quinzaine*.

Pehlevi, an ancient West-Iranian (Median and Persian) idiom, in use chiefly during the period of the Sassanides (235-640 A.D.). See PERSIA, ZEND.

Pei-ho, a river of China, rises near the borders of Mongolia, flows north-east and south-east, past Peking and Tien-tsin, and falls into the Gulf of Pe-chi-li after a course of more than 350 miles. The mouth of the river is defended by the powerful forts of Taku (q.v.). See CHINA.

Peine Forte et Dure, the 'strong and sore torture,' a species of torture formerly applied by the law of England to those who, on being arraigned for felony, refused to plead, and stood mute, or who were guilty of equivalent contumacy. In the reign of Henry IV. it had become the practice to load the offender with iron weights, and thus press him to death; and till nearly the middle of the 18th century pressing to death in this horrible manner was the regular and lawful mode of punishing persons who stood mute on their arraignment for felony. Latterly a practice prevailed, which had no sanction from the law, of first trying the effect of tying the thumbs tightly together with whipcord, that the pain might induce the offender to plead. Among instances of the infliction of the *peine forte et dure* are the following: Juliana Quick, in 1442, charged with high-treason in speaking contemptuously of Henry VI.; Margaret Clitheron, 'the martyr of York,' in 1586, for her constancy to the Catholic faith; Walter Calverly of Calverly, in Yorkshire, arraigned at the York assizes in 1605, for murdering his two children and stabbing his wife; and Major Strangways, in Newgate in 1657, for refusing to plead when charged with the murder of his brother-in-law. In 1720 a person of the name of Phillips was pressed in Newgate for a considerable time, till he was released on his submission; and the same is recorded in the following year of one Nathaniel Hawes, who lay under a weight of 250 lb. for seven minutes. As late as 1741 a person is said to have been pressed to death at the Cambridge assizes, the tying of his thumbs having been first tried without effect. A statute of 1772 virtually abolished the *peine forte et dure*, by enacting that any person who shall stand mute when arraigned for felony or piracy shall be convicted. A later statute (1828) made standing mute equal to a plea of 'not guilty.'

Peipus, LAKE, lies between Russia and Esthonia. On the south it is connected with Lake Pskoff by a long, narrow channel, the length of both lakes being 87 miles, the greatest breadth about 30, the area 1356 sq. m., and the depth from 14 to 49 feet. Their waters, which abound in fish, are carried to the Gulf of Finland by the Narova. The shores are marshy and flat.

Peirce, BENJAMIN, mathematician, was born at Salem, Massachusetts, 4th April 1809, and studied at Harvard, where in 1833 he became professor. In 1849 he became consulting astronomer to the American Nautical Almanac; and from 1867 to 1874 he was superintendent of the Coast Survey. In 1836-46 he issued an admirable series of mathematical text-books, and he contributed to various mathematical journals. His paper on the discovery of Neptune (1848) attracted universal attention; and his papers on the constitution of Saturn's rings (1851-55) were equally remarkable. His great *Treatise on Analytic Mechanics* appeared in 1857; and he left his mark on various departments of mathematical and astronomical investigation. He died at Cambridge, 6th October 1880.

Peishwa. See MAHRATTAS.

Pekan, or WOOD-SHOCK (*Martes pennanti*), an American species of Marten (q.v.), the largest of all the species, was formerly common in North America from Alaska and the Slave Lake into the central United States, but is now extinct in settled districts. There seems to be nothing in its habits to justify its common name of Fisher or Fisher Marten; by hunters it is called Black Fox.

Pekin, capital of Tazewell county, Illinois, on the Illinois River, 10 miles by rail S. of Peoria. It manufactures flour, ploughs, wagons, &c. Pop. 12,000.

Peking, or, as now often pronounced, PEKING (i.e. 'Northern Capital'), the capital of China, is in 39° 54' 36" N. lat. and 116° 27' E. long. It is situated in a sandy plain, and is surrounded by many-gated walls, with suburbs smaller than is usual with large Chinese cities. The visitor coming from T'ien-tsin is not prepared for his approach to it by villas and mansions with their parks and gardens, such as greet him in drawing near to the capitals of the West. At a turn in the road the city bursts at once on his view, standing up grand and grim, complete in itself with its lofty walls, and the loftier towers upon them. The city consists, in fact, of two cities—the Inner and the Outer—known also as the Manchu or Tatar and the Chinese, or, alternatively, as the Northern and the Southern. They are separated by a high wall common to them both, but properly belonging to the former, and giving it the appearance of nearly a square, on which the other partly rests in the form of a rectangle, its southern and northern walls longer than those of the square, but the other two shorter. The walls of the Manchu city average 50 feet in height, and are fully 60 feet wide at the bottom and 40 at the top; the dimensions of those of the Chinese city are less—30 feet in height, and 25 and 15 in width. Those of the former measure 14½ miles in circuit, including its part of the cross-wall, and those of the Chinese city 10. Not counting the cross-wall, the whole circuit measures about 21 miles, including altogether an area of nearly 26 sq. m. In all, Peking has sixteen gates. Over each is raised a tower about 100 feet high, and of very imposing appearance. All the gates of the Manchu city are guarded by semicircular enceintes, enclosing a yellow-tiled temple to Kwan Ti, a hero of our 2d century, now honoured as the 'god of war.'

When a stranger has entered by a gate of the Northern City, and rides or drives along the cross-wall to its central gate, he is greatly impressed by the magnificence of the walls and towers, and readily believes Peking is one of the grandest cities in the world. He sees a street about 200 feet across, lined with what seem to be brilliant shops on each side, with wide spaces for foot-passengers, and between them a carriage-way, raised about two feet, on which a constant stream of vehicles, with horses, mules, camels, and donkeys, is hurrying. But by-and-by this impression of the magnificence of the city is displaced by another of the dilapidation and decay, squalor and filth, which everywhere obtrude themselves. In republican times, however, an edile has been appointed, and municipal improvements of various kinds have been and are being introduced.

Peking is, at least as to part of the site it occupies, one of the most ancient cities of the world. Here stood the metropolis of the feudal state of Yen, whose obscure history is vaguely traceable back to the 8th century B.C. In our 10th and 12th centuries two Tatar tribes that successfully imposed their sovereignty on the northern half of the empire made the old metropolis of Yen their capital. The second of them, which had ab-

sorbed the other, fell before the invading Mongols in the 13th century, and Kublai, a grandson of Genghis Khan, enters the chronological line as sovereign of all China in 1280. He also made Peking his chief capital, and there he was found by Marco Polo, who styles the city *Khan-baligh*, 'the city of the Khan,' a name frequently corrupted in old narratives into *Cambaluc* and *Cambalu*. A century later the Mongols were driven out of the empire by the Chinese Ming dynasty, the founder of which at first fixed his capital at what we call Nanking (q.v.), meaning 'Southern Capital,' after the transfer to Peking by the founder's son; that is to say, the third Ming emperor, called from the name of his reign Yung-lo, on his accession in 1403, made preparations to transfer the seat of government back to the Kublai site. This movement was carried out in 1421, the idea being to concentrate defensive power against the restless Mongols. The south wall of the Inner City was carried half a mile beyond that of Kublai; and a later emperor built in 1552 the wall of the Outer City.

However, the Manchus, when they became masters of the empire in 1643, found this great city ready for them. They had only to maintain it in good condition, and for a time they did so; but for more than a century it was allowed to run very much to decay. As Dr Williams observed a generation ago, 'Peking stands to-day, like the capitals of the ancient Roman and Byzantine empires, upon the debris of centuries of buildings.' A new era in its history commenced in October 1860, when one of its gates was surrendered to the English and French allies, leading to the signing of a treaty within its walls, and the ultimate establishment of the various foreign legations in the Inner City; also over a decade later to the reception of the foreign ministers, though not in the Forbidden City, in June 1873 by the young emperor in person. After the 'Boxer' troubles of 1900, the foreign legations stipulated for small protecting garrisons of their own troops, and also insisted upon a reserved foreign quarter in which the Chinese had only limited rights.

The Inner City is divided into three portions, the largest of which by far may be called the General City. But at the heart of it are two enclosures, into the innermost of which entrance was almost to the end of the 19th century entirely forbidden to uninvited foreigners, and also to the Manchus and Chinese themselves, excepting such as had some official connection with the court. It was called the Purple Forbidden City, is very nearly 2½ miles in circuit, and constituted in fact the imperial residence. In it were the palaces of the emperor, his empress, and other members of the imperial family, most of which are now, of course, occupied by the president and other high republican officials. But there are also other palaces and buildings not a few—for instance, several reception-halls (*tien*). The one which a visitor, entering by the 'Meridian Gate,' would first approach is the *T'ai Ho*, or 'Hall of Grand Harmony,' built of marble on a terrace 20 feet high, and rising itself over 110 feet. Its principal apartment is about 200 feet long and 90 wide, and was furnished with a throne for the emperor, who held his levées here on New-year's Day, his birthday, and other great occasions. Here, too, is the 'Palace of Heavenly Purity,' where the emperor met his cabinet at dawn for the transaction of business. The president, of course, holds receptions of foreign envoys; but buildings in foreign style have been added, motor-cars, telephones, and other modernities introduced. In a word, a state of flux has succeeded to rigid antiquity.

Surrounding the Forbidden City is the 'Imperial'

or 'August' City, an oblong rectangle, about 6 miles in circuit, and encompassed by a wall 20 feet in height. In the space between the wall on the south and that of the Forbidden City, on the right or east of the avenue from the front gate of the cross-wall, stands the great temple in which the emperor and the members of the imperial clan worshipped their ancestors. Opposite to it, on the west or the left of the avenue, is the altar to 'the Spirits of the Land and Grain.' In the corresponding space on the north, between the two enclosures, there is an artificial mound 150 feet high, crowned at five different points with as many Buddhist temples, and well wooded all over. It is called the *King Shan*, loosely translated 'Prospect Hill,' and affords the finest view of the entire city. It is separated from the Forbidden City by a moat, which is crossed by more than one marble bridge. Among the people the common name for it is 'Coal Hill,' their belief being that it was formed by stores of coal, deposited there—when the last Ming emperor, who finally hanged himself here, was threatened by the rebels—by way of provision against a siege. The western portion of 'the August City' goes by the name of the Western Park. A principal attraction in it is an artificial lake more than a mile long, though not nearly so wide, fed by a stream brought from the hills to the west of the city, which used also to supply the moat all round the walls. The lake is crossed by a marble bridge of nine arches, and in the proper season its surface is beautiful with the large, brilliant flowers of the lotus. Certain names may have been changed so as to harmonise better with republican principles, but the external aspect has not altered much.

We now come to the General City. On either side of the avenue leading from the central gate of the cross-wall to the August City were in Manchu times the principal offices of the government—the Six Boards and the Censorate. In the same neighbourhood was the Observatory, whence the Germans in 1901 carried off the old Jesuit instruments, sent back under the Paris peace treaty. Here also were the Provincial Hall for literary examinations, the Colonial Office, and the *Han Lin Yüan*, which we call the 'National Academy,' and to belong to which was the highest literary distinction in China. All these are now things of the past, having left not a wrack behind.

In the north-east of the city is the *Yung Ho Kung*, a grand lamasery, where more than a thousand Mongol and Tibetan monks dwell, and are provided for, while they study their religion under the rule of a *Gegen*, or 'living Buddha.' This remarkable building, which is much visited by foreign travellers, used to be the residence of the third Manchu emperor before he came to the throne. At the north end is a lofty building containing a wooden image of Maitrêya, 70 feet high. A little farther to the west stands, amidst many cypresses, the temple of Confucius; in the lofty hall are the spirit-tablets of the sage and his most celebrated disciples and followers—nothing else. Close by these rises from a circlet of water the *Pi-yung Kung*, commonly called 'The Hall of the Classics,' from the most remarkable thing about it—182 pillared slabs of granite, reared up in two corridors, and having the text of all the classical books engraved on them, in front and behind, in large characters; here the emperor used to conduct the final literary examinations.

In the western side of the city are the headquarters of the general-in-chief, who has the control of the police and garrison of the city, and in some respects directs its civil administration. Here also are the Drum and Bell Towers, both conspicuous objects. Five great bells were cast in the Yung-lo

period, early in the 15th century. One of them is here, another about 2 miles in a north-west direction from the city, in 'The Great Bell Temple.' It is indeed a monster, 14 feet high, 34 feet in circumference at the rim, and 9 inches thick, and is said to weigh 120,000 lb. (see BELL). It is covered, inside and out, with myriads of Chinese characters, from the *Fah Hwa* and *Ling Yen*, two Buddhist sūtras.

Going towards the south wall, we note two great structures on our way. One is the *Ti Wang Miao*, or 'Temple of Emperors and Kings,' where the reigning emperor used to go to worship the spirits of nearly two hundred sovereigns, who are believed to have ruled from the mythical Fuh-hi (at least 3000 years B.C.) down to our own days; and with them are associated the spirits of the ablest and best of their ministers. The other structure is the great Tutelary (wall and moat) Temple of the capital; grimy, and full of fortune-tellers and other quacks, like the corresponding temples throughout the country. All the foreign legations and all the Christian missions are situated within the Inner City; conspicuous among the latter is the new Roman Catholic cathedral, a magnificent structure, completed in 1888.

The Chinese or Outer City is very sparsely populated in comparison with its area, most of the inhabitants being thickly gathered in the neighbourhood of the Inner City gates. Much of the ground is under cultivation, large tracts are wooded, green fields show themselves, and other open spaces are occupied with artificial lakes and tanks. Where it is built over, the streets are for the most part narrow, and the people are busy and bustling. There are club-houses not a few, various temples, and charitable institutions for the poor, the aged, and for children, the last mentioned being cared for in founding hospitals, as in the Inner City. The *T'ien T'an*, or 'Altar to Heaven,' with its adjunct the *Ch'i Ku T'an*, or 'Altar of Prayer for Grain,' and the 'Altar of Agriculture,' dedicated to the ancient sovereign, Shên Nung, to whom the first teaching of husbandry (about 2735 B.C.) is ascribed, are all near the southern wall, and are reached by a 'great street,' or avenue. The first two altars are enclosed by more than three miles of wall, the space within planted with forest trees. Within a second wall is a grove of fine cypresses encompassing the buildings. The 'Altar to Heaven' stands on a splendid triple circular terrace of white marble, with steps leading from one terrace to the next, each being surrounded by a balustrade of the same marble, richly carved. On the upper terrace, which is 30 feet in diameter and about 20 feet above the ground, the emperor appeared to greet the dawning sun on the day of the winter solstice, attended by his grandees and ministers. He had passed the night in the 'Fasting Palace,' which is not far off, in religious vigil. His own place at the altar, where he alternately stood and knelt, is a large circular slab, unflawed and unstained. In front of him is a pavilion containing the tablet for the spirit of *Shang-Ti*, or God, and on either side, in smaller pavilions, are the tablets of his own ancestral line. The religious service that is then celebrated has been performed from time immemorial. With trivial modifications, President Yüan Shi-k'ai went through the same ceremony at Christmas 1913. The 'Altar of Prayer for Grain,' a similar structure, but of less dimensions, was burned down on 18th September 1889; on its upper terrace there was a triple-roofed circular building, the imposing appearance of which, with the splendour of its blue tiles, made it be regarded as more important than the other altar, and to be commonly, though erroneously, styled by foreign visitors 'The Temple of Heaven.' To this altar the emperor

used to come in the early spring to pray for a blessing on the labours of the year. Here also he repaired in seasons of drought to pray for rain, but without any pomp of state. He had to plod his way on foot to the place of fasting, and there brood over his own sins and errors of government before he dared to ascend the altar. A short distance to the east stands the 'Altar of Agriculture,' in an enclosure about two miles in circumference. This contains four different altars—to the Spirits of the Sky, of the Earth, of the planet Jupiter, and of the old Shên Nung. But all these spirits were honoured and sacrificed to, not as independent powers, but as 'servants of *Shang-Ti*,' doing his will for the good of men. The planet has an altar because of the connection which the period of its revolution has with the sexagenary cycle, a complex subject which has been brilliantly elucidated by the Swiss *savant* Léopold de Saussure, and also by the late Professor Édouard Chavannes. The chief attraction of the spot is the ceremony of ploughing which used to take place there in the spring. The emperor came to it attended by certain of his great officials, and turned up a few furrows in a portion set apart for him, as an example of agricultural industry to all his people. Some of the provincial magistrates have portions assigned to them for the same purpose. The ceremony is copied and grotesquely performed by the authorities throughout the country—in latter-day republican times, no doubt, fitfully and with irregularity. The principal streets of the Chinese city are more than 100 feet wide, but the side streets are mere lanes. The streets are not usually paved, and according to the state of the weather are deep in mud or in dust. In the smaller streets the houses are miserable shanties; in the main streets both private houses and shops are one-story brick edifices, the shops being gay with paint and gilding. The shops are open in front, the goods being often piled up outside; and many trades are carried on in the streets or in tents and movable shops. Since the establishment of the republic, here, as in the Northern City, great improvements have been introduced into municipal affairs, a special *sedile* being appointed to look after such things as sewerage, lighting, water-supply, and Western amenities generally; but it is too soon to say that any part of Peking, Inner or Outer (with the exception, perhaps, of the Legation Quarter), has been brought up to the standards of Western capitals.

There are three Catholic cemeteries (Portuguese, French, and native), and a Russian one; and there are mission buildings, Russian and other, and hospitals. The climate of Peking is severe, the temperature in winter being from 25° to 10° F.; and in summer the heat is great, the thermometer rising to 105°, though the usual summer temperature is 75° to 90°.

As to the population of Peking, Du Halde estimated it at about three millions two hundred years ago. The general impression was that in the last quarter of the 19th century it was under a million. No doubt it fluctuated considerably with the fortunes of the dynasty. Dr Williams, after living in the city for years and being *chargé d'affaires* of the American legation, said half a century ago that the residents most likely to form a correct judgment put down the entire population at a million or somewhat less. 'No census returns,' he adds, 'are available to prove this figure, nor can it be stated what is the proportion of Manchus, Mongols, and Chinese, except that the last outnumber both the others.'

During the crisis in the history of the empire to which the Japanese war of 1894-95 led, Peking witnessed various *coups d'état*, and was, in the

years immediately following, a centre of intrigue on the part of the European powers, vast railway schemes being eagerly promoted in the various competing interests. The railway from Peking to T'ien-tsin (73 miles) was opened in 1897; and the lines for which, in the scramble of 1898-99, concessions were granted connect Peking with Hankow, Nanking, Shanghai, Hangchow, and Canton, and with the Manchurian and Siberian systems. The Chinese telegraphs were connected with Siberian lines, and so with Europe, in 1892. Since then there have been enormous developments. The events of 1900 have been recorded under the head of CHINA—the 'Boxer' troubles, the eight weeks' siege of the legations, the expedition of the European and other allies, the withdrawal of the court to Si-ngan Fu, the relief of the legations by the entry of the allies on 14th August, the occupation of the 'Forbidden City,' and the tedious and protracted peace negotiations.

Though great Asian trade routes to Kulja and Semiretchinsk start from Peking, the commerce of the city itself is inconsiderable; provisions are very dear, and many of the people are very poor and miserable. The manufactures are unimportant. The government of the city is distinct from that of the department, and is administered by a superintendent (a high functionary in imperial days called *fu-yin*, but now in republican times styled *king-chao*), a mayor, and officers in the several quarters. Since 1868 there had been an imperial university with American and European professors, and now the Peking Government University and the Peking University (the latter a missionary undertaking) are but two of numerous universities springing up all over China.

Pelagius, a celebrated heresiarch of the 5th century. He was probably born about the middle of the 4th century, in Britain, or, according to some, in Brittany, his name being supposed to be a Greek rendering (*Pelagios*) of the Celtic appellation *Morgan* ('sea-born'). He was a monk, but he never entered into holy orders. He settled in Rome about 400, where he seems to have been scandalised by the low tone and morals then obtaining. His views seem to have been early developed; and during his stay in Rome he seems to have given them full expression—especially in his commentaries on the Pauline Epistles, which were published at this time. It has been remarked that his doctrinal tendencies have something in common with those of the Eastern Church, and may therefore be taken as showing that Eastern influences were still alive in the British churches. But more probably his theology was the outcome of his own devout and earnest, but narrow and anti-speculative mind. Jerome and Orosius tell tales to his discredit; but these are refuted by the respect with which Augustine always speaks of his character and conduct. The controversy about Pelagianism was not started by Pelagius, but by a devoted disciple of his. In Rome he had attached to his views a follower of great energy named Cœlestius, probably an Irish Scot, originally a lawyer, who was practising in Rome when Pelagius came thither. He became a monk, and accompanied Pelagius wherever he went. In 410, after the sack of the city by the Goths, the two withdrew to Africa. After some time Pelagius made a pilgrimage to Jerusalem, where he met St Jerome. Cœlestius having remained at Carthage, and sought to be admitted to ordination, his doctrines became the subject of discussion, and in a synod several opinions ascribed to him were condemned—proceedings which introduced St Augustine into the controversy. Meanwhile Pelagius remained at Jerusalem, and news of the proceedings at Carthage having been carried to Palestine, in 415 he was accused of heresy before

the synod of Jerusalem. As adopted by Cœlestius, his doctrines seem to have been a reaction against Gnosticism, Manichæism, and Fatalism, in the interest as he conceived of a higher morality than he found in Rome. The Pelagian heresy was held to deny original sin; Adam's sin injured himself only; his posterity are born as innocent as he was before the fall. Adam would have died even if he had not sinned. Children are baptised that they may be united to Christ, not that they may be purged from original sin. It is possible to live without sin. Grace as understood by the Catholic Church was not required; free-will and the teaching of the law may suffice; Pelagius did not grant that the will must be moved by God before a man can take one step onwards towards life eternal. The essence of the doctrine is a view of the freedom of the will that may be called liberty of indifferences; the will is equally free to choose to do good and to do evil. This freedom is found also in heathens; and thus natural ability heightens human responsibility, while it seems to diminish the need of divine grace.

The impeachment failed, and in a synod subsequently held at Diospolis in the same year Pelagius evaded condemnation by accepting the decrees of the synod of Carthage. But a new synod of Carthage in 416 condemned Pelagius and Cœlestius, and wrote to Pope Innocent I. requesting his approval of the sentence, with which request Innocent complied. Zosimus, the successor of Innocent, wavered; but a council of 214 bishops was held in Carthage, in which the doctrines of Pelagius were formally condemned in nine canons; and on receipt of these Zosimus reopened the cause, cited and condemned Cœlestius and Pelagius, and published a decree adopting the canons of the African Council, and requiring that all bishops should subscribe them, under pain of deposition. Nineteen Italian bishops refused to accept these canons and were deposed. Their leader was Julian, Bishop of Eclanum, near Beneventum. Pelagius himself was banished from Rome in 418 by the Emperor Honorius, and he and Cœlestius were again condemned by the Council of Ephesus in 431. The date and place of the death of Pelagius are not known. The most important of the writings on the Pelagian side have been lost. Julian is chiefly known through the replies of Augustine, whose anti-Pelagian treatises are edited by the Rev. Dr W. Bright (1880). Pelagius's *Fourteen Books of a Commentary on St Paul's Epistles*, his *Epistle to Demetrius*, and his *Memorial to Pope Innocent*, included by collectors in the works of St Jerome, are much mutilated, but yet almost certainly genuine. All his other works have been lost, except some fragments.

SEMI-PELAGIANISM was a modification of the doctrine of the Pelagians as to the powers of the human will, and as to the effects to be attributed to the action of the supernatural grace of God, and of the divine decree for the predestination of the elect. The Pelagians, discarding altogether the doctrine of the fall of Adam, and the idea that the powers of the human will had been weakened through original sin, taught that man, without any supernatural gift from God, is able, by his own natural powers, to fulfil the entire law, and to do every act which is necessary for the attainment of eternal life. The condemnation of this doctrine by the several councils held in the early part of the 5th century is capable of various constructions, and has been urged by some to the extreme of denying altogether the liberty of man, and converting the human will into a merely passive instrument, whether of divine grace upon the one hand, or of sinful concupiscence upon the other. The writings of St Augustine on this controversy have been differently construed by the different

Christian communions, and the same diversity of opinion existed in his own day. Among those who, dissenting from the extreme view of Pelagius, at the same time did not go to the full length of the Augustinian writings in opposition to Pelagius, were some monks of the southern provinces of Gaul, and especially of Marseilles, whence their school was called Massilian, from the Latin name (*Massilia*) of that city. Of these leaders the chief was a priest named Cassian (Joannes Cassianus), who had been a deacon at Constantinople. Of the system which he propounded it may be enough to say that it upheld the sufficiency of man's natural powers only so far as regards the first act of conversion to God and the initial act of man's repentance for sin. Every man naturally possesses the capability of beginning the work of self-conversion; but for all ulterior acts, as well as for the completion of justification, the assistance of God's grace is indispensable. The Semi-Pelagian doctrine is often confounded with that of the Molinistic (see MOLINA) school of Roman Catholic theology; but there is one essential difference. The latter persistently maintain the necessity of grace for all supernatural acts, even for the beginning of conversion, although they are generally represented as agreeing with the Semi-Pelagians as to the mode of explaining the freedom of the human will acting under the influence of divine grace. The chief writers in the controversy were Prosper, Hilary, and Fulgentius; and the question was referred to Celestine, Bishop of Rome in 431. It continued, however, to be agitated in the West for a considerable time. Faustus, Bishop of Reji (Riez in the Basses Alpes), towards the end of the 5th century revived the error, and it was condemned in a council held at Arles in 475, and still later in a synod (the second) held at Arausio (Orange) in 525, and again in the third council of Valence in 530. The words of Augustine were formally accepted; but the tendency which produced Pelagianism and Semi-Pelagianism has often reappeared.

See works on Pelagius by Wiggers (1832; trans. by Emerson, Andover, 1840); Jacobi (1842); Wörter (1866); Klasen (1882); for Semi-Pelagianism, the monograph of Geffen (1826); also the articles AUGUSTINE, JANSEN, PREDESTINATION, SIN, WILL.

Pelargonium, a genus of plants of the family Geraniaceæ, including many of the most favourite greenhouse flowers, to which the old generic name *Geranium* is often popularly given. The characters which distinguish *Pelargonium* from *Geranium*, as now restricted by botanists, are given in the article GERANIUM. The species are numerous, and mostly natives of South Africa, and a few are natives of the Canary Islands. Some of them are herbaceous and some are stemless; most of them are half-shrubby. Some have tuberous rootstocks. The leaves exhibit great variety in form, division, &c. The flowers are always in stalked umbels, which arise from the axils of the leaves, or in the stemless kinds from the midst of the leaves. *Pelargonium inquinans* forms perfect thickets in Southern Spain and Morocco, whilst *P. zonale*, the kind with circular leaves marked with a brown stripe, is completely naturalised in Italy. The branches of this latter species, as well as those of *P. carnosum* and *P. crithmifolium*, are eaten, roasted in ashes, by the Hottentots. Some species not possessing much beauty of flower are cultivated for the grateful odour of their leaves, which in some resembles that of roses, in others that of apples, lemons, &c.; whilst that of many species is rather unpleasant. A few species endure the open air in the south of England; many are planted out in summer even in Scotland. Water must be liberally supplied during flowering; but no plants more strongly require a period of rest,

and water must then be very sparingly given. The shrubby and sub-shrubby kinds are easily increased by cuttings either of the branches or the roots, stout pieces of the latter being best. Sandy soil and very moderate supplies of water are requisite till the cuttings are rooted, when richer soil and more water are needed. The tuberous-rooted species are increased by cuttings of the roots and by seed.

Pelasgians, a term somewhat variously used for certain inhabitants of ancient Greece. In Homer the Pelasgi seem to have been an unimportant tribe living in Thessaly. Herodotus seems to regard the Pelasgi not as Hellenic, but as barbarians who had occupied Hellas or parts of it ere the Hellenes came thither (see GREECE, section on *History*). Modern students have also interpreted the term differently. Some regard the Pelasgians as the pre-Aryan occupants of Greece, others as the common ancestors of Greeks and Italians. Since the startling discoveries of Mycenaean culture in Crete (a phase of native Aegean culture), culminating in the Bronze Age, the name has been given to the non-Aryan Mediterranean race, which was gradually mixed with invaders of (Aryan) Achæan and, later, of Dorian stock. Then 'Cyclopean' (or less frequently 'Pelasgian') is a name applied to certain architectural works in Greece, which probably date from before 1000 B.C., and are wholly unconnected in point of evolution with any style of Greek architecture subsequently developed. The characteristic which distinguishes Cyclopean work from any other form of architecture is that it consists of huge polygonal stones, which may or may not be so arranged as to fit into one another without interstices requiring lesser stones to fill them up, but which are always hewn and are always kept in their places not by means of mortar or any other binding substance, but by their own great weight. On the other hand, work of this kind is not necessarily ancient: other considerations than the nature of the work itself are requisite to date it. Nor is it confined to Greece: similar remains are to be found in Egypt, Asia Minor, Sicily, Sardinia, Spain, and Crete, as well as in Greece and Italy. The most notable ancient Cyclopean works in Greece are the walls of Tiryns, Psophis, and Mycenæ, the Lion Gate and so-called Treasuries (graves) of the latter place, and a (probable) temple on Mount Ocha. These Cyclopean walls (especially at Tiryns) were so thick as to allow galleries to be run lengthwise through them. At Tiryns window-like openings look down from these galleries on to the town. That these galleries served the purposes of fortification in some way is clear, but in what way is not clear. The walls are broken by gates, of which the best known is the celebrated Lion Gate at Mycenæ. In this form of doorway, in order to relieve the pressure on the lintel (which rests horizontally on the perpendicular stone doorposts), a triangular space is left above the lintel, and this space is filled, in the case of the Lion Gate, with a slab, on which are sculptured the figures of two animals (not lions) rampant, one on either side of a pillar. This quasi-heraldic device is undoubtedly of oriental origin, or imitated from some Assyrian model, but proves nothing as to the origin of the architecture or its builders. The same means for relieving the pressure on the lintel is employed in ancient remains in Cornwall. The Treasuries or tombs are underground chambers in the shape of bee-hives, vaulted with overlapping stones, and approached by a narrow passage through the side of the hill in which they are situated. For the Pelasgian or Minoan architecture in Crete, uncovered since 1900, see CRETE. The term Cyclopean was applied by the Greeks to that kind of architecture on the strength of the

popular etymology of the term: *kylklôpes* = builders of a 'cycle' or ring-wall. See CYCLOPES.

Pelayo, said to have been the first Christian king of Spain (q.v.), seems to have made head against the Arabs in Asturias (q.v.) in the 8th century.

Pelee. See MARTINIQUE, ST PIERRE.

Pelesch, a royal castle of Rumania, built by Doderer of Vienna in 1873-84, in a romantic situation in the mountains, 70 miles N. of Bucharest.

Pelew Islands, also PALAU, a group in the Pacific, south-east of the Philippines, at the western extremity of the Caroline Archipelago, were, with the Caroline and Marianne Islands (except Guam), purchased by Germany from Spain in 1899, and in 1919 assigned to Japan as mandatory of the League of Nations. There are about twenty-five islands, mountainous, wooded, and surrounded with coral-reefs. Area, 170 sq. miles. The principal is Babelthouap or Babeltop. The soil is rich and fertile, and the climate healthy. Bread-fruit, coconuts, sugar-cane, palms, areca-nuts, yams, &c. are grown. Turtles, trepang, and fish abound on the coasts. The inhabitants, about 3000, are of the Malay race. The men go entirely naked, and the women nearly so. The islands were discovered by the Spaniards in 1543, and visited again in 1696.

See Semper, *Die Palauinseln* (1873); Kubary, *Die sozialen Einrichtungen der Palauer* (1885); Marche, *Lupon et Palouan* (Paris, 1887); F. W. Christian, *The Caroline Islands* (1899); Finsch, *Karoliner und Marianen* (1900).

Pelham, THE FAMILY OF, takes its name from a castle and lordship in the north-east of Hereford, and was elevated to the peerage in the person of Sir Thomas Pelham, who in 1706 was created Baron Pelham, and married Lady Grace Holles, sister of the Earl of Clare. His successor, THOMAS PELHAM HOLLES, Duke of Newcastle, and minister of the first two Georges, was born in 1693, and educated at Westminster and Clare Hall, Cambridge. In 1711 he succeeded to the vast estates of his maternal uncle the Duke of Newcastle, and next year to the peerage of his father, the first Lord Pelham. George I. rewarded his services by creating him Earl of Clare (1714) and Duke of Newcastle in Northumberland (1715). He was made Lord-lieutenant of Middlesex and Nottingham, and a Knight of the Garter in 1718, and in the same year he married Lady Henrietta Godolphin, granddaughter of the great Marlborough. In 1724 he succeeded Carteret as Secretary of State, and held the office continuously under Walpole and his successors for thirty years, although a man of no particular ability except in parliamentary tactics. In 1754 he succeeded his brother, Henry Pelham, as premier, but retired in November 1756 to give place to the Duke of Devonshire, himself being rewarded with the title of Duke of Newcastle-under-Lyme, with special remainder to the Earl of Lincoln, his niece's husband. In July 1757 he was again premier, and compelled to take the first William Pitt into his ministry and to give him the lead in the House of Commons, and the supreme direction of the war and of foreign affairs. A succession of brilliant victories followed—Newcastle being only nominal head of the administration—and the great commoner had almost brought the war to a successful termination, when the accession of George III. led to the resignation of Pitt, and the replacement of Newcastle, in May 1762, by Lord Bute, as head of the ministry. Newcastle declined a proffered pension, with the remark that if he could no longer serve he would not burden his country. In the Rockingham ministry, formed in 1765, he filled for a few months the office of Privy Seal. He died in August 1768.—His younger brother, HENRY PELHAM (1696-1754), took an active part in sup-

pressing the rebellion of 1715, became Secretary of State for War in 1724, and was a zealous supporter of Walpole. In 1743 he was made head of a ministry as First Commissioner of the Treasury and Chancellor of the Exchequer. Events during his ministry were the war of the Austrian succession, the Jacobite rebellion of the '45, the successful financial bill of 1750 (see GEORGE II.), the reform of the calendar, and Lord Hardwick's Marriage Act. His father's ducal title descended to Henry, ninth Earl of Lincoln, whose great-grandson,

HENRY PELHAM-CLINTON, fifth Duke of Newcastle, and twelfth Earl of Lincoln, was born 22d May 1811, and educated at Christ Church, Oxford. He represented South Notts in parliament from 1832 to 1846, when he was ousted by the influence of his father, the fourth duke, for supporting Sir Robert Peel in his free-trade measures. He was a Lord of the Treasury in the brief Conservative administration of 1834-35, and First Commissioner of Woods and Forests in the Peel administration, 1841-46. He was then made Irish Secretary, but went out of office with his chief a few months afterwards. He succeeded to the dukedom in 1851, and returned to office in 1852, filling the post of Secretary of State for the Colonies in the Aberdeen government. The war with Russia broke out, and in June 1854 it was found necessary to create a Secretary of State for War, and the new office was assigned to Newcastle. The terrible sufferings of the British army before Sebastopol in the winter months of 1854 raised a storm of popular discontent, and when the House of Commons determined to inquire into the conduct of the war the duke resigned. He was Colonial Secretary in the second administration of Lord Palmerston, and held the seals with general approval from 1859 till his death, 18th October 1864. See Life, by Martineau (1908).

Pelican (*Pelecanus*), a genus of birds comprising a family, *Pelecanidae*, having a very long, large, flattened bill, the upper mandible terminated by a strong hook, which curves over the tip of the lower one; beneath the lower mandible a great pouch of naked skin is appended; the tongue is very short, and almost rudimentary; the face and throat are naked, the wings of moderate length, the tail rounded. The species are widely distributed, frequenting the shores of the sea, lakes, and rivers, and feeding chiefly on fish. Although birds of powerful wing, they are seldom seen at a great distance from land. All of them are birds of large size. They take their prey by hovering over the water, and plunging upon it when it appears. They often fly in large flocks, and the sudden swoop of a flock of pelicans at a shoal of fish is a striking and beautiful sight. They store up their prey in their pouch, from which they bring it out at leisure, either for their own eating or to feed their young. The pouch is capable of being wrinkled up into small size, and of being greatly distended. The Common Pelican (*P. onocrotalus*) is as large as a swan, white, slightly tinged with flesh colour, and, in old birds, the breast golden yellow. The quill-feathers are black, but are scarcely seen except when the wings are expanded. It is a native of the eastern parts of Europe and of many parts of Asia and Africa, and frequents both the seacoast and also rivers and lakes. It makes a nest of grass on the ground in some retired spot near the water, often on an island, and lays two or three white eggs. The parents are said to carry water to their young, as well as food, in their pouch. During the night the pelican sits with its bill resting on its breast. The nail or hook which terminates the bill is red; and it has been supposed that the fable of the pelican feeding its young with blood from its own breast originated in its habit of pressing the

bill upon the breast in order the more easily to empty the pouch, when the red tip might be mistaken for blood. Another explanation is that the characteristic has been transferred to the pelican from the flamingo, which does discharge into the mouths of its young a bloody-looking secretion which it disgorges (see *Notes and Queries*, 1869, ii. p. 361). And long since Sir Thomas Browne in *Vulgar Errors* pointed out that the carvings

Pelican (*Pelecanus crispus*).

and pictures, ecclesiastical and heraldic, of the so-called pelican feeding its young with its own blood were by no means quite like a pelican, and noted that a like tale was told by the Egyptians of the vulture. The story, which was unknown to the classical writers, seems to have originated in Egypt; and the love of the vulture for its young was proverbial there (see *Academy*, 1884, i. p. 97). The Rufous-necked Pelican (*P. fuscus*) abounds in the West Indies and in many parts of America. Other species are found in other parts of the world, and in some places the number of pelicans is prodigious, particularly in some of the most southern parts of the world. See also **HERALDRY**.

Pelican-fish (*Eurypharynx pelecyanoides*), a remarkable deep-sea Teleostean fish, described by

Pelican-fish (*Eurypharynx pelecyanoides*).

Vaillant in 1882. The body is somewhat eel-like, and is fringed on the dorsal and ventral middle line with spinous rays. It is the region of the jaws, however, which is most remarkable, the gape

is so enormous. The fish probably engulfs small animals in whale-like fashion, but at the bottom of the sea instead of at the surface. Gill and Ryder discovered a similar form, *Gastrostomus bairdii*, in 1883, in which the mouth again suggests a pelican's pouch. The equally strange Saccopharyngidae are perhaps allied, but the jaws are less enormous, and the animals are notable for swallowing fishes larger than themselves.

Pelion, the ancient name of a wooded mountain-range in Thessaly, extending along the east coast. According to the myth, the Titans, in order to scale Olympus, the abode of the gods, placed Ossa (q.v.) on the summit of Pelion, the highest peak (5310 feet) of the range. Its sides and summit have always been clothed with forests of oak, chestnut, beech, elm, plane, and pine; it was of Pelion timber that the Argo (see ARGONAUTS) was built. The Centaur Chiron had his home on this mountain.

Pelissier, AMABLE JEAN JACQUES, Duc de Malakhoff, Marshal of France, was born 6th November 1794, at Maromme, near Rouen, and, having passed successfully through the colleges of La Flèche and St Cyr, entered the army. He served on the staff in Spain in 1823, made the campaign of the Morea in 1828, joined the first expedition to Algiers in 1830 as major of cavalry, and in 1839 returned to Algeria with the rank of lieutenant-colonel. In 1845 he acquired an unenviable notoriety by suffocating more than 500 Arabs who took refuge in caves in the Dahra. By 1850 he had attained the rank of General of Division. On the outbreak of the Crimean war in 1854 he was given the command of the first corps, and soon succeeded Marshal Canrobert in the chief command before Sebastopol. On 8th September he stormed the Malakhoff, the key of Sebastopol, for which exploit he was rewarded with a marshal's baton, and on his return to France was created Duc de Malakhoff and a senator, and received a grant of 100,000 francs. In 1858 he came to London as the French ambassador, but resigned his post in the following year, and died governor of Algeria, 22d May 1864. See Hamley, *The War in the Crimea* (1891).

Pelitic Structure, in Geology, applied to rocks which have a texture like that of dried mud.

Pelju. See PELEW.

Pella, the ancient capital of Macedonia, and the birthplace of Philip II. and Alexander the Great, was situated in the midst of marshes, a few miles NW. of Thessalonica, which stood half-way between it and the head of what is now the Gulf of Saloniki. Its royal castle had wall-paintings by Zeuxis.

Pellagra (Ital. *pelle agra*, 'rough skin'), a disease, unknown prior to the first half of the 18th century, which is common among the peasantry of northern Italy, and occurs also among the same class in Corfu, Rumania, the Landes and Gironde in France, in Spain, and more recently in America, in Syria, and occasionally in Britain. But the headquarters of the disease are in the northern and north central provinces of Italy. It is an error to describe pellagra as the result of poverty alone—to call it *il delirio della miseria*. Originally believed to be due to a dietary of diseased maize, it is now usually regarded as a malady brought on by 'deficiency diet,' and it tends to disappear when the food is augmented by fresh articles rich in protein, such as eggs, milk, and meat. The disease makes its appearance in spring, in the form of a reddish-brown rash, which smarts painfully where exposed to the sun and air, as on the bare hands and feet; towards autumn this disappears, leaving, however, hard, dry spots on the skin, and returning

with increased severity in the following spring, and again in each successive year, till the skin becomes shrivelled and yellow, or even black in certain spots, and the body is reduced to a mummified state. A burning feeling in the mouth and bowels is an accompanying symptom, and profuse diarrhoea, along with a rapid wasting and dropsy, is a frequent cause of death. As the disease progresses disorders relating to the nervous system gradually develop, and culminate in melancholy, dementia, or mania; death often ensues from weakness, or the patients drag out their life within the walls of an asylum. In 1817 one of every five or six of the population in some parts of Italy showed symptoms of the disease; in 1881 the deaths from it were nearly 5 per 1000 of the total population, in 1887 about 2; and since then it has steadily decreased, in part owing to the hospitals for special treatment.

Pellat, JOSEPH SOLANGE HENRI (1850-1909), born at Grenoble, was from 1874 lecturer and professor of Physics at Paris.

Pellegrini, CARLO, caricaturist, was born at Capua in 1839, came to London in 1864, and from 1868 till his death on 22d January 1889 was the 'Ape' of *Vanity Fair*, the delineator of its inimitable series of cartoons of celebrities. Especially good was his statuette in red plaster of Mr Lowe standing on a match-box (1871).

Pellico, SILVIO, an Italian poet, celebrated for his long and cruel imprisonment by the Austrians, was born 24th June 1788, at Saluzzo, in Piedmont, and was educated in Pignerol, where his father, Onorato Pellico, a lyric poet, had a silk-factory. In his sixteenth year he accompanied his sister Rosina (on her marriage) to Lyons, where he remained until Foscolo's *Sepolcri* awakened in him a strong patriotic feeling and an irresistible desire to return to Italy. Coming, about 1810, to Milan, he was warmly received by Ugo Foscolo and Vincenzo Monti, and became French tutor in the military school. His tragedies of *Laodamia* and *Franческа da Rimini* gained him an honourable name amongst Italian poets. He also translated the *Manfred* of Byron, with whom he had become acquainted. He lived in great intimacy with the most eminent patriots and authors of liberal views, and took an active part in a periodical called *Il Conciliatore*, which after a time was suppressed on account of its liberal tone. In 1820 he was arrested on a charge of Carbonarism, and sent to the prison of Sta Margherita, and afterwards to the Piombi at Venice. After two years' imprisonment he was condemned to death, but had his sentence commuted to fifteen years' imprisonment, and was carried to the fortress of Spielberg near Brünn; he was, however, liberated in August 1830. During his imprisonment he had written two other dramas; and afterwards he published an account of his sufferings during his ten years' imprisonment, under the title *Le mie Prigioni* (Paris, 1833), which has been translated into many languages, and has made his name familiar where it would not have been known on account of his poetry. Pellico's health, never robust, was permanently injured. The Marchioness of Barolo received him into her house at Turin as her secretary. Pellico subsequently published numerous tragedies and other poems, and a little catechism on the duties of man. He died January 31, 1854. See the *Life* by Chiala (Italian, 1852), and those by Bourdon (Paris, 8th ed. 1885) and Rivieri (1899-1901).

Pellitory, or WALL-PELLITORY (*Parietaria*), a genus of plants of the natural order Urticæ, having both unisexual and hermaphrodite flowers on the same plant, the perianth of both kinds 4-fid. The Common Pellitory (*P. officinalis*), which grows on old walls and heaps of rubbish in Britain and

many parts of Europe and Asia, is a perennial herb, with erect or prostrate stems, ovate leaves, and inconspicuous flowers. It sometimes attracts attention from the manner in which the pollen is copiously discharged in hot summer days by an elastic movement of the filaments. It is an old domestic remedy as a diuretic, owing to the nitre it contains. There is no quicker way of cleaning bottles and decanters than putting in a few fresh leaves of this plant and shaking them with a little water. It is on account of this use in cleaning glass that the Italians call the herb 'Erba vetriola.' The tooth-powder used

Pellitory (*Parietaria officinalis*).

by the empress Octavia consisted of burnt pellitory with some salt and perfume added.

PELLITORY OF SPAIN (*Anacyclus Pyrethrum*) is nearly allied to Camomile (q.v.), a native of the Levant and of Barbary.

Pelopidas, a celebrated Theban general, of noble descent, noted among his fellow-citizens for his disinterested patriotism. The inviolable friendship between himself—one of the richest men in Thebes—and Epaminondas—one of the poorest—is among the most beautiful things recorded in Greek history. In 382 B.C. he was driven from Thebes by the oligarchic party, who were supported by the Spartans, and was forced to seek refuge at Athens, whence he returned secretly with a few associates, 379 B.C., and recovered possession of the Cadmeia, or citadel, slaying the Spartan leader, Leontiades, with his own hand. Plutarch gives us a vivid picture of the adventurous exiles gliding quietly in disguise into the city on a winter afternoon, amid bitter wind and sleet. Having been elected Boeotarch, in conjunction with Melon and Charon, he set about training and disciplining his troops, so that they soon became as formidable as the Lacedæmonians, and were successful in several small encounters with the latter. His 'sacred band' of Theban youth largely contributed to the victory of Epaminondas at Leuctra (371 B.C.), but failed in a subsequent attack on Sparta itself. In the expedition of the Thebans against the cruel tyrant, Alexander of Phæræ (368 B.C.), Pelopidas was, after several important successes, treacherously taken prisoner, when in the character of an ambassador, but was rescued by Epaminondas in the expedition of the following year. He was then sent to Susa, as ambassador from Thebes, to counteract the Spartan and Athenian intrigues going on at the court of Persia, and bore himself very nobly whilst there. His diplomacy was successful. In 364 B.C. a third expedition was planned against Alexander of Phæræ, who, as usual, was threatening the Thessalian towns. The command was given to Pelopidas, and in the summer he marched into Thessaly, where he won the battle of Cynoscephalæ, but was himself killed while too eagerly pursuing the foe.

Peloponnesus ('the isle of Pelops'), now called the Morea (q.v.), a peninsula which formed the southern part of ancient Greece, Hellas Proper being situated to the northward of the isthmus on which stood the city of Corinth. See GREECE. The whole area is less than 9000 sq. m. Among its most important cities were Sparta and Argos. Sparta acquired after the Messenian war a decided supremacy over the other states, and disputed the supremacy with Athens in a war of almost thirty years' duration (431-404 B.C.)—the famous Peloponnesian war, of which the history has been written by Thucydides.

Pelops, in Greek Mythology, the grandson of Zeus, and the son of Tantalus, was slain by his father, and served up at an entertainment which he gave to the gods, in order to test their omniscience. They were not deceived, and would not touch the horrible food; but Demeter, absorbed with grief for the loss of her daughter, ate part of a shoulder without observing. The gods then commanded the members to be thrown into a cauldron, out of which Clotho brought the boy again alive, and the want of the shoulder was supplied by an ivory one. According to the legend most general in later times, Pelops was a Phrygian, who, being driven by Ilos from Sipylus, came with great treasures to the peninsula which derived from him the name of Peloponnesus, married Hippodamia, obtained her father's kingdom by conquering him in a chariot-race, and became the father of Atreus, Thyestes, and other sons. But in what appear to be the oldest traditions he is represented as a Greek, and not as a foreigner. He was said to have revived the Olympic games, and was particularly honoured at Olympia.

Peloria, abnormal regularity in a flower normally irregular, as in *Toadflax* (q.v.).

Pelota, a ball game played, especially by the Basques, against a wall with a wicker racket.

Pelotas, a thriving river-port of Rio Grande do Sul, on the São Gonçalo, near the Lagôa dos Patos, prepares jerked beef; pop. 70,000.

Pel's Fish-owl (*Scotopelia peli*), so named from its discoverer, is found in West Africa and the Zambesi region. It measures about 2 feet in length; its wing is 16½ inches long. Its colour above is a deep rufous bay crossed with numerous irregular bars of black; the wing is similarly barred; the under surface of the body is light bay with heart-shaped bars of black; the bill is of a dark-blue lead-colour, and the iris is dark brown. The birds from the Zambesi are a little larger than those from West Africa. The natives regard this owl as a fetish bird possessing the power of destroying whatever it looks on.

Peltier Effect. See ELECTRICITY.

Peltry, a general term applied to the trade in skins of wild animals, and to the skins themselves. It is understood to mean only skins undressed, except by drying, and chiefly those which, when dressed, are called furs. See FURS.

Pelusium, the Greek name of an ancient Egyptian city, situated at the north-eastern angle of the Delta, and important as the key of Egypt on the Asiatic side. The eastern mouth of the Nile derived from it the epithet Pelusiatic. Its identity with Sin of the Old Testament and the Greek Sais is doubtful. The *Ostrum Pelusiacum* was choked up with sand as long ago as the 1st century B.C., and the whole district is a wilderness of sand and marshes.

Pelvis. This term is used to indicate one of the chief divisions of the skeleton. It consists of the sacrum, coccyx, and the innominate or haunch bones. Each of the latter originally consisted of

three parts—ilium, ischium, pubis—which have become fused together. By the articulation of the pubic bones in the middle line anteriorly the innominate bones form the anterior and lateral aspects of the pelvis. Wedged in between them posteriorly are the sacrum and coccyx. Various powerful ligaments give support to and maintain the pelvic bones in position. Notwithstanding the importance of this part of the skeleton, the ancient Greek physician had no word whereby to designate it, and both Greek and Roman associated the sacrum and coccyx with the vertebral column, and the innominate bones with the lower extremities.

Fig. 1.—Adult Human Pelvis, *in situ* :

a, lumbar vertebra; b, sacrum; c, coccyx; d, ilium; e, head of femur in acetabulum; f, pubis; g, ischium.

The pelvis is divided into two parts by a plane which extends from the upper margin or promontory of the sacrum to the upper margin of the articulation between the two pubic bones—i.e. the symphysis pubis. On the inner surface of each innominate bone a line may be traced from the sacral promontory to the symphysis pubis. This is named the ilio-pectineal line, and it helps to complete the circumference of the plane which divides the pelvis into two parts. The space *above* this plane lies mostly between the expanded iliac bones. It belongs to the abdomen proper, and is named the *false pelvis*. The space below the level of the sacral promontory and ilio-pectineal lines is called the *true pelvis*, and certain descriptive terms are employed in connection with it. Thus the plane which separates it from the false pelvis is called the *inlet* or *brim* of the true pelvis. Its inferior circumference or *outlet* extends from the tip of the coccyx to the inferior border of the pubic symphysis, and from the one ischial tuberosity to the other. Between the ischial tuberosities in front and extending forwards to the symphysis there is the *subpubic arch*. The space between the *inlet* and the *outlet* is named the *cavity* of the true pelvis. The measurements of the true pelvis are made along certain definite lines which are applicable to the brim, the cavity, or the outlet. These are (1) the *antero-posterior* or conjugate diameter—i.e. from the mesial line in front to the mesial line behind; (2) the *transverse* or widest diameter; (3) the *oblique* diameters—right and left. These extend from the articulation between sacrum and ilium on one side to the farthest point on the opposite side of the mesial plane. In the erect attitude of the body the plane of the brim of the true pelvis forms an angle with the horizontal which varies from 60° to 65°. Thus the weight of the upper part of the body which is communicated to the sacrum is directed downwards and transmitted through the innominate bones to the heads of the femora, and so to the inferior extremities. In addition to the ligaments, muscles, blood-vessels, and nerves which constitute the soft parts of the pelvis, there are

certain special organs which are present in both sexes, and others which are peculiar to each sex.

Fig. 2.
a, adult male, and b, female pelvis.

Thus, of those common to both sexes, there are the urinary bladder and the rectum. The urinary bladder is placed behind the symphysis pubis, and only rises out of the pelvis into the abdomen when considerably distended. The rectum—a name applied to that part of the alimentary canal which passes through the pelvis—is placed on the front of the sacrum and coccyx, a short distance below which it terminates in the anus. The lower end of the rectum is supported by two muscles—the *levator ani*—which surround it so completely as to form a floor or diaphragm for the pelvis. In addition to these organs there are others which are characteristic of the sexes. In the male we have the *vesiculæ seminales* and the *prostate gland*—the latter surrounding the outlet of the urinary bladder. In the female we have the *uterus*, *ovaries*, and their various appendages. The diverse functions of these organs have led to corresponding and well-marked differences in the size and form of the osseous pelves of the sexes. In the female the bones are more slender, and the muscular impressions less distinct. The true pelvis has a greater breadth and capacity, but its perpendicular depth is less. The *inlet* is more nearly circular; the ischial tuberosities are wider apart, and the subpubic arch is much wider. All of these differences indicate special modifications in connection with the necessities of child-bearing. Although the depth of the cavity of the true pelvis steadily increases from childhood to puberty, yet the characteristics of the sexes are discernible even at birth.

But not only does the pelvis display features which are characteristic of sex; it also presents characters which are peculiar to individual races of mankind. In this field of study a great amount of valuable work has been contributed by Sir William Turner of Edinburgh University, and embodied in the reports of the *Challenger* expedition. In determining those features peculiar to race numerous measurements have been made, mostly in relation to the cavity of the true pelvis with its brim and outlet; but many of the external dimensions of the entire pelvis have also been noted, as well as the dimensions of individual bones. One of the most valuable of the external measurements is the comparison between the maximum height and breadth of the entire pelvis. A common result is obtained by the following formula, $\frac{\text{height} \times 100}{\text{breadth}}$, which establishes what is called a *breadth-height index*. Another index of great importance is the result of a comparison between the *conjugate* and *transverse* diameters at the brim of the pelvis. This is named the *pelvic or brim index*, and is obtained by the formula, $\frac{\text{conj. diam.} \times 100}{\text{transverse diam.}}$. The measurements are usually recorded in millimetres.

As the result of numerous measurements Sir William Turner has devised a classification of pelves based upon the relation of the conjugate and transverse diameters at the brim of the true pelvis—i.e. upon the *brim index*. Thus, those pelves in which the conjugate diameter of the brim is either longer than the transverse or closely approaches it are named *dolichopellic* (*pellis*, the Greek equivalent of the Latin *pelvis*, 'a basin'; and *dolichos*, 'long'), and in these the brim index is above 95. When the transverse diameter of the brim greatly exceeds the conjugate they are named *platypellic* (*platys*, 'wide'), and the brim index is below 90. In cases where the transverse diameter is not greatly in excess of the conjugate—i.e. where the brim index varies between 90 and 95, both inclusive—the term *mesatipellic* (*mesaitatos*, 'middlemost') is applied. Grouping the pelves under these headings we find that such races as Australians, Bushmen, Hottentots, Kaffirs, Malays, Andaman Islanders, &c. are *dolichopellic*. Negroes, Tasmanians, New Caledonians, &c. are *mesatipellic*. British, French, Germans, Europeans generally, natives of India, Chinese, American Indians, &c. are *platypellic*. These results are obtained from the examination of male pelves, since, as we have already seen, the female pelvis is modified in its diameters in relation to the special requirements of sex.

If now we compare the human pelvis with that of the lower mammalia, we shall find that the human pelvis is characterised by breadth and shallowness and the great capacity of the true pelvis. When, therefore, the conjugate diameter at the brim of the pelvis is longer than the transverse—i.e. when the pelvis is *dolichopellic*—an approach is made to the condition which prevails even to a greater extent among the lower animals, and it is 'a degraded or animalised arrangement' as compared with *platypellic* pelvis of Europeans.

We have seen that in man the weight of the trunk is transmitted to the lower limbs through the pelvis, whereas in quadrupeds the downward pressure of the weight of the trunk is differently disposed. Doubtless, therefore, the *attitude* has great influence in controlling the expansion of the pelvis in the transverse diameter when the parts are young and plastic. It may therefore be owing to the habits and mode of life of the black races in their aboriginal state that their pelves approach the lower type. Take, for example, the aboriginal Australian who sits on the ground embracing his knees with his arms, or any of the savages whose favourite attitude is 'squatting'—i.e. sitting down with the body bent forward and the buttocks resting on the heels; or again, when in pursuit of game a stooping or crouching attitude is adopted. In all these positions the pressure upon the sacrum and pelvis is diminished, and there is a tendency to approximate the conditions to those of the anthropoid apes, while the white man on the other hand preserves the erect attitude whether standing, sitting, or walking.

Pemba, a coral island off the east coast of Africa, 27 miles NE. of Zanzibar Island, measures 46 miles by $4\frac{1}{2}$; area, 380 sq. m.; pop. 100,000. On one of the numerous bays on the east coast stands the chief town, Chaka. Pemba produces three-fourths of the world's cloves. It is attached to Zanzibar. See a book by Craster (1913).

Pembroke, the county town of Pembrokeshire, on a navigable creek of Milford Haven, 9 miles W. of Tenby, and 80 W. by N. of Cardiff. On the extremity of the ridge on which the town is built stands Pembroke Castle, founded in 1094 by Arnulf de Montgomery, a very imposing ruin, with a Norman keep 75 feet high and 52 in diameter. Beneath is a huge natural cavern, 70 by 50 feet. The birthplace of Henry VII., this castle

in 1648 was taken by Cromwell after a six weeks' siege. Monkton Priory, with its roofless Decorated choir, is another interesting structure. The Pembroke boroughs were merged in the county in 1918. At Pembroke Dock, or Pater, 2 miles north-west, a naval dockyard and arsenal was established in 1814. It was decided in 1925 to close it. Pop. of Pembroke (1861) 15,071; (1921) 15,481.

Pembroke, a town of Ontario, on the Allumette Lake, 74 miles WNW. of Ottawa, has timber industries; pop. 8000.

Pembroke, EARLS OF. The earldom of Pembroke was first conferred by Stephen, in 1138, upon Gilbert de Clare (died 1148), whose family took its name from Clare in Suffolk. Gilbert's son, the second earl, RICHARD DE CLARE, surnamed Strongbow, went to Ireland to push his fortune in 1170 by permission of Henry II. (q.v.). He married the daughter of Dermot, king of Leinster, became governor of Ireland in 1173, and died at Dublin in 1176. For later Earls, see AYMER DE VALENCE, HERBERT. For the two Pembroke Colleges (unlike in origin), see CAMBRIDGE, OXFORD.

Pembrokeshire, a maritime county of South Wales, the westernmost of the Principality. Measuring 30 by 25 miles, it has an area of 611 sq. m., or 391,181 acres, of which three-fourths is arable. The coast-line is much of it rugged and precipitous; and inland the surface is undulating, green hills alternating with fertile valleys, and attaining a maximum altitude of 1754 feet in the Precelly range, which traverses the north of the county from east to west. Rivers are the Teifi, separating Pembrokeshire from Cardigan, and the East and the West Cleddau. The rocks are largely Silurian; the soil varies much in quality; and coal, slate, lead, and iron have been worked. St David's Cathedral and half-a-dozen mediæval castles make up the antiquities with Ogam inscriptions, neolithic implements, and Roman coins. At Haverfordwest and Tenby a colony of Flemings was established in 1107. They adopted the English tongue; and Pembrokeshire, or 'Little England beyond Wales,' is now over more than half its area inhabited by an English-speaking population, although it is the remotest of all the Welsh counties. It was harried by Owen Glendower in 1405; and on 22d February 1797 it witnessed the last French invasion, when 600 regulars and 800 gaol-birds landed near Fishguard, only to surrender unconditionally to some militia and yeomanry under Lord Cawdor. Pembrokeshire returns one member. Pop. 92,000. See Fenton's *Historical Tour through Pembrokeshire* (1811), and Phillips's *History of Pembrokeshire* (1909).

Pemmican, a North American Indian preparation, was introduced into British navy victuallings in order to supply arctic expeditions with an easily-preserved food, containing the largest amount of nutriment in the smallest space. As made by the Indians, it consists of the lean portions of venison, buffalo, or other meat, dried in the sun, or wind, and then pounded into a paste and tightly pressed into cakes; sometimes a few fruits of *Amelanchier canadensis* (June-berry or Service-berry) are added to improve the flavour. It will keep for a very long time uninjured. That made for the arctic voyagers was chiefly of beef.

Pemphigus, or POMPHOLYX, belongs to that order of skin diseases which is characterised by an eruption of large vesicles, filled with serous fluid, and known as *bullæ*. The disease occurs both in the acute and in the chronic form. In a mild case of acute pemphigus, bullæ, or blisters, from the size of a pea to that of a chestnut, appear in succession (chiefly on the extremities), and having continued three or four days break, form a thin

scab, and soon heal, unaccompanied with febrile or inflammatory symptoms. In severe cases there is considerable constitutional disturbance, the bullæ are larger, and the scabs heal with difficulty. The chronic form differs mainly from the acute by its prolonged continuance. The acute variety chiefly affects children, and has been ascribed to dentition, errors of diet, &c.; while the chronic form chiefly attacks aged persons, and is probably due to debility and impaired nutrition. The acute form usually requires nothing but cooling medicines and diet, and mild local dressings, like boric ointment, to protect the raw surfaces from exposure to the air. In the chronic form a nutritious diet, with tonics and change of air, is most commonly successful. In obstinate cases arsenic or a vaccine is sometimes of use.

Pen, an instrument for writing with a fluid ink. When the Egyptians, Greeks, Romans, and some other ancient nations wrote upon papyrus or parchment they used a reed pen (Lat. *calamus*), and when they used tablets of wood or stone covered with wax they wrote upon them with a pointed stylus of bronze, bone, or other material. Some of these ancient reed pens have been preserved. One, now at Naples, was found in a papyrus at Herculaneum. Reed pens are still the only kind used by the natives of Persia and some neighbouring countries. A metal pen does not suit their mode of writing. These reed pens are pointed much in the same way as quills, and are made from the reeds or stems of *Phragmites communis*, which is also a British plant, from *Saccharum Ravenneæ*, and probably other species. The Chinese and Japanese write with a small brush or hair-pencil. Quills are known to have been used for writing with as early as the 7th century of our era, but long after that reed pens also were employed in European countries.

Metal pens were in use, but probably only to a very limited extent, among the ancient Romans. In the museum at Naples there is a bronze pen, nibbed like a modern steel pen, which was found at Pompeii. Another of a somewhat different shape was discovered at Herculaneum. Bronze and silver writing pens appear to have been occasionally made in the middle ages, but there is little doubt these were more curiosities than articles in general use, and the same may be said of all metallic pens of more recent date, sometimes referred to in books, until we come to the beginning of the 19th century. For centuries before that quills were universally employed among western nations, and in schools steel pens were only very partially substituted for them till about 1840.

Perhaps the earliest English metallic pens of which we have any certain knowledge were some made in 1780 by Harrison, split-ring maker, Birmingham, for Dr Priestley. They were of sheet-steel, formed into a tube and filed into shape, the joining of the metal making the slit. Brass pens were also made in England before the end of the 18th century; one of these seems to have been in the Strawberry Hill collection of art objects and curiosities (Walpole's), which was sold in London in 1842. In the early part of the 19th century various plans were tried to produce pens more lasting than ordinary quills. The quills were pointed with metal, and pens constructed of horn and tortoise-shell had small pieces of diamond and other hard gems embedded in them by pressure. Another plan was to attach gold to their points. Such pens were, of course, too costly for general use. Barrel pens of steel made by one Wise were on sale in London in 1803, but these, too, were high in price, and did not take the market. The first English patent for the manufacture of steel pens is that of Bryan Donkin in 1803. A patent, the first of its kind in

America, was granted in 1810 to Peregrine Williamson of Baltimore for the manufacture of metallic pens. Steel pens of the barrel type were being made in 1815 by Sheldon of Sedgley, the price being 18s. per dozen. By 1820 the number of manufacturers had increased. To James Perry belongs the credit of bringing steel pens into general use. He began pen-making at Manchester in 1819, using the best Sheffield steel (from Swedish charcoal iron) for the purpose. Perry removed to Red Lion Square, London, and had developed the pen trade with remarkable energy before the prominent Birmingham makers, Mitchell, Gillott, and Mason, caused a revolution in the trade by machine-made pens. He took out a patent for a new method of making pens in 1830, from hard, thin, elastic metal, and a 'length of slitted or cleft space' scarcely exceeding that of quill-pens; and he made other improvements in 1832. The greatest improvement in the manufacture was the adoption of the screw handpress for the cutting out of pens, enabling the manufacturer to supply them cheaply and in quantities. At first the method of slitting pens by means of a press was kept a profound secret by Gillott and Mason. To John Mitchell, Birmingham, has been assigned priority in this invention. Sir Josiah Mason made barrel pens in 1828, and 'slip' pens for Perry in 1829. At the end of 1875, when Sir Josiah Mason retired from his business, his output exceeded 32,000 gross weekly. To Mitchell, Gillott (whose patent is dated 1831), and Sir Josiah Mason chiefly belongs the credit of first making steel pens by machinery, thus enabling them to be sold cheaply and to become articles of common use.

An ordinary pen looks a simple enough instrument, but before it assumes its present appearance it has to go through some sixteen different processes. Birmingham is the great seat of the steel-pen trade. The steel of which the pens are made comes from Sheffield, and is in sheets 6 feet long and 1 foot 5 inches wide. It is first cut into strips of convenient width; next it is annealed, and rolled to the requisite thickness, when it is found to have trebled its original length and to have acquired a bright surface from the action of the rollers. The 'blanks' or first shape of the pen are now cut out by means of a press; next comes the operation of *marking* or stamping the name on the pen, then *piercing*; but before they can be formed into the shape of a pen they require to be softened by *annealing*. They are freed from dust and grease, placed in round pots, which are again enclosed in larger ones, are covered with charcoal dust, put into a muffle or iron box, heated to a dull red, and then allowed to cool. The pens are next *raised* or formed into the required shape by a blow from a screw-press fitted with a punch and a die. Then they are *hardened*. This is done by arranging them in thin layers in covered iron pans of a round shape, which are heated to a bright redness in a muffle. The contents of the pans are next emptied into a bucket, immersed in a tank of oil, and transferred to a perforated cylinder, which, being quickly rotated, drains off the oil. The pens are still greasy and as brittle as glass, and in order to cleanse them they are again placed in perforated buckets and plunged into a tank of boiling soda-water. They are next tempered, or softened, by enclosure in an iron cylinder which is kept revolving over a charcoal fire until the requisite degree of softness is attained. The pens have been blackened by this operation; they are next *scoured* by being dipped into a tub of diluted sulphuric acid, and then put into iron barrels containing water and material made from broken and finely-ground annealing pots. The barrels are kept revolving for five, or sometimes eight, hours; then

the pens are subjected to a second process of scouring in barrels filled with dry material of the same kind; and then to a third process in which dry sawdust is the scouring or cleaning agent. The pens have now acquired a bright, silver tone, and the points have been rounded. They have then to be ground between the pierced portion and the point; this is done on a small revolving solid wheel or 'bob' made of wood, covered with leather, and coated with emery-powder. Next comes the operation of *slitting*, which is cleverly accomplished by a cutting-press, but, the edges of the slit being sharp, the pens are again polished in revolving barrels. They are now coloured and varnished; the colouring is done in a copper or iron cylinder over a coke fire; if to be lacquered they are placed in a solution of shellac. Afterwards the spirit is drained off, the pens are placed in wire cylinders, and kept revolving until the lacquer is dry. Next the pens are spread on iron trays and put into an oven, the heat of which spreads the lacquer evenly over the surface. Girls now look over the pens, throw aside the faulty ones, and the good ones are packed into boxes ready for sale.

How the trade grew may be seen from the fact that in 1839 steel pens were almost unknown; in 1849 the trade was a leading industry in Birmingham; there were twelve factories employing about 2000 men, women, and girls, the weekly output of pens being stated at 65,000 gross. The output has since gone on increasing year by year. Successful patents in connection with pens have been those dealing with points which are turned up or turned down, thickened or 'planished,' for smooth writing.

All the pen-makers now make pen-holders. Sir Josiah Mason related that he made the first stick pen-holders for Perry in 1832, and for Gillott in 1835.

Pens are also made of silver, platinum, and aluminium bronze. They have also been made of vulcanite. The gold pen, which is incorrodible with ink, was also made in Birmingham for Mordan and others. Made in the United States as early as 1836, it has become a speciality there. The gold pen goes through no less than forty-five different processes, from the gold-bar, which is alloyed, to the highly finished article of commerce. To give firmness to the point of the pen it is tipped with iridium. To avoid the troublesome necessity of dipping in an ink-bottle, many forms of reservoir pens have been devised, carrying ink within the holder. Early forms, dating back to 1835, were unsatisfactory. In the stylograph the nib is dispensed with, a finely tapered point connecting with the barrel containing the ink, and closing the aperture by a spring when the pen is not in use. Pressure on the paper opens the aperture. The more popular fountain pen has a reservoir of ink and an iridium-tipped gold nib. A feed-bar conveys the ink to the nib by capillarity, and also admits air to fill its place. There are many devices for filling and prevention of leaking.

See Bunce's *Josiah Mason* (1890), which contains a sketch of the history of the steel-pen trade.

Penæaceæ, a small family of shrubby xerophytic flowering-plants, of the archichlamydeous dicotyledons, found in South Africa. They are heath-like in habit. The flowers, which have no petals, are regular, tetramerous, axillary, with tubular receptacle. The bracts are often coloured. The chief genera are *Penæa* and *Sarcocolla*.

Penal Laws. See CATHOLIC EMANCIPATION, IRELAND.

Penal Servitude is a sentence for criminal offences which has been introduced in lieu of the sentence of transportation beyond the seas; see IMPRISONMENT, PRISONS.

Penance (Lat. *pœnitentia*), in Roman Catholic theology, means both the sorrow for sin and also the sacrament by which absolution is conveyed. It means also the voluntary or accepted self-inflicted punishment by which a repentant sinner manifests his sorrow for sin, and seeks to atone for the sin, and to avert the punishment which, even after the guilt has been remitted, may still remain due to the offence. Penance is believed in the Roman Catholic Church to be one of the sacraments of the New Law. It will be necessary to explain it briefly both under its relations as a sacrament and as a private personal exercise.

Penance as a state of mind is simply sorrow for evil-doing, accompanied with a purpose of amendment. Penance is the fruit or the manifestation of this sorrow, and it is commonly accompanied or expressed by some of those external acts which are the natural manifestations of any deep sorrow, either negative, as the neglect of ordinary attention to dress, to the care of the person, to the use of food, or positive, as the direct acts of personal mortification and self-inflicted pain, such as fasting, wearing haircloth, strewing the head with ashes, watching of nights, sleeping on hard boards, &c. Such manifestations of sorrow, whether from motives of religion or from merely natural causes, are common among the Eastern races, and are frequently alluded to in the Scriptures. In the personal practice of the early Christians penance found a prominent place, and the chief and acknowledged object of the stated Fasts (q.v.), and other works of mortification which prevailed, was that of penitential correction, or of the manifestation of sorrow for sin.

A still more striking use of penance, however, in the early church, was the disciplinary one; and this, in the Roman Catholic view, is connected with the sacramental character of penance. Any discussion of this purely theological question would be out of place here, and it will be enough to state briefly that Roman Catholics number penance among the Seven Sacraments, and believe it to be of direct divine institution (Matt. xviii. 18; John xx. 23; 1 Cor. v. 5). The matter of this sacrament consists, in their view, of the three acts of the penitent—contrition, or heartfelt sorrow for sin, as being an offence against God; confession, or detailed accusation of one's self to a priest approved for the purpose; and satisfaction, or the acceptance and accomplishment of certain penitential works, in atonement of the sin confessed. The form of the sacrament is the sentence of absolution from sin pronounced by the priest who has received the confession, and has been satisfied of the penitential disposition of the self-accusing sinner. In all these points, of course, they differ from Protestants. Even in the apostolic times the practice prevailed of excluding persons of scandalous life from the spiritual fellowship of the Christian community (see EXCOMMUNICATION); and, without attempting to fix the date, it may be stated as certain, from the authority of Tertullian and other writers, that from a very early time the persons so excluded were subjected to certain penitential regulations. The class of offenders so treated were those who had been notoriously guilty of the grievous crimes of idolatry or apostasy, murder, adultery, and other scandalous offences. The period of penitential probation differed in different times and places, but in general was graduated according to the enormity of the sin, some going so far in their rigour (see NOVATIAN) as, contrary to the clearly-expressed sense of the church, to carry it even beyond the grave. In the earlier ages much depended upon the spirit of each particular church or country; but about the 4th century the public

penitential discipline assumed a settled form, which, especially as established in the Greek Church, is so curious that it deserves to be briefly described. Sinners of the classes already referred to had their names enrolled, and were (in some churches, after having made a preliminary confession to a priest appointed for the purpose) admitted, with a blessing and other ceremonial, by the bishop to the rank of penitents. This enrolment appears to have commonly taken place on the first day of Lent. The penitents so enrolled were arranged in four grades, called—1. (Gr. *prosklaiontes*, Lat. *flentes*) 'Weepers'; 2. (Gr. *akroomenoi*, Lat. *audientes*) 'Hearers'; 3. (Gr. *hypopiptotes*, Lat. *prosternentes*) 'Prostraters'; 4. (Gr. *systantes*, Lat. *consistentes*) 'Standers.' Of these classes the first were obliged to remain outside of the church at the time of public worship, and to ask the prayers of the faithful as they entered. The second were permitted to enter and to remain in the place and during the time appointed for the Catechumens (q.v.), but, like them, were required to depart before the commencement of the solemn part of the Liturgy (q.v.). The third were permitted to pray with the rest, but kneeling or prostrate, and for them were prescribed many other acts of mortification. The fourth were permitted to pray with the rest in a standing posture, although apparently in a distinct part of the church; but they were excluded from making offerings with the rest, and still more from receiving the communion. The time to be spent in each of these grades at first differed very much according to times and circumstances, but was afterwards regulated by elaborate laws, called penitential canons. Still it was in the power of the bishop to abridge or to prolong it; a power the exercise of which is connected with the historical origin of the practice of Indulgence (q.v.). Of these four grades the first two hardly appear in the Western Church. It is a subject of controversy whether, and how far, this discipline was extended to other than public sinners; but it seems certain that individuals, not publicly known as sinners, voluntarily enrolled themselves among the penitents. All four grades wore a distinguishing penitential dress, in which they appeared on all occasions of public worship, and were obliged to observe certain rules of life, to renounce certain indulgences and luxuries, and to practise certain austerities. In some churches they were employed in the care of the sick, the burial of the dead, and other of the more laborious works of charity. The penitent, in ordinary cases, could only be restored to communion by the bishop who had excluded him, and this only at the expiration of the appointed time, unless the bishop himself had shortened it; but in case of dangerous illness he might be restored, with the condition, however, that if he recovered from the illness the whole course of penance should be completed. The reconciliation of penitents took place commonly in Holy Week, and was publicly performed by the bishop in the church, with prayer and imposition of hands. It was followed by the administration of communion. If any of the clergy were guilty of a crime to which public penance was annexed, they were first deposed from the rank of the clergy, and then subjected to the ordeal, like the laity themselves. This public discipline continued in force with greater or less exactness in the 5th, 6th, and 7th centuries, gradually, however, being replaced by semi-public, and ultimately by private penance. In the 11th and 12th centuries the public penance had entirely disappeared. The nature and origin of private penance is a subject of controversy between Catholics and Protestants; the former contending that it had existed from the first, and

that it held the same place even in the ages of public penance for *secret sins* which the public penance did for public offences. At all events, from the date of the cessation of the public discipline it has existed universally in the Roman Church. The priest, in absolving the penitent, imposes upon him the obligation of reciting certain prayers, undergoing certain works of mortification, or performing certain devotional exercises. These acts of the penitent are held to form an integral part of the sacrament of penance. See CONFESION; and Morinus, *De Pœnitentiâ* (1651).

By Protestant churches penance is not recognised; yet a confession was made and a penance inflicted publicly in a church at East Clevedon in Somersetshire in 1882; and there is a curious letter from Dr Pusey to Mr Hope-Scott, then abroad (1844), desiring him to procure a 'discipline' and 'send it by B. What was described to me was of a very sacred character: five cords each with five knots, in memory of the five wounds of our Lord. . . . I should be glad to know also whether there were any cases in which it is unsafe—e.g. in a nervous person.' An approach to the Roman Catholic polity on the subject was in use among the English Puritans of the 17th century, and more particularly in the Church of Scotland during that and the succeeding century, when it was common 'to make satisfaction publicly on the Stool of Repentance' (q.v.). In Ayrshire the kirk-sessions were accustomed regularly to provide sackcloth suits for ecclesiastical offenders as late as 1781; a heinous breach of the seventh commandment might involve the penitents' standing in the 'public place of repentance' in church, arrayed more or less completely in sackcloth, every successive Sunday for six months on end (see Edgar's *Old Church Life in Scotland*, 1885). It does not seem to have occurred to the Reformers or their more immediate successors in the Protestant churches that their system of discipline, with its public rebukes and enforced humiliations of various kinds, was liable to be interpreted in a sense very different from that of a mere expression of sorrow for sin; but the belief is now very general among the most zealous adherents of their doctrinal opinions that in all this they adopted practices incongruous with their creed, and in harmony rather with that of the Church of Rome. Nor do they seem to have perceived that Church Discipline (q.v.), in its proper sense, as relating to ecclesiastical rights and privileges, is wholly distinct from the imposition of penalties by churches or church courts. Penitential humiliations, imposed by ecclesiastical authority, are now no more in favour where church discipline is most strict than where the utmost laxity prevails. The commutation of penalties deemed shameful, for a fine to the poor of the parish, was an abuse once prevalent in Scotland, but never sanctioned by the higher ecclesiastical authorities. See Watkins, *History of Penance* (1920).

Penang (*Pulo P'enang*, 'Betel-nut Island'), the official but less used name of which is PRINCE OF WALES ISLAND, one of the British Straits Settlements (q.v.), lies at the northern extremity of the Strait of Malacca, 2 to 10 miles from the west coast of the Malay Peninsula, and 360 miles NNW. of Singapore. Length, 15 miles; breadth, 5 to 10 miles; area, 107 sq. m., three-fifths being hilly. A sanatorium crowns the highest point, 2920 feet above sea-level. The whole is covered with forest and vegetation, coconut and areca palms predominating. In the low lands the thermometer ranges from 70° to 95° Fahr., and at the sanatorium from 60° to 75°. The rainfall averages 111 inches a year. Penang is a great shipping centre for the products of the Malay States of the Peninsula. By far the most important exports

are rubber and tin, the next being spices, copra, sugar, and tobacco. Georgetown, the capital, is situated at the north-east extremity of the island, and is defended by forts; pop. about 100,000. Province Wellesley, on the peninsula opposite, forms part of the same settlement administratively. Forty-five miles in length by 4 to 11 in breadth, with an area of 270 sq. m., it produces tapioca, sugar, rice, and coconuts. Another dependency of the settlement is the Dindings, including the island of Pangkor, situated about 80 miles S. of Penang. The raja of Kedah ceded Penang to the English in 1785 in return for an annual pension of £1000. Thirteen years later Province Wellesley was acquired, in order to put down piracy. In 1805 the East India Company, the proprietors of the settlement, made Penang a presidency of equal rank with Bombay and Madras. From 1823 Singapore and Malacca were united with it, but in 1831 the seat of government was transferred from Penang to Singapore. Pop. of Penang, including Province Wellesley and the Dindings, (1881) 190,597, (1921) 310,781, one-half Chinese, nearly one-fourth Malays, with many Tamils and others from India. Many thousands of Chinese and Indians arrive every year, and the arrivals are not balanced by the departures.

PENANG LAWYERS is the commercial name for the stems of a species of palm imported from Penang for walking-sticks. They are small and hard, and have a portion of the root-stock attached, which is left to form the handle.

Penarth Beds. See TRIASSIC SYSTEM.

Penates. See LARES.

Pencils. A slender stick of black lead, slate, or coloured chalk, encased in a small round piece of wood, is called a pencil; but the term is also applied to small hair-brushes used by artists, and it was to these that the name was originally given. Some early manuscripts have lines upon them ruled with ordinary metallic lead. When pencils of Black Lead (q.v.), called also graphite and plumbago, were first used is uncertain, but Beckmann points out that they are distinctly mentioned in a book on fossils by Conrad Gesner, printed at Zurich in 1565. The discovery of the use of black lead as a material for writing or drawing with was an important one, since for work where words or lines may require to be frequently rubbed out no other substance has such valuable properties.

For a long time the plumbago from the Borrowdale mines in Cumberland furnished the 'leads' for the best pencils ever made. These mines have been exhausted since 1850; but when the graphite from them was available it had, in the case of the larger and purer pieces, only to be cut into square rods of the proper size for pencils. In order to work up the smaller bits, cuttings, and dust of this precious material, Mr W. Brockedon, in 1843, patented a method by which he first reduced these small pieces to powder, and then, by subjecting it to great pressure in dies from which air is exhausted, produced a cake as solid and compact as the natural graphite, and equally suitable for cutting into leads. For a considerable number of years past, owing to the Borrowdale plumbago being worked out, black-lead pencils, as well as coloured pencils or crayons, have been made by the process invented about the close of the 18th century by Conté of Paris, which consists in thoroughly mixing the black lead with clay, both being first reduced to a state of fine division and most carefully purified. The proportions of graphite and clay vary from two of the latter to one of the former (for light hard pencils) to equal parts of the two ingredients (for the dark soft kinds).

Water is added to the mixture, which is repeatedly ground, and then placed in canvas bags and squeezed in a hydraulic or steam press till it acquires the consistency of stiff dough. In this state it is placed in a strong metal cylinder, whose bottom is perforated with apertures of the proper size for the section of the pencil leads. The black-lead mixture, being in a plastic state, is then squeezed out through the apertures by a plunger into continuous strips or threads, which are arranged in straight lengths on a board to dry. After being exposed to a slight artificial heat, the strips are cut into the usual lengths for pencils, and placed in a covered crucible, which is raised to a red heat. When cooled they are ready for use.

An extensive mine of fine graphite was opened at Bogodolsk in eastern Siberia about 1850. Much of this black lead is scarcely if at all inferior in quality to that formerly obtained in Cumberland. Graphite is also mined at Schwarzbach in Bohemia; at Passau, Bavaria; in Norway, New Zealand, Mexico, various parts of the United States, and in Canada. The graphite found at Ticonderoga in New York State is of very pure quality; as its product is 99.9 per cent. pure carbon, it is the purest graphite known or likely to be discovered. Workable deposits of graphite are found at several places in Canada. A good deal of what occurs in the township of Buckingham, in the province of Quebec, is also very pure, and is made into pencils. For other localities, see **BLACK LEAD**.

The wood of the Virginian or Florida cedar (see **JUNIPER**), being straight grained and easily cut, is remarkably well suited for pencil-making. That of *J. procera* from Kenya competes successfully. Two rectangular pieces of the proper size, cut out by machinery, go to make a pencil, the one containing the groove for the lead being thicker than the other. After the lead is inserted the two pieces are glued together, and then cut to a round shape by revolving cutters. The operations of cutting out the square fillets of wood and rounding them after they are glued are very rapidly performed. Pencils are sometimes cut in a hexagonal shape. Besides the maker's name, letters indicating the character of the lead are stamped upon pencils. For Great Britain these are H, HH, HHH, B, BB, BBB, HB, and F. H signifies hard; once and twice repeated it means harder and very hard. B stands for black (and soft), and, when repeated, for still blacker. HB, the most generally useful, means hard and black; while F signifies firm. In the United States the letters used differ somewhat. They are H, hard; VH, very hard; VVH, still harder; S, soft; VS, very soft; VVS, still softer, for deep black shading; M, medium; MH, medium hard; MB, medium black.

Owing to the multiplicity of processes for reproducing pen-and-ink drawings (see **ILLUSTRATION**), and the cultivation of that method for book illustration, the black-lead pencil is much less used now than in the earlier half of the 19th century. Drawings in chalk or charcoal, since either material makes a much blacker line, have usually deeper and more effective shading than can be given with pencil. Still, a finished drawing in black lead by a skilled hand has charms of its own, and it is to be regretted that so few of these of any importance are now made by artists of high standing.

Coloured pencils are made with ordinary pigments—e.g. Prussian blue and chrome yellow for their respective colours—mixed with white wax and tallow or with gum and tallow, clay being sometimes added; but none of these coloured preparations are heated like those made of graphite and clay. Copying and ink pencils are made of a concentrated solution of an aniline violet added to

a mixture of graphite and China clay. For some kinds gum is added, and in such cases graphite is sometimes omitted.

The arrangement of a small rod of black lead, which is kept projecting as it wears away from a tube fitted to a metal pencil-case, was patented by Hawkins and Mordan in 1822. An alloy of lead, antimony, and a little mercury is made into ever-pointed pencils for writing on paper prepared with a suitable surface.

The manufacture of black-lead and coloured pencils is extensively carried on in England, Austria, Germany, and America. At Nürnberg in Bavaria there are many factories; the name of Faber there is famous.

Penda (circa 577–655), heathen king of Mercia (q.v.), was constantly at war with Northumbria. He defeated Oswald (q.v.) at Maserfelth (perhaps Oswestry) in 642, but was himself defeated and slain by Oswy on the Winwaed, either in Lothian or in Yorkshire.

Pendant, a hanging ornament, used in ceilings, vaults, staircases, timber-rooms, &c. It is sometimes a simple ball and sometimes elaborately ornamented, and is chiefly used in the later Gothic and Elizabethan styles.

Pendant. See **FLAG**.

Pendennis Castle. See **FALMOUTH**.

Pendleton, a north-western suburb of Manchester, wholly within the borough of Salford.

Pendragon. See **DRAGON**.

Pendulum. The two chief varieties are the *simple pendulum* and the *ordinary or complex pendulum*. Examples of the latter occur in all the forms of clockwork where a balance-wheel has been dispensed with (see **HOROLOGY**). A small leaden or golden bullet, when suspended from a fixed point by an extremely fine thread, may represent a simple pendulum, provided it vibrates in a small circular arc. Once set in motion, this instrument will move in the same arc for ever unless interfered with, because at each swing, when descending through the first half of its circular path, it acquires energy enough to raise it to an equal height on the opposite side. In ordinary experiments the bullet will perform many thousand oscillations by itself alone, before the resistance of the air and other interferences cause the movement to subside and at last cease, by imperceptibly diminishing the length of the arc.

This long-continued and self-sustaining action is manifestly due to the attraction of the earth, the force that causes a stone to fall to the ground, because at the end of each swing of the bullet its weight tends to pull it vertically downwards, and the string constrains it to repeat its course along the circular arc. A most interesting and valuable application of the pendulum, therefore, is for measuring the acceleration of velocities of falling bodies. For that purpose it is much superior to Atwood's Machine (q.v.) or any other method which has yet been devised.

If the circular path or swing is short—not exceeding, for example, that of a clock pendulum which beats seconds—there are two results to be remembered. First, that so long as the length of

Pendant.

thread is unchanged, it matters not how far the bullet may swing on each side, the time or duration of each oscillation is also unchanged. This 'pendulum-law' was discovered by Galileo in the church of Pisa, as he watched a lamp swinging by a chain. The quality that each swing occupies the same time is so important in horology that the introduction of the pendulum by Huygens as a time-measurer formed the principal epoch in the history of that science. The term *isochronism* ('equal-timeness') was invented to mark this property of the pendulum. The second law of the pendulum is that to make the bullet move faster we must shorten the thread in the following proportion: for twice as many oscillations take a quarter the length of string; for thrice as many take one-ninth the length; for four times as many take one-sixteenth the length. That law is otherwise expressed by saying the length of the thread is inversely as the square of the number of oscillations made in a given time (see CENTRE: *Centre of Oscillation*).

These and other properties of the pendulum are wrapped up in the formula: $t^2 : \pi^2 :: l : g$, which mathematicians have established: where t = time in seconds of one oscillation, l = length (in inches) of the thread, $\pi = 3.1415927$, a well-known ratio; and g = the accelerating force of gravity, or twice the space through which a heavy body falls in one second. When $t = 1$ in that formula—i.e. when our pendulum beats seconds, a result easily attained at any part of the world—then immediately we have $g = \pi^2 l = 9.8696$. In other words, multiply the length of the seconds pendulum in any latitude or longitude by the fixed number 9.8696 to find the value of g . By this valuable and simple result it has been shown that the force of gravity slightly and gradually increases as we travel from the equator towards either pole, the length of the seconds pendulum diminishing in the same proportion. The poles are therefore nearer to the centre than the equator is, which is an independent proof that our planet is spheroidal, and resembles in shape an orange rather than a lemon.

The following table readily gives the length of the seconds pendulum at any of the stations by dividing the corresponding number in the third column by the fixed number 9.8696. At London, for example, $32.191 \div 9.8696 = 3.262$ feet, length of seconds pendulum. Dent's clock in the tower of the House of Commons beats once in two seconds, and must therefore have a pendulum 13.046 feet long.

The table also shows the acceleration (feet per second) due to gravity, as ascertained from observations made by means of the seconds pendulum. The results are arranged in the order of their latitude.

Since the length of the seconds pendulum is due entirely to natural causes, and can always be easily verified, it was chosen as a standard of the British measures of length. Experience has taught, however, that these are more easily known by preserving an artificial standard.

The universal application of the pendulum for

time-measurement and ascertaining the local value of g has been followed by some special uses of it which are of interest. Thus Sir George B. Airy, astronomer-royal, applied it to form an estimate of the earth's mean density by observations taken at a coal-pit, 1200 feet deep, near South Shields. One pendulum being stationed at the surface and another at the bottom of the pit, their oscillations were exactly compared by means of an electric wire, with the result that a clock at the mouth of the pit would gain $2\frac{1}{2}$ seconds per day if removed to the bottom. From these data (*Phil. Trans.* 1856) the density of the earth was estimated to be 6.565.

By the Foucault experiment the pendulum was utilised in a striking manner to prove the perpetual rotation of our planet round its axis. A globe of metal is suspended by a long wire to a lofty roof, the point of suspension being vertically over the centre of a round table; and after being drawn aside from the position of rest this pendulum is allowed to begin its vibrations, but so as to have no tendency to right or left. Students of dynamics know that it must continue swinging to and fro in the same plane unless interfered with from without. The table beneath the pendulum revolves very slowly in a direction contrary to the hands of a watch; but since the floor and whole building revolve with the table, the observers naturally refer the relative motion to the pendulum, still swinging in its original plane. By marking twenty-four equal divisions round the edge of the table the spectators, if the experiment took place at the pole, would be furnished with a good clock. The angle through which the earth rotates in a given time, multiplied by the sine of the latitude, gives the angle through which the plane of oscillation passes in that time.

The pendulum, in Horology, is absolutely accurate as a time-keeper, if only the proper length is preserved. That is mainly done by means of a screw turning on the rod, under the 'bob' or ball, so as to push it up and therefore shorten the pendulum, or let it fall lower down and lengthen the pendulum. It was found in winter that clocks went too fast, and at mid-summer too slow, because cold shortened the metallic rod and heat lengthened it. A further refinement was therefore devised to secure a uniform length without the screw adjustment, the result being what are known as 'compensation pendulums.' Both the common methods of these depend on the same principle. (A simple and practically accurate form of pendulum is made with a wooden rod, which is less liable to expansion and contraction than metal.) The 'mercurial pendulum' carries within it a glass cylinder nearly full of mercury, so proportioned in quantity to the weight of the pendulum that when the latter expands downwards by the heat the change is counterbalanced by the upward expansion of the liquid in its jar. In winter, of course, the pendulum and the quicksilver are similarly contracted in opposite directions, to secure a good average length and mark better time. The second form of compensation pendulum is called the 'gridiron,' because it consists of several upright bars, as in the diagram. If the black bars be, for example, steel, and those between be brass or copper, then by a proper adjustment of their lengths any change of temperature will not materially affect the time-keeping property of the pendulum. Brass is much more subject to extension and contraction than steel. It is obvious from the figure that when the heat

dilates the brass bars they must raise the bob D, and therefore counteract the downward extension of the steel bars, such as BC or *bc* and Aa. For accurate and uniform time-measurement the grid-iron has, in the experience of some astronomers, proved superior to the mercurial pendulum.

Penelope, in Homeric legend, the wife of Ulysses (Odysseus), and mother of Telemachus, who was still an infant when Ulysses went to the Trojan war. During his long wanderings after the fall of Troy he was generally regarded as dead, and Penelope was vexed by the urgent wooing of many suitors, whom she put off on the pretext that she must first weave a shroud for Laertes, her aged father-in-law. To protract the time she undid by night the portion of the web which she had woven by day. When the suitors had discovered this device her position became more difficult than before; but fortunately Ulysses returned in time to rescue his chaste spouse from their distasteful importunities. Later tradition represents Penelope in a very different light, asserting that by Hermes (Mercury), or by all her suitors together, she became the mother of Pan (q.v.), and that Ulysses, on his return, divorced her.

Penelope. See GUAN.

Peneus, the old name of the river Salambria in Thessaly. Fed by streams from the Pindus Mountains, the river flows sluggishly at first through the plain of Thessaly and the vale of Tempe to the Gulf of Salonika.

Penge, an urban district of Kent, in Bromley parliamentary borough, adjoining Lewisham and Croydon, a residential suburb of London; pop. 26,000.

Pengelly, WILLIAM, geologist and anthropologist, was born at East Looe, Cornwall, 12th January 1812. After a short experience of the sea, under his father, he educated himself, and opened a Pestalozzian school in Torquay, where he was afterwards a private tutor in mathematics and natural science. He was active in his support of local scientific societies, and was specially interested in the geology of Devonshire, and later in the antiquity of man. He is best remembered for his investigation of the Bovey Tracey beds and of the Brixham Cave and Kent's Hole. He died 16th March 1894. See the Memoir by his daughter (1897).

Penguins (*Sphenisciformes*), a peculiar order of flightless marine birds. They are mostly confined to the Far South, but some extend up to the Galápagos Islands in the Pacific. They breed in large numbers on islands and rocky coasts in the Southern Ocean. They have many peculiarities, such as the transformation of the wing into a swimming-paddle, covered with small narrow, flat, feathers. The legs are included in the skin of the body, and the large feet are placed very far back. There are about half-a-dozen genera—e.g. *Aptenodytes*, including the large King Penguin and still larger Emperor; *Spheniscus* or Jackass-penguins; the Rock-hoppers—*Catarrhaetes* and *Megadyptes*. Penguins stand apart from other birds; perhaps their nearest relatives are the divers and grebes. The nest is usually little more than a hole in the ground or a small heap of stones. Their alleged stupidity and callousness in man's presence probably means little more than inexperience. The plumage of the neck is valued by furriers; and large numbers of 'Johnnies,' as the sailors call them, are slaughtered annually. The flesh, though dark, is wholesome food, and makes excellent 'hare-soup'; the belly is loaded with fat. That the penguins are not altogether a modern race of birds is shown by the remains of a species—*Palaeudyptes antarcticus*—which existed in New Zealand in late Eocene or early Miocene times. This bird differed from existing penguins in having rather longer wings, and may therefore conceivably have possessed the power of flight; it was a large form like the King Penguin of to-day.

Penicillaria. See MILLET.

Penicillium, a well-known genus of Mould (q.v.), multiplying mainly by conidia, or asexual spores, chains of which form tufts at the ends of erect conidiophores. They belong to the Ascomycetes, but perithecia are seldom formed. See CHEESE, FUNGI.

Penicuik, a town of Midlothian, on the left bank of the North Esk, 10 miles S. of Edinburgh by road, has a Romanesque church-tower and large paper-mills, dating from 1709; whilst 2 miles NNE. are Glencorse barracks (1804-82), originally a depot for French prisoners. Pop. (1841) 907; (1921) 2673.

Peninsular and Oriental Company carries mails and passengers between Great Britain and India, China, Japan, and Australia. The company in its present form was incorporated by royal charter in 1840, although it had then had an existence of three years' duration as the Peninsular Company, which carried mails to Portugal and Spain, and afterwards to Egypt.

Peninsular War (1807-14). The dissensions between Charles IV., king of Spain, and his son Ferdinand gave the Emperor Napoleon I. an opportunity of interfering in the affairs of that country. In pursuance of a treaty ratified on 29th October 1807 with the Spanish king, he had sent an army into Portugal under Junot, by whom Lisbon was seized, and the members of the royal house of Braganza obliged to flee to the Brazils. Ostensibly with the object of supporting Junot's army, other French troops gradually occupied Salamanca, Valladolid, and other important positions in Spain, including Madrid, where Murat was in command. A popular outbreak against the king and his favourite, Manuel Godoy, caused the former to abdicate and his son Ferdinand to assume the crown. But the latter was induced to meet the French emperor at Bayonne, and by him held a prisoner, while his father was again proclaimed king. Riots at Madrid, Toledo, and other places during the spring of 1808 caused the feeble king such alarm that he surrendered his crown to Napoleon, by whom it was bestowed upon his brother Joseph Bonaparte, then king of Naples. He was proclaimed in Madrid on 24th July 1808.

Owing to the large powers of the local junta, and to a decentralised form of government, the action of the capital of Spain had little effect upon that of her provinces, which rose against the French and those who favoured them in all directions. The organised forces of Spain amounted at this time to about 127,000 of all arms, while the French army in the Peninsula, exclusive of Junot's troops in Portugal, consisted of some 80,000 conscripts of various nations, French, Swiss, Italians, Poles, and even Portuguese, soon reinforced by 23,000 fresh troops. Arms, clothing, and money were freely supplied by Great Britain to the patriots of Spain and Portugal, whose numbers rapidly increased. The first operations of the French under Marshal Bessières in the north were uniformly successful, except at Saragossa, which Palafox gallantly held against Lefebvre-Desnouettes. In Catalonia they suffered several defeats, and in Andalusia their general, Dupont, surrendered at Bailén with 18,000 men. The first armed interference of the British in the affairs of the Peninsula was the despatch on 12th July 1808 of Sir Arthur Wellesley with some 30,000 men to Portugal. Landing these troops in Mondego

River, he defeated Laborde at Rorica and Junot at Vimeiro, but then handed over the command to Sir Harry Burrard, who had been sent out to supersede him, to be himself superseded within a few hours by Sir Hew Dalrymple. The latter officer concluded the convention of Cintra with the French commander, who evacuated Portugal by 30th September 1808. The three English generals were examined before a court of inquiry as to this convention, but no further steps were taken.

Sir John Moore, appointed to the command of the British troops (some 30,000) in Portugal on 6th October, had moved to Valladolid by 22d December, effecting a junction with Sir David Baird's division from Coruña. But the Spanish troops had in the meantime suffered a succession of defeats. The French had received large reinforcements; Napoleon himself was in Madrid; and Soult with 60,000 men was in his front. Moore therefore executed a rapid and masterly retreat to Coruña, and there fought a successful battle to cover the embarkation, being mortally wounded himself at the moment of victory. For three months no further steps were taken by the British government, but in December Sir John Cradock was sent out to take command in Portugal, and he took up a position covering Lisbon from the French, now under Marshal Victor. In this position Sir Arthur Wellesley, who was again sent out, found matters on 22d April 1809. The French armies in Spain now numbered nearly 400,000 men, divided into eight corps d'armée, under six marshals and Generals Junot and St Cyr, and operating in the north, south, east, and west. So long as Napoleon himself was able to direct operations they were characterised by unity of purpose and consequent success. Saragossa, attacked for the third time, after a memorable defence of sixty-three days, surrendered to Marshal Lannes on 21st February 1809, and many victories were gained over the Spanish levies; but in Catalonia St Cyr effected comparatively little. The outbreak of war in Germany drew Napoleon to that country in April, and the operations in Spain were somewhat neglected in consequence. The jealousies of the French commanders too prevented any unity of action there.

Sir A. Wellesley first marched against Soult with 20,000 British and 40,000 Spanish under Cuesta, and drove him out of Portugal. King Joseph, with 80,000 men under Marshal Victor, attacked at Talavera on 26th July and suffered a severe defeat. For this victory Sir A. Wellesley was created Viscount Wellington, but, being left without reinforcements, he was obliged to retire to Almeida, while the defeat of the Spanish at Ocana (November 20) enabled the French to overrun the whole of Andalusia, except Cadiz, which still held out. Wellington, foreseeing the impossibility of taking the offensive at that time, prepared during the winter a triple line of earthworks, 29 miles long, from Torres Vedras on the Zizandra to Alhandra on the Tagus, thus covering his base at Lisbon. The French, 65,000 strong, under Masséna, moved against him in the spring of 1810, captured the fortress of Ciudad Rodrigo on the 11th July, and attacked him in the position of Busaco on 29th September. The attack was beaten off, and Wellington, carrying out his preconceived plan, retired slowly into the lines of Torres Vedras, carrying with him as much of the resources of the country as possible, and directing the Portuguese troops to harass the flanks and rear of the French. To avoid starvation Masséna, finding himself unable to attack Wellington's fortifications, and having lost 30,000 men, began to retire on 14th November. Reinforcements having reached Wellington early in 1811, he followed, defeated Masséna at Sabagal on 3d April 1811, and drove him out of Portugal.

Soult in the meantime had defeated the Spaniards at Gebora (February 19), and captured the fortress of Badajoz. He also invested Cadiz, but General Graham with a force of 12,000 men attacked and defeated Marshal Victor's covering force at Barrosa on 5th March, which checked his further movements. Wellington, now designing to march on Madrid and thence against the French line of communications with Bayonne, found it necessary to capture Badajoz and Almeida. Masséna, at the head of 50,000 men, marched to the relief of the latter place. He was checked at Fuentes de Oñoro on 5th May, where a hard-fought battle caused him to retreat and abandon Almeida to the British. Wellington then turned towards Badajoz, which Soult endeavoured to relieve with a force of 23,000 men. The British (7000) and Spaniards (25,000) engaged him on the 16th May in the bloody battle of Albuera, compelling him to retire, which he did in a southerly direction.

Matters were, however, in a very critical state for the British, for the whole of Valencia, Asturias, and Galicia was in the hands of the French, who still had nearly 300,000 men in Spain, and had received no other check except from General Hill in Estremadura and at Tarifa, which fortress repelled Soult. Napoleon, too, threatened to take the field again in person. But this was prevented by the outbreak of war between France and Russia, and early in 1812 Wellington commenced his well-matured plan for freeing Spain from the invader. He captured Ciudad Rodrigo on 19th January, stormed Badajoz on 6th April, and called in Hill's division from the south. Marmont, who had collected his troops about Salamanca, found his flank threatened, and had at first to retire; but on 22d July he turned upon the British, and fought the battle of Tormes, where he was wounded and his army defeated. Wellington entered Madrid on 12th August. King Joseph then withdrew Soult from Andalusia to Valencia, where they joined Suchet. But the Spanish army neglected to guard the British line of communications, and Clausel, who succeeded Marmont, proved so formidable a general that Wellington again found himself obliged to retire towards Salamanca and Portugal.

Events elsewhere, however, lessened the power of his enemies, reducing their numbers to 197,000 men. Jealousy existed between Joseph and his generals; and Wellington's position was strengthened by his appointment as commander-in-chief of the Spanish and Portuguese armies. These now amounted to 200,000 men, of which 70,000 Anglo-Portuguese had been brought into a good state of discipline. He again advanced eastward in the spring of 1813, obliging the French to evacuate Burgos and the line of the Ebro. They attempted to withstand him at Vitoria on 21st June, but sustained a crushing defeat, abandoning all their artillery, stores, and baggage. The blockades of Pampeluna and St Sebastian followed. Joseph, who had quarrelled with Soult, was superseded in the command, which was given to the latter. In spite, however, of great skill on his part, a series of terrible battles in the Pyrenees were uniformly disastrous to him. St Sebastian was taken on 7th October, the victory of Nivelle won on 10th November, and Wellington enabled to base himself on the northern ports. In February 1814 Bayonne was invested, on 27th Soult was defeated at Orthes, and again at Toulouse on 10th April, which city was occupied by the British. But Napoleon had already abdicated, having, after the disastrous Russian campaign, been overpowered by the allied forces of Russia, Prussia, and Austria, by whom France was invaded and Paris taken. See also articles on France, Spain, Portugal, Wellington, Napoleon, Soult, Masséna, Sir John Moore,

Vitoria, Badajoz, Torres Vedras, Coruña, Busaco, &c.; Napier's *History of the Peninsular War* (1828-40), and Oman's (1902 *et seq.*).

Penitential, a book of the codified Canon-law relative to penances and their imposition and relaxation; see CASUISTRY, PENANCE.

Penitential Psalms, seven Psalms, so called as being specially expressive of sorrow for sin, accepted by Christian devotion as forms of prayer suitable for the repentant sinner. They are Psalms vi., xxxii., xxxviii., li., cii., cxxx., and cxliii. of the Authorised Version (vi., xxxi., xxxvii., l., ci., cxxix., and cxlii. of the Vulgate). They were very early set apart, and have a special place in the Roman Breviary; more than one pope attached an indulgence to the recital of them. The most frequent in use is the 51st (50th), the *Miserere* (q.v.).

Penitentiary, the name given to one of the offices of the Papal court, and also to the dignitary (a cardinal, called *Penitentiarius*) who presides over it. The subjects which come under the notice of the penitentiary are all matters relating to the confessional, especially the absolution from sins and from canonical censures, reserved to the pope.—For Penitentiary in another sense, see PRISONS.

Penjdeh, or PANJDEH. See AFGHANISTAN, TURKESTAN.

Penkridge, a town of Staffordshire, on the Penk, 6 miles S. of Stafford by rail, in an agricultural district; pop. 2600.

Penmaenmawr, a watering-place of Carnarvonshire, 4 miles SW. of Conway by rail; pop. 4500. The urban district forms part of the Carnarvon boroughs parliamentary constituency. The mountain of Penmaenmawr, the northern extremity of the Snowdon group, is 1553 feet high; on its summit are the remains of a great British fort, Dinas Penmaen.

Penn, WILLIAM, the founder of the colony of Pennsylvania, was the son of Admiral William Penn, and was born at London, 14th October 1644. His early years were spent partly in Essex and partly in Ireland, where his father had several estates, the gift of Cromwell. Penn studied at Christ Church, Oxford, and while there was converted to Quakerism by the preaching of a disciple of George Fox, named Thomas Loe. He objected personally to attend the services of the Church of England, and to wear the surplice of a student—both of which he considered eminently papistical. A story which, however, cannot be proved, tells how Penn, along with some companions who had also become Quakers, attacked several of his fellow-students, and tore the obnoxious robes from their backs. At all events his persistent nonconformity caused him to be expelled from the university. His father was so excessively annoyed at his conduct that he gave him a thrashing, and turned him out of doors; but he soon afterwards relented, and sent his son to travel on the Continent, in the hope that change of scene and the gaiety of French life would alter the bent of his mind. They failed, however, to effect this, but the youth certainly acquired a grace and suavity of address that he did not before possess. In 1666 the admiral sent him to Ireland to manage his estate of Shangarry in the county of Cork, and act as clerk of the cheque at Kinsale Harbour. Penn acquitted himself to his father's complete satisfaction; for in matters of business he was as practical an Englishman as in religion he was an out-and-out mystic. In the city of Cork, however, he again fell in with Thomas Loe, and for attending a Quaker meeting was, along with others, imprisoned by the mayor, but was immediately afterwards released on appealing to the lord president of the Council of Munster, who was personally

acquainted with him. On his return to England, Penn and his father again quarrelled, because the 'conscience' of the former would not allow him to take off his hat to anybody—not even to the king, the Duke of York, or the admiral himself. Penn was again turned out of doors by his perhaps testy, but assuredly provoked parent. The mother, however, stepped in, and smoothed matters so far that Penn was allowed to return home, and the admiral even exerted his influence with the government to wink at his son's attendance at the illegal conventicles of the Quakers, which nothing would induce him to give up. In 1668, however, he was thrown into the Tower, on account of a publication entitled *The Sandy Foundation Shaken*, in which he attacked the ordinary doctrines of the Trinity, God's 'satisfaction' in the death of Christ, and justification by the imputation of Christ's righteousness. While in prison he wrote the most famous and popular of his books, *No Cross, no Crown*, and *Innocency with her Open Face*, a vindication of himself that contributed to his liberation, which was obtained through the interference of the Duke of York. In September 1670 Admiral Penn died, leaving his son an estate of £1500 a year, together with claims upon government for £16,000. In 1671 the upright but incorrigible sectary was again committed to the Tower for preaching; the Conventicle Act did not touch the case, but, as he refused to take the oath of allegiance, he was sent to Newgate for six months. Here he wrote, besides several manifestoes, three treatises; one of them, entitled *The Great Case of Liberty of Conscience*, is an admirable defence of the doctrine of toleration. After regaining his liberty he visited Holland and Germany for the advancement of Quakerism. The Princess-Palatine Elizabeth, the granddaughter of James I., showed him particular favour. On his return he married, in the beginning of 1672, Gulielma Maria Springett, daughter of Sir William Springett, and for some years thereafter continued to propagate, by preaching and writing, the doctrines of his sect.

Circumstances having turned his attention to the New World, he in 1681 obtained from the crown, in lieu of his monetary claim upon it, a grant of territory in North America. Penn wanted to call it Sylvania, on account of its forests, but the king (Charles II.) insisted on the prefix Penn in honour of his father. His great desire was to establish a home for his co-religionists in the distant West, where they might preach and practise their convictions in unmolested peace. Penn, with several friends, sailed for the Delaware in September 1682, was well received by the settlers, and in November held his famous interview with the Indian tribes, under a large elm-tree at Shackamaxon, afterwards Kensington, and now a part of Philadelphia. He planned and named the city of Philadelphia, and for two years governed the colony wisely and well, but on strictly Puritan principles. Not only Quakers, but persecuted members of other religious sects sought refuge in his new colony, where from the first the principle of toleration was established by law.

Towards the end of the reign of Charles II. Penn returned to England to exert himself in favour of his persecuted brethren at home. His influence with James II.—an old friend of his father's—was so great that many people have never felt quite satisfied about the nature of their relations. The suspicion, however, that Penn allowed himself to be used as a tool by the court is not justified by any known facts, and Macaulay—who with an ungracious animosity has urged the view of his complicity in some of the disgraceful incidents that followed Monmouth's rebellion—has been convicted of haste and inaccuracy in several important par-

ticulars. At anyrate, his exertions in favour of the Quakers were so far successful that in 1686 a proclamation was issued to release all persons imprisoned on account of their religious opinions, and more than 1300 Quakers were set free. In the April following James issued an edict for the repeal of all religious tests and penalties, but the mass of Non-conformists mistrusted his sincerity, and refused to avail themselves of it. After the accession of the Prince of Orange as William III. Penn was twice accused of treason, and of corresponding with the exiled monarch, but was acquitted. In 1690 he was charged with conspiracy, but was not arrested. Nevertheless, in the following year, the charge was renewed. Nothing appears to have been done for some time, but Penn at last, through the kindly offices of his friends, Locke, Tillotson, and others, had the matter thoroughly investigated, and he was finally and honourably acquitted in 1693. In 1692 he had been deprived of his government, but it was restored to him in 1694. In the latter year his wife died, and Penn published a memoir testifying to her great virtues; but in less than two years he married again, his second wife being Hannah Calowhill, of Bristol, a Quaker lady. In 1699 he paid a second visit to the New World, where Pennsylvania required his presence to restore peace and order after the arbitrary behaviour of his deputy. His stay, which lasted two years, was marked by many useful measures, and by efforts to ameliorate the condition of both the Indians and Negroes. He departed for England towards the end of 1701, leaving the management of his affairs to an agent named Ford, whose villainy virtually ruined Penn. When the rogue died he left false claims against his master, which Penn refused to pay, allowing himself to be thrown into the Fleet in 1708. His friends afterwards procured his release, but not till his constitution was fatally impaired; for the last five years of his life his memory and understanding were greatly weakened. He died at Ruscombe, in Berkshire, July 30, 1718. The proprietary claims of his descendants were bought up by a pension of £4000, which in 1884 was commuted (see PENSIONS).

See Macaulay's *History of England*, and J. Paget's *Inquiry into the Evidence of the Charges brought by Lord Macaulay against William Penn* (1858); the Life prefixed to his collected works (2 vols. 1726), and to later issues of 'select works;' and *Lives by Clarkson* (1849). Hepworth Dixon (new ed. 1856), Robert J. Burdette (New York, 1882), Stoughton (new ed. 1883), and J. W. Graham (1917).

Pennalism. See FAGGING.

Pen-names. See PSEUDONYMS.

Pennant, THOMAS, traveller, was born of a good old Welsh family at Downing, near Holywell, Flintshire, 14th June 1726, and was educated at Wrexham, Fulham, and Hadley. In 1744 he went up to Queen's College, Oxford, but he left without taking a degree, having meanwhile, in 1746, ridden down into Cornwall—the first of his many tours. These included visits to Ireland (1754); the Continent (1765), where he made the acquaintance of Buffon and Voltaire; Scotland (1769 and 1772), which 'was then,' he says, 'almost as unknown as Kamchatka, but ever since has been inondée with southern visitants;' and the Isle of Man (1774), besides rambles through England and his native principality. He married twice, in 1759 and 1777; was made member of the Royal Society of Uppsala, an F.R.S., and a D.C.L. of Oxford; and died at Downing, 16th December 1798.

From boyhood a naturalist, for years a correspondent of Linnaeus, Pennant published *British Zoology* (1765-77), *British Quadrupeds* (1771), *Arctic Zoology* (1785), *History of London* (1790), &c.; but to-day he is chiefly remembered by his *Tours*

in Scotland (3 vols. 1771-75) and Wales (2 vols. 1778-81), the former of which works extorted from Johnson the admission: 'He's a *Whig*, sir, a *sad dog*; but he's the best traveller I ever read; he observes more things than any one else does.'

See the amusing *Literary Life of the late Thomas Pennant, Esq., by Himself* (1793), and the memoir prefixed to Sir John Rhys's edition of the *Tours in Wales* (3 vols. Carnarvon, 1883).

Pennatula, an interesting marine animal whose quill-like or feather-like appearance is suggested by the title and by the popular name Sea-pen. It is one of the Alcyonaria, and a good type of the very distinct order Pennatulacea. Like almost all Alcyonarians, it is a colony of polyps or zooids, but, as in other Pennatulacea, the first-formed polyp becomes long and substantial, and turns into a support for all the rest. The lower part of the support forms a stalk which is fixed in the mud on the floor of the sea; the upper part, or rachis, gives off, by budding, numerous secondary polyps or zooids. These are of two kinds—(a) larger 'autozooids,' nutritive and sexual, which fuse together in bilateral leaves or pinnules; and (b) inconspicuous 'siphonozooids,' which have no tentacles, are non-sexual, and occur in crowds on the rachis, serving to keep up internal currents of water. Up the centre of the stalk and rachis there runs a calcareous axis, and around both kinds of zooids, as well as in the flesh between them, there are numerous smooth red needles of lime, which give the whole colony a fine colour. When a living Sea-pen is touched in the dark it becomes brilliantly luminous or phosphorescent, the seat of the light-production being inside the larger zooids. A

Fig. 1.
Ventral View of *Pennatula phosphorea* (about one-half natural size).

Fig. 2.
Cross section of the axis and one 'leaf' set of fused Polyps (after Marshall). The most ventral polyp is longest and oldest.

common British species, *Pennatula phosphorea*, about 5 inches long, is common off the coasts in water ten to twenty fathoms deep; a magnificent form, *P. grandis*, from the northern waters of both the Old World and the New, may be over 2 feet long. See A. M. and W. P. Marshall, Report on Pennatulids (Birmingham, 1882), Kölliker's 'Challenger' Report (1880), Hickson's 'Siboga' Report (1918).

Pennell, JOSEPH, American etcher and book illustrator, born in 1860 at Philadelphia, has achieved great distinction at exhibitions throughout the United States and Europe, and is represented in most of the notable galleries. He has

also written numerous books including *A Canterbury Pilgrimage* (1885), *Our Sentimental Journey Through France and Italy* (1888), and works on illustration, lithography, and etching. In his *Life of James M'Neill Whistler* (1908), as also in the *Whistler Journal* (1921), he was aided by his wife, Elizabeth Robins Pennell (born at Philadelphia, 1855). Her works, mostly illustrated by her husband, include biographies of *Mary Wollstonecraft* (1884) and *Charles Godfrey Leland* (1906), *French Cathedrals, Monasteries, and Abbeys* (1909), *Our Philadelphia* (1914).

Penni, GIOVANNI FRANCESCA, usually called *Il Fattore*, a painter of the Umbrian school, born at Florence probably in 1496, died at Naples in 1536. He was a pupil and favourite of Raphael, and most of his works are copied from his master.

Pennine or PENNINITE, mineral of the chlorite group, found in the Pennine Alps. A hydrous silicate of aluminium, magnesium, and iron, it occurs in long green rhombohedra, pleochroic from clear green to brown or reddish.

Pennine Alps. See ALPS.—For the Pennine Range, see GREAT BRITAIN.

Pennisetum, a genus of grasses, natives of Africa (tropical and subtropical), Southern Europe, Asia, and America. Some are cultivated as cereals. See MILLET.

Pennon. See FLAG.

Pennsylvania, a north-eastern state, the second in population, of the United States of America; area, 45,215 sq. m.

The Appalachian (q.v.) system of mountains crosses Pennsylvania from north-east to south-west. It here attains its greatest breadth, but none of the ridges reach any great altitude, though a few peaks among the Alleghanies attain a height of more than 2500 feet. Between the Blue or Kittatinny Mountains on the east and the higher Alleghany range on the west lie numerous minor forest-clad chains, interspersed with picturesque valleys, many of them rendered exceedingly fertile by the limestone bed which produces their soil. The surface of the state is naturally divided into three sections, the low district south-east of the mountains, the mountainous region, and the broken hilly plateau in the west. The triangular south-eastern part of the state consists of a narrow level plain near the Delaware River, with an elevation of not more than 100 feet above the sea, merging into a higher rolling region which extends to the base of the mountains. From Canada to the southern limit of the Appalachians extends an almost continuous valley, lying east of the main ranges, and separated from the coast region by the skirting south-eastern ridge. This 'great valley' is throughout its whole extent protected by a southern or eastern wall, except in Pennsylvania, where, through a break of about 50 miles, the Cumberland Valley is without a barrier toward the sea, and the fertile calcareous soil spreads out over Lancaster and parts of York, Berks, and Chester counties, making this one of the best farming regions of the country. The mountain region covers a belt which in places is more than 100 miles in width, and embraces about one-fourth of the area of the state. More than twenty ranges have been named, and the whole region is justly celebrated for its scenery. The rivers have in various places cut gaps through the ridges, thus affording passages for travel and commerce. Many of these water-gaps are exceedingly picturesque, and are much visited by tourists. The western plateau region comprises about one-half the area of the state; it is crossed by a few ridges, contains some isolated peaks, and is deeply furrowed by

watercourses. Much of this section is heavily wooded.

The geology of Pennsylvania is particularly remarkable on account of the great development of the different periods of the Palæozoic era. The formations in the south-eastern part of the state are in dispute, but the vicinity of Philadelphia is generally admitted to be Archæan, and a little farther north is a belt of Quaternary alluvium. The Silurian deposits, which extend along the Hudson River in New York, continue into Pennsylvania and form the Kittatinny Mountains. The Devonian area of New York also covers a large part of the northern and north-eastern portion of Pennsylvania. West of the Kittatinnies the mountains present alternate Silurian and Devonian formations. West of the Alleghanies, throughout the great bituminous coalfields, the rocks are mainly conglomerate. The mountains and the western plateau region were originally highly elevated tracts, and have suffered to a vast extent from erosion. They have contributed nearly all the material for building up the lowland regions of New Jersey, Delaware, Maryland, and Virginia, and for the formation of the Lower Mississippi valley. The geological disturbances have been greatest and most frequent in the eastern part of the state, where the beds of anthracite coal occur at all angles and in some cases in a vertical position, whereas the bituminous coal-beds of the western field are nearly horizontal. The breaking of the strata and the enormous pressure to which the eastern coal-deposits have been subjected has resulted in giving Pennsylvania the most valuable anthracite basins of the country. It is a notable fact that the percentage of gas in the coal regularly increases from the eastern ranges to the western coal-measures. Although Pennsylvania is one of the richest mineral regions of the world, there is no department of her mineral wealth in which she exercises such exclusive control as in her deposits of anthracite coal. The bituminous coal is excellent in quality and variety, and the amount is practically inexhaustible, but the western coalfields are only part of a vast deposit which extends westward and southward into adjoining states. The iron ore which has contributed so materially to her wealth and prosperity is mined from an extensive belt which reaches on the north to Canada and on the south to Alabama. Even the petroleum and natural gas which are such important products of western Pennsylvania are found in other sections; but as yet her anthracite coal-basins are without a rival. The anthracite tract covers an area of 472 sq. m., and is situated in the highland district between the Delaware and Susquehanna rivers. The most important deposits lie in three great fields, known as the southern, middle, and northern fields. It is estimated that with an output of 100,000,000 tons per year the anthracite mines would not be exhausted for two centuries. In 1880 the output was 28,649,811 tons; in 1923, 92,663,854 tons. Pittsburgh is the centre of the bituminous region, and the production in 1923 was 169,044,178 tons. The proximity of coal and iron in such vast quantities has made Pennsylvania a great mining and manufacturing state. Though much surpassed by the Lake Superior region in the mining of iron ore, Pennsylvania still ranks high in the manufacture of pig-iron.

The successful boring for Petroleum (q.v.) in 1859 produced an excitement which was not surpassed even by the discovery of gold in California. Fortunes were made and lost in a day. The mining of petroleum and the manufacture of the various articles produced from it have created new and important industries. The utilisation of natural gas for heating and manufacturing purposes also

for a time modified methods of living in western Pennsylvania. There are large zinc-works at South Bethlehem, and nickel is obtained in Lancaster county. Copper is mined to a limited extent; slate, marble, and limestone are largely quarried; and salt-springs abound in the petroleum region. There are many medicinal springs.

The eastern part of the state is drained by the Delaware and its tributaries the Schuylkill and Lehigh. The Susquehanna, with its affluents the North Branch, the West Branch, and the 'beautiful Juniata,' occupies the central drainage area. The Susquehanna is too rapid and too shallow for navigation, but it is used for floating quantities of timber, and coal, lumber, and other products are carried by the canals along its banks. A portion of the north-western region belongs to the valley of the Genesee, but the greater part of western Pennsylvania is drained by the Alleghany and Monongahela rivers, which, uniting at Pittsburgh to form the Ohio, furnish the state with a great highway of inland navigation. Pennsylvania has 16,000 miles of railroad and 800 miles of canals. For the 'Pennsylvania system,' see PRISONS.

In the mountains and wooded sections the smaller wild animals are still abundant. The panther, wild cat, and black bear are occasionally seen, and in some places the deer and wild turkey are not uncommon. The climate is healthful, but subject to extremes, and much modified by differences of elevation. Heavy snows fall on the mountains in winter, and the rivers of the western half of the state are often flooded in spring and summer (see e.g. JOHNSTOWN). Nearly one-fourth of the state is wooded; lumbering is one of the sources of wealth in the north, and farther south and west are great forests of hemlock, which maintain some of the largest tanneries in the world. In the Pocono swamps and plateaus, between the Wyoming and Kittatinny Mountains, the virgin growth of beech is known as the 'Shades of Death.' The soil, except in the mountains, is rich and fertile. Agriculture is a leading occupation, and in many crops Pennsylvania holds a high rank. The mountain regions and the western plateau are well suited for grazing, and the horses, cattle, sheep, and dairy products are noted for their excellence. The most important industries of Pennsylvania are mining and manufacturing. The amount of capital invested is greater than in any other state, and in the value of her manufactured products Pennsylvania is surpassed only by New York. Her commerce, both foreign and domestic, is very extensive. Shipbuilding is an interest of importance; river-steamers are built at Pittsburgh, and the perfection reached in the construction of iron steamships on the banks of the Delaware has given to that stream the title of the 'Clyde of America.'

History.—The first permanent settlement in the state was made in 1643 by Swedes, at the present site of Chester. Their colony of New Sweden was twelve years later conquered by the Dutch. In 1664 the English obtained possession, and the territory now called Pennsylvania was in 1681 granted by Charles II. to William Penn (q.v.). The friendly relations already existing between the whites and the Indians were re-established by Penn by a treaty, which was faithfully observed by both parties for more than fifty years. During the French and Indian wars, however, and again during the war of the revolution, the frontier settlements were attacked. In the struggle for independence and in the civil war Pennsylvania took a prominent part, and witnessed a number of the most famous battles and events connected with each. Schools were established by the earliest settlers, and a system of education formed part of the original scheme of government prepared by William Penn. The pub-

lic schools now are attended by over one and a half million pupils, and there are more than thirty universities and colleges in the state. A system of Soldiers' Orphan Schools was established in 1865, and there are numerous other charitable and educational institutions. There is a large foreign element in the population; many of the miners and ironworkers, especially, are of Irish, Hungarian, and Italian birth, and serious riots have not seldom occurred (see also MOLLY MAGUIRES). Among the farmers a very large proportion are of German descent, and still speak the *patois* known as 'Pennsylvania Dutch.' This belongs to the South German dialects, and is most closely related to the Pfälzisch; it preserves many old and curious German words, but is also interspersed more or less with Germanised English words, according to the locality. There are perhaps two million people around Philadelphia and New York who speak the *patois*; and in the country south-east of the Alleghenies they have their own dialectal newspapers. Specimens (spelt phonetically) of the dialect may be given: 'Ich trink tschenerli rooter wei' (I generally drink red wine); and 's wetter iss d'r gants daak schee gwest' (the weather has been fine the entire day). See Prof. S. S. Haldeman's *Pennsylvania Dutch* (1872); H. H. Reichard, *Pennsylvania-German Dialect Writings* (Lancaster, Pa. 1918); also A. J. Ellis's *Early English Pronunciation* (part iv. 1875).

The state contains 67 counties, and returns 2 senators and 36 representatives to congress. Philadelphia, the metropolis of the state, is the leading manufacturing city of the Union and ranks third in population (1,823,158 in 1920). Among other important cities are Pittsburgh, with which the large adjoining city of Allegheny is combined (588,193), Scranton (137,783), Reading (107,784), Erie (93,372), Harrisburg, the capital (75,917), Wilkes-Barre (73,833), Allentown (73,502), Johnstown (67,327), Altoona (60,331), Chester (58,030), Lancaster (53,160), Bethlehem (50,358). Pop. of the state (1850) 2,311,786; (1900) 6,302,115; (1910) 7,665,111; (1920) 8,720,159.

Penny (O.E. *pening* or *pending*; apparently from *pand*, 'a pawn,' Ger. *pfand*, Lat. *pannus*), a British coin, first mentioned in the laws of Ina, king of the West Saxons, about the close of the 7th century. It was at this time a silver coin, and weighed about 22½ troy grains, being thus about 1/10th of the Saxon pound-weight. This relation to the pound-weight is evidently derived from the usage of the early Franks, who retained the Roman division of the *libra* into 20 *solidi*, and the *solidus* into 12 *denarii* (the denarius being thus the 240th part of the *libra* or pound). See MARK. Halfpence and farthings were not coined in England till the time of Edward I., but the practice previously prevailed of so deeply indenting the penny with a cross mark that the coin could be easily broken into two or four parts as required. Silver farthings ceased to be coined under Edward VI., and silver halfpennies under the Commonwealth. Up to this time the penny had steadily decreased in weight; and under Elizabeth it was finally fixed at 7½ grains, or 1/16 of an ounce of silver, a value to which the subsequent copper pennies closely approximated. In 1672 an authorised copper coinage of pence, halfpence, and farthings was established. In 1797 twopenny pieces were coined, but were soon withdrawn. The penny of the present bronze coinage, first issued in the end of 1860, is of only about half the value of the old copper penny and as metal is worth only about one-seventh of a penny. The German *pfennig* was also originally a silver coin, bearing the same relation to the German pound of silver as the English penny to its pound. Now the nickel ten-pfennig

piece is $\frac{1}{10}$ th of the mark. The old Scots penny was only $\frac{1}{12}$ th of the English one, as the pound Scots and the Scots shilling were also $\frac{1}{12}$ th of the English coins of the same names. In the 12th century it was made very broad and thin.

Pennyroyal (*Mentha Pulegium*). other species occur locally.

Pennyroyal (*Mentha pulegium*), a species of Mint (q.v.), a native of Europe and western Asia, abundant in England and in some parts of Ireland, not found wild in Scotland, though sometimes grown there in gardens for its reputed medicinal

qualities. It enjoys a high popular reputation as an emmenagogue, but no dependence may be placed in its efficacy. The name pennyroyal is given in North America to a small plant, *Hedeoma pulegioides*, allied to the mints, and having, like them, a pleasant aromatic smell and a warm pungent taste. It is much in use in domestic medicine, in the form of a warm infusion, to promote perspiration and as an emmenagogue.

Penny Weddings was the name given to festive marriage ceremonials in Scotland at which the invited guests made contributions in money (seldom more than 1s. each), to pay the general expenses, and leave over a small sum, which would assist the newly-married pair in furnishing their dwelling. This practice was prevalent in the 17th century; and, as leading to 'profane minstrelsing and promiscuous dancing,' was denounced by an Act of the General Assembly, 1645, as well as by numerous acts of presbyteries and kirk-sessions about the same period.

Pennywort. For Ivy-leaved Toadflax, see TOADFLAX; for Cotyledon, NAVELWORT.—Marsh or Water Pennywort is a small British umbelliferous plant, *Hydrocotyle vulgaris*, a low herb with roundish peltate leaves, growing in marshy places. Totally unlike most members of its family in superficial appearance, it has its flowers few in number and almost sessile, so that the umbel is almost reduced to a head. The stem is creeping, rooting at the joints. Other species of *Hydrocotyle* are distributed over temperate and tropical regions.

END OF VOL. VII.
